7.3.3 On sea trials and under free running conditions the relationship between ship speed and impeller rotational speed is to be verified against the water jet's design basis.

7.3.4 Any trials and testing identified from the FMEA report, *see* 2.4.4, are to be carried out.

■ *Section 8*
Installation, maintenance and replacement

8.1 General

8.1.1 All water jet system propulsion units are to be provided with a copy of the manufacturer's installation and maintenance manual that is pertinent to the actual equipment. *See* 2.3.24.

8.1.2 The manual required by 8.1.1 is to be placed on board and is to contain the following information:

(a) Description of the water jet propulsion system with details of function and design operating limits. This is also to include details of support systems such as lubrication, cooling and condition monitoring arrangements.

(b) Identification of all components together with details of any that have a defined maximum operating life.

(c) Instructions for installation of the system on board ship with details of any required specialised equipment.

(d) Instructions for commissioning at initial installation and following maintenance.

(e) Maintenance and service instructions to include inspection/renewal of bearings and sealing arrangements. This is also to include component fitting procedures, clearance measurements and lubricating oil treatment where applicable.

(f) Actions required in the event of fault/failure conditions being detected.

(g) Precautions to be taken by personnel working during installation and maintenance.

Requirements for Fusion Welding of Pressure Vessels and Piping

Section

■ *Section 1* General

1.1 Scope

1.1.1 The requirements of this Chapter apply to the welding of pressure vessels and process equipment, heating and steam raising boilers and pressure pipes. The allocation of Class is determined from the design criteria referenced in Chapters 10, 11 and 12.

1.1.2 Fusion welded pressure vessels will be accepted only if manufactured by firms equipped and competent to undertake the quality of welding required for the Class of vessel proposed. For Class 1, 2/1 and 2/2 pressure vessels, the manufacturer's works are to be approved in accordance with the requirements specified in *Materials and Qualification Procedures for Ships*, Book A Procedure MQPS 0-4.

1.1.3 For pressure vessels which only have circumferential seams, *see* Ch 10,1.5.4 and Ch 11,1.5.5.

1.2 General requirements for welding plant and welding quality

1.2.1 In the first instance, and before work is commenced, the Surveyors are to be satisfied that the required quality of welding is attainable with the proposed welding plant, equipment and procedures in accordance with the guidelines specified in *Materials and Qualification Procedures for Ships Book A, Procedure 0-4*.

1.2.2 All welding is to be in accordance with the requirements specified in Chapter 13 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.3 Manufacture and workmanship of fusion welded pressure vessels

1.3.1 Pressure vessels are to be constructed and examined in accordance with the requirements specified in Chapter 13 of the Rules for Materials, unless more stringent requirements are specified.

■ *Section 2* Manufacture and workmanship of fusion welded pressure vessels

2.1 General requirements

2.1.1 Prior to commencing construction, the design of the vessel is to be approved where required by Ch 10,1.6 and Ch 11,1.6.

2.1.2 Pressure vessels will be accepted only if manufactured by firms that have been assessed and approved in accordance with MQPS 0-4.

2.2 Materials of construction

2.2.1 Where the construction requires post weld heat treatment, consideration should be given to certifying the material after subjecting the test pieces to a simulated heat treatment.

2.3 Tolerances for cylindrical shells

2.3.1 Measurements are to be made to the surface of the parent plate and not to a weld, fitting or other raised part.

2.3.2 In assessing the out-of-roundness of pressure vessels, the difference between the maximum and minimum internal diameters measured at one cross-section is not to exceed the amount given in Table 17.2.1.

Table 17.2.1 Tolerances for cylindrical shells

Nominal internal diameter of vessel in mm	Difference between maximum and minimum diameters	Maximum departure from designed form
≤ 300 > 300 ≤ 460 > 460 ≤ 600 > 600 ≤ 900 > 900 ≤ 1220 > 1220 ≤ 1520 > 1520 ≤ 1900	1,0 per cent of internal diameter	1,2 mm 1,6 mm 2,4 mm 3,2 mm 4,0 mm 4,8 mm 5,6 mm
> 1900 ≤ 2300 > 2300 ≤ 2670 > 2670 ≤ 3950	19 mm	6,4 mm 7,2 mm 8,0 mm
> 3950 ≤ 4650 > 4650	19 mm 0,4 per cent of internal diameter	0,2 per cent of internal diameter

2.3.3 The profile measured on the inside or outside of the shell, by means of a gauge of the designed form of the shell, and having a chord length equal to one-quarter of the internal diameter of the vessel, is not to depart from the designed form by more than the amount given in Table 17.2.1. This amount corresponds to *x* in Fig. 17.2.1.

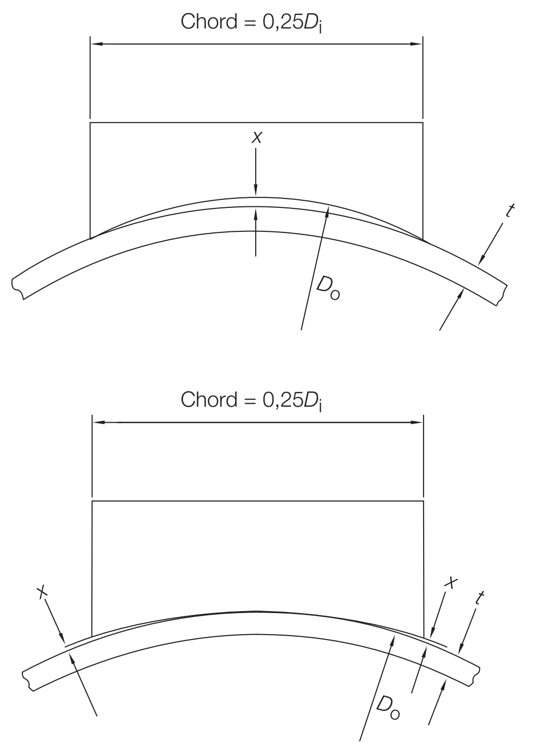

Fig. 17.2.1 Tolerances for cylindrical shells

2.3.4 Shell sections are to be measured for out-of-roundness, either when laid flat on their sides or when set up on end. When the shell sections are checked while lying on their sides, each measurement for diameter is to be repeated after turning the shell through 90° about its longitudinal axis. The two measurements for each diameter are to be averaged, and the amount of out-of-roundness calculated from the average values so determined.

2.3.5 Where there is any local departure from circularity due to the presence of flats or peaks at welded seams, the departure from designed form shall not exceed that of Table 17.2.1.

2.3.6 The external circumference of the completed shell is not to depart from the calculated circumference (based upon nominal inside diameter and the actual plate thickness) by more than the amounts given in Table 17.2.2.

Table 17.2.2 Circumferential tolerances

Outside diameter (nominal inside diameter plus twice actual plate thickness), in mm	Circumferential tolerance
300 to 600 inclusive	±5 mm
Greater than 600	±0,25 per cent

Section 3
Repairs to welds on fusion welded pressure vessels

3.1 General

3.1.1 Repairs to welds on fusion welded pressure vessels are to be in accordance with the requirements of Chapter 13 of the Rules for Materials.

Section 4
Post-weld heat treatment of pressure vessels

4.1 General

4.1.1 Post-weld heat treatment of fusion welded pressure vessels are to be in accordance with the requirements of Chapter 13 of the Rules for Materials.

Section 5
Welded pressure pipes

5.1 General

5.1.1 Fabrication of pipework is to be carried out in accordance with the requirements of Ch 13,5 of the Rules for Materials.

5.2 Welding workmanship

5.2.1 Preheating is to be effected by a method which ensures uniformity of temperature at the joint. The method of heating and the means adopted for temperature control are to be to the satisfaction of the Surveyors.

5.2.2 All welding is to be performed in accordance with the approved welding procedures in this Section by welders who are qualified for the materials, joint types and welding processes employed.

5.2.3 Welding without filler metal is generally not permitted for welding of duplex stainless steel materials.

5.2.4 All welds in high pressure and high temperature pipelines are to have a smooth surface finish and even contour; if necessary, they are to be made smooth by grinding.

5.2.5 Check tests of the quality of the welding are to be carried out periodically at the discretion of the Surveyors.

■ *Section 6*
Non-Destructive Examination

6.1 General

6.1.1 Non-Destructive Examination (NDE) of pressure vessels and piping is to be performed in accordance with the requirements of Ch 13,4 and 5 of the Rules for Materials.

Section

Section 1 General requirements

1.1 General

1.1.1 This Chapter applies to both cargo ships and passenger ships and is in addition to other relevant Chapters of the Rules.

1.1.2 The Rules contained in this Chapter cover machinery arrangements and control systems necessary for operating essential machinery from a (centralised) control station on the bridge under normal sea-going and manoeuvring conditions, but do not signify that the machinery space may be operated unattended.

1.1.3 In general, ships complying with the requirements of this Chapter will be eligible for the machinery class notation **IP**, *see* Pt 1, Ch 2,2.4.

1.1.4 The details of control systems will vary with the type of machinery being controlled, and special consideration will be given to each case.

1.2 Plans

1.2.1 **Control systems**. Where control systems are applied to essential machinery or equipment the following plans are to be submitted in triplicate:

- Details of operating medium, i.e. pneumatic, hydraulic or electric including standby sources of power.
- Description of operation with explanatory diagrams.
- Line diagrams of control circuits.
- List of monitored points.
- List of control points.
- List of alarm points.
- Test schedule including test facilities provided.

1.2.2 Plans for the control systems of the following machinery are to be submitted:

- Main propelling machinery, including all auxiliaries essential for propulsion.
- Controllable pitch propellers.
- Electric generating plant.
- Evaporating and distilling systems for use with main steam machinery.
- Steam raising plant for essential services.

1.2.3 **Alarm systems**. Details of the overall alarm system linking the machinery space control station with the bridge control station are to be submitted.

1.2.4 **Control stations**. Details of bridge and machinery space control stations are to be submitted, e.g. control panels and consoles.

1.2.5 **Machinery configurations**. Plans showing the general arrangement of the machinery space, together with the layout and configuration of the main propulsion and essential machinery, are to be submitted.

Section 2 Machinery arrangements

2.1 Main propulsion machinery

2.1.1 The main propulsion machinery may be oil engines, turbines or electric motors but the configuration of the propulsion system and its relationship with other essential equipment is to comply with the remaining requirements of this Section.

2.1.2 The main propulsion machinery is to drive one of the generators required by 2.2.2. This generator is to be capable of supplying the essential electrical load under all normal sea-going and manoeuvring conditions.

2.1.3 Standby machinery is to be provided capable of being readily connected to the main propulsion system so as to provide emergency propulsion. This standby machinery is to be capable of connection so as to provide an alternative drive to the generator required in 2.1.2. It need not provide power to both systems simultaneously, *see also* 2.2.2.

2.2 Supply of electric power and essential services

2.2.1 Continuity of electrical power supply and essential services are to be ensured under all normal sea-going and manoeuvring conditions without manual intervention in the machinery space. Methods by which this may be achieved include automatic start-up of generating sets and essential pumps or manual start-up of these services from the bridge.

2.2.2 Generating sets and converting sets are to be sufficient to ensure the operation of services essential for the propulsion and safety of the ship even when one generating set or converting set is out of service.

2.3 Controllable pitch propellers

2.3.1 For propulsion systems with controllable pitch propellers a standby or alternative power source for the actuating medium for controlling the pitch of the propeller blades is to be provided.

Section 3
Control arrangements

3.1 Bridge control

3.1.1 Means are to be provided to ensure satisfactory control of propulsion from the bridge in both the ahead and astern directions when operating on either the main or standby engine(s).

3.1.2 Instrumentation to indicate the following is to be fitted on the bridge and at any other station from which the propulsion machinery may be controlled:
(a) Propeller speed.
(b) Direction of rotation of the propeller for a fixed pitch propeller.
(c) Pitch position for a controllable pitch propeller.
(d) Direction and magnitude of thrust.
(e) Clutch position, where applicable.

3.1.3 An alarm is to operate in the event of a failure of the power supply to the bridge control system.

3.1.4 Emergency Stop Functions, independent of the bridge control system, are to be provided on the bridge to enable the watchkeeping officer to stop the main propulsion machinery in an emergency.

3.2 Alarm system

3.2.1 An alarm system is to be provided to indicate faults in essential machinery and control systems in accordance with this Chapter.

3.2.2 Machinery faults are to be indicated at the control stations on the bridge and in the machinery space.

3.2.3 In the event of a machinery fault occurring, the alarm system is to be such that the watchkeeping officer on the bridge is made aware of the following:
(a) A machinery fault has occurred.
(b) The machinery fault is being attended to, and
(c) The machinery fault has been rectified. (Alternative means of communication between the bridge control station and the machinery control station may be used for this function.)

3.2.4 The alarm system should be designed with self-monitoring properties. As far as practicable, any fault in the alarm system should cause it to fail to the alarm condition.

3.2.5 The alarm system should be capable of being tested during normal machinery operation.

3.2.6 Failure of the power supply to the alarm system is to be indicated as a separate fault alarm.

3.2.7 Alarm indication is to be both audible and visual. If arrangements are made to silence audible alarms they are not to extinguish visual alarms.

3.2.8 The acceptance of an alarm on the bridge is not to silence the audible alarm in the machinery space.

3.2.9 Machinery alarms should be distinguishable from other audible alarms, e.g. fire, carbon dioxide.

3.2.10 Acknowledgement of visual alarms is to be clearly shown.

3.2.11 If the audible alarm has been silenced and a second fault occurs before the first has been rectified, the audible alarm is again to operate. To assist in the detection of transient faults which are subsequently self-correcting, fleeting alarms should lock-in until accepted.

3.3 Communication

3.3.1 Two means of communication are to be provided between the bridge and the control station in the machinery space. One of these means may be the bridge control system; the other is to be independent of the main electrical power supply.

3.3.2 The bridge, machinery space control station and any other control position from which the propulsion machinery can be controlled are to be fitted with means to indicate which station is in command.

3.3.3 Change-over between control stations is to be possible under all normal sea-going and manoeuvring conditions without affecting the speed or direction of propulsion. This changeover may be effected only with the acceptance of the station taking control.

3.4 Engine starting safeguards

3.4.1 Where it is possible to start a main propulsion or auxiliary oil engine from the bridge, an indication that sufficient starting air pressure is available is to be provided on the bridge.

3.4.2 The number of automatic consecutive attempts which fail to produce a start is to be limited to safeguard sufficient starting air pressure, or, in the case of electric starting, a sufficient charge level in the batteries.

3.4.3 An alarm is to be provided for low starting air pressure, set at a limit which will still permit engine starting operations.

3.4.4 Where propulsion or auxiliary engines are started from the bridge, interlocks are to be provided to prevent starting of the engine under conditions which could hazard the machinery. These are to include ‘turning gear engaged’, ‘low lubricating oil pressure’ and ‘shaft brake engaged’.

3.5 Operational safeguards

3.5.1 Means are to be provided to prevent the machinery and shafting being subjected to excessive torque or other detrimental mechanical and thermal overloads.

3.5.2 Prolonged running in a restricted speed range is to be prevented automatically or, alternatively, an indication of restricted speed ranges is to be provided at each control station.

3.5.3 For ships propelled by steam turbines the risk of thermal distortion of the turbines is to be prevented by automatic steam spinning when the shaft is stopped in the manoeuvring mode. An audible and visual alarm is to operate on the bridge and in the machinery space when the shaft has been stopped for two minutes.

3.5.4 In the case of lubricating oil systems for main propulsion and standby engine(s), the engine(s) is to be stopped automatically on failure of the lubricating oil supply. The circuit and sensor employed for this automatic shutdown are to be additional to the alarm circuit and sensor required by Ch 14,8. Where means are provided to over-ride the automatic shutdown required by this paragraph, the arrangements are to be such as to preclude inadvertent operation. Visual indication of operation of the over-ride is to be fitted.

3.5.5 In the case of oil engines, oil mist monitoring is to be provided for crankcase protection where arrangements are fitted to over-ride the automatic stop for failure of the lubricating oil supply.

3.5.6 Boilers with automatic controls which under normal operating conditions do not require any manual intervention by the operators are to be provided with safety arrangements which automatically shut-off the oil fuel to all the burners in the event of either low water level or combustion air failure. Oil fuel is to be shut-off automatically to any burner in the event of flame failure.

3.5.7 Arrangements are to be provided to automatically stop propulsion gas turbines for the following fault conditions:
(a) Overspeed, *see* Ch 4,4.
(b) High exhaust temperature, *see* Ch 4,3.
(c) Flame failure, or
(d) Excessive vibration.

3.5.8 Where standby pumps are arranged to start automatically in the event of low discharge pressure from the working pump an alarm is to be given to indicate when the standby pump has started.

3.6 Automatic control of essential services

3.6.1 All control systems for essential services are to be stable throughout the operating range of the main propulsion machinery.

3.6.2 The temperature of the following is to be automatically controlled within normal operating limits:
Oil engines:
(a) Lubricating oil to the main engine and/or auxiliary engines.
(b) Oil fuel – temperature or viscosity.
(c) Piston coolant, where applicable.
(d) Cylinder coolant main and auxiliary engines, where applicable.
(e) Fuel valve coolant, where applicable.
Steam plant:
(a) Lubricating oil to main engine and/or auxiliary engines.
(b) Oil fuel to burners – temperature or viscosity.
(c) Superheated steam.
(d) External de-superheated steam.
Gas turbines:
(a) Lubricating oil to main engine and auxiliary engines.
(b) Oil fuel – temperature or viscosity.
(c) Exhaust gas.

3.6.3 The pressure of the following is to be automatically controlled within normal operating limits:
Steam plant:
(a) Superheated steam.
(b) Oil fuel.
(c) External de-superheated steam system(s).
(d) Gland steam.
(e) Reduced steam ranges.

3.6.4 The level of the following is to be automatically controlled within normal operating limits:
Steam plant:
(a) Boiler drum level.
(b) De-aerator level.
(c) Condenser level.

3.6.5 Boilers essential for the propulsion of the vessel are to be provided with an automatic combustion control system.

3.7 Local control

3.7.1 The arrangements are to be such that essential machinery can be operated with the system of bridge control or any automatic controls out of action. Alternatively, the control systems should have sufficient redundancy so that failure of the control equipment in use does not render essential machinery inoperative.

■ *Section 1* General

1.1 Application

1.1.1 The requirements of this Chapter apply to the design and construction of steering gear.

1.1.2 Whilst the requirements satisfy the relevant regulations of the *International Convention for the Safety of Life at Sea 1974* as amended, and the IMO Protocol of 1978, attention should be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

1.1.3 Consideration will be given to other cases, or to arrangements which are equivalent to those required by the Rules.

1.2 Definitions

1.2.1 **Steering gear control system** means the equipment by which orders are transmitted from the navigating bridge to the steering gear power units. Steering gear control systems comprise transmitters, receivers, hydraulic control pumps and their associated motors, motor controllers, piping and cables.

1.2.2 **Main steering gear** means the machinery, rudder actuator(s), the steering gear power units, if any, and ancillary equipment and the means of applying torque to the rudder stock (e.g., tiller or quadrant) necessary for effecting movement of the rudder for the purpose of steering the ship under normal service conditions.

1.2.3 **Steering gear power unit** means:

(a) in the case of electric steering gear, an electric motor and its associated electrical equipment;

(b) in the case of electrohydraulic steering gear, an electric motor and its associated electrical equipment and connected pump;

(c) in the case of other hydraulic steering gear, a driving engine and connected pump.

1.2.4 **Auxiliary steering gear** means the equipment other than any part of the main steering gear necessary to steer the ship in the event of failure of the main steering gear but not including the tiller, quadrant or components serving the same purpose.

1.2.5 **Power actuating system** means the hydraulic equipment provided for supplying power to turn the rudder stock, comprising a steering gear power unit or units, together with the associated pipes and fittings, and a rudder actuator. The power actuating systems may share common mechanical components, i.e., tiller quadrant and rudder stock, or components serving the same purpose.

1.2.6 **Maximum ahead service speed** means the maximum service speed which the ship is designed to maintain, at the summer load waterline at maximum propeller RPM and corresponding engine MCR.

1.2.7 **Rudder actuator** means the components which converts directly hydraulic pressure into mechanical action to move the rudder.

1.2.8 **Maximum working pressure** means the maximum expected pressure in the system when the steering gear is operated to comply with 2.1.2(b).

1.2.9 **Steering arrangements** means the complete system of components for providing ship directional control.

1.2.10 **Directional control system** means the equipment used to effect changes in ship direction e.g., the rudder, podded propulsion unit, azimuth thrusters or water jet nozzle. Note that for podded propulsion systems, azimuth thrusters, water jet systems, or other similar systems for effecting changes in ship direction, it is to be assumed that the units must provide thrust in addition to rotation and hence the directional control system must include the propulsion system.

1.3 General

1.3.1 The steering gear is to be secured to the seating by fitted bolts, and suitable chocking arrangements are to be provided. The seating is to be of substantial construction.

1.3.2 The steering gear compartment is to be:

(a) readily accessible and, as far as practicable, separated from machinery spaces; and

(b) Provided with suitable arrangements to ensure working access to steering gear machinery and controls. These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage.

1.4 Plans

1.4.1 Before starting construction, the steering gear machinery plans, specifications and calculations are to be submitted. The plans are to give:

(a) Details of scantlings and materials of all load bearing and torque transmitting components and hydraulic pressure retaining parts together with proposed rated torque and all relief valve settings.
(b) Schematic of the hydraulic system(s), together with pipe material, relief valves and working pressures.
(c) Details of control and electrical aspects.

1.5 Materials

1.5.1 All components used in steering arrangements for ship directional control are to be of sound reliable construction to the Surveyor's satisfaction.

1.5.2 All components transmitting mechanical forces to the rudder stock are to be tested according to the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.5.3 Ram cylinders; pressure housings of rotary vane type actuators, hydraulic power piping, valves, flanges and fittings; and all steering gear components transmitting mechanical forces to the rudder stock (such as tillers, quadrants, or similar components) are to be of steel or other approved ductile material, duly tested in accordance with the requirements of the Rules for Materials. In general, such material is to have an elongation of not less than 12 per cent nor a tensile strength in excess of 650 N/mm^2. Special consideration will be given to the acceptance of grey cast iron for valve bodies and redundant parts with low stress levels.

1.5.4 Where appropriate, consideration will be given to the acceptance of non-ferrous material.

1.6 Rudder, rudder stock, tiller and quadrant

1.6.1 For the requirements of rudder and rudder stock, *see* Pt 3, Ch 13,2.

1.6.2 For the requirements of tillers and quadrants including the tiller to stock connection, *see* Table 19.1.1.

1.6.3 In bow rudders having a vertical locking pin operated from the deck above, positive means are to be provided to ensure that the pin can be lowered only when the rudder is exactly central. In addition, an indicator is to be fitted at the deck to show when the rudder is exactly central.

1.6.4 The factor of safety against slippage, S (i.e., for torque transmission by friction) is generally based on

$$S = \frac{\text{the torque transmissible by friction}}{M}$$

where

M is the maximum torque at the relief valve pressure which is generally equal to the design torque as specified by the steering gear manufacturer.

1.6.5 For conical sections, S is based on the following equation:

$$S = \frac{\mu\, A\, \sigma_r}{\sqrt{(W + A\, \sigma_r\, \theta)^2 + Q^2}}$$

where

A = interfacial surface area, in mm^2
W = weight of rudder and stock, if applicable, when tending to separate the fit, in N
Q = shear force = $\dfrac{2M}{d_m}$ in N

where

d_m in mm is the mean contact diameter of tiller/stock interface and M in Nmm is defined in 1.6.4
θ = cone taper half angle in radians (e.g., for cone taper 1:10, θ = 0,05)
μ = coefficient of friction
σ_r = radial interfacial pressure or grip stress, in N/mm^2.

Table 19.1.1 Connection of tiller to stock

Item	Requirements
(1) Dry fit – tiller to stock, *see also* 1.6.4 and 1.6.5	(a) For keyed connection, factor of safety against slippage, S = 1,0 The maximum stress in the fillet radius of the tiller keyway should not exceed the yield stress For conical sections, the cone taper should be ≤ 1:10 (b) For keyless connection, factor of safety against slippage, S = 2,0 The maximum equivalent von Mises stress should not exceed the yield stress For conical sections, the cone taper should be ≤ 1:15 (c) Coefficient of friction (maximum) = 0,17 (d) Grip stress not to be less than 20 N/mm^2
(2) Hydraulic fit – tiller to stock, *see also* 1.6.4 and 1.6.5	(a) For keyed connection, factor of safety against slippage, S = 1,0 The maximum stress in the fillet radius of the tiller keyway should not exceed the yield stress For conical sections, the cone taper should be ≤ 1:10 (b) For keyless connection, factor of safety against slippage, S = 2,0 The maximum equivalent von Mises stress should not exceed the yield stress For conical sections, the cone taper should be ≤ 1:15 (c) Coefficient of friction (maximum) = 0,14 (d) Grip stress not to be less than 20 N/mm^2
(3) Ring locking assemblies fit – tiller to stock, *see also* 1.6.3	(a) Factor of safety against slippage, S = 2,0 The maximum equivalent von Mises stress should not exceed the yield stress (b) Coefficient of friction = 0,12 (c) Grip stress not to be less than 20 N/mm^2
(4) Bolted tiller and quadrant (this arrangement could be accepted provided the proposed rudder stock diameter in way of tiller does not exceed 350 mm diameter), *see* symbols	Shim to be fitted between two halves before machining to take rudder stock, then removed prior to fitting Minimum thickness of shim, For 4 connecting bolts: $t_s = 0{,}0014\,\delta_t$ mm For 6 connecting bolts: $t_s = 0{,}0012\,\delta_t$ mm Key(s) to be fitted Diameter of bolts, $\delta_{tb} = \dfrac{0{,}60\,\delta_{su}}{\sqrt{n_{tb}}}$ mm A predetermined setting-up load equivalent to a stress of approximately 0,7 of the yield strength of the bolt material should be applied to each bolt on assembly. A lower stress may be accepted provided that two keys, complying with item (5), are fitted. Distance from centre of stock to centre of bolts should generally be equal to $\delta_t\left(1{,}0 + \dfrac{0{,}30}{\sqrt{n_{tb}}}\right)$ mm Thickness of flange on each half of the bolted tiller ≥ $\dfrac{0{,}66\,\delta_t}{\sqrt{n_{tb}}}$ mm
(5) Key/keyway, *see* symbols	Effective sectional area of key in shear ≥ $0{,}25\,\delta_t^2$ mm^2 Key thickness ≥ $0{,}17\,\delta_t$ mm Keyway is to extend over full depth of tiller and is to have a rounded end. Keyway root fillets are to be provided with suitable radii to avoid high local stress
(6) Section modulus – tiller arm (at any point within its length about vertical axis), *see* symbols	To be not less than the greater of: (a) $Z_{TA} = \dfrac{0{,}15\,\delta_t^3\,(b_T - b_s)}{1000\,b_T}$ cm^3 (b) $Z_{TA} = \dfrac{0{,}06\,\delta_t^3\,(b_T - 0{,}9\,\delta_t)}{1000\,b_T}$ cm^3 If more than one arm fitted, combined modulus is to be not less than the greater of (a) or (b) For solid tillers, the breadth to depth ratio is not to exceed 2
(7) Boss, *see* symbols	Depth of boss ≥ δ_t Thickness of boss in way of tiller ≥ $0{,}4\,\delta_t$

Symbols

b_s = distance between the section of the tiller arm under consideration and the centre of the rudder stock, in mm
NOTE: b_T and b_s are to be measured with zero rudder angle

b_T = distance from the point of application of the load on the tiller to the centre of the rudder stock, in mm

n_{tb} = number of bolts in the connection flanges, but generally not to be taken greater than six

t_s = thickness of shim for machining bolted tillers and quadrants, in mm

Z_{TA} = section modulus of tiller arm, in cm^3

δ_t = Rule rudderstock diameter in way of tiller, *see* Pt 3, Ch 13

δ_{tb} = diameter of bolts securing bolted tillers and quadrants, in mm

Section 2
Performance

2.1 General

2.1.1 Unless the main steering arrangements for ship directional control comprise two or more identical power units, in accordance with 2.1.4 or 8.1.1, every ship is to be provided with main steering arrangements and auxiliary steering arrangements in accordance with the requirements of the Rules. The main steering arrangements and the auxiliary steering arrangements are to be so arranged that the failure of one of them will not render the other one inoperative.

2.1.2 The main steering arrangements for ship directional control are to be:
(a) Of adequate strength and capable of steering the ship at maximum ahead service speed which shall be demonstrated in accordance with 7.2;
(b) Capable of putting the rudder over from 35° on one side to 35° on the other side with the ship at its deepest sea-going draught and running ahead at maximum ahead service speed and under the same conditions, from 35° on either side to 30° on the other side in not more than 28 seconds.
(c) Operated by power where necessary to meet the requirements of (b) and in any case when the Rules excluding strengthening for navigation in ice, require a rudder stock over 120 mm diameter in way of the tiller; and
(d) So designed that they will not be damaged at maximum astern speed; however, this design requirement need not be proved by trials at maximum astern speed and maximum rudder angle.

2.1.3 The auxiliary steering arrangements for ship directional control are to be:
(a) Of adequate strength and capable of steering the ship at navigable speed and of being brought speedily into action in an emergency;
(b) Capable of putting the rudder over from 15° on one side to 15° on the other side in not more than 60 seconds with the ship at its deepest sea-going draught and running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater; and
(c) Operated by power where necessary to meet the requirements of (b) and in any case when the Rules, excluding strengthening for navigation in ice, require a rudder stock over 230 mm diameter in way of the tiller.

2.1.4 Where the main steering arrangements for ship directional control comprise two or more identical power units, auxiliary steering arrangements need not be fitted, provided that:
(a) In a passenger ship, the main steering arrangements are capable of operating the ship's directional control system as required by 2.1.2(b) while any one of the power units is out of operation;
(b) In a cargo ship, the main steering arrangements are capable of operating the ship's directional control system as required by 2.1.2(b) while operating with all power units;
(c) The main steering arrangements are arranged so that after a single failure in its piping system or in one of the power units the defect can be isolated so that steering capability can be maintained or speedily regained.

2.1.5 Main and auxiliary steering gear power units are to be:
(a) Arranged to re-start automatically when power is restored after power failure;
(b) Capable of being brought into operation from a position on the navigating bridge. In the event of a power failure to any one of the steering gear power units, an audible and visual alarm is to be given on the navigating bridge;
(c) Arranged so that transfer between units can be readily effected.

2.1.6 Where the steering gear is so arranged that more than one power or control system can be simultaneously operated, the risk of hydraulic locking caused by a single failure is to be considered.

2.1.7 A means of communication is to be provided between the navigating bridge and the steering gear compartment.

2.1.8 Steering gear, other than of the hydraulic type, will be accepted provided the standards are considered equivalent to the requirements of this Section.

2.1.9 Manually operated gears are only acceptable when the operation does not require an effort exceeding 16 kg under normal conditions.

2.2 Rudder angle limiters

2.2.1 Power-operated steering gears are to be provided with positive arrangements, such as limit switches, for stopping the gear before the rudder stops are reached. These arrangements are to be synchronised with the gear itself and not with the steering gear control.

Section 3
Construction and design

3.1 General

3.1.1 Rudder actuators other than those covered by 8.3 and the 'Guidelines' are to be designed in accordance with the relevant requirements of Chapter 11 for Class I pressure vessels (notwithstanding any exemptions for hydraulic cylinders).

3.1.2 Accumulators, if fitted, are to comply with the relevant requirements of Chapter 11.

3.1.3 The welding details and welding procedures are to be approved. All welded joints within the pressure boundary of a rudder actuator or connecting parts transmitting mechanical loads are to be of full penetration type or of equivalent strength.

3.1.4 The construction is to be such as to minimise local concentrations of stress.

3.1.5 The design pressure for calculations to determine the scantlings of piping and other steering gear components subjected to internal hydraulic pressure shall be at least 1,25 times the maximum working pressure to be expected under the operational conditions specified in 2.1.2(b) taking into account any pressure which may exist in the low pressure side of the system. Fatigue criteria may be applied for the design of piping and components, taking into account pulsating pressures due to dynamic loads, *see* Section 9.

3.1.6 For the rudder actuator, the permissible primary general membrane stress is not to exceed the lower of the following values:

$$\frac{\sigma_B}{A} \text{ or } \frac{\sigma_y}{B}$$

where

σ_B = specified minimum tensile strength of material at ambient temperature

σ_y = specified minimum yield stress or 0,2 per cent proof stress of the material, at ambient temperature

A and *B* are given by the following Table:

	Wrought steel	*Cast steel*	*Nodular cast iron*
A	3,5	4	5
B	1,7	2	3

3.2 Components

3.2.1 Special consideration is to be given to the suitability of any essential component which is not duplicated. Any such essential component shall, where appropriate, utilise anti-friction bearings such as ball bearings, roller bearings or sleeve bearings which shall be permanently lubricated or provided with lubrication fittings.

3.2.2 All steering gear components transmitting mechanical forces to the rudder stock, which are not protected against overload by structural rudder stops or mechanical buffers, are to have a strength at least equivalent to that of the rudder stock in way of the tiller.

3.2.3 Actuator oil seals between non-moving parts, forming part of the external pressure boundary, are to be of the metal upon metal type or of an equivalent type.

3.2.4 Actuator oil seals between moving parts, forming part of the external pressure boundary, are to be duplicated, so that the failure of one seal does not render the actuator inoperative. Alternative arrangements providing equivalent protection against leakage may be accepted.

3.2.5 Piping, joints, valves, flanges and other fittings are to comply within the requirements of Chapter 12 for Class I piping systems components. The design pressure is to be in accordance with 3.1.5.

3.2.6 Hydraulic power operated steering gear are to be provided with the following:

(a) Arrangements to maintain the cleanliness of the hydraulic fluid taking into consideration the type and design of the hydraulic system;

(b) A fixed storage tank having sufficient capacity to recharge at least one power actuating system including the reservoir, where the main steering gear is required to be power operated. The storage tank is to be permanently connected by piping in such a manner that the hydraulic systems can be readily recharged from a position within the steering gear compartment and provided with a contents gauge.

3.3 Valve and relief valve arrangements

3.3.1 For vessels with non-duplicated actuators, isolating valves are to be fitted at the connection of pipes to the actuator, and are to be directly fitted on the actuator.

3.3.2 Arrangements for bleeding air from the hydraulic system are to be provided, where necessary.

3.3.3 Relief valves are to be fitted to any part of the hydraulic system which can be isolated and in which pressure can be generated from the power source or from external forces. The settings of the relief valves is not to exceed the design pressure. The valves are to be of adequate size and so arranged as to avoid an undue rise in pressure above the design pressure.

3.3.4 Relief valves for protecting any part of the hydraulic system which can be isolated, as required by 3.3.3 are to comply with the following:

(a) The setting pressure is not to be less than 1,25 times the maximum working pressure.

(b) the minimum discharge capacity of the relief valve(s) is not to be less than 110 per cent of the total capacity of the pumps which can deliver through it (them).
Under such conditions the rise in pressure is not to exceed 10 per cent of the setting pressure. In this regard, due consideration is to be given to extreme foreseen ambient conditions in respect of oil viscosity.

3.4 Flexible hoses

3.4.1 Hose assemblies approved by Lloyd's Register (hereinafter referred to as 'LR') may be installed between two points where flexibility is required but are not to be subjected to torsional deflection (twisting) under normal operating conditions. In general, the hose should be limited to the length necessary to provide for flexibility and for proper operation of machinery, *see also* Ch 12,7.

3.4.2 Hoses should be high pressure hydraulic hoses according to recognised Standards and suitable for the fluids, pressures, temperatures and ambient conditions in question.

3.4.3 Burst pressure of hoses is to be not less than four times the design pressure.

Section 4
Steering control systems

4.1 General

4.1.1 Steering gear control is to be provided:

(a) For the main steering gear, both on the navigating bridge and in the steering gear compartment;
(b) Where the main steering gear is arranged according to 2.1.4, by two independent control systems, both operable from the navigating bridge. This does not require duplication of the steering wheel or steering lever. Where the control system consists of a hydraulic telemotor, a second independent system need not be fitted, except in a tanker, chemical tanker or gas carrier of 10 000 gross tonnage and upwards;
(c) For the auxiliary steering gear, in the steering gear compartment and, if power operated, it shall also be operable from the navigating bridge and is to be independent of the control system for the main steering gear.
(d) Where the steering gear is so arranged that more than one control system can be simultaneously operated, the risk of hydraulic locking caused by single failure is to be considered.

4.1.2 Any main and auxiliary steering gear control system operable from the navigating bridge is to comply with the following:

(a) Means are to be provided in the steering gear compartment for disconnecting any control system operable from the navigating bridge from the steering gear it serves;
(b) The system is to be capable of being brought into operation from a position on the navigating bridge.

4.1.3 The angular position of the rudder shall:

(a) If the main steering gear is power-operated, be indicated on the navigating bridge. The rudder angle indication is to be independent of the steering gear control system;
(b) Be recognisable in the steering gear compartment.

4.1.4 Appropriate operating instructions with a block diagram showing the changeover procedures for steering gear control systems and steering gear actuating systems are to be permanently displayed in the wheelhouse and in the steering gear compartment.

4.1.5 Where the system failure alarms for hydraulic lock, *see* Table 19.5.1, are provided, appropriate instructions shall be placed on the navigating bridge to shut down the system at fault.

Section 5
Electric power circuits, electric control circuits, monitoring and alarms

5.1 Electric power circuits

5.1.1 Short-circuit protection, an overload alarm and, in the case of polyphase circuits, an alarm to indicate single phasing is to be provided for each main and auxiliary motor circuit. Protective devices are to operate at not less than twice the full load current of the motor or circuit protected and are to allow excess current to pass during the normal accelerating period of the motors.

5.1.2 Where steering gear motor circuits are supplied by converters, consideration will be given to arrangements that provide an equivalent level of safety, reliability, availability and indication to those specified in 5.1.1 provided that technical justification is submitted.

5.1.3 The alarms required by 5.1.1 are to be provided on the bridge and in the main machinery space or control room from which the main machinery is normally controlled.

5.1.4 Indicators for running indication of each main and auxiliary motor are to be installed on the navigating bridge and at a suitable main machinery control position.

5.1.5 A low-level alarm is to be provided for each power actuating system hydraulic fluid reservoir to give the earliest practicable indication of hydraulic fluid leakage. Alarms are to be given on the navigation bridge and in the machinery space where they can be readily observed.

5.1.6 Two exclusive circuits are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors.

5.1.7 Each of these circuits is to be fed from the main switchboard. One of these circuits may pass through the emergency switchboard.

5.1.8 One of these circuits may be connected to the motor of an associated auxiliary electric or electrohydraulic power unit.

5.1.9 Each of these circuits is to have adequate capacity to supply all the motors which can be connected to it and which can operate simultaneously.

5.1.10 These circuits are to be separated throughout their length as widely as is practicable.

5.1.11 In ships of less than 1600 gross tonnage, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements than described in 5.1.1, for such a motor primarily intended for other services.

5.2 Electric control circuits

5.2.1 Electric control systems are to be independent and separated as far as is practicable throughout their length.

5.2.2 Each main and auxiliary electric control system which is to be operated from the navigating bridge is to comply with the following:

(a) It is to be served with electric power by a separate circuit supplied from the associated steering gear power circuit, from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected.

(b) Each separate circuit is to be provided with short-circuit protection only.

5.3 Monitoring and alarms

5.3.1 Alarms and monitoring requirements are indicated in 5.3.2 and Table 19.5.1.

Table 19.5.1 Alarm requirements

Item	Alarm	Note
Rudder position	— Failure	Indication, *see* 4.1.3 *See* 5.3.3
Steering gear power units, power	Failure	—
Steering gear motors	Overload, Single phase	For alarm and running indication locations, *see* 5.1.3 and 5.1.4
Control system	Failure	*See* 5.3.3
Control system power	Failure	—
Steering gear hydraulic oil level	Low	Each reservoir to be monitored. For alarm locations, *see* 5.1.5
Auto pilot	Failure	Running indication
Hydraulic oil temperature	High	Where oil cooler is fitted
Hydraulic lock	Fault	Where more than one system (either power or control) can be operated simultaneously each system is to be monitored, *see* Note
Hydraulic oil filter differential pressure	High	When oil filters are fitted

NOTE
This alarm is to identify the system at fault and to be activated when (for example):

- position of the variable displacement pump control system does not correspond with given order; or
- incorrect position of 3-way full flow valve or similar in constant delivery pump system is detected.

5.3.2 The alarms described in Table 19.5.1 are to be indicated on the navigating bridge and the additional locations described and are to be in accordance with the alarm system specified by Pt 6, Ch 1,2.3.

5.3.3 Steering control systems are to be monitored and an audible and visual alarm is to be initiated on the navigation bridge in the event of:

- failure of the control system, including command and feedback circuits; or
- unacceptable deviation between the rudder order and actual rudder position and/or unacceptable delay in response to changes in the rudder order.

■ *Section 6* Emergency power

6.1 General

6.1.1 Where the rudder stock is required to be over 230 mm diameter in way of the tiller, excluding strengthening for navigation in ice, or for ships fitted with podded propulsion units or water jet systems where the power per propulsion unit exceeds 2,500 kW, an alternative power supply, sufficient at least to supply the steering arrangements which comply with the requirements of 2.1.3 and also its associated control system and the steering angle indicator, shall be provided automatically, within 45 seconds, either from the emergency source of electrical power or from an independent source of power located in the steering gear compartment. This independent source of power shall be used only for this purpose.

6.1.2 In every ship of 10 000 gross tonnage and upwards, the alternative power supply shall have a capacity for at least 30 minutes of continuous operation and in any other ship for at least 10 minutes.

6.1.3 Where the alternative power source is a generator, or an engine driven pump, starting arrangements are to comply with the requirements relating to the starting arrangements of emergency generators.

■ *Section 7* Testing and trials

7.1 Testing

7.1.1 The requirements of the Rules relating to the testing of Class 1 pressure vessels, piping, and related fittings including hydraulic testing apply.

7.1.2 After installation on board the vessel the steering gear is to be subjected to the required hydrostatic and running tests.

7.1.3 Each type of power unit pump is to be subjected to a type test. The type test shall be for a duration of not less than 100 hours, the test arrangements are to be such that the pump may run in idling conditions, and at maximum delivery capacity at maximum working pressure. During the test, idling periods are to be alternated with periods at maximum delivery capacity at maximum working pressure. The passage from one condition to another should occur at least as quickly as on board. During the whole test no abnormal heating, excessive vibration or other irregularities are permitted. After the test, the pump is to be opened out and inspected. Type tests may be waived for a power unit which has been proven to be reliable in marine service.

7.2 Trials

7.2.1 The steering gear is to be tried out on the trial trip in order to demonstrate to the Surveyor's satisfaction that the requirements of the Rules have been met. The trial is to include the operation of the following:

(a) The steering gear, including demonstration of the performances required by 2.1.2(b) and 2.1.3(b):
   - For the main steering gear trial, the propeller pitch of controllable pitch propellers is to be at the maximum design pitch approved for the maximum continuous ahead RPM;
   - If the ship cannot be tested at the deepest draught then the loading condition can be accepted on the conditions that either the rudder is fully submerged (at zero speed waterline) and the vessel is in an acceptable trim condition, or the rudder load and torque at the trial loading condition have been reliably predicted and extrapolated to the full load condition, to the satisfaction of the Administration. In any case, for the main steering gear trial, the speed of the ship corresponding to the maximum continuous revolutions of main engine and maximum design pitch applies;

(b) The steering gear power units, including transfer between steering gear power units;
(c) The isolation of one power actuating system, checking the time for regaining steering capability;
(d) The hydraulic fluid recharging system;
(e) The emergency power supply required by 6.1.1;
(f) The steering gear controls, including transfer of control and local control;
(g) The means of communication between the steering gear compartment and the wheelhouse, also the engine room, if applicable;
(h) The alarms and indicators;
(j) Where the steering gear is designed to avoid hydraulic locking this feature shall be demonstrated.

Test items (d), (g), (h) and (j) may be effected at the dockside.

7.2.2 The ability of the machinery to reverse the direction of thrust in sufficient time and bring the ship to rest within a reasonable distance from maximum ahead service speed is to be demonstrated and recorded.

7.2.3 The stopping times, ship headings and distances recorded on trials, together with the results of trials to determine the ability of ships having multiple propulsion/steering arrangements to navigate and manoeuvre with one or more of these devices inoperative, shall be available on board for the use of the Master or designated personnel.

■ *Section 8*
Additional requirements

8.1 For tankers, chemical tankers or gas carriers of 10 000 tons gross and upwards and every other ship of 70 000 tons gross and upwards

8.1.1 The main steering gear is to comprise two or more identical power units complying with provisions of 2.1.4.

8.2 For tankers, chemical tankers or gas carriers of 10 000 tons gross and upwards

8.2.1 Subject to 8.3 the following are to be complied with:

(a) The main steering gear is to be so arranged that in the event of loss of steering capability due to a single failure in any part of one of the power actuating systems of the main steering gear, excluding the tiller, quadrant or components serving the same purpose, or seizure of the rudder actuators, steering capability is to be regained in not more than 45 seconds after the loss of one power actuating system.
(b) The main steering gear is to comprise either:
   (i) two independent and separate power actuating systems, each capable of meeting the requirements of 2.1.2(b); or
   (ii) at least two identical power actuating systems which, acting simultaneously in normal operation, are capable of meeting the requirements of 2.1.2(b). Where necessary to comply with these requirements, inter-connection of hydraulic power actuating systems is to be provided. Loss of hydraulic fluid from one system is to be capable of being detected and the defective system automatically isolated so that the other actuating system or systems remain fully operational.
(c) Steering gears other than of the hydraulic type are to achieve equivalent Standards.

8.3 For tankers, chemical tankers or gas carriers of 10 000 tons gross and upwards but of less than 100 000 tons deadweight

8.3.1 Solutions other than those set out in 8.2.1 which need not apply the single failure criterion to the rudder actuator or actuators, may be permitted provided that an equivalent safety Standard is achieved and that:

(a) Following loss of steering capability due to a single failure of any part of the piping system or in one of the power units, steering capability is regained within 45 seconds; and
(b) Where the steering gear includes only a single rudder actuator special consideration is given to stress analysis for the design including fatigue analysis and fracture mechanics analysis, as appropriate, the material used, the installation of sealing arrangements and the testing and inspection and provision of effective maintenance. In consideration of the foregoing, regard will be given to the 'Guidelines' in Section 9.

8.3.2 Manufacturers of steering gear who intend their product to comply with the requirements of the 'Guidelines' are to submit full details when plans are forwarded for approval.

■ *Section 9*
'Guidelines' for the acceptance of non-duplicated rudder actuators for tankers, chemical tankers and gas carriers of 10 000 tons gross and upwards but of less than 100 000 tons deadweight

9.1 Materials

9.1.1 Parts subject to internal hydraulic pressure or transmitting mechanical forces to the rudder-stock are to be made of duly tested ductile materials complying with recognised Standards. Materials for pressure retaining components are to be in accordance with recognised pressure vessel Standards. These materials are not to have an elongation less than 12 per cent nor a tensile strength in excess of 650 N/mm^2.

9.2 Design

9.2.1 **Design pressure**. The design pressure should be assumed to be at least equal to the greater of the following:
(a) 1,25 times the maximum working pressure to be expected under the operating conditions required in 2.1.2(b).
(b) The relief valve(s) setting.

9.2.2 **Analysis.** In order to analyse the design the following are required:
(a) The manufacturers of rudder actuators should submit detailed calculations showing the suitability of the design for the intended service.
(b) A detailed stress analysis of pressure retaining parts of the actuator should be carried out to determine the stresses at the design pressure.
(c) Where considered necessary because of the design complexity or manufacturing procedures, a fatigue analysis and fracture mechanics analysis may be required. In connection with these analyses, all foreseen dynamic loads should be taken into account. Experimental stress analysis may be required in addition to, or in lieu of, theoretical calculations depending upon the complexity of the design.

9.2.3 **Dynamic loads for fatigue and fracture mechanics analysis.** The assumption for dynamic loading for fatigue and fracture mechanics analysis where required by 3.1.5, 8.3 and 9.2.2 are to be submitted for appraisal. Both the case of high cycle and cumulative fatigue are to be considered.

9.2.4 **Allowable stresses.** For the purpose of determining the general scantlings of parts of rudder actuators subject to internal hydraulic pressure the allowable stresses should not exceed:

$$\sigma_m \le f$$
$$\sigma_1 \le 1{,}5f$$
$$\sigma_b \le 1{,}5f$$
$$\sigma_1 + \sigma_b \le 1{,}5f$$
$$\sigma_m + \sigma_b \le 1{,}5f$$

where

f = the lesser of $\dfrac{\sigma_B}{A}$ or $\dfrac{\sigma_y}{B}$

σ_b = equivalent primary bending stress
σ_m = equivalent primary general membrane stress
σ_y = specified minimum yield stress or 0,2 per cent proof stress of material at ambient temperature
σ_B = specified minimum tensile strength of material at ambient temperature
σ_1 = equivalent primary local membrane stress

A and B are as follows:

	Wrought steel	*Cast steel*	*Nodular cast iron*
A	4	4,6	5,8
B	2	2,3	3,5

9.2.5 **Burst test.** Pressure retaining parts not requiring fatigue analysis and fracture mechanics analysis may be accepted on the basis of a certified burst test and the detailed stress analysis required by 9.2.2 need not be provided.
The minimum bursting pressure should be calculated as follows:

$$P_b = P A \frac{\sigma_{Ba}}{\sigma_B}$$

where
A = as from table in 9.2.4
P = design pressure as defined in 9.2.1
P_b = minimum bursting pressure
σ_B = tensile strength as defined in 9.2.4
σ_{Ba} = actual tensile strength.

9.3 Construction details

9.3.1 **General.** The construction should be such as to minimise local concentrations of stress.

9.3.2 **Welds.**

(a) The welding details and welding procedures should be approved.

(b) All welded joints within the pressure boundary of a rudder actuator or connection parts transmitting mechanical loads should be full penetration type or of equivalent strength.

9.3.3 **Oil seals.** Oil seals forming part of the external pressure boundary are to comply with 3.2.3 and 3.2.4.

9.3.4 **Isolating valves** are to be fitted at the connection of pipes to the actuator, and should be directly mounted on the actuator.

9.3.5 **Relief valves** for protecting the rudder actuator against over-pressure as required in 3.3.3 are to comply with the following:

(a) The setting pressure is not to be less than 1,25 times the maximum working pressure expected under operating conditions required by 2.1.2(b).

(b) The minimum discharge capacity of the relief valve(s) is to be not less than 110 per cent of the total capacity of all pumps which provided power for the actuator. Under such conditions the rise in pressure should not exceed 10 per cent of the setting pressure. In this regard due consideration should be given to extreme foreseen ambient conditions in respect of oil viscosity.

9.4 Non-destructive testing

9.4.1 The rudder actuator should be subjected to suitable and complete non-destructive testing to detect both surface flaws and volumetric flaws. The procedure and acceptance criteria for non-destructive testing should be in accordance with requirements of recognised Standards. If found necessary, fracture mechanics analysis may be used for determining maximum allowable flaw size.

9.5 Testing

9.5.1 Tests, including hydrostatic tests, of all pressure parts at 1,5 times the design pressure should be carried out subject to any limitations imposed by valves and other components. Where additional testing of systems or sub-systems following final assembly is required, the test pressure may be subject to any limitations imposed by valves and other components.

9.5.2 When installed on board the ship, the rudder actuator should be subjected to a hydrostatic test at the pressure defined in 9.5.1 and a running test.

9.6 Additional requirements for steering gear fitted to ships with Ice Class notations

9.6.1 *See* Pt 3, Ch 9.

Section 1 General requirements

1.1 Application

1.1.1 This Chapter applies to azimuth or rotatable thruster units, for propulsion or D.P. duty which transmit a power greater than 220 kW used as the sole means of steering and are in addition to the relevant requirements of Chapter 19.

1.1.2 In general, for a vessel to be assigned an unrestricted service notation a minimum of two azimuth thruster units are to be provided where these form the sole means of propulsion. Where a single thruster installation is proposed, it will be subject to special consideration.

1.2 Plans

1.2.1 The following additional plans are to be submitted for consideration together with particulars of materials and the maximum shaft power and revolutions per minute:

- Sectional assembly including nozzle ring structure, nozzle support struts, etc.
- Shafts, gears and couplings.
- Steering mechanisms with details of ratings.
- Bearing specifications.
- Schematic piping systems.

Section 2 Performance

2.1 General

2.1.1 The arrangement of thrusters is to be such that the ship can be satisfactorily manoeuvred.

2.1.2 For vessels with multiple azimuthing thrusters, the requirement for auxiliary steering arrangements in Ch 19,2 is to be achieved by equipping each of the azimuthing thrusters with its own dedicated and independent steering gear control system and power actuating system. Consideration will be given to alternative arrangements providing equivalence can be demonstrated.

2.1.3 In addition to the requirements of Chapter 19, the azimuthing mechanism is to be capable of a rotational speed of not less than 1,5 rev/min.

2.1.4 The main steering arrangements are to be capable of changing the direction of the ship's directional control system from one side to the other at declared steering angle limits at an average rotational speed of not less than 0,4 rev/min, with the ship running ahead at maximum ahead service speed.

2.1.5 The auxiliary steering arrangements are to be:

(a) Capable of changing the direction of the ship's directional control system from one side to the other at declared steering angle limits at an average rotational speed of not less than 0,083 rev/min, with the ship running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater.

(b) For all ships, operated by power where necessary to meet the requirements of (a) and in any ship having power more than 2,500 kW propulsion power per thruster unit.

Section 3 Construction and design

3.1 Materials

3.1.1 Specification for materials of gears, shafts, couplings and propeller, giving chemical composition, heat treatment and mechanical properties are to be submitted for approval.

3.1.2 Specification for materials for the stock, struts, etc., are to be submitted for approval.

3.1.3 Where an ice class notation is included in the class of a ship, additional requirements are applicable as detailed in Part 8 and Pt 3, Ch 9.

3.2 Design

3.2.1 The requirements detailed in Chapters 1, 5, 6, 7, 8, 9, 14 and 19 are to be complied with where applicable.

3.2.2 For steerable thrusters with a nozzle, the equivalent rudder stock diameter in way of tiller, used in Table 19.1.1 in Chapter 19, is to be determined as follows:

$$\delta_t = 26{,}03 \sqrt[3]{(V + 3)^2 A_N x_P} \quad \text{mm}$$

where

V = maximum service speed, in knots, which the ship is designed to maintain under thruster operation

A_N = projected nozzle area, in m^2, and is equal to the length of the nozzle multiplied by the mean external vertical height of the nozzle

and

x_P = horizontal distance from the centreline of the steering tube to the centre of pressure, in metres. The position of the centre of pressure is determined for both ahead and astern cases from Pt 3, Ch 13, 2.3.1.

The corresponding maximum turning moment, M_T, is to be determined as follows:

M_T = turning moment for conical couplings and is to be taken as the greatest of M_F, M_A or M_W

M_F = $P_L\, x_P$ x 10^6 N mm (kgf mm) in the ahead condition

M_A = $P_L\, x_P$ x 10^6 N mm (kgf mm) in the astern condition

M_W = the torque generated by the steering gear at the maximum working pressure supplied by the manufacturer, in N mm (kgf mm). M_W is not to exceed the greater of $3{,}0M_F$ or $3{,}0M_A$

P_L = lateral force on rudder acting at centre of pressure, as defined in Pt 3, Ch 13,2.2.1 (where A_R equals $2A_N$), in kN (tonne-f).

3.2.3 The nozzle structure is to be in accordance with Pt 3, Ch 13,3.

3.2.4 In addition to the requirements of Table 13.3.1, in Pt 3, Ch 13, the scantlings of the nozzle stock or steering tube are to be such that the section modulus against transverse bending at any section xx is not less than:

$$Z = 1{,}73 \sqrt{\left(V + 3^4\right) A_N^2\, x_P^2 + \frac{a^2}{4}\, T_M^2\, 10^4} \quad \text{cm}^3$$

where

a = dimension, in metres, as shown in Fig. 20.3.1

T_M = maximum thrust of the thruster unit in tonnes.

3.2.5 The scantlings of nozzle connections or struts will be specially considered. In the case of certain high powered ships, direct calculation may be required.

3.2.6 For steerable thrusters without a nozzle the scantlings in way of the tiller will be specially considered.

3.3 Steering gear elements

3.3.1 These gears are to be considered for the following conditions:

- a design maximum dynamic duty steering torque;
- a static duty ($\leq 10^3$ load cycles) steering torque, and the static duty steering torque should be not less than M_T.

Values for the above should be submitted together with the plans.

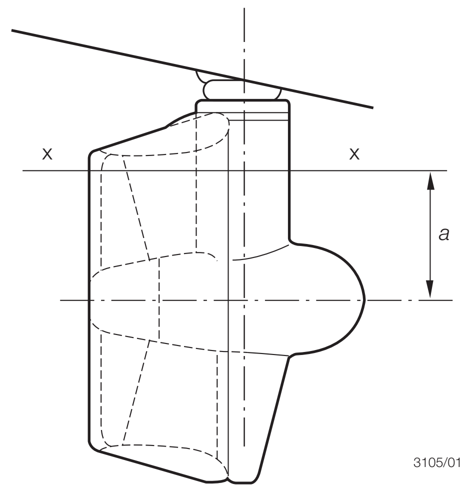

Fig. 20.3.1 Steerable thruster

3.4 Components

3.4.1 The hydraulic power operating systems for each azimuth thruster are to be provided with the following:

(a) arrangements to maintain the cleanliness of the hydraulic fluid, taking into consideration the type and design of the hydraulic system;

(b) a fixed storage tank having sufficient capacity to recharge at least one azimuth power actuating system including the reservoir. The piping from the storage tank is to be permanent and arranged in such a manner as to allow recharging from within the thruster space.

■ *Section 4* Control engineering arrangements

4.1 General

4.1.1 Except where indicated in this Section the control engineering systems are to be in accordance with Pt 6, Ch 1.

4.1.2 Steering control is to be provided for the azimuth thrusters from the navigating bridge, the main machinery control station and locally.

4.1.3 An indication of the angular position of the thruster(s) and the magnitude of the thrust are to be provided at each station from which it is possible to control the direction of thrust.

4.1.4 Means are to be provided at the remote control station(s) to stop each thrust unit.

4.2 Monitoring and alarms

4.2.1 Alarms and monitoring requirements are indicated in 4.2.2 and Table 20.4.1.

Table 20.4.1 Alarms for control systems

Item	Alarm	Note
Thruster azimuth	–	Indicator, *see* 4.1.3
Steering motor	Power failure, single phase	Also running indication on bridge and at machinery control station
Propulsion motor	Overload, power failure	Also running indication on bridge and at machinery control station
Control system power	Failure	
Hydraulic oil supply tank level	Low	
Hydraulic oil system pressure	Low	
Hydraulic oil system temperature	High	Where oil cooler is fitted
Hydraulic oil filters differential pressure	High	Where oil filters are fitted
Lubricating oil supply	Low	If separate forced lubrication

4.2.2 The alarms described in Table 20.4.1 are to be indicated individually on the navigating bridge and in accordance with the alarm system specified by Pt 6, Ch 1,2.3.

Section 5
Electrical equipment

5.1 General

5.1.1 The electrical installation is to be designed, constructed and installed in accordance with the requirements of 5.2 to 5.4.

5.1.2 Where the thruster units are electrically driven the relevant requirements, including surveys, of Pt 6, Ch 2 are to be complied with.

5.2 Generating arrangements

5.2.1 Where a central power generation system is employed, the requirements of Pt 6, Ch 2,16.3.5 are to be complied with.

5.2.2 The generating and distribution system is to be so arranged that after any single failure, steering capability can be maintained or regained within a period not exceeding 45 seconds, and the effectiveness of the steering after such a fault will not be reduced by more than 50 per cent. This may be achieved by the parallel operation of two or more generating sets, or alternatively when the electrical requirements may be met by one generating set in operation, on loss of power, the automatic starting and connection to the switchboard of a standby set, provided that this set can restart and run a thruster with its auxiliaries.

5.2.3 The failure of one thruster unit or its control system is not to render any other thruster inoperative.

5.3 Distribution arrangements

5.3.1 Thruster auxiliaries and controls are to be served by individual circuits. Services that are duplicated are to be separated throughout their length as widely as is practicable and without the use of common feeders, transformers, converters, protective devices or control circuits.

5.4 Auxiliary supplies

5.4.1 Where the auxiliary services and thruster units are supplied from a common source, the following requirements are to be complied with:
(a) the voltage regulation and current sharing requirements defined in Pt 6, Ch 2,9.4.2 and 9.4.7 are to be maintained over the full range of power factors that may occur in service,
(b) auxiliary equipment and services are to operate with any waveform distortion introduced by converters without deleterious effect. (This may be achieved by the provision of suitably filtered/converted supplies).

Section 6
Testing and trials

6.1 General

6.1.1 The requirements detailed in Chapters 1, 5 and 19 are to be complied with and, in addition, the performance specified in 2.1.2 is to be demonstrated to the Surveyor's satisfaction.

6.1.2 The actual values of steering torque should be verified during sea trials to confirm that the design maximum dynamic duty torque has not been exceeded.

Section 1
Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems

1.1 Scope

1.1.1 The requirements of this Chapter are applicable to condition monitoring systems and machinery condition-based maintenance systems which:

(a) provide control, alarm or safety functions for essential machinery and equipment (*see* Pt 6, Ch 1,2.1.1) in accordance with manufacturers recommendations; or
(b) provide machinery condition related information as part of a machinery planned maintenance scheme for use as an alternative to machinery and equipment surveys required by the Regulations (*see* Pt 1, Ch 3) in accordance with LR's ShipRight procedures.

1.1.2 Condition monitoring systems which deviate from the requirements of this Section but provide an equivalent level of performance may be submitted to LR for consideration.

1.1.3 The requirements of this Section are to be applied to condition monitoring systems where the assignment of the **MCM** descriptive note is requested.

1.1.4 The requirements of this Section are to be applied to machinery condition-based maintenance systems where the assignment of the **MCBM** Descriptive Note is requested in addition to the **MCM** Descriptive Note.

1.2 Plans and particulars

1.2.1 The information and plans required to be submitted are as specified in the relevant Chapters of Parts 5 and 6 applicable to the particular machinery and where specified in this Chapter.

1.2.2 In addition to information required by 1.2.1, the documents listed in the *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring* are to be submitted to LR for consideration.

1.2.3 In addition to information required by 1.2.1, the documents listed in the *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring* are to be submitted to LR for consideration where the **MCBM** Descriptive Note is requested.

1.2.4 Equipment type approval reports providing evidence of compliance with 1.3.1 and 1.3.2 are to be submitted.

1.2.5 Additional information and plans providing evidence of compliance with the requirements of 1.3.3, 1.4.1 and 1.5.4 are to be submitted.

1.3 General requirements for condition monitoring systems

1.3.1 Condition monitoring equipment is to be capable of providing the service for which it is intended and is to satisfy the relevant requirements for condition monitoring equipment in LR's Type Approval System, *Product Assessment and Test Specification* (*TACM*).

1.3.2 Condition monitoring equipment is to be suitable for the environment in which it is intended to operate and is to satisfy the relevant requirements for environmental testing in LR's Type Approval System, *Test specification No.1*.

1.3.3 The installation of condition monitoring equipment in spaces and locations in which flammable mixtures are liable to collect, e.g., areas containing flammable gas or vapour and/or combustible dust, is to be minimised as far as is practicable and is to satisfy the relevant requirements for the use of electrical equipment in flammable atmospheres in Pt 6, Ch 2,14.

1.3.4 Where permanently installed condition monitoring systems are used, the cables are to comply with the relevant Sections of Pt 6, Ch 2,11 and the piping systems are to comply with relevant Sections of Chapters 12 and 13.

1.3.5 Where the system is based on programmable electronic systems, the requirements of Pt 6, Ch 1,3.6.3 are to be complied with.

1.3.6 Portable condition monitoring equipment is to be maintained and calibrated in accordance with a recognised National or International Standard to ensure the accuracy of the readings obtained. The standard is to include the issue of calibration certificates by a recognised test house in accordance with a recognised National or International Standard for instrument calibration. Copies of calibration certificates are to be retained on board and referenced on all condition monitoring reports submitted as part of the onboard condition monitoring program. Portable equipment used in hazardous areas is to be of a safe type suitable for use in the appropriate hazardous zone.

1.3.7 Measuring points are to be clearly identified in the submission and proposals to ensure repeatability of measurements are to be included.

1.3.8 The condition monitoring equipment is, as far as is practicable, to be located and installed such that it is accessible for maintenance and survey.

1.3.9 The condition monitoring equipment is to be installed in accordance with the manufacturer's instructions, *see* the *Product Assessment and Test Specification (PACM)*, or by an approved technical organisation as defined in the LR *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring*, and to the satisfaction of the LR Surveyor.

1.4 Requirements for systems providing control, alarm and safety functions

1.4.1 In addition to the requirements of 1.3, condition monitoring equipment which provides control, alarm or safety functions for essential machinery and equipment is also to satisfy the relevant requirements for control, alarm and safety systems in Pt 6, Ch 1 and the installation of electrical equipment in Pt 6, Ch 2.

1.5 Requirements for systems providing machinery condition related information as part of machinery condition-based maintenance systems

1.5.1 In addition to the requirements of 1.3, condition monitoring equipment which provides machinery condition related information as part of a machinery planned maintenance scheme for use as an alternative to machinery and equipment surveys required by the Regulations is also to satisfy the relevant requirements of LR's *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring*.

1.5.2 Where condition monitoring data is used as part of a machinery condition-based maintenance system, persons interpreting data and making diagnostic decisions are to be suitably competent, in accordance with ISO 18436 or an equivalent recognised National Standard. Evidence of competence, including training certificates of those providing analysis and data interpretation, are to be submitted and held on board. These certificates are to be made available to LR on request for audit and survey purposes.

1.5.3 The condition monitoring equipment is, as far as is practicable, to be located and installed such that it is accessible for maintenance and survey.

1.5.4 The condition monitoring equipment is to be installed in accordance with the manufacturer's instructions, *see* the *Product Assessment and Test Specification* (*TACM*) or by an approved technical organisation as defined in the *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring*, and to the satisfaction of the LR Surveyor.

1.6 Requirements for machinery condition-based maintenance systems

1.6.1 Any vessel applying to operate a machinery condition-based maintenance system with the **MCBM** Descriptive Note is also to have an approved planned maintenance system in place with the **MPMS** Descriptive Note assigned.

1.6.2 Where a **MCBM** Descriptive Notation is requested and a vessel operates both an approved continuous machinery (CSM) survey cycle and has an approved machinery condition monitoring system in place which meets the requirements of the **MCM** Descriptive Notation, the **MCBM** Descriptive Notation is to be taken to mean that the vessel complies with the requirements of the **MCM** notation; however, the **MCM** Descriptive Notation will not be assigned.

1.6.3 Proposals for machinery condition-based maintenance systems are to be submitted for approval and are to meet the requirements of LR's *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring*, and be to the satisfaction of the LR Surveyor. This plan is to include proposals for returning the vessel to a conventional maintenance and survey regime, and withdrawal of the **MCBM** Descriptive Notation, if the Owner decides for any reason to withdraw from condition-based maintenance or if the vessel should change ownership and the new Owners do not wish to retain the **MCBM** Descriptive Note.

1.6.4 Machinery condition-based maintenance systems are to be developed in accordance with the methodology given in ISO 17359 or an equivalent recognised National Standard.

1.6.5 Proposals are to identify those items of machinery and equipment which are to be maintained according to their condition and those which are to be maintained in accordance with manufacturer's time-based and running hours-based service and maintenance requirements. To assess which items are to be maintained according to their condition, a criticality assessment is to be carried out.

1.6.6 The criticality assessment is to include a FMEA/ FMECA assessment and is to take account of:

- machinery and equipment redundancy;
- failure rate and mean time to repair;
- local effects of failure on the safe operation of the machinery and equipment; and
- wider effects of failure on the ship's essential services and the safe operation of the ship, including environmental impact.

The criticality assessment is included in the submission for approval in accordance with LR's *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring*, as stated in 1.6.3, and is to be to the satisfaction of the LR Surveyor.

1.6.7 Boilers and pressure vessels are not eligible for condition-based monitoring.

1.6.8 For all machinery and equipment which is proposed for maintenance based on condition monitoring data, in addition to the criticality assessment in 1.6.5, evidence is to be submitted which demonstrates that the condition of the machinery and equipment can be measured accurately and that the measured parameters are clearly defined in the condition monitoring plan.

1.6.9 Machinery condition monitoring is to meet the requirements of 1.3 and 1.5; in addition, the machinery condition-based maintenance plan is to include guidance on parameter limit values, trend analysis and fault diagnosis. This requirement for guidance information does not remove the requirement for those persons with responsibility for analysing condition monitoring data to be suitably trained and competent, in accordance with 1.5.2.

1.6.10 As part of the criticality assessment, it is to be demonstrated that any machinery included in the list of items for condition-based maintenance shall have measurable performance parameters which will give adequate warning of machinery deterioration that may result in failure, to allow maintenance to be scheduled in advance of such failure.

1.6.11 The condition-based maintenance plan is to maintain records of all data included in the plan approval document. The plan shall include proposals for:

- essential data describing the machine;
- essential data describing operating conditions;
- the measurement position;
- the measured quantity units and processing; and
- date and time information.

These records are to be available on request to any LR Surveyor or representative.

1.6.12 Proposals to ensure repeatability of results are to be submitted for approval.

1.6.13 Those items of machinery and equipment which are subject to a mandatory five-year survey are still required to be surveyed by a LR Surveyor at intervals not exceeding five years. A list of these items is to be found in LR's *ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring*.

1.6.14 For items which are not suitable for condition-based maintenance, *see* 1.6.7, the required maintenance will, as a minimum, comply with the equipment manufacturer's maintenance requirements.

1.6.15 The **MCBM** records, including diagnostic analysis and condition assessment reports, for items of machinery and equipment being maintained on the basis of condition monitoring data, are to be surveyed over a five-year continuous survey cycle, with 20 per cent of the records being subject to survey each year such that all records are surveyed over a five-year period.

Section 1 General requirements

1.1 General

1.1.1 This Chapter states the requirements for ships having machinery redundancy, and are in addition to the relevant requirements in other relevant Sections of these Rules.

1.1.2 The requirements, which are optional, cover machinery arrangements and control systems necessary for ships which have propulsion and steering systems configured such that, in the event of a single failure of a system or item of active equipment, *see* 1.1.3, the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are unaffected by the failure. The ship is also to retain steering capability at a service speed of not less than seven knots. The requirements also cover machinery arrangements where the propulsion and steering systems are installed in separate compartments such that, in the event of a loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability.

1.1.3 For the purpose of this Chapter, items of active equipment are those which have a defined function for operation of a propulsion or steering system, such as but not limited to:

- Prime movers, i.e. diesel engines, electric motors, steam turbines and gas turbines;
- Generators and their excitation equipment;
- Transformers and converters;
- Gearing and shafting systems;
- Propulsion devices, i.e. propellers, water jets and thrusters;
- Pumps;
- Valves (where power actuated);
- Fuel treatment plant;
- Coolers/heaters;
- Filters;

Piping and electrical cables connecting items of active equipment are not considered to be active.

1.1.4 Requirements additional to these Rules may be imposed by the Flag State with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.1.5 Sections 2, 3 and 4 state the applicable requirements for arrangements necessary to maintain availability of propulsion and manoeuvring capability, in the event of a single failure in equipment. Ships complying with the applicable requirements of Sections 2 to 4 will be eligible for the machinery class notation **PMR** or **PMRL** (Propulsion Machinery Redundancy), **SMR** or **SMRL** (Steering Machinery Redundancy) or **PSMR** or **PSMRL** (Propulsion and Steering Machinery Redundancy), which will be recorded in the *Register Book*.

NOTE
The additional **L** character to **PMR**, **SMR** and **PSMR** notations indicates a limited capability.

1.1.6 Section 5 states the additional requirements necessary to maintain availability of propulsion and manoeuvring capability where machinery is installed in separate compartments and the loss of any one compartment due to fire or flooding has been addressed. Ships complying with the applicable requirements of Sections 2 to 5 of this Chapter will be eligible for the machinery class notation **PMR★** or **PMRL★** (Propulsion Machinery Redundancy in separate machinery spaces), **SMR★** or **SMRL★** (Steering Machinery Redundancy in separate machinery spaces) or **PSMR★** or **PSMRL★** (Propulsion and Steering Machinery Redundancy in separate machinery spaces) which will be recorded in the *Register Book*.

1.1.7 For assignment of **PSMR** or **PSMR★** machinery class notations, the ship is to retain the ability to use not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability at a service speed of not less than seven knots in the event of a single failure of a system or item of equipment.

1.1.8 Where the ship does not comply with 1.1.7 but can retain a service speed of not less than seven knots using available installed prime mover capacity and propulsion systems (which may be less than 50 per cent) following a failure of a system or item of equipment, machinery class notations **PSMRL** or **PSMRL★** may be assigned. The available installed prime mover capacity and installed propulsion systems are to be identified and included in 1.2.7.

1.2 Plans and information

1.2.1 In addition to the plans and information required by Parts 5 and 6, the information detailed in 1.2.2 to 1.2.6 is also to be submitted.

1.2.2 **Machinery spaces**. Plans showing the general arrangement of the machinery spaces, together with a description of the propulsion system, main and emergency electrical power supply systems and steering arrangements are to be submitted. The plans are to indicate segregation and access arrangements for machinery spaces and associated control rooms/stations.

1.2.3 **Failure Mode and Effects Analysis (FMEA)**. For the propulsion systems, electrical power supplies, essential services, control systems and steering arrangements, a FMEA report is to be submitted and is to address the requirements identified in Sections 2 and 5.

1.2.4 **Manoeuvring capability**. An assessment of the ship's ahead and astern manoeuvring capability, under the following operating conditions, is to be submitted:

(a) Where only 50 per cent or less of the installed prime mover capacity and 50 per cent or less of the installed propulsion systems are available.

(b) Where the steering capability requirements described in 3.2.1 are available.

IMO Resolution MSC 137(76) – *Standards for Ship Manoeuvrability*, provides guidance, on standard manoeuvres required in an assessment of the manoeuvrability of ships.

1.2.5 **Testing and trials procedures**. A schedule of testing and trials to demonstrate that the ship is capable of being operated with machinery functioning as described in 4.2 is to be submitted. In addition, any testing programme that may be necessary to prove the conclusions of the FMEA is to be submitted.

1.2.6 **Operating Manuals**. Operating Manuals are to be submitted for information and provided on board. The manuals are to include the following information:

(a) Particulars of machinery and control systems.

(b) General description of systems for propulsion and steering.

(c) Operating instructions for all machinery and control systems used for propulsion and steering.

(d) Procedures for dealing with the situations identified in the FMEA report.

1.2.7 **Installed prime mover capacity and installed propulsion systems**. A schedule of the propulsion systems and their operating capacity and capability under normal and foreseeable failure conditions is to be submitted.

■ *Section 2*
Failure Mode and Effects Analysis (FMEA)

2.1 General

2.1.1 An FMEA is to be carried out in accordance with 2.1.2 to 2.1.7 for the propulsion systems, electrical power supply systems and steering systems to demonstrate that a single failure in active equipment or loss of an associated sub-system, *see* 1.1.3, will not cause loss of all propulsion and/or steering capability as required by a class notation. Typical sub-systems include associated control and monitoring arrangements, data communications, power supplies (electrical, hydraulic or pneumatic), fuel, lubricating, cooling, etc.

2.1.2 The FMEA is to be carried out using the format presented in Table 22.2.1 or an equivalent format that addresses the same safety issues. Analyses in accordance with IEC 60812, *Analysis techniques for system reliability – Procedure for failure mode and effects analysis (FMEA)* or IMO MSC Resolution 36(63) Annex 4 – *Procedures for Failure Mode and Effects Analysis*, would be acceptable.

2.1.3 The FMEA is to be organised in terms of equipment and function. The effects of item failures at a stated level and at higher levels are to be analysed to determine the effects on the system as a whole. Actions for mitigation are to be determined.

2.1.4 The FMEA is to:

(a) identify the equipment or sub-system, mode of operation and the equipment;

(b) identify potential failure modes and their causes;

(c) evaluate the effects on the system of each failure mode;

(d) identify measures for reducing the risks associated with each failure mode; and

(e) identify trials and testing necessary to prove conclusions.

Table 22.2.1 Failure Mode and Effects Analysis

Project: **Failure Mode and Effects Analysis**												
System:				Element:								Sheet No:
Item No.	Component Description	Function	Mode of Operation	Failure Mode	Failure Cause	Failure Detection	Effect of Failure		Severity	Corrective Action		Remarks
							On Item	On System				
NOTE The 'severity category' is to be in accordance with the following: (a) Catastrophic; (b) Hazardous; (c) Major; or (d) Minor.												

2.1.5 At sub-system level it is acceptable, for the purpose of these Rules, to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed. In addition, their failure need only be dealt with as a cause of failure of the pump.

2.1.6 Where FMEA is used for consideration of systems that depend on software-based functions for control or co-ordination, the analysis is to investigate failure of the functions rather than a specific analysis of the software code itself.

2.1.7 The FMEA is to establish that in the event of a single failure:

(a) for **PSMR** and **PSMR★** notations, that the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability;
(b) for **PMR** and **PMR★** notations, that the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems;
(c) for **SMR** and **SMR★** notations, that the steering capability remains available;
(d) for **PSMRL★** notation, that the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are not directly affected by the failure and retain steering capability at a service speed of not less than seven knots; and
(e) for **PMRL★** notation, that the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are not directly affected by the failure.

■ *Section 3*
Machinery arrangements

3.1 Main propulsion machinery

3.1.1 For **PSMR**, **PSMR★**, **PMR** and **PMR★** notations, independent main propulsion systems are to be provided so that the ship will retain not less than 50 per cent of the prime mover capacity and not less than 50 per cent of the installed propulsion systems in the event of a single failure of a system or active item of equipment, *see* 1.1.3. In the event of a single failure in equipment, the remaining system(s) is to be capable of maintaining a service speed of not less than seven knots and, for **PSMR** and **PSMR★** notations, give adequate manoeuvring capability, *see* 1.2.4.

3.1.2 For **PMRL**, **PSMRL**, **PMRL★** and **PSMRL★** notations, independent main propulsion systems are to be provided so that there remains the ability to use the remaining available installed prime mover capacity and installed propulsion systems following a single failure of a system or item of equipment. In the event of a single failure in equipment, the remaining system(s) is to be capable of maintaining a manoeuvring speed and, for **PSMRL** and **PSMRL★** notations, give adequate manoeuvring capability, *see* 1.2.4.

3.2 Steering machinery

3.2.1 For **PSMR**, **PSMR★**, **SMR** and **SMR★** notations, independent steering systems for manoeuvring the ship are to be installed, such that steering capability will continue to be available in the event of any of the following:

(a) Single failure in the steering gear equipment.
(b) Loss of power supply or control system to any steering system.

3.3 Electrical power supply

3.3.1 The main busbars of the switchboard supplying the propulsion machinery and essential services are to be capable of being isolated by a multi-pole linked circuit breaker, disconnector, or switch-disconnector into at least two independent sections.

3.3.2 In the event of the loss of one section or failure of the power supply from one generator, there is to be continuity of sufficient electrical power to supply essential services such that the available installed prime mover capacity and installed propulsion systems will continue to have the ability of functioning at their operational capability where **PSMRL**, **PSMRL★**, **PMRL and PMRL★** notations are required. *See* 3.2.1 for steering machinery requirements.

3.3.3 In the event of the loss of one section or failure of the power supply from one generator, there is to be continuity of sufficient electrical power to supply essential services such that the ship will retain not less than 50 per cent of the prime mover capacity and not less than 50 per cent of the installed propulsion systems where **PSMR**, **PSMR★**, **PMR** and **PMR★** notations are required. *See* 3.2.1 for steering machinery requirements.

3.3.4 For ships capable of operating with one service generator connected to the switchboard, arrangements are to be such that a standby generator will automatically start and connect to the switchboard on loss of the service generator. Sequential starting of essential services is to be provided.

3.3.5 For ships operating with two or more generator sets in service connected to the switchboard, arrangements are to be such that, in the event of loss of one generator, the remaining set(s) is to be adequate for the continuity of essential services supplied from that switchboard. This may be achieved by preferential tripping of non-essential services. Alternatively, arrangements can be such that a standby generator will start automatically and connect to the switchboard on loss of one of the generator sets in service.

3.4 Essential services for machinery

3.4.1 Services essential for the operation of the propulsion machinery, steering and the supply of electrical power are to be arranged so to that the ship will retain not less than 50 per cent of the prime mover capacity and 50 per cent of the installed propulsion systems and retain steering capability in the event of a single failure in any of the services, where required by the respective class notations.

3.5 Oil fuel storage and transfer systems

3.5.1 The arrangements for the storage of oil fuel bunkers are to ensure that there is an adequate supply of existing oil fuel on board to allow sufficient time for a shore-based quality analysis of new bunkers, in accordance with ISO 8217 *Petroleum Products – Fuels (Class F) Specification of Marine Fuels* prior to use.

3.5.2 Provision is to be made to enable samples of oil fuel to be taken at the bunkering manifolds.

■ *Section 4*
Control arrangements

4.1 General

4.1.1 This Section states the requirements for the installation of control, alarm and safety systems but does not signify that machinery spaces may be operated unattended. For unattended machinery space operation, compliance with Pt 6, Ch 1,4 is also required.

4.1.2 The control, alarm and safety systems required in 4.2 are to comply with Pt 6, Ch 1,2.

4.2 Bridge control

4.2.1 The controls, alarms, instrumentation and safeguards required in 4.2.2 to 4.2.6 are to be provided on the bridge.

4.2.2 For **PSMR**, **PSMR★**, **PMR** and **PMR★** notations, means are to be provided to ensure satisfactory control of propulsion in both the ahead and astern directions when all main propulsion systems are functioning and when one propulsion system is not available.

4.2.3 For **PSMR**, **PSMR★**, **SMR** and **SMR★** notations, means are to be provided to ensure satisfactory control of steering when all steering systems are functioning and when any one steering system is not available.

4.2.4 Where required by 5.4.3, isolation of essential services is to be carried out either automatically or manually from the bridge. Indication of the status of isolation arrangements is to be provided.

4.2.5 Instrumentation to indicate the operational status of running and standby machinery is to be provided for the propulsion systems, the supply of electrical power, steering systems and other essential services.

4.2.6 Alarms are to be provided in the event of:

(a) A fire in any machinery compartment.

(b) A high bilge level in any machinery compartment. Irrespective of the assignment of the **UMS** notation, the bilge level detection system and arrangements for automatically pumping bilges, if applicable, are to comply with Pt 6, Ch 1,4.6.

■ *Section 5*
Separate machinery spaces ★ (star) Enhancement

5.1 General

5.1.1 This Section states the additional requirements where propulsion and steering machinery are installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability.

5.1.2 The machinery arrangements, control arrangements and FMEA required by Sections 2 to 4, together with testing and trials requirements in Section 6, are to be complied with in addition to 5.2 to 5.7.

5.2 Machinery arrangements

5.2.1 The main propulsion machinery is to be arranged in not less than two compartments such that, in the event of the loss of one compartment, propulsion power and/or manoeuvring capability will continue to be available, where required by the respective class notations.

5.2.2 The steering systems are to be arranged in not less than two separate compartments, such that steering capability will continue to be available in the event of the loss of one compartment, where required by the respective class notations.

5.3 Electrical power supply

5.3.1 The generating sets and converting sets required by Pt 6, Ch 2,2 are to be arranged so that they are located in at least two separate machinery compartments.

5.3.2 The independent sections of the switchboard required by 3.3.1 are to be arranged in not less than two separate compartments.

5.3.3 In the event of the loss of one compartment, there is to be continuity of sufficient electrical power to supply essential services, such that propulsion power and steering capability will continue to be available.

5.4 Essential services for machinery

5.4.1 Services essential for the operation of the propulsion machinery, steering and the supply of electrical power are to be arranged, so that propulsion power and steering capability are maintained in the event of the loss of one machinery compartment.

5.4.2 The design of systems which may have a common source, such as those used for supplying oil fuel, lubricating oil, fresh and sea-water cooling, ventilation of compartments and engine starting energy, is to ensure continuous availability of supply in the event of the loss of any one compartment. Where applicable, continuous availability of heating services, oil fuel and water treatments is also to be provided. *See* 3.5 and 5.6 for oil fuel storage and transfer systems.

5.4.3 Where essential services are arranged so that they may supply machinery in another compartment, means of isolation from that compartment is to be provided.

5.4.4 Where pumps for essential services are arranged to supply more than one compartment, standby pumps for the same supplies are to be provided in a different compartment. The standby pumps are to be arranged to start automatically if the discharge pressure from the working pumps falls below a predetermined value.

5.5 Bilge drainage arrangements

5.5.1 The independent power pumps for bilge drainage are to be located in two separate watertight compartments. Each pump is to be capable of draining any compartment. Means of isolation from other compartments is to be provided.

5.5.2 In addition to the independent power pumps installed to comply with 5.5.1, an emergency bilge drainage arrangement is to be provided in each main propulsion machinery space.

5.5.3 Each separate machinery compartment is to be provided with at least one independent power pump direct bilge suction.

5.6 Oil fuel storage

5.6.1 The oil fuel service tanks required by Ch 14,4.18 are to be located in separate compartments.

5.6.2 Provision is to be made to ensure that oil fuel preparation and transfer arrangements to the oil fuel service tanks are continuously available in the event of the loss of any one compartment, *see also* 5.4.2.

5.7 FMEA

5.7.1 The FMEA required by 2.1.1 for the propulsion systems, electrical power supplies, essential services, control systems and steering arrangements is also to address the following:

(a) Fire in a machinery space or control room.
(b) Flooding of any watertight compartment which could affect propulsion or steering capability.
(c) Separation of machinery spaces.

■ *Section 6* Testing and trials

6.1 Sea trials

6.1.1 In addition to the requirements for sea trials in Ch 1,5.2, trials are to be carried out to demonstrate that when the ship is operating 50 per cent of the prime mover capacity and 50 per cent of the installed propulsion systems, a speed of not less than 7 knots can be maintained with adequate steering capability, where required by the respective class notations.

6.1.2 Trials are to be carried out to demonstrate the ship's steering capability in accordance with the assessment required by 1.2.4 with one steering system out of action.

6.1.3 Where the FMEA report has identified the need to prove the conclusions, testing and trials are to be carried out as necessary to investigate the following:

(a) The effect of a specific component failure.
(b) The effectiveness of automatic/manual isolation systems.
(c) The behaviour of any interlocks that may inhibit operation of essential systems.

6.1.4 During sea trials, the operational envelope(s) is to be determined under the conditions detailed in 3.1.1 and/or 3.2.1, as required for the class notation.

Section

■ *Section 1* General

1.1 Scope and application

1.1.1 The requirements of this Chapter are additional for passenger ships and are related to machinery and equipment providing services necessary to support safe return to port under the ship's own propulsion in the event of flooding or after a fire and to support orderly evacuation and abandonment in the event of a fire.

1.1.2 The requirements of this Chapter are restricted to machinery and equipment specifically addressed by relevant engineering systems Rules.

1.1.3 The requirements of this Chapter should be read in conjunction with LR's ShipRight Procedure SRtP. Where the requirements of this Chapter and ShipRight SRtP are complied with, the vessel will be assigned the Descriptive Note SRtP.

NOTE

Vessels without the descriptive note should also be appraised, using the ShipRight Procedure SRtP Appendix 1 and 2 unless otherwise advised.

1.1.4 The performance of machinery and equipment for services referred to in the relevant SOLAS Regulations that are not specifically addressed by relevant engineering systems Rules are not considered (e.g., basic services to safe areas, radiocommunications, navigation systems, etc.). However, these services are to be considered in terms of:

(a) the supply of electrical power in accordance with SOLAS 1974, as amended; and
(b) protection provided to machinery and equipment described in 1.1.2 (e.g., fire suppression measures in spaces containing propulsion machinery).

1.1.5 For passenger ships having a length of 120 m or more, or having three or more main vertical zones, the requirements of Sections 1 to 5 apply.

1.1.6 For other passenger ships not covered by 1.1.5, the requirements of Sections 2 and 4 are not applicable. The requirements of Section 3 shall be restricted to the qualitative failure analysis described in 3.2.2.

1.1.7 These requirements do not address operational decisions on the actual use of machinery and equipment in the event of flooding or fire (e.g., the use of propulsion and steering in a flooding damage condition).

1.2 Definitions

1.2.1 For the purposes of this Chapter, 'the relevant SOLAS Regulations' refers to SOLAS 1974, as amended:

(a) Chapter II-1/B-1, Regulation 8-1, *System capabilities after a flooding casualty on passenger ships*;
(b) Chapter II-2/G, Regulation 21, *Casualty threshold, safe return to port and safe areas*; and
(c) Chapter II-2/G, Regulation 22, *Design criteria for systems to remain operational after a fire casualty*.

(a) and (b) apply for Sections 2 and 3, (c) applies for Section 4.

1.2.2 For the purposes of this Chapter, 'relevant engineering systems Rules' refers to this Part (i.e., Part 5), Pt 6, Ch 1 and Pt 6, Ch 2.

1.2.3 The 'casualty threshold' in the context of a fire includes:

(a) loss of space of origin up to the nearest 'A' class boundaries, which may be a part of the space of origin, if the space of origin is protected by a fixed fire extinguishing system; or
(b) loss of the space of origin and adjacent spaces up to the nearest 'A' class boundaries, which are not part of the space of origin.

1.2.4 Ship lengths and main vertical zones considered are to be as defined by Pt 3, Ch 1,6.1.8 and SOLAS 1974, as amended Chapter II-2/A, Regulation 3.32, respectively.

1.2.5 'Safe areas' are those that will be available, during a ship's return to port under its own propulsion after a casualty that does not exceed the casualty threshold stipulated, to provide the basic services to ensure that the health of passengers and crew is maintained.

1.2.6 For the purposes of this Chapter, 'reversionary control stations' are those control stations provided for use during safe return to port and orderly evacuation and abandonment to satisfy the requirements of Sections 2 and 4 in the event of the normal control station being subject to fire damage or flooding.

1.2.7 A 'failure' is the termination of the ability of an item to perform a required function. For the purposes of Section 3:

(a) failures result from a fault in a component or system such that it cannot perform an intended or required function, including faults resulting from fire or flooding damage;
(b) 'common cause failures' are those failures which will cause more than one item to fail simultaneously, or within a sufficiently short period of time as to have the effect of simultaneous failures; and
(c) 'consequential failures' are secondary failures caused by the effects of a primary failure, i.e., where the occurrence of a failure leads directly to further failures.

1.3 General requirements and risk management

1.3.1 For passenger ships having a length of 120 m or more, or having 3 or more main vertical zones, it is the responsibility of the Shipbuilder to ensure that the arrangement of the ship's machinery and equipment as described in 1.1.2 are sufficient for the intended operating modes and to support the provision of the services that the National Administration has determined to be necessary for:

(a) the ship's safe return to port under its own propulsion, *see* Section 2:
  (i) after a casualty that does not exceed the casualty threshold; or
  (ii) when the ship is subject to flooding of any single watertight compartment; and/or
(b) supporting the orderly evacuation and abandonment of the ship if the casualty threshold is exceeded, *see* Section 4.

This necessitates activities, which will normally be risk based, to determine the machinery and equipment needed to remain operational for a period of time to satisfy the requirements of the relevant SOLAS Regulations to the satisfaction of the National Administration. These activities are to be carried out prior to the submission of plans in accordance with this Chapter.

1.3.2 The activities referred to in 1.3.1 may be conducted at the same time, or in conjunction with, activities to determine the criteria that the National Administration specify as necessary to achieve overall compliance with the relevant SOLAS Regulations. The ship's intended operational routes and/or service restrictions may be considered when establishing criteria.

1.3.3 It is the responsibility of the Shipbuilder to ensure that watertight and fire divisions, fire-fighting systems and bulkhead decks shown on the plans are those approved by the National Administration.

1.3.4 Where alternatives to the requirements of this Chapter are proposed, details demonstrating that the machinery and engineering systems comply with the relevant SOLAS Regulations are to be submitted for consideration.

1.4 Plans and information

1.4.1 In addition to the plans and information otherwise required by relevant engineering systems Rules, the plans and information detailed in 1.4.2 to 1.4.12 are to be submitted.

1.4.2 The analysis report described in 3.1.5(a) that includes the following information:

(a) identification of any applicable standards used for analysis of the design;
(b) description of the analysis team and their roles for information only;
(c) identification of the objectives of the analysis, including any National Administration acceptance criteria;
(d) identification of assumptions made in the analysis;
(e) description of intended system function under normal conditions and in the event of fire or flooding;
(f) identification of the equipment, system or sub-system and mode of operation, including the design plans and information considered;
(g) identification of casualty scenarios, probable failure modes and acceptable deviations from the intended or required function;
(h) evaluation of the local effects and the effects on the overall installation of each failure mode as applicable;
(j) identification of the worst case scenario in the event of a fire casualty or flooding, as described in 2.1.1, and an assessment of the ship's ahead and astern manoeuvring capability under these conditions (IMO Resolution MSC.137(76), *Standards for Ship Manoeuvrability*, provides standards to assess the manoeuvrability of ships); and
(k) trials, testing and other activities necessary to verify compliance with Section 3. The final report described in 3.1.5(b) is to be submitted once the proposed design is finalised.

1.4.3 Description of intended system function under normal conditions and in the event of fire or flooding for the services referred to in Sections 2 and 4.

1.4.4 Details of analyses conducted to assess the availability of services referred to in Sections 2 and 4 in the event of fire or flooding.

1.4.5 Details of National Administration criteria (*see also* 1.3.1), including:

(a) service speed, manoeuvring capability and time period of operation and ship range for ship return to port under its own propulsion;
(b) systems determined to be vital to damage control efforts;
(c) identification of required internal communications arrangements; and
(d) identification of navigation light circuits to be capable of operation during return to port.

1.4.6 General arrangement plans of the ship showing the location of machinery and equipment, piping systems, cables and controls stations to be employed for:

(a) each of the services described in 2.1.2, 2.1.3, and 4.1.2; and
(b) the provision of electrical power described in 2.1.4 and 4.1.3.

The plans are to identify:

(c) watertight compartments and the bulkhead deck; and
(d) for passenger ships having a length of 120 m or more or having three or more main vertical zones:
  (i) safe areas in the context of a casualty; and
  (ii) casualty threshold 'A' class structural fire protection boundaries.

The plans are to indicate segregation and fire/flooding protection measures and access arrangements for machinery spaces and associated control stations. These plans are also to be made available to the Surveyor on board.

1.4.7 A functional description of the system configurations and intended systems operation in the event of a fire or flooding casualty for the services referred to in Sections 2 to 4. This is to include reversionary control stations and required internal communications. A copy is to be provided on board.

1.4.8 Identification and details:
(a) equipment designed to operate in flooded spaces or under fire conditions; and/or
(b) other flooding or fire protection measures.

1.4.9 A schedule of normal and emergency operating loads on the electrical system for the different expected operating conditions and services described in Sections 2 and 4.

1.4.10 Details identifying the auxiliary systems required for the operation and control of machinery and equipment to provide the services described in Sections 2 and 4.

1.4.11 Details of time period of operation and ship range and service speed corresponding to fuel storage capacity available in the event of fire or flooding scenarios.

1.4.12 A schedule of activities, including testing and trials, to verify that the ship is capable of providing the services described in Sections 2 and 4.

■ *Section 2* Safe return to port

2.1 General

2.1.1 Consistent with the requirements of the relevant SOLAS Regulations, this Section provides design criteria for machinery and equipment described in 1.1.2 to remain operational for the ship's safe return to port under its own propulsion, in the event of:
(a) a fire casualty that does not exceed the casualty threshold; or
(b) flooding of any single watertight compartment.

2.1.2 When fire damage from a casualty does not exceed the casualty threshold or when the ship is subject to flooding of any single watertight compartment, machinery and equipment essential for the following services are to remain operational in the remaining part of the ship not affected by fire or flooding:
(a) **propulsion systems and their necessary auxiliaries and control systems**. Propulsion machinery and auxiliary machinery essential for the propulsion of the ship at a service speed and range/distance acceptable to the National Administration for return to port under its own propulsion, *see* Section 3;
(b) **steering systems and steering-control systems**. Steering systems and steering-control systems sufficient to provide manoeuvring capability acceptable to the National Administration for return to port under its own propulsion, *see* Section 3;
(c) **systems for transfer and service of oil fuel**. Systems for internal transfer and service of oil fuel capable of fuel supply to active propulsion and power generation equipment;
(d) **bilge and ballast system**. The bilge pumping systems, and all associated equipment essential for its operation, in all spaces not directly affected by the casualty, *see also* Chapter 13 and Pt 6, Ch 1,2.7;
(e) **flooding detection systems**. *See also* Ch 13,14;
(f) **internal communications**. The means of communication required by:
  (i) Ch 1,4.7, Pt 6, Ch 1,2.2.2 and/or 2.6.3 between the bridge and machinery main and subsidiary control stations and engineer's accommodation; and
  (ii) Ch 19,2.1.7 between the navigating bridge and the steering gear compartment;
necessary for operation of machinery and equipment, or otherwise identified by the National Administration to be required, during a ship's return to port under its own propulsion; and
(g) **navigation lights**. Electric circuit protection, controls and failure alarms for lights specified by the National Administration to be capable of operation, *see also* Pt 6, Ch 2,15.6.

2.1.3 In addition to the requirements of Pt 6, Ch 2,1.16 and 1.17, when fire damage from a casualty does not exceed the casualty threshold or when the ship is subject to flooding of any single watertight compartment, machinery and equipment essential for the following services are to remain operational in the remaining part of the ship not affected by fire or flooding:
(a) for **internal communication**:
  (i) general emergency alarm system. This is in addition to the requirements of Pt 6, Ch 2,18.2;
  (ii) public address system. This is in addition to the requirements of Pt 6, Ch 2,18.3; and
  (iii) from the safety centre as required by Pt 6, Ch 2,17.10.3;
where identified by the National Administration to be required to satisfy the relevant SOLAS Regulations for communication between the bridge, engineering spaces, safety centre, fire-fighting and damage control teams, and for passenger and crew notification and mustering;
(b) for **fire main systems** where supplied by electrically driven fire pumps, the pumps (and electrical equipment essential for their operation) are to be located and arranged such that operating capability will be available in the event of any main vertical zones being directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 2,17.4;
(c) for **fixed fire-extinguishing systems**:
  (i) for automatic sprinkler systems where supplied by electrically driven pumps, the pumps are to be located and arranged such that operating capability will be available in all spaces not directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 2,17.2;
  (ii) for electrically driven refrigeration units for carbon dioxide fire-extinguishing systems, the units are to be located and arranged such that operating capability will be available in all spaces not directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 2,17.5; and
  (iii) electrically operated fire-extinguishing media release alarms in spaces not directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 2,17.9.

(d) the fire detection and alarm system in all spaces not directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 1,2.8 and Pt 6, Ch 2,17.1;
(e) power-operated watertight doors in spaces not directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 2,19.1;
(f) lighting of safe areas and escape route or electrically powered low location lighting. This is in addition to the requirements of Pt 6, Ch 2, 3, 5.4, 5.7, 18.1 and 18.4; and
(g) other systems required by relevant engineering systems Rules that the National Administration has determined to be vital to damage control efforts.

2.1.4 When fire damage from a casualty does not exceed the casualty threshold or when the ship is subject to flooding of any single watertight compartment, electrical power, where required, is to be available and sustainable for the following services:
(a) those required by 2.1.2;
(b) navigational systems, including navigation lights, required by the National Administration to be capable of operation during return to port (*see also* Pt 7, Ch 9 for relevant classification notations);
(c) internal communication required during a ship's return to port under its own propulsion. Where applicable, charging power for portable means of communication is to be included;
(d) external communication (for communicating via the GMDSS or the VHF Marine and Air Band distress frequencies even if the main GMDSS equipment is lost);
(e) fire pumps for the fire main system not directly affected by the casualty;
(f) fixed fire-extinguishing systems (gaseous and water) designed to protect an entire space in all spaces not directly affected by the casualty;
(g) fire detection and alarm system in all spaces not directly affected by the casualty;
(h) power-operated watertight and semi-watertight doors;
(j) systems and equipment intended to support the provision of services to safe areas;
(k) other systems that the National Administration has determined to be vital to damage control efforts; and
(l) other fixed electrically powered loads intended to be operated during return to port.

The electrical power available is to be at least sufficient to supply the machinery and equipment specified by the National Administration as necessary and any additional loads identified in (l) during a ship's return to port under its own propulsion with due regard to such services as may be operated simultaneously.

2.1.5 Auxiliary and support systems (e.g., engine-room ventilation, lighting of spaces outside safe areas not affected by the casualty, etc.) required for the operation and control of machinery and equipment required to operate in accordance 2.1.2 and 2.1.3 and to provide electrical power in accordance with 2.1.4 are to remain operational.

2.1.6 Oil fuel stores, machinery and equipment are to have sufficient capacity to permit the services required by 2.1.2 to 2.1.5 to be provided for a time period of operation, ship range/distance and service speed acceptable to the National Administration for the ship's return to port under its own propulsion.

2.1.7 To satisfy 2.1.2 to 2.1.6, machinery and equipment is to be provided, constructed, segregated and arranged such that the services specified may be provided safely and effectively in the event of potential damage to machinery and equipment as a result of a fire that does not exceed the casualty threshold or flooding of any single watertight compartment, including control, safety, alarm and monitoring equipment and control stations.

2.1.8 A description of the intended system function in the event of fire or flooding for the services referred to in this Section are to be submitted for consideration, *see* 1.4.2 and 1.4.3. A risk based analysis is to be conducted in accordance with standards acceptable to LR to assess the availability of services required by this Section (for propulsion and steering, *see* Section 3; for other services, *see* 1.4.4 and 3.3.4).

■ *Section 3*
Qualitative failure analysis for propulsion, steering and essential services

3.1 General

3.1.1 A qualitative risk based failure analysis is to be conducted in accordance with this Section to assess compliance with the analysis objectives.

3.1.2 The analysis is to assess the magnitude and consequences of various types of potential hazards in the design that might lead to failure to fulfil the analysis objective(s) stated in 3.2. The following are to be considered during the analysis:
(a) analysis facilitation;
(b) these Rules;
(c) relevant statutory regulations and National Administration criteria;
(d) the ship design;
(e) the intended ship operation; and
(f) the relevant machinery, equipment and systems.

3.1.3 Those conducting the analysis and their roles are to be recorded in the analysis report.

3.1.4 Requirements specified by the National Administration to satisfy the relevant SOLAS Regulations for the ship's propulsion and steering during return to port, *see* 2.1.2, are to be identified in the analysis report, *see also* 1.3.1.

3.1.5 The analysis is to be documented, *see* 1.4.2, and two reports are to be submitted:

(a) a preliminary analysis, after the initial arrangements of different compartments and propulsion and steering arrangements are known, to permit an assessment of compliance with this Section. This is to include an assessment of propulsion and steering capability in the event of a failure, fire or flooding in any compartment casualty; and then

(b) a final report on the design, documenting compliance with this Section, that includes a detailed assessment of machinery and equipment required to provide propulsion and steering safely and effectively in accordance with the applicable requirements of 2.1.2.

3.2 Analysis objectives

3.2.1 For passenger ships having a length of 120 m or more, or having 3 or more main vertical zones, the analysis is to:

(a) assess, identify and record the effects of failure in propulsion and steering equipment and systems after a fire casualty or flooding as described in 2.1.1(a) and (b); and

(b) verify compliance with 2.1.2(a) and (b).

3.2.2 For other passenger ships, the analysis is to assess, identify and record the effects of failure in propulsion and steering equipment in any space.

3.3 Analysis scope

3.3.1 The analysis is to consider the propulsion and steering machinery, equipment and other associated systems and equipment which might impair the availability of propulsion and steering.

3.3.2 To consider the effects of fire or flooding, the analysis is to address the installed locations of relevant equipment and systems.

3.3.3 The analysis is to include assessment of potential common cause failures and consequential failures when analysing system redundancy intended to maintain propulsion and/or steering in the event of a failure.

3.3.4 Where the analysis scope is extended to additionally consider other services and verify additional compliance with the requirements of Sections 2 and/or 4, details may be submitted, *see* 1.4.3 and 1.4.4.

■ *Section 4*

Orderly evacuation and abandonment after a casualty

4.1 General

4.1.1 Consistent with the requirements of the relevant SOLAS Regulations, this Section provides design criteria for machinery and equipment described in 1.1.2 to remain operational, thereby supporting orderly evacuation and abandonment of the ship in the event of a fire that exceeds the casualty threshold.

4.1.2 In addition to the requirements of Pt 6, Ch 2,1.14, when fire damage from a casualty exceeds the casualty threshold, machinery and equipment essential for the provision of the following emergency services are to remain operational in the remaining part of the ship not affected by fire:

(a) for **fire main systems** where supplied by electrically driven fire pumps, the pumps (and electrical equipment essential for their operation) are to be located and arranged such that operating capability will be available in all main vertical zones not directly affected by the casualty. This is in addition to the requirements of Pt 6, Ch 2,17.4;

(b) for **internal communication**:
   - (i) general emergency alarm system. This is in addition to the requirements of Pt 6, Ch 2,18.2;
   - (ii) public address system. This is in addition to the requirements of Pt 6, Ch 2,18.3; and
   - (iii) from the safety centre as required by Pt 6, Ch 2,17.10.3;

   where identified by the National Administration to be required to satisfy SOLAS 1974 as amended, Chapter II-2/G, Regulation 22.3.1.2 for communication in support of fire-fighting and/or for passenger and crew notification and evacuation;

(c) for **bilge systems**, the bilge pumping systems, and all associated equipment essential for its operation, in all spaces not directly affected by the casualty to permit the removal of fire-fighting water. This is in addition to the requirements of Chapter 13 and Pt 6, Ch 1,2.7; and

(d) lighting of escape routes, assembly stations and at embarkation stations of life-saving appliances and electrically powered low location lighting. This is in addition to the requirements of Pt 6, Ch 2, 3, 5.4, 5.7, 18.1 and 18.4.

4.1.3 When fire damage from a casualty exceeds the casualty threshold, electrical power, where required, is to be available and sustainable for the following services:

(a) those required by 4.1.2;

(b) other required means of internal communications systems not addressed by 4.1.2(b);

(c) means of external communications provided to communicate via the GMDSS or the VHF Marine and Air Band distress frequencies even if the main GMDSS equipment is lost;

(d) guidance systems for evacuation not addressed by 4.1.2(d);

(e) life-saving appliances and arrangements;

(f) other systems that the National Administration has determined to be necessary to comply with SOLAS 1974 as amended, Chapter II-2/G, Regulation 22.3.1; and
(g) other fixed electrically powered loads intended to be operated during evacuation and abandonment.

The electrical power available is to be at least sufficient to supply the machinery and equipment specified by the National Administration as necessary to support orderly evacuation and abandonment with due regard to such services as may be operated simultaneously.

4.1.4 Machinery and equipment required to satisfy this sub-Section is to be capable of operation for at least 3 hours based on the assumption of no damage outside the unserviceable main vertical zone. System operation within the unserviceable main vertical zones is not required.

4.1.5 A description of the intended system function in the event of fire for the services referred to in this Section is to be submitted for consideration, *see* 1.4.3. A risk based analysis is to be conducted in accordance with standards acceptable to LR to assess the availability of services required by this Section, *see* 1.4.4 and 3.3.4.

■ *Section 5*
Verification, testing and trials

5.1 General

5.1.1 Activities, including testing and trials, are to be carried out to verify that the services described in Sections 2 and 4 may be provided in the event of fire or flooding to the satisfaction of LR, *see* 1.1.3 and 1.4.12. These activities are to include at least those in 5.1.2 and 5.1.3.

5.1.2 System Capability Testing is to be carried out to verify the ability of each essential system to provide capabilities in line with the design criteria. This testing is to be completed during harbour acceptance trials and sea trials, to the satisfaction of LR.

5.1.3 Scenario testing is to be carried out, verifying the ability of all the essential systems to provide the required capabilities under the identified fire and flooding casualties, taking full account of interaction and dependencies between the essential systems. Tests can be performed during harbour acceptance trials; however, certain scenarios will be required to be tested under sea-going conditions, where performance can only be properly verified during trials at sea (e.g., navigational systems, manoeuvrability, etc.). Testing of at least six scenarios is to be completed and is to include at least:
(a) loss of a Main Vertical Zone;
(b) casualty that results in the largest reduction in propulsion power;
(c) casualty that results in the largest reduction in steering capability;
(d) casualty that results in the most manual actions;
(e) casualty with the highest fire risk/load; and
(f) casualty affecting the greatest number of essential systems.

NOTE: It is acceptable that scenarios (b), (c), (d), (e) and (f) may be covered by the same test if applicable.

5.1.4 The above testing is to verify:
(a) The effect of a specific component failure.
(b) The effectiveness of automatic/manual isolation systems.
(c) The behaviour of any interlocks that may inhibit operation of essential systems.

5.2 Trials

5.2.1 In addition to the requirements for sea trials in Ch 1,5.2, trials are to be carried out to demonstrate that an acceptable service speed and steering capability for return to port can be achieved in the event of fire or flooding, *see* 2.1.2(a), (b) and 5.1.3. The operational envelope(s) under the failure conditions is(are) to be determined.

■ *Section 1* General

1.1 Scope

1.1.1 The requirements of this Chapter apply to machinery and equipment fitted to combustion machinery in order to reduce emissions produced by the combustion of fuel. Such machinery and equipment is hereinafter referred to as emissions abatement plant.

The requirements are intended to ensure that the emissions abatement plant is safe to operate and maintain and, additionally, where the combustion machinery provides power for essential services, that failure of the emissions abatement plant does not result in an unacceptable loss or degradation of those essential services.

The requirements are applicable to emissions abatement plant making use of both primary techniques, which reduce emissions by controlling the combustion process or removing pollutants prior to combustion, and to secondary emissions abatement techniques which reduce emissions from the exhaust gas after combustion.

It should be noted that these requirements do not provide for the reliability or redundancy necessary to ensure continued operation of the emissions abatement plant, and thereby compliance with relevant emissions requirements, following failure of any machinery, equipment or components associated with the emissions abatement plant.

■ *Section 2* Functional requirements

2.1 Functional requirements of emissions abatement plant

2.1.1 Emissions abatement plant is to be capable of operating at the maximum output power of the combustion machinery to which it is connected. Where the machinery installation is configured such that it is not intended to operate all the combustion machinery connected to the emissions abatement plant simultaneously in normal operating conditions, this will be subject to special consideration and supported by the submission required by 3.1.2. For engines, the maximum power is as stated on the Engine International Air Pollution Prevention Certificate (EIAPPC) or an equivalent certificated engine rating for vessels which are not subject to MARPOL Annex VI.

2.1.2 Operation and maintenance of the emissions abatement plant is not to present a hazard to the ship's occupants or to the environment.

2.1.3 Failure of the emissions abatement plant is not to present a hazard to the ship's occupants or any other hazard other than untreated emissions to the environment.

2.1.4 Where the emissions abatement plant is connected to combustion machinery providing power for essential services, failure of, or the inability to operate, the emissions abatement plant is not to prevent the combustion machinery from delivering sufficient power to those essential services so as to ensure the safe operation of the ship.

2.1.5 Any discharges to water from the emissions abatement plant are to be in accordance with the requirements of National and International Regulations, as applicable.

■ *Section 3* Information to be submitted

3.1 General

3.1.1 The information required by this Section, the information required by Pt 3, Ch 1,5 and Chapter IV of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk*, as applicable (hereinafter referred to as the Rules for Ships for Liquid Chemicals).

3.1.2 A description of the emissions abatement plant and the abatement technique(s) used. This is to include details of the proposed combustion machinery operating configurations where using a common emissions abatement system for multiple exhaust gas inlet streams and any limitations on the operation of combustion machinery connected to the emissions abatement system.

3.1.3 Where emissions abatement plant makes use of more than one abatement technique, e.g., separate means for reducing NO_x and SO_x, details demonstrating their compatibility with the combustion machinery and with each other.

3.1.4 Diagram showing the process flows.

3.1.5 Details of the maximum and minimum ambient and sea-water temperatures within which the emissions abatement plant is to operate, and maximum and minimum ambient air temperature and humidity where applicable.

3.1.6 Details of the hazards associated with operation and maintenance and reasonably foreseeable failure of the emissions abatement plant and the means by which they are mitigated.

3.1.7 Details of any fuel treatments, fuel additives or fuel emulsification used as a primary means of emissions abatement from combustion machinery, together with a manufacturer's letter confirming the suitability of combustion machinery to operate with such treatments and additives. Details are to include evidence that materials, fuel filtration and arrangements for the control of viscosity and temperature have been suitably modified, along with evidence of the suitability of fuel pumps and fuel valves for the treated fuel, with particular attention to viscosity, lubricity and stability, as applicable.

3.2 Materials

3.2.1 Details of the materials proposed for all types of construction.

3.3 Chemical substances

3.3.1 Details of the flammability, toxicity, corrosivity and reactivity of any chemicals used, together with details of any exothermic and hazardous reactions, particularly with regard to sea-water.

3.3.2 General arrangement of spaces where toxic or flammable liquids, gases, dusts or vapours are stored or may accumulate, indicating the hatches and other access openings.

3.3.3 Details of arrangements for loading, storage, transfer and disposal of chemicals, by-products or waste products.

3.3.4 General arrangement showing spaces maintained at an over-pressure to prevent the ingress of gases, dusts or vapours.

3.3.5 Details and arrangements of blowdown and bleed-off systems, where applicable, including quantities of chemicals, substances and effluents and the capacity and working pressure of tanks and receivers installed for the reception of such substances and effluents.

3.3.6 Arrangements for purging, gas freeing, inerting or otherwise rendering safe of the emissions abatement plant and storage facilities for chemicals, effluent and by-products associated with the plant.

3.3.7 The flow and return flow of chemicals, substances, effluent or by-products, including:

(a) Substance supply and product discharge, with details of the arrangements showing the location of shut-off valves and of the control and indicating stations.
(b) The process plant parameters and analysis of conditions under which emergency shut-down will be initiated.
(c) Measures to eliminate risk of process fluid reverse flows which could present a risk to propulsion engines, auxiliary engines and essential services.
(d) The proposed emergency procedures for controlled shut-down of the plant, i.e., depressurising, isolating and the arrangements for the continued operation of the essential services necessary to allow for such controlled shut-down under the emergency conditions identified in 3.3.7(b), as applicable.

3.3.8 Proposals for the decontamination of the emissions abatement plant compartments for installations using chemicals, substances and/or producing effluent or by-products or where there is a possibility of generating hazardous substances during the operation of plant. These proposals are to include both normal operating requirements for decontamination (such as for carrying out maintenance) and post-incident decontamination.

3.3.9 Arrangement for the detection of liquids, gas and vapours where such substances could present a fire, explosion or health hazard.

3.4 Mechanical equipment

3.4.1 Details of mechanical equipment associated with the emissions abatement plant to be installed.

3.4.2 Details of any safety and pressure-relief devices and their discharge arrangements.

3.4.3 Plans showing the materials of construction, working pressures and temperatures, maximum and minimum exhaust gas flows, fuel quality parameters, maximum and minimum flow rates of any water, fluids, chemicals or substances required by the process, maximum effluent or by-product discharge rate resulting from the process.

3.4.4 Details of the arrangements for protecting the emissions abatement plant, its tanks and vessels against temperature, over-pressure and vacuum. Details are to include consideration of storage temperature requirements and, where applicable, tanks are to be maintained within the temperature limits of the chemicals and substances they contain so as to avoid risks of boiling, stress corrosion, freezing and other temperature-sensitive processes.

3.4.5 Details of the by-pass arrangements or, where considered unnecessary, evidence demonstrating that the emissions abatement plant is capable of continued operation with the expected gas flows. Evidence is to include conditions where the emissions abatement plant is in a shut-down condition, both as a result of emergency conditions and when shut down for normal operational reasons. This is to be supported by detailed proposals demonstrating material suitability and is to ensure that, where there is a risk of blockage, this can be monitored so as to ensure that remedial action can be taken before blockage presents a risk to both propulsion and auxiliary engine and emissions abatement plant operations.

3.5 Pressure vessels

3.5.1 Plans of any pressure vessels, including details of the support of the vessels. Diagrammatic plans for systems associated with emissions abatement process equipment as required by Chapter 10 and Chapter 11, as applicable.

3.5.2 Details of the safety and pressure-relief devices and their discharge arrangements.

3.5.3 Stress calculations taking into account the ship linear and angular accelerations, roll and pitch amplitudes, ship flexure and wind loads, appropriate to any condition which may normally arise at sea.

3.6 Pumping and piping

3.6.1 Plans of the emissions abatement plant piping systems, showing the materials of construction, scantlings, support and expansion arrangements, together with the calculations.

3.6.2 Diagrammatic plans for systems associated with emissions abatement process equipment, as required by Chapter 12, Chapter 13 and Chapter 14 and by the Rules for Ships for Liquid Chemicals, as applicable.

3.6.3 Plans showing the arrangement and dimensions of main exhaust pipes, with details of flanges, bolts and weld attachments and particulars of the materials of the pipes, flanges, bolts and welding consumables.

3.6.4 Details of the safety and pressure-relief devices and their discharge arrangements.

3.6.5 Details of air and sounding pipes to tanks containing chemicals, substances and effluent.

3.6.6 The arrangements for the storage on board the ship, and the disposal, of bilge and effluent from the emissions abatement plant spaces, giving particular consideration to the risk of flooding as a result of emissions abatement plant failure. Recognition is to be given to the requirements of the appropriate National Authority.

3.7 Electrical and control equipment

3.7.1 General arrangement plan of the process plant, showing the location of the major items of electrical equipment.

3.7.2 Line diagram of the installation(s), indicating the rating of the various items of rotating machinery, converters and transformers.

3.7.3 Arrangement plans and circuit diagrams of the switchboards.

3.7.4 General arrangement plan of the process plant, showing the location of electrical equipment in hazardous zones.

3.7.5 A schedule of safe-type electrical equipment located in hazardous zones, giving details of the type of equipment employed, the certifying authority and the certificate number.

3.7.6 Line diagrams of any control system(s) fitted.

3.7.7 General arrangement plan of the process plant, showing the locations of items of control equipment and the locations of hazardous zones.

3.7.8 Schedule of the parameters which are monitored and controlled, including alarms and shut-down devices.

■ *Section 4* Materials

4.1 General

4.1.1 The materials used in the construction of the emissions abatement plant and any associated chemical and effluent storage tanks are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* and/or the Rules for Ships for Liquid Chemicals.

■ *Section 5* Hull construction

5.1 General

5.1.1 The hull structure is to comply with the relevant requirements of Parts 3 and 4, except where stated otherwise in this Section.

5.1.2 All substance and effluent tank structures and their location relative to the ship's hull are to comply with Chapters 2 and 4 of the Rules for Ships for Liquid Chemicals.

5.1.3 Where necessary, the probable temperature variations during operations and the thermal stress considerations are to be stated. Where it is necessary either to heat or cool chemical storage tanks, the arrangements are to meet the requirements of Chapter 7 of the Rules for Ships for Liquid Chemicals.

5.1.4 Where independent tanks are used for chemical substances, these are to be bunded to contain spillage. The bund is to comply with the following:

(a) the bund is dimensioned so as to contain the maximum contents of the tank at the angles of inclination required for main and auxiliary machinery in Table 1.3.2 in Chapter 1; or
(b) there is a drain arrangement meeting the requirements of 5.1.6; or
(c) the tank is located in a dedicated compartment containing no equipment other than that required by the tank with permanent access and floor plates positioned above the liquid level if the tank were to discharge its full contents into the compartment. Any valves, equipment and emergency stop functions are to be operable from outside this compartment and are to meet the requirements of 5.2.

Tanks and spill containment arrangements are to be fitted with alarms and safeguards, in accordance with Table 9.1.9.

5.1.5 Proposals are to be made for the dimensioning of containment arrangements, relative to the potential leakage which may require containment. Where it is not practicable to contain the potential leakage fully and where this leakage can pose a hazard to personnel, proposals are to be submitted, demonstrating that leakage will be transferred to a suitable retention tank, and the means of transfer shall be capable of operating in a dead ship condition and shall be fitted with a flow detection alarm, in accordance with Table 9.1.9.

5.1.6 Tanks are to be arranged such that any residues and slops can be pumped out, drained or otherwise removed from the tank without exposing personnel to these residues and slops.

5.1.7 Chemical tanks are not to be located in the same space as essential machinery and equipment.

5.1.8 Arrangements for venting and gas-freeing chemical tanks required by emissions abatement plant are to meet the requirements of Chapter 8 of the Rules for Ships for Liquid Chemicals.

5.2 Location service and control spaces

5.2.1 Where flammable or toxic chemicals, gases or vapours are present, as identified in 3.3.1 and 3.3.2, service and control stations essential to the operation of the plant are to meet the requirements of 9.1.4, and should, wherever possible, be located so that access thereto is from a defined safe space. If such a location is not possible, the station is to be specially ventilated.

Arrangements are to be made in spaces occupied by emissions abatement plant, in order that substances which are flammable, corrosive, toxic or likely to present a hazard due to reaction when mixed are kept separate unless they are fully contained within a part of the emissions abatement system which has been designed for the safe mixing of such substances.

5.3 Integrity of water and gastightness between compartments

5.3.1 Where integrity of water or gastightness is required between compartments containing the plant, it is to be maintained in way of pipe tunnels or duct keels where these traverse such compartments.

5.3.2 Installations and the spaces in which they are installed are to be, in all cases, compliant with applicable National and International requirements for prevention, detection and extinction of fire.

5.4 Cofferdams

5.4.1 Cofferdams are to be sited as required by the Rules for Ships for Liquid Chemicals, as applicable, segregating any spaces in which chemicals, substances or effluents are stored or retained in bulk.

5.5 Plant support structure

5.5.1 Decks and other structures supporting the plant are, in general, to comply with the requirements of Part 3. Such structures can, however, be considered on the basis of an agreed uniformly distributed loading in association with local loads at plant support points, provided that adequate transverse strength of the ship is maintained.

5.5.2 Where the nature and dispositions of heavy plant items are such that forces on the ship and support structure due to ship motions are significant (whether underway with or without working fluids, or moored with working fluids), calculations of the loading and the structural response are to be submitted.

5.6 Loading due to wave-induced motions

5.6.1 In cases where the mass distribution of large columnar equipment items is such that the centre of action of the dynamic force differs significantly from the centre of gravity of the item, due account of this is to be taken in the calculation of the forces and moments at the support positions.

5.7 Integrity of weather deck

5.7.1 The integrity of the weather deck is to be maintained. Where items of plant penetrate the weather deck and are intended to constitute the structural barrier to prevent the ingress of water to spaces below the freeboard deck, their structural strength is to be equivalent to the Rule requirements for this purpose. Otherwise, such items are to be enclosed in superstructures or deckhouses fully complying with the Rules.

Section 6
Mechanical equipment

6.1 General

6.1.1 Emissions abatement plant associated with oil engines, gas turbine and boilers is to comply with the requirements of Chapters 2, 4 and 10 respectively, as applicable.

6.1.2 The mounting arrangements for the equipment is to be capable of withstanding the forces and moments stated in 5.5 and 5.6.

6.1.3 The design is to take account of the risk of fire or explosion hazards which may arise from deposition of chemicals, unburnt fuel, particulates or any by-products of chemical reactions which may arise during normal operation.

6.1.4 The emissions abatement plant is to be capable of being started in a hot condition without risk of failure due to thermal shock.

6.1.5 Safety or pressure-relief devices are to discharge to a place which will not present a hazard to the ship's occupants or to any machinery.

6.1.6 Where bursting discs or rupture panels are used as safety and pressure-relief devices, these are to be dimensioned and designed in accordance with a recognised National or International Standard.

6.1.7 Where it can be expected that there will be deposition of materials, caking and waste, arrangements are to be provided for the safe cleaning of such systems.

6.1.8 Where there is a possibility of operating conditions in the system falling below the dew point temperature of any gases or vapours present in the system, suitable drains are to be provided to permit the discharge of any condensate formed.

6.2 By-pass or equivalent arrangements

6.2.1 The emissions abatement plant is to be provided with a by-pass capable of transmitting the minimum and maximum exhaust gas flows from the combustion machinery to which it is connected. Where a by-pass is considered unnecessary, the emissions abatement plant is to be capable of safely transmitting the minimum and maximum exhaust gas flows with the emissions abatement plant out of operation, such that the combustion machinery to which it is connected can continue to operate.

6.2.2 Where a by-pass is fitted, there is to be a flow path for exhaust gas at all times.

6.2.3 A means of measuring differential pressure across the emissions abatement plant is to be provided.

6.3 Shared emissions abatement plant

6.3.1 Where emissions abatement plant is connected to more than one engine or source of exhaust gas, valves or equivalent means of isolating the exhaust systems of individual engines from common manifolds are to be provided to prevent reverse flow of exhaust gas into the exhaust manifolds of engines which have been shut down.

6.3.2 Where isolating valves are fitted, a means to verify the effectiveness of the isolation is to be provided.

6.4 Maintenance of back-pressure

6.4.1 The exhaust back-pressure, after installation of emissions abatement plant, is to remain within the allowable limits stated by engine and combustion machinery manufacturers under all expected operating conditions, unless it is intended to operate the system at a negative pressure by means of an induced draught fan.

6.4.2 Where an induced draught fan is fitted to maintain the required exhaust back-pressure, a fan failure is not to prevent the combustion machinery from operating.

6.4.3 Where the emissions abatement plant is fed from multiple exhaust gas inlet streams, the back-pressure is to be maintained within the allowable limits provided by engine machinery manufacturers for all engine or combustion machinery operating configurations.

6.5 Protection of combustion machinery

6.5.1 Measures are to be implemented to ensure that water from the emissions abatement plant cannot flow back into engine turbo-charger(s) or other machinery.

6.5.2 Means are to be provided for protecting critical engine components from foreign object damage resulting from failure of, or damage to, the emissions abatement plant. Where such damage is considered unlikely, evidence is to be submitted accordingly.

6.5.3 Where chemicals or substances are injected into the exhaust gas stream before turbo-charger(s) or emissions abatement plant are fitted, this is not to present a risk of damage, chemical attack or performance degradation to the turbo-charger(s) or engine(s) or machinery with which they are associated.

6.5.4 Where fuel treatments, additives or emulsification are used as a primary means of abating exhaust emissions, machinery is to be compatible with such additives, treatments and emulsified fuel.

6.5.5 Where exhaust gas is re-circulated as a means of emission abatement, the re-circulated exhaust gas is not to cause fouling and corrosion of critical engine components and scavenge air temperature is to be maintained at a level which does not adversely affect engine performance.

6.5.6 Where a wet scrubber is used to clean and cool re-circulated exhaust gas, the scrubber is to satisfy the requirements of 7.1.9.

■ *Section 7* Pumping and piping

7.1 General

7.1.1 Pipe work and transfer systems which may carry chemical substances are to meet the requirements of Chapter 5 of the Rules for Ships for Liquid Chemicals. Lining steel pipe systems with corrosion-resistant materials is subject to special approval. The elasticity of the lining is not to be less than that of the supporting boundary material.

7.1.2 Pipe systems carrying sea-water or fresh water are to meet the requirements of Chapters 12, 13 and 14. Where there is a risk of fresh water or sea-water systems becoming contaminated with process chemicals, substances or effluent, pipe systems are to comply with 7.1.1.

7.1.3 Chemical transfer and control arrangements are to meet the requirements of Ch 5,5.6 of the Rules for Ships for Liquid Chemicals.

7.1.4 Bilge and effluent pumping and piping systems in the emissions abatement plant spaces are to be constructed of material suitable for any chemicals or substances used by the emissions abatement plant, effluent that is produced or any combination of substances on board which might result from accidental admixture.

7.1.5 Arrangements are to be provided for the control of the bilge and effluent pumping and piping system. They are to be installed in the emissions abatement plant spaces from within these spaces and also from a position outside the spaces.

7.1.6 Bilge and effluent pumping and piping systems for hazardous materials should, wherever possible, be installed in the space associated with the particular hazard.

7.1.7 Piping systems carrying chemical substances or effluents and by-products are to meet the requirements of Chapter 6 of the Rules for Ships for Liquid Chemicals. This requirement includes exhaust piping where such substances are injected into exhaust gas or where the exhaust gas passes through a liquid scrubber which uses chemical substances.

7.1.8 Where filters are used, they are to be capable of being safely removed for cleaning and replacement safely without interrupting emissions abatement plant or engine operations.

7.1.9 Where scrubbers are used, the following apply:

(a) Closed loop wet scrubbers are to have natural gravity fall drainage from the wet sump of the scrubber to the process tank or circulating pump suction, with the drain line dimensioned to accommodate 125 per cent of the maximum pumping capacity of the installed water pump(s). No valves are to be fitted to the drain line from the scrubber sump to the process tank unless it can be demonstrated that suitable precautions are in place to prevent the possibility of the scrubber filling with water and reverse-flowing into the engine exhaust duct. Where a valve is fitted to this line, the system is to be protected as for the overboard discharge valve of an open loop system, in accordance with Table 9.1.9.

(b) For open loop wet scrubbers, the overboard discharge valve and any other sea-water valves downstream of the scrubber are to be protected in accordance with Table 9.1.9. The sea suction valve(s) are also to have position indicators which are to give remote indication of valve position. The scrubber is to be mounted above the waterline under all operating conditions to prevent sea-water ingress into the scrubber from the natural flow.

(c) For wet scrubbing systems (open loop and closed loop), an overflow line is to be fitted to prevent the risk of reverse flow of water to engines, boilers and other machinery. This overflow is to be dimensioned to accommodate 125 per cent of maximum capacity of installed water pumps and is to have no impairment to flow. This overflow line is to be directed to the process tank in closed loop or hybrid installations. On open loop installations, it is to be directed overboard. The overboard discharge is to have an effective means of preventing reverse flow of sea-water. Alternative arrangements to prevent the risk of reverse flow are subject to special consideration.

(d) Overboard discharge connections from scrubbers are to be positioned below the lowest operating waterline and are to be internally protected from effluent-induced corrosion.

7.1.10 Where applicable, tanks are to be maintained within the temperature limits of the chemicals and substances they contain so as to avoid risks of boiling, stress corrosion, freezing and other temperature-sensitive processes.

■ *Section 8* Pressure vessels

8.1 General

8.1.1 Pressure vessels are to be in accordance with the requirements of the relevant Sections of Chapter 10 or Chapter 11 as applicable, or with agreed Codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted for the marine environment.

8.1.2 Mounting arrangements are to take account of forces and moments generated at the supports. Mounting arrangements are to take account of thermal expansion and contraction.

8.1.3 Access is to be provided for inspection, and checking of mountings, fittings, controls and pressure-relief devices.

8.1.4 Arrangements are to allow the pressure settings of pressure-relief devices to be checked.

8.1.5 Where provision is made to isolate pressure-relief devices from pressure vessels for maintenance purposes, at least two such pressure-relief devices are to be fitted.

The isolating or blocking valves are to be arranged such that at least one pressure-relief device remains operational at all times.

■ *Section 9*
Electrical and control equipment

9.1 General

9.1.1 Electrical system(s) associated with emissions abatement plant are to meet the requirements of Pt 6, Ch 2.

9.1.2 Control system(s) associated with the emissions abatement plant are to meet the requirements of Pt 6, Ch 1.

9.1.3 Electrical and control equipment associated with the emissions abatement plant is to be compatible with any chemicals used and meet the requirements of Chapter 10 of the Rules for Ships for Liquid Chemicals.

9.1.4 Where flammable or toxic chemicals, gases or vapours are present, as identified in 3.3.1 and 3.3.2, or where there is a possibility that flammable gases and vapours can be produced as a result of deviations from normal operation, the defining of hazardous zones is to be in accordance with Pt 6, Ch 2,14.

As a minimum, for the detection of gas and vapours, a gas detection system is to be fitted which is to activate at a concentration corresponding to the substance safe occupational level. The locations of the detectors are to be determined relative to the layouts of the individual spaces and are to be indicated on the plan submission required by 3.3.9. Where it is not practicable to install a detection system where gas detection equipment is not appropriate, e.g., for substances not emitting gases or vapours, alternative proposals are to be submitted to ensure the safety of persons from exposure to such substances.

9.1.5 Process tanks which form part of the operating loop of any emissions abatement equipment are to have a high level alarm, in accordance with Table 9.1.9. Effluent tanks which are not part of the normal process loop and which are used for storage of effluent or substances prior to discharge from the vessel are to be protected, in accordance with Table 9.1.9.

Tank alarm and trip sensors are to be positioned at a point which will allow the system shut-down to operate before the tank overflows, based on the maximum design flow rates and shut-down response time. Where a low level is identified as presenting a risk to crew or machinery, tanks are to have a low level alarm and a low level trip. These are to be positioned so as to operate before a low level results in a hazardous condition, based on system design flow rates and a system shut-down response time.

9.1.6 An emergency stop function is to be provided, which is to:

- Close quick-closing valves on chemical tank(s) (where applicable).
- Stop chemical feed pump(s) (where applicable).
- Where fitted, open exhaust gas cleaning by-pass valve.
- Stop scrubber water pumps and close scrubber water inlet valve (where applicable).

9.1.7 The emergency stop function is to be capable of being actuated from the machinery control room, the navigating bridge and from within compartments containing exhaust gas cleaning plant.
In order to mitigate the risk of chemical release, spaces containing chemical storage tanks or chemical pumping equipment are to have an emergency stop which is to shut down the chemical supply to the emissions abatement plant. Other parts of the emissions abatement plant such as wash water pumps need only be stopped by this emergency stop where loss of chemical injection could result in further risks arising from operating the plant without chemical injection. This is to form part of the submission required in 3.1.6.

9.1.8 Alarms and safeguards are to be provided for the critical system parameters in order to avoid danger to crew and machinery. As a minimum, the alarms and safeguards listed in Table 9.1.9 are to be fitted. Where these Rules require alarms and also trip protection to be fitted, the alarm and trip are to be independent of each other.

9.1.9 Where emissions abatement plant makes use of chemical substances, a means of monitoring abnormal flows of such chemicals is to be provided.

Table 9.1.9 Machinery emissions to air abatement plant: alarms and safeguards

Item	Alarm	Note
Exhaust gas outlet temperature	High	
Exhaust gas inlet temperature	High	
Exhaust gas inlet temperature	Low	Only for selective catalytic reduction
Differential pressure across abatement plant unit	High	
Abatement plant by-pass valve in exhaust duct	Valve movement	*See* Note 1
Machinery exhaust duct isolating valve	Valve movement	*See* Note 2
Wet emissions abatement unit overboard discharge valve	Closed	Emissions abatement plant is to be shut down automatically, *see* Note 6
Wet emissions abatement unit overflow line flow detection	Flow present	Emissions abatement plant is to be shut down automatically, *see* Note 6
Wet emissions abatement water pressure	Low	
Wet emissions abatement unit water level	1st Stage high	
Wet emissions abatement unit water level	2nd Stage high	Emissions abatement plant is to be shut down automatically, *see* Note 6
Chemical feed flow	High	Chemical feed pump is to be shut down automatically
Chemical feed flow	1st Stage low	
Chemical feed flow	2nd Stage low	Chemical feed pump is to be shut down automatically
Process tank level	1st Stage high	*See* Note 3
Process tank level	2nd Stage high	Emissions abatement plant is to be shut down automatically, *see* Note 3
Chemical storage tank level	1st Stage high	
Chemical storage tank level	2nd Stage high	
Chemical storage tank level	Low	
Chemical storage tank temperature	High	*See* Note 4
Chemical storage tank temperature	Low	*See* Note 4
Chemical tank containment bund level	High	Tank outlet quick closing valve is to close automatically, *see* Note 5
Chemical tank containment drain line flow detection	Flow present	Tank outlet quick closing valve is to close automatically, *see* Note 5
Exhaust gas recirculating fan failure	Failure	
Recirculating exhaust gas temperature return to engine	High	
Induced draught fan failure	Failure	Where fitted

NOTES
1. Only where a by-pass valve is fitted, *see* 3.3.5. This valve shall open to the by-pass position as part of the unit shut-down logic.
2. Only where fitted, *see* 5.1.
3. The process tank is any tank forming part of a wet abatement system flow loop or effluent tanks which receive bleed-off from the main flow loop, or such tanks not forming part of the system flow loop but which are essential for operation of the system, including those on exhaust gas recirculating installations, *see* 7.1.9. Where low level can present a hazard, process tanks are also to have low level protection.
4. Where chemical substances are to be kept within a defined temperature range, alarms will be fitted, based on the allowable temperature range, *see* 5.1.2 and 7.1.10.
5. Chemical spillage detection alarm will depend on the means of spill containment fitted, *see* 5.1.2.
6. Wet emissions abatement unit shall include such systems fitted as part of the exhaust gas recirculating installations.

Section 1
General requirements

1.1 General

1.1.1 This Chapter applies to all ships intended to be classed with Lloyd's Register (hereinafter referred to as 'LR'), and is in addition to other relevant Sections of the Rules.

1.1.2 Control engineering systems are to:
- provide control of required services and habitability requirements during defined operational conditions. This is to include, but is not limited to, power generation, propulsion and their associated services;
- provide control of the engineering systems necessary to ensure availability of essential and emergency safety systems during all normal and reasonably foreseeable abnormal conditions;
- provide control of the engineering systems necessary to ensure transitional power supplies remain available;
- be suitably protected against damage to itself under fault conditions and to prevent injury to personnel; and
- not fail in a way which may cause machinery and systems located in hazardous areas to create additional fire or explosion risk.

1.1.3 Control engineering systems on passenger ships having a length of 120 m or more or having three or more main vertical zones (*see* Pt 5, Ch 23,1.2.4 for definitions) are, in addition to the requirements of this Chapter, to be located, designed and arranged to comply with Pt 5, Ch 23, as applicable.

1.1.4 LR will be prepared to give consideration to special cases or to arrangements which are equivalent to the Rules where sufficient technical justification is provided. For unconventional designs, *see also* Pt 7, Ch 15.

1.2 Documentation required for design review

1.2.1 The documentation described in 1.2.2 to 1.2.9 is to be submitted for design review.

1.2.2 Where control, alarm and safety systems are intended for the machinery or equipment as defined in 1.2.3 the following are to be submitted:
- Description of operation with explanatory diagrams.
- Line diagrams of control circuits.
- List of monitored points.
- List of control points.
- Details of alarms and warnings to be presented by the user interface, including:
  - (i) an approach to category assignments which is in accordance with the IMO *Code on Alerts and Indicators, 2009*; and
  - (ii) for alarms required by these Rules, the intended operator response and the message to be presented.
- Test schedules (for both works testing and sea trials) which should include methods of testing and test facilities provided, *see* 1.3.1.
- Failure Mode and Effects Analysis (FMEA) where required by other sections of the Rules.
- List of safety functions and details of any overrides, including consequences of use, *see* 2.4.8 and 2.6.8.

1.2.3 Plans for the control, alarm and safety systems of the following are to be submitted:
- Air compressors.
- Bilge and ballast systems.
- Cargo pumping systems for tankers.
- Cargo and ballast pumps in hazardous areas.
- Cargo tank, cargo hold, ballast tank and void space instrumentation where such arrangements are specified by other sections of the Rules (e.g., water ingress detection, gas detection).
- Controllable pitch propellers.
- Electric generating plant.
- Fixed water based local application fire-fighting systems, *see* 2.9.
- Incinerators.
- Inert gas generators.
- Main propelling machinery including essential auxiliaries.
- Miscellaneous machinery or equipment (where control, alarm and safety systems are specified by other Sections of the Rules).
- Oil fuel transfer and storage systems.
- Steam raising plant. (Boilers and their ancillary equipment).
- Steering gear.
- Thermal fluid heaters.
- Transverse thrust units.
- Valve position indicating systems.
- Waste-heat boiler.
- Waterjets for propulsion purposes.
- Windlasses.

1.2.4 **System operational concept**. A description of the intended operation of the control, alarm and safety systems for the main and auxiliary machinery, and other systems essential for the propulsion and safety of the ship. This description is to include a demonstration that the design provides an effective means of operation and control for all ship operating conditions.

1.2.5 **Alarm systems**. Details of the overall alarm system linking the main control station, subsidiary control stations, the bridge area and accommodation are to be submitted.

1.2.6 **Programmable electronic systems**. In addition to the documentation required by 1.2.2 the following is to be submitted:

(a) System requirements specification.
(b) System functional description.
(c) System integration plan, *see* 2.14.2.
(d) Failure Mode and Effects Analysis (FMEA), *see* 2.14.5.
(e) Details of the hardware configuration in the form of a system block diagram, including input/output schedules.
(f) Hardware certification details, *see* 2.10.5 and 2.13.3.
(g) Software production plans, including applicable procedures, *see* 2.15.4.
(h) Factory acceptance, integration and sea trial test schedules for hardware and software.
(j) Details of data storage arrangements, *see* 2.10.10 and 2.13.6.

1.2.7 For wireless data communication equipment:

(a) Details of manufacturer's installation and maintenance recommendations;
(b) network plan with arrangement and type of aerials and identification of location;
(c) specification of wireless communication system protocols and management functions, *see* 2.12.4; and
(d) details of radio frequency and power levels, including details of those permitted by the National Administration.

1.2.8 Plans showing the location and details of control stations, e.g., control panels and consoles. Location and details of controls and displays on each panel. Detailed user interface specifications. A general arrangement plan of control rooms showing the position of consoles, handrails, operator area, lighting, door and window arrangements. Drawing of HVAC systems including vent arrangements.

1.2.9 **Fire detection systems**. Plans showing the system operation and the type and location of all machinery space fire detector heads, manual call points and the fire detector indicator panel(s) are to be submitted. The plans are to indicate the position of the fire detectors in relation to significant items of machinery, ventilation and extraction openings.

1.3 Control, alarm and safety equipment

1.3.1 Equipment associated with control, alarm and safety systems as defined in 1.2.3 are to be surveyed at the manufacturers' works in accordance with the approved test schedule *see* 1.2.2, and the inspection and testing are to be to the Surveyor's satisfaction.

1.3.2 Equipment used in control, alarm and safety systems is to be suitable for its intended purpose, and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the *Procedure for LR Type Approval System* will be supplied on application. For fire detection alarm systems, *see* 2.8.2 and for programmable electronic systems, *see* 2.10.5 and 2.13.3.

1.3.3 Where equipment requires a controlled environment, an alternative means is to be provided to maintain the required environment in the event of a failure of the normal air conditioning system, *see also* Table 14.12.3 in Pt 5, Ch 14.

1.3.4 Assessment of performance parameters, such as accuracy, repeatability, etc., are to be in accordance with an acceptable National or International Standard, e.g., IEC 60051: *Direct acting indicating analogue electrical measuring instruments and their accessories* (all parts).

1.3.5 Special consideration will be given to arrangements that comply with a relevant and acceptable National or International Standard, such as IEC 60092-504: *Electrical installations in ships – Part 504: Special features – Control and instrumentation*.

1.4 Alterations and additions

1.4.1 When an alteration or addition to the approved system(s) is proposed, plans are to be submitted for approval. The alterations or additions are to be carried out under survey and the installation and testing are to be to the Surveyor's satisfaction.

1.4.2 Details of proposed software modifications are to be submitted for consideration. Modifications are to be undertaken in accordance with defined modification processes which are part of the supplier's or system integrator's quality management system. The following documentation is to be submitted:

(a) Project-specific software modification plan.
(b) An impact analysis which identifies the effect(s) of the proposed modification. The results of the analysis are to be used to inform the extent of verification and validation that is to be applied. This analysis is to consider both the local impact and, where applicable, the system level impact of the modification.
(c) Configuration management records that satisfy the requirements of ISO 10007, to demonstrate the traceability of the proposed modification.
(d) Factory acceptance, integration and sea trial test schedules as determined by the impact analysis in (b).
(e) Updated documentation as detailed in 1.2.5.

1.4.3 Verification and validation activities are to demonstrate that the modified functionality performs as expected and that the modification has not unintentionally modified functionality outside the scope of the modification.

1.4.4 Software versions are to be uniquely identified by number, date or other appropriate means. Modifications are not to be made without also changing the version identifier. A record of changes to the system since the original issue (and their identification) is to be maintained and made available to the LR Surveyor on request.

1.5 Definitions

1.5.1 An Emergency Stop (E-Stop) is a safeguard instigated by a single human action. It requires a stop of all movement within the controlled system as rapidly as possible to prevent a hazard occurring or to reduce an existing hazard to persons, machinery or the vessel.

1.5.2 An Emergency Trip (E-Trip) is a safeguard instigated by a single human action and means the disconnection of fuel, electrical, hydraulic or other power source from the

controlled system to prevent a hazard occurring or to reduce an existing hazard to persons, machinery or the vessel. Movement within the system may be allowed to continue.

1.5.3 An Emergency Stop Function may be either an Emergency Stop or Emergency Trip, as appropriate to the system and risk being controlled.

1.5.4 Alarm System: a system which will alert relevant personnel to faults, abnormal situations and other conditions requiring attention in the machinery and the safety and control systems.

1.5.5 Control System: a system which responds to input signals from the process and/or operator and generates output signals causing the equipment under control to operate in the desired manner.

1.5.6 Failure: a loss of the ability of a structure, system or element to function within acceptance criteria.

1.5.7 Fail safe: a system design such that, when a failure occurs, the system reverts to the least hazardous state.

1.5.8 A reasonably foreseeable abnormal condition is an event, incident or failure that:

- has happened and could happen again;
- is planned for (e.g., emergency actions cover such a situation, maintenance is undertaken to prevent it, etc.).

They should be identified by:

- using analysis processes that were capable of revealing abnormal conditions;
- employing a mix of personnel including competent safety/risk professionals and those with relevant domain knowledge and understanding to apply the processes;
- referencing relevant events and historic data; and
- documenting the results of the analysis.

1.5.9 Safety System: a designated system that:

- implements the required safety functions necessary to achieve or maintain a safe state for the equipment under control; and
- is intended to achieve, on its own or with other safety systems, the necessary safety needed for the required safety functions.

1.5.10 Safe State: the state of equipment under control when safety is achieved. For some situations, a safe state only exists so long as the equipment under control is continuously controlled. Such continuous control may be for a short or indefinite period.

1.5.11 System: a set of elements which interact according to a design, where an element of a system can be another system, called a sub-system, which may be a controlling system or a controlled system, and may include hardware, software and human interaction.

■ *Section 2* Essential features for control, alarm and safety systems

2.1 General

2.1.1 Systems complying with ISO 17894, *Ships and marine technology – Computer applications – General principles for the development and use of programmable electronic systems in marine applications*, may be accepted as meeting the requirements of this Section, in which case evidence of compliance is to be submitted for consideration.

2.2 Control stations for machinery

2.2.1 A system of alarm and warning displays and controls is to be provided which readily ensures identification of faults in the machinery and satisfactory supervision of related equipment by duty personnel. This may be provided at a main control station or, alternatively at subsidiary control stations. In the latter case, a master alarm display is to be provided at the main control station showing which of the subsidiary control stations is indicating a fault condition.

2.2.2 At the main control station (if provided) or close to the subsidiary stations (if fitted) means of communication with the bridge area, the accommodation for engineering personnel and, if necessary, the machinery space are to be provided.

2.2.3 Where operator interfaces are installed in the wheelhouse, illumination should not interfere with night vision. All illumination and lighting of instruments, keyboards and controls are to be adjustable to zero illumination, except for lighting for visual indication of alarms and the controls of dimmers, which are to remain readable.

2.2.4 Provision is to be made at the main control station, or subsidiary control stations as appropriate, for the operation of an engineers' alarm which is to be clearly audible in the engineers' accommodation.

2.2.5 Provision is to be made at the main control station and any other subsidiary control station from which the main propulsion and auxiliary machinery or associated equipment may be controlled to indicate which station is in control.

2.2.6 Control of machinery and associated equipment is to be possible only from one station at a time.

2.2.7 Changeover between control stations is to be arranged so that it may only be effected with the acceptance of the station taking control. The system is to be provided with interlocks or other suitable means to ensure effective transfer of control.

2.3 Alarm systems, general requirements

2.3.1 Machinery, safety and control system faults are to be indicated at the relevant control stations to advise duty personnel of a fault condition. The presence of unrectified faults is to be clearly indicated at all times.

2.3.2 Alarms and warnings associated with machinery and equipment required to satisfy this sub-Section are to be categorised according to the urgency and type of response required by the crew, as described in the IMO *Code on Alerts and Indicators, 2009*. The assignment of a category to each alert is to be evaluated on the basis not only of the machinery or equipment being monitored, but also the complete installation. Categories not included in an alarm system may be omitted from the system design. Details of alternative alert management proposals supported with evidence of service experience may be submitted for consideration by LR.

2.3.3 Where the facility to provide messages in association with alarms and warnings exists, messages accompanying alarms and warnings are to describe the condition and indicate the intended response required by the crew.

2.3.4 Where the facility to provide messages in association with alarms and warnings exists, messages of different categories are to be clearly distinguishable from each other. Alarms associated with machinery, safety and control system faults are to be clearly distinguishable from other alarms (e.g., fire, general alarm).

2.3.5 Where alarms are displayed as group alarms provision is to be made to identify individual alarms at the main control station (if fitted) or alternatively at subsidiary control stations.

2.3.6 All alarms are to be both audible and visual. If arrangements are made to silence audible signals they are not to extinguish visual indications.

2.3.7 Acknowledgement of visual alarms is to be clearly indicated.

2.3.8 Acknowledgement of alarms at positions outside a machinery space is not to silence the audible signal or extinguish the visual indication in that machinery space.

2.3.9 If an alarm has been acknowledged and a second fault occurs prior to the first being rectified, audible signals and visual indications are again to operate. Where alarms are displayed at a local panel adjacent to the machinery and with arrangements to provide a group or common fault alarm in the control room, the occurrence of a second fault prior to the first alarm being rectified need only be displayed at the local panel; however, the group alarm is to be re-initiated. Unacknowledged alarms on monitors are to be distinguished by either flashing text or a flashing marker adjacent to the text. A change of colour will not in itself be sufficient to distinguish between acknowledged and unacknowledged alarms.

2.3.10 For the detection of transient faults which are subsequently self-correcting, alarms are required to lock in until accepted.

2.3.11 The alarm system is to be arranged with automatic changeover to a standby power supply in the event of a failure of the normal power supply. Where an alarm system could be adversely affected by an interruption in power supply, changeover to the standby power supply is to be achieved without a break.

2.3.12 Failure of any power supply to the alarm system is to operate an audible and visual alarm.

2.3.13 The alarm system should be designed with self-monitoring properties. Insofar as practicable, any fault in the alarm system should cause it to fail to the alarm condition.

2.3.14 The alarm system is to be capable of being tested during normal machinery operation, *see* 7.1.2.

2.3.15 The alarm system is to be designed as far as practicable to function independently of control and safety systems such that a failure or malfunction in these systems will not prevent the alarm system from operating.

2.3.16 Disconnection or manual overriding of any part of the alarm system is to be clearly indicated.

2.3.17 When alarm systems are provided with means to adjust their set point, the arrangements are to be such that the final settings can be readily identified.

2.3.18 Where monitors are provided at the station in control and, if fitted, in the duty engineer's accommodation, they are to provide immediate display of new alarm information regardless of the information display page currently selected. This may be achieved by provision of a dedicated alarm monitor, a dedicated area of screen for alarms or other suitable means.

2.3.19 Where practicable, alarms displayed on monitors are to be displayed in the order in which they occur. Alarms requiring manual shut-down or slow-down action are to be given visual prominence.

2.4 Safety systems, general requirements

2.4.1 Safety systems are to operate automatically in case of serious faults endangering the machinery, so that:

(a) normal operating conditions are restored, e.g., by the starting of standby machinery, or
(b) the operation of the machinery is temporarily adjusted to the prevailing conditions, e.g., by reducing the output of the machinery, or
(c) the machinery is protected from critical conditions by shutting off the fuel or power supplies thereby stopping the machinery.

2.4.2 The safety system required by 2.4.1(c) is to be designed as far as practicable to operate independently of the control and alarm systems, such that a failure or malfunction in the control and alarm systems will not prevent the safety system from operating, *see* Pt 5, Ch 14,12.1.4.

2.4.3 For safety systems required by 2.4.1(a) and (b) complete independence from other control systems is not necessary.

2.4.4 Safety systems for different items of the machinery plant are to be arranged so that failure of the safety system of one part of the plant will not interfere with the operation of the safety system in another part of the plant.

2.4.5 The safety system is to be designed to 'fail-safe'. The characteristics of the 'fail-safe' operation are to be evaluated on the basis not only of the safety system and its associated machinery, but also the complete installation. Failure of a safety system is to initiate an audible and visual alarm.

2.4.6 When a safety system is activated, an audible and visual alarm is to be provided to indicate the cause of the safety action.

2.4.7 The safety system is to be manually reset before the relevant machinery can be restarted.

2.4.8 Where arrangements are provided for overriding a safety system, they are to be such that inadvertent operation is prevented. Visual indication is to be given at the relevant control station(s) when a safety override is operated. The consequences of overriding a safety system are to be established and documented.

2.4.9 The safety system is to be arranged with automatic changeover to a standby power supply in the event of a failure of the normal power supply.

2.4.10 Failure of any power supply to a safety system is to operate an audible and visual alarm.

2.4.11 When safety systems are provided with means to adjust their set point, the arrangements are to be such that the final settings can be readily identified.

2.4.12 As far as practicable, the safety system required by 2.4.1(b) is to be arranged to effect a rapid reduction in speed or power.

2.5 Control systems, general requirements

2.5.1 Control systems for machinery operations are to be stable throughout their operating range.

2.5.2 Failure of any power supply to a control system is to operate an audible and visual alarm.

2.5.3 Control systems should be designed to 'fail-safe'. The characteristics of the 'fail-safe' operation are to be evaluated on the basis not only of the control system and its associated machinery, but also the complete installation.

2.5.4 The control system is to be designed such that normal operation of the controls cannot induce detrimental mechanical or thermal overloads in the machinery.

2.5.5 Remote or automatic controls are to be provided with suitable instrumentation at the relevant control stations to ensure effective control by duty personnel and to indicate that the system is functioning correctly.

2.5.6 When control systems are provided with means to adjust their sensitivity or set point, the arrangements are to be such that the final settings can be readily identified.

2.5.7 Failure of a control system is not to result in the loss of ability to provide essential services by alternative means. This may be achieved by manual control or redundancy within the control system or redundancy in machinery and equipment, *see also* 2.13.2. Instrumentation is to be provided at local manual control stations to ensure effective operation of the machinery by duty personnel.

2.6 Bridge control for main propulsion machinery

2.6.1 Means are to be provided to ensure satisfactory control of propulsion from the bridge in both the ahead and astern directions.

2.6.2 The following indications are to be provided on the bridge:

(a) Propeller speed.
(b) Direction of rotation of propeller for a fixed pitch propeller or pitch position for a controllable pitch propeller, *see also* Pt 5, Ch 7,5.3.
(c) Direction and magnitude of thrust.
(d) Clutch position, where applicable.
(e) Shaft brake position, where applicable.

2.6.3 The propeller speed, direction of rotation and, if applicable, the propeller pitch are to be controlled from the bridge under all sea-going and manoeuvring conditions.

2.6.4 Remote control of the propulsion machinery is to be from only one control station at any one time, *see also* 2.2.6. Main propulsion control units on the navigating bridge may be interconnected. Means are to be provided at the control station to ensure smooth transfer of control between the bridge and other control stations.

2.6.5 Means of control, independent of the bridge control system, are to be provided on the bridge to enable the watch-keeper to stop the propulsion machinery in an emergency.

2.6.6 Audible and visual alarms are to operate on the bridge and in the alarm system required by 4.2 if any power supply to the bridge control system fails. Where practicable, the preset speed and direction of thrust are to be maintained until corrective action is taken.

2.6.7 Two means of communication are to be provided between the bridge and the main control station in the machinery space. One of these means may be the bridge control system; the other is to be independent of the main electrical power supply, *see also* 2.2.2 and Pt 5, Ch 1,4.

2.6.8 Automation systems are to be designed in a manner such that a threshold warning of impending or imminent slow-down or shut-down of the propulsion system is given to the officer in charge of the navigational watch in time to assess navigational circumstances in an emergency. In particular, the systems are to control, monitor, report, alert and take safety action to slow down or stop propulsion while providing the officer in charge of the navigational watch an opportunity to intervene manually, except for those cases where manual intervention will result in total failure of the engine and/or propulsion equipment within a short time, for example, in the case of overspeed.

2.7 Valve control systems

2.7.1 Where cargo, bilge, ballast, oil fuel transfer and sea valves for engine services are operated by remote or automatic control, the requirements of 2.7.2 to 2.7.5 are to be satisfied.

2.7.2 Failure of control system power or actuator power is not to permit a valve to move to an unsafe condition.

2.7.3 Positive indication is to be provided at the remote control station for the service to show the actual valve position or alternatively that the valve is fully open or closed.

2.7.4 Equipment located in places which may be flooded is to be capable of operating when submerged.

2.7.5 A secondary means of operating the valves, which may be by local manual control, is to be provided.

2.7.6 For requirements applicable to closing appliances on scuppers and sanitary discharges, *see* Pt 3, Ch 12,4.2. For power supplies on passenger ships, *see* Ch 2,3.2.

2.8 Fire detection alarm systems

2.8.1 Fire detection and fire alarm systems are to comply with Chapter 9 of the *Fire Safety Systems Code* (FSS) and 2.8.2 to 2.8.23 as applicable.

2.8.2 Fire detection control units, indicating panels, detector heads, manual call points and short-circuit isolation units are to be Type Approved in accordance with Test Specification Number 1 given in LR's Type Approval System for an environmental category appropriate for the locations in which they are intended to operate. For addressable systems, *see also* 2.10.

2.8.3 The alarm system is to be designed with self-monitoring properties. Power or system failures are to initiate an audible alarm distinguishable from the fire alarm. This alarm may be incorporated in the machinery alarm system as required by 2.3.

2.8.4 When fire detectors are provided with means to adjust their sensitivity, the arrangements are to be such that the set point can be fixed and readily identified.

2.8.5 The fire detector heads are to be of a type which can be tested and reset without the renewal of any component. Facilities are to be provided on the fire-control panel for functional testing and reset of the system.

2.8.6 When it is intended that a particular loop is to be temporarily switched off, this state is to be clearly indicated at the fire detection indicating panels.

2.8.7 When it is intended that a particular detector(s) is (are) to be temporarily switched off locally, this state is to be clearly indicated at the local position. Reactivation of the detector(s) is to be performed automatically after a preset time.

2.8.8 It is to be demonstrated to the Surveyor's satisfaction that detector heads are so located that air currents will not render the system ineffective whether the ship is at sea or in port.

2.8.9 An audible fire alarm is to be provided having a characteristic tone which distinguishes it from the alarm system required by 2.3 or any other alarm system.

2.8.10 Where an automatic fire detection system is to be fitted in a machinery space, the requirements of 2.8.11 to 2.8.15 are also to be satisfied. *See also* SOLAS 1974, as amended Reg. II-2/C.7, or Chapter 4 as applicable.

2.8.11 Detector heads are to be located in the machinery spaces so that all potential fire outbreak points are guarded. A combination of detectors is to be provided to ensure that the system will react to all possible fire characteristics.

2.8.12 Fire detection indicating panels are to denote the section in which a detector or manually operated call point has operated. At least one indicating panel is to be so located that it is easily accessible to responsible members of the crew at all times. An indicating panel is to be located on the navigating bridge.

2.8.13 A fire detection control unit is to be located in the navigating bridge area, the fire-control station, or in some other position such that a fire in the machinery spaces will not render it inoperable.

2.8.14 The audible fire-alarm is to be immediately audible on all parts of the navigating bridge, the fire-control station, the crew accommodation areas and the machinery spaces.

2.8.15 Facilities are to be provided in the fire detection system to initiate manually the fire alarm from the following locations:

(a) Positions adjacent to all exits from machinery spaces.
(b) Navigating bridge.
(c) Control station in engine room.
(d) Fire-control station.

2.8.16 Fire detection systems within the accommodation spaces and cabin balconies are also to comply with 2.8.17 to 2.8.22.

2.8.17 In passenger ships, the fixed fire detection and fire alarm systems are to be capable of remotely and individually identifying each detector and manually operated call point. On other ships, indicating units are to denote, as a minimum, the section in which a detector or manually operated call point has operated. At least one indication unit is to be so located that it is easily accessible to responsible members of the crew. One indicating unit is to be located on the navigating bridge if the control panel is located in the central control station.

2.8.18 Clear information is to be displayed on or adjacent to each indicating unit about the spaces covered and the location of the section and, for passenger ships, each detector and manually operated call point.

2.8.19 The fire detection system is not to be used for any other purpose, except that closing of fire doors and similar functions may be permitted at the control panel.

2.8.20 The fire-control panel is to be located on the navigating bridge or in a central fire-control station and may form part of that panel specified in 2.8.13. For passenger ships carrying more than 36 passengers, the fire-control panel is to be located in the continuously manned central control station.

2.8.21 Detectors and manually operated call points are to be grouped into sections. The activation of any detector or manually operated call point is to initiate a visual and audible fire signal at the control panel and indicating units. If the signals have not received attention within two minutes an audible alarm is to be automatically sounded throughout the crew accommodation and service spaces, control stations and machinery spaces of Category A. This alarm sounder system need not be an integral part of the detection system.

2.8.22 A section of fire detectors and manually operated call points which covers a control station, a service space or an accommodation space is not to include a machinery space of Category A.

2.8.23 For electrical engineering requirements, *see* Ch 2,17.1.

2.9 Fixed water-based local application fire-fighting systems

2.9.1 Where fixed water-based local application fire-fighting systems are installed in accordance with SOLAS as amended Ch. II-2/C, Reg. 10.5.6, arrangements are to be in accordance with this sub-Section.

2.9.2 Systems are to be available for immediate use and arranged for manual activation from inside and outside the protected space. *See also* Ch 2,17.3.4.

2.9.3 The activation of a system is not to result in loss of electrical power or reduction of the manoeuvrability of the ship and is not to require confirmation of space evacuation or sealing, *see also* Ch 2,17.3.12.

2.9.4 System zones and protected areas are to be arranged to allow essential services to be provided by machinery and/or equipment located outside areas affected by direct spray or extended water in the event of a system activation, where the machinery and/or equipment is duplicated or otherwise replicated to provide redundancy.

2.9.5 A control panel is to be provided for managing actions such as opening of valves, starting of pumps and initiation of alarms and warnings and processing information from detectors. This panel is to be independent of the fire detection control unit required by 2.8.

2.9.6 Alarms are to be initiated upon activation of a system and are to indicate the specific zone activated at the control panel. Alarms are to be provided in each protected space, at an attended machinery control station and in the wheelhouse. The audible alarm signal is to be distinguishable from other safety system signals.

2.9.7 A failure in a manual system activation switch circuit is not to prevent system activation using other installed manual system activation switches or, where installed, automatic activation. The means of activation are to be provided with self-monitoring facilities which will activate an alarm at an attended control station in the event of failure detection.

2.9.8 Where SOLAS requires the system, additionally, to be capable of automatic release, the arrangements are to be in accordance with 2.9.9 to 2.9.12.

2.9.9 A minimum of two fire detectors are to be provided for each protected area. One is to be a flame detector and the other is to be a smoke or heat detector, as considered appropriate to the nature of the risk and ambient conditions. The system is to be activated upon detection by two of the detectors. A fault in one detector is to initiate an alarm at an attended control station and is not to inhibit activation of the system under the control of the other detector or manually.

2.9.10 The fire detectors are to be arranged (located, oriented, guarded, etc.) to ensure that a fire in one protected area will not result in the inadvertent automatic activation of a system for another protected area. Guards or barriers provided to comply with this requirement are not to reduce the ability to detect a fire in the protected area.

2.9.11 A fire detection alarm system panel in accordance with 2.8 may be used for receiving fire detection signals. Separate loops are not required provided that the address of the initiating device can be identified at the control panel. The received signals are then to be sent to the control panel required by 2.9.5 for processing and action.

2.9.12 The system's fire detection systems and control units are to meet the performance criteria of SOLAS Ch II/C, Reg. 7 and are to be Type Approved in accordance with *Test Specification Number 1* given in LR's *Type Approval System* for an environmental category appropriate for the locations in which they are intended to operate.

2.10 Programmable electronic systems – General requirements

2.10.1 The requirements of this sub-Section are to be complied with where control, alarm or safety systems incorporate programmable electronic equipment. Systems for essential services and safety critical applications, systems incorporating shared data communication links and systems which are integrated are to comply with the additional requirements of 2.11, 2.13 and 2.14 as applicable. For systems complying with ISO 17894, *Ships and marine technology – Computer applications – General principles for the development and use of programmable electronic systems in marine applications*, *see* 2.1.2.

2.10.2 Where programmable electronic systems share resources, any components that can affect the ability to provide effectively required control, alarm or safety functions are to fulfil the requirements of 2.10 to 2.14 related to providing those required functions.

2.10.3 Programmable electronic equipment is to revert to a defined safe state on initial start-up or re-start in the event of failure.

2.10.4 In the event of failure of any programmable electronic equipment, the system, and any other system to which it is connected, is to fail to a defined safe state or maintain safe operation, as applicable.

2.10.5 Programmable electronic equipment is to be certified by a recognised authority as suitable for the environmental conditions in which it is intended to operate, *see also* 2.13.3.

2.10.6 Emergency stop functions are to be hard-wired and independent of any programmable electronic equipment. Alternatively, the system providing emergency stop functions is to comply with the requirements of 2.13.2 and/or 2.13.8.

2.10.7 Programmable electronic equipment is to be provided with self-monitoring capabilities such that hardware and functional failures will initiate an audible and visual alarm in accordance with the requirements of 2.3 and, where applicable, 4.2. Hardware failure indications are to enable faults to be identifiable at least down to the level of the lowest replaceable unit and the self-monitoring capabilities are to ensure that diagnostic information is readily available.

2.10.8 Means are to be provided to recover or replace data required for safe and effective system operation lost as a result of component failure. The submission required by 1.2.6 is to address reinstatement of system operation following data loss.

2.10.9 System configuration, programs and data are to be protected against loss or corruption in the event of failure of any power supply. For essential services and safety critical systems, *see* 2.13.6.

2.10.10 Where it is necessary to store data required for system operation in volatile memory, a back-up power supply is to be provided that prevents data loss in the event of loss of the normal power supply. The submission required by 1.2.6 is to include details of any routine maintenance necessary and the measures necessary to restore system operation in the event of data loss as a result of power supply failure.

2.10.11 Back-up power supplies required by 2.10.10 are to be rated to supply the connected load for a defined period of time that allows sufficient time to restore the supply in the event of loss of the normal power supply as a result of failure of a main source of electrical power. This period is not to be less than 30 minutes.

2.10.12 Where regular battery replacement is required to maintain the availability of volatile memory back-up power supply required by 2.10.10, these are to be included in the schedule of batteries required by Ch 2,1.2.15 and 12.7, irrespective of battery type and size. Applicable entries in this schedule are to note that these batteries are not for safety critical systems or essential or emergency services.

2.10.13 Access to system configuration, programs and data is to be restricted by physical and/or logical means providing effective security against unauthorised alteration.

2.10.14 Where date and time information is required by the equipment, this is to be provided by means of a battery backed clock with restricted access for alteration. Date and time information is to be fully represented and utilised.

2.10.15 Displays and controls are to be protected against liquid ingress due to spillage.

2.10.16 Display units are to comply with the requirements of an acceptable National or International Standard, e.g., IEC 60950-*1: Information technology equipment – Safety - Part 1: General requirements,* in respect of emission of ionising radiation.

2.10.17 Where systems detect fault conditions, any affected mimic diagrams are to ensure that the status of unreliable and incorrect data is clearly identified.

2.10.18 Multi-function displays and controls are to be duplicated and interchangeable where used for the control or monitoring of more than one system, machinery item or item of equipment. At least one unit at the main control station is to be supplied from an independent uninterruptible power system (UPS).

2.10.19 The number of multi-function display and control units provided at the main control station and their power supply arrangements are to be sufficient to ensure continuing safe operation in the event of failure of any unit or any power supply.

2.10.20 Software lifecycle activities, e.g., design, development, supply and maintenance, are to be carried out in accordance with an acceptable quality management system. Software quality plans are to be submitted. These are to demonstrate that the provisions of ISO/IEC 90003: Software engineering – *Guidelines for the application of ISO 9001:2000 to computer software*, or equivalent, are incorporated. The plans are to define responsibilities for the lifecycle activities, including verification, validation, module testing and integration with other components or systems.

2.11 Data communication links

2.11.1 Where control, alarm or safety systems use shared data communication links to transfer data, the requirements of 2.11.2 to 2.11.10 are to be complied with. The requirements apply to local area networks, fieldbuses and other types of data communication link which make use of a shared medium to transfer control, alarm or safety related data between distributed programmable electronic equipment or systems.

2.11.2 Data communication is to be automatically restored within 45 seconds in the event of a single component failure. Upon restoration, priority is to be given to updating safety critical data and control, alarm and safety related data for essential services. Components comprise all items required to facilitate data communication, including cables, switches, repeaters, software components and power supplies.

2.11.3 Loss of a data communication link is not to result in the loss of ability to operate any essential service by alternative means, *see also* 2.13.2.

2.11.4 The properties of the data communication link (e.g., bandwidth, access control method, etc.) are to ensure that all connected systems will operate in a safe, stable and repeatable manner under all operating conditions. The latency of control, alarm and safety related data is not to exceed two seconds.

2.11.5 Protocols are to ensure the integrity of control, alarm and safety related data, and provide timely recovery of corrupted or invalid data.

2.11.6 Means are to be provided to monitor performance and identify hardware and functional failures. An audible and visual alarm is to operate in accordance with the requirements of 2.3 and, where applicable, 4.2 in the event of a failure of an active or standby component.

2.11.7 System self-monitoring capabilities are to be arranged to initiate transition to a defined safe state for the complete installation in the event of data communication failure, *see also* 2.5.3.

2.11.8 Means are to be provided to prevent unintended connection or disconnection of any equipment where this may affect the performance of any other systems in operation.

2.11.9 Data cables are to comply with the applicable requirements of Ch 2,11. Other media will be subject to special consideration.

2.11.10 The installation is to provide adequate protection against mechanical damage and electromagnetic interference.

2.11.11 Components are to be located with appropriate segregation such that the risk of mechanical damage or electromagnetic interference resulting in the loss of both active and standby components is minimised. Duplicated data communication links are to be routed to give as much physical separation as is practical.

2.12 Additional requirements for wireless data communication links

2.12.1 The requirements of this sub-Section are in addition to 2.11 and apply to systems incorporating wireless data communication links.

2.12.2 Wireless data communication links are not to be used for safety critical systems or essential services that are required for the propulsion or safety of the ship, except as permitted by 2.12.3.

2.12.3 For services not required to operate continuously, wireless data communication links may be considered where an alternative means of operation can be brought into action within an acceptable period of time.

2.12.4 Wireless data communication is to employ recognised international wireless communication system protocols that incorporate the following:

(a) Message integrity: fault prevention, detection, diagnosis and correction, ensuring that the received message is not corrupted or altered when compared to the transmitted message.
(b) Configuration and device authentication: is to permit connection only of devices that are included in the system design.
(c) Message encryption: protection of the confidentiality and/or criticality of the data content.
(d) Security management: protection of network assets and prevention of unauthorised access to network assets.

2.12.5 The wireless system is to comply with the radio frequency and power level requirements of the International Telecommunications Union and any requirements of the National Administration with which the ship is registered.

2.12.6 Compliance with different port state and local regulations pertaining to the use of radio-frequency transmission that would prohibit the operation of a wireless data communication link, due to frequency and power level restrictions, is not addressed by these requirements and is the responsibility of the Owner and Operator.

2.13 Programmable electronic systems – Additional requirements for essential services and safety critical systems

2.13.1 The requirements of 2.13.2 to 2.13.10 are to be complied with where control, alarm or safety systems for essential services, as defined by Ch 2,1.6, or safety critical systems, incorporate programmable electronic equipment.
(a) Safety critical systems are those which provide functions intended to protect persons from physical hazards (e.g., fire, explosion, etc.), or to prevent mechanical damage which may result in the loss of an essential service (e.g., main engine low lubricating oil pressure shut-down).
(b) Applications that are not essential services may also be considered to be safety critical (e.g., domestic boiler low water level shut-down).

2.13.2 Alternative means of safe and effective operation are to be provided for essential services and, wherever practicable, these are to be provided by a fully independent hard-wired back-up system. Where these alternative means are not independent of any programmable electronic equipment, the software is to satisfy the requirements of LR's *Software Conformity Assessment System – Assessment Module GEN1 (1994)*.

2.13.3 Items of programmable electronic equipment used to implement control, alarm or safety functions are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 1 (2002)*. Type approval to an alternative and relevant National or International Standard may be submitted for consideration.

2.13.4 The system is to be configured such that control, alarm and safety function groups are independent. A failure of the system is not to result in the loss of more than one of these function groups. Proposals for alternative arrangements providing an equivalent level of safety will be subject to special consideration.

2.13.5 For essential services, the system is to be arranged to operate automatically from an alternative power supply in the event of a failure of the normal supply.

2.13.6 Volatile memory is not to be used to store data required for:

- an essential service or safety critical functions; or
- ensuring safety or preventing damage, including during start-up or re-start.

Alternative proposals which demonstrate that an equivalent level of system integrity will be achieved may be submitted for consideration.

2.13.7 Failure of any power supply is to initiate an audible and visual alarm in accordance with the requirements of 2.3 and, where applicable, 4.2.

2.13.8 Where it is intended that the programmable electronic system implements an emergency stop function or safety critical functions, the software is to satisfy the requirements of LR's *Software Conformity Assessment System – Assessment Module GEN1 (1994)*. Alternative proposals providing an equivalent level of system integrity will be subject to special consideration, e.g., fully independent hard-wired back-up system, redundancy with design diversity, etc.

2.13.9 Control, alarm and safety related information is to be displayed in a clear, unambiguous and timely manner, and, where applicable, is to be given visual prominence over other information on the display.

2.13.10 Means of access to safety critical functions are to be dedicated to the intended function and readily distinguishable.

2.14 Programmable electronic systems – Additional requirements for integrated systems

2.14.1 The requirements of 2.14.2 to 2.14.7 apply to integrated systems providing control, alarm or safety functions in accordance with the Rules, including systems capable of independent operation interconnected to provide co-ordinated functions or common user interfaces. Examples include integrated machinery control, alarm and monitoring systems, power management systems and safety management systems providing a grouping of fire, passenger, crew or ship safety functions, *see* Ch 2,17 to 19.

2.14.2 System integration is to be managed by a single designated party, and is to be carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements of all parties involved. This procedure is to be submitted for consideration where the integration involves control functions for essential services or safety functions including fire, passenger, crew, and ship safety.

2.14.3 The system requirements specification, *see* 1.2.6, is to identify the allocation of functions between modules of the integrated system, and any common data communication protocols or interface standards required to support these functions.

2.14.4 Reversionary modes of operation are to be provided to ensure safe and graceful degradation in the event of one or more failures. In general, the integrated system is to be arranged such that the failure of one part will not affect the functionality of other parts, except those that require data from the failed part.

2.14.5 Where the integration involves control functions for essential services or safety functions, including fire, passenger, crew, and ship safety, a Failure Mode and Effects Analysis (FMEA) is to be carried out in accordance with IEC 60812: *Analysis techniques for system reliability – Procedure for failure mode and effects analysis (FMEA)*, or an equivalent and acceptable National or International Standard and the report and worksheets submitted for consideration. The FMEA is to demonstrate that the integrated system will 'fail-safe', *see* 2.4.5 and 2.5.3, and that essential services in operation will not be lost or degraded beyond acceptable performance criteria where specified by these Rules.

2.14.6 The quantity and quality of information presented to the operator are to be managed to assist situational awareness in all operating conditions. Excessive or ambiguous information that may adversely affect the operator's ability to reason or act correctly is to be avoided, but information needed for corrective or emergency actions is not to be suppressed or obscured in satisfying this requirement.

2.14.7 Where information is required by the Rules or by National Administration requirements to be continuously displayed, the system configuration is to be such that the information may be viewed without manual intervention, e.g., the selection of a particular screen page or mode of operation. *See also* 2.10.16.

■ *Section 3* Ergonomics of control stations

3.1 Objectives

3.1.1 In order to take account of operator tasks at control stations, enhance usability and reduce human error, the layout arrangements are to comply with the requirements set out in 3.2.

3.1.2 In order to establish a working environment that has minimum distractions, is sufficiently comfortable, helps maintain vigilance and maximises communication amongst operators at main control stations, the requirements of 3.3 are to be complied with.

3.1.3 The requirements of 3.4 to 3.6 apply to operator interfaces for essential engineering systems located either locally, remotely or within the main control room. The requirements are intended to enhance the usability of systems and equipment, reduce human error, enhance situational awareness and support safe and effective monitoring and control under normal and abnormal modes of operation.

3.2 Control station layout

3.2.1 Control stations are to provide sufficient space and access for the intended number of operators in the expected operating conditions.

3.2.2 Local control stations are to be positioned to minimise the risk of harm to the operator.

3.2.3 Controls, displays and indicators are to be both logically and physically grouped, according to their function.

3.2.4 Where a function may be accessed from more than one interface, the arrangement of displays and controls is to be consistent.

3.2.5 Frequently used controls and displays are to be within easy reach and visible to the operator from the normal working position.

3.2.6 Controls and displays used infrequently and which may be used in an emergency are to be clearly identifiable, clearly visible, easily accessible and positioned to allow safe operability.

3.2.7 The relationship of a control with a display is to be immediately apparent.

3.2.8 The relationship of controls and displays with the equipment under control is to be immediately apparent.

3.2.9 There is to be adequate spacing between controls and between controls and obstructions.

3.2.10 Controls and their associated displays are to be located such that the information on the displays can be easily read during the operation of the controls.

3.2.11 Indicators related to controls are to be visible during their operation.

3.2.12 Instruments are to face the operator's intended working position.

3.3 Physical environment

3.3.1 Control stations are to be positioned, as far as practicable, away from, or insulated against, sources of structurally transmitted vibration and noise, such as ventilation fans, engine intake fans and other noise sources.

3.3.2 In general, noise levels are to comply with IMO Res. A.468(XII) *Code on Noise Levels on Board Ships*, and take into account IMO Res. A.343(IX), *Recommendation on Methods of Measuring Noise Levels at Listening Posts*.

3.3.3 Where provided, the heating, ventilation and air conditioning system is to be capable of maintaining the temperature between 18°C and 27°C.

3.3.4 The flow of air from heating or air conditioning systems is not to be guided directly to the operator, or means are to be provided to adjust the direction of airflow from those systems.

3.3.5 Lighting is to be located to avoid glare from working and display surfaces, and is to be flicker-free. Surfaces are to have a non-reflective or matt finish.

3.3.6 Placement of controls, displays and indicators are to consider the position of light sources relative to the operator, with respect to reflections and evenness of lighting.

3.3.7 Where a transparent cover is fitted over a control, display or indicator, it is to be designed to minimise reflections.

3.3.8 The level of lighting is to be sufficient to enable operation of user interfaces. Lighting levels in accordance with Table 1.3.1 will be considered to satisfy this requirement.

Table 1.3.1 Specific lighting levels

Work area	Ideal Lux	Minimum Lux
General Lighting	540	220
Control room consoles (front)	540	320
Control room consoles (rear)	325	110
Local operating panels	540	320
Remote operating panels	540	320

3.3.9 Seating provided for use at control stations is to allow for varying height and/or reach needs of operators. Seating arrangements are to minimise the need for twisting and/or turning motions by the operator.

3.3.10 Physical hazards, e.g., sharp edges, protuberances and trip hazards, are to be avoided.

3.3.11 Sufficient handrails or equivalent are to be fitted to enable operators to move and stand safely in rough seas.

3.3.12 Work surfaces are to be capable of withstanding oils and solvents common to ships and are to be easy to clean.

3.4 Operator interface

3.4.1 The design of the operator interface is to permit the satisfactory monitoring, control and supervision of the machinery and equipment.

3.4.2 Information is to be presented to the operator consistently, both within and between different interfaces, *see* 3.6.2 to 3.6.4.

3.4.3 The response of the machinery and equipment to operator input is to be consistent between interfaces for the same function.

3.4.4 Visual, audible or mechanical feedback is to be provided to indicate that operator input has been acknowledged.

3.4.5 Functions requested by the operator are to be confirmed by the displays on completion.

3.4.6 Indications and documentation are to be in English or the language of the crew.

3.5 Controls

3.5.1 Operator inputs are to be checked for errors, for example, out of range data or incorrect actions, and the operator is to be alerted when they occur.

3.5.2 Means are to be provided to correct wrong inputs or commands rapidly and safely.

3.5.3 Assistance is to be provided to the operator to recover from operator errors, for example, through advisory screens where the automation system has this facility.

3.5.4 Operator confirmation is to be provided for any control action that could affect the safety of the ship, i.e., they should not rely on single keystrokes.

3.5.5 The purpose of each control is to be clearly indicated. Where standard symbols have been internationally adopted, they should be used.

3.5.6 The settings of mechanical controls are to be immediately evident.

3.5.7 The means of operation of mechanical controls is to be consistent with expectations.

3.5.8 Controls or combined controls and indicators are to be distinguishable from indicators.

3.5.9 Where control is provided by touch screens, the soft keys are to be of a sufficient size for operation in areas where vibration occurs or gloves are likely to be worn.

3.5.10 Where virtual keypads/keyboards or dialogue boxes are used on touch screens, they are not to obscure status or alarm areas of the display.

3.5.11 Keyboards are to be divided logically into functional areas. Alphanumeric, paging and specific system keys are to be grouped separately.

3.5.12 Controls that affect the safe operation of the ship should be arranged so as to minimise the possibility of inadvertent operation.

3.6 Displays

3.6.1 The displays and indicators are to present the operator with clear, timely and relevant information.

3.6.2 Graphical symbols and colour coding are to be consistent. The graphical symbols of display functions are to be in accordance with a recognised International Standard, for example, ISO 14617 (all parts) *Graphical symbols for diagrams*. Colour coding of functions and signals is to be in accordance with a recognised International Standard, for example, ISO 2412: *Shipbuilding – Colours of indicator lights*.

3.6.3 The symbols used in mimic diagrams for the services listed in Pt 6, Ch 2,1.6.1 are to be consistent across all displays.

3.6.4 The display of information is to be consistent with respect to screen layout and arrangement of information.

3.6.5 Flashing of information is to be reserved for unacknowledged alerts or transient states, for example, valve moving.

3.6.6 The functions supported by a display are to be clearly indicated. For displays that can support multiple functions, it is to be possible to select the display associated with the primary function or an overview by a simple operator action.

3.6.7 The operating mode of the machinery and equipment is to be clearly indicated.

3.6.8 In general, indications provided by instrumentation which are displayed digitally are not to change more frequently than twice per second.

3.6.9 To indicate an increasing value in a single direction, on a fixed circular scale, the pointer is to move clockwise. If the pointer is fixed, the scale is to move anticlockwise to indicate an increase in value.

3.6.10 To indicate an increasing value on a horizontal linear scale, the pointer is to move from left to right. On a vertical linear scale, the pointer is to move upwards to indicate an increase in value.

3.6.11 The pointer is not to obscure the numbers on the scale.

3.6.12 Alphanumeric data, text, symbols and other graphical information is to be readable from relevant operator positions under lighting conditions, as specified in 3.3.8. Character height in millimetres is to be not less than three and a half times the reading distance in metres and character width is to be 0,7 times the character height.

3.6.13 A simple sans-serif character font is to be used in displays. In descriptive text, lower case letters are to be used, where appropriate, as opposed to capitals, to improve readability.

3.6.14 Where information related to the safe operation of machinery and equipment is provided, it is to be continuously available to the operator.

3.6.15 Failures are to be indicated in a clear and unambiguous manner. Sufficient information is to be provided for the operator to identify the cause of the failure.

■ *Section 4* Unattended machinery space(s) – UMS notation

4.1 General

4.1.1 Where it is proposed to operate the following machinery in an unattended space, no matter what period is envisaged, the controls, alarms and safeguards required by Part 5, together with those given in 4.2 to 4.7 are to be provided:
(a) Air compressors.
(b) Controllable pitch propellers and transverse thrust units.
(c) Electric generating plant.
(d) Inert gas generators.
(e) Incinerators.
(f) Main propelling machinery including essential auxiliaries.
(g) Oil fuel transfer and storage systems (purifiers and oil heaters).
(h) Steam raising plant (boilers and their ancillary equipment).
(j) Thermal fluid heaters.
(k) Waste heat boilers.

4.2 Alarm system for machinery

4.2.1 An alarm system which will provide warning of faults in the machinery is to be installed. The system is to satisfy the requirements of 2.3.

4.2.2 Audible and visual indication of machinery alarms is to be relayed to the engineers' accommodation so that engineering personnel are made aware that a fault has occurred.

4.2.3 The engineers' alarm required by 2.2.4 is to be activated automatically in the event that a machinery alarm or warning has not been acknowledged in the space within a predetermined time.

4.2.4 Audible and visual indication of machinery alarms is to be relayed to the navigating bridge control station in such a way that the navigating officer of the watch is made aware when:
(a) a machinery fault has occurred;
(b) the machinery fault is being attended to; and
(c) the machinery fault has been rectified.
Alternative means of communication between the bridge area, accommodation for engineering personnel and machinery spaces will be considered.

4.2.5 Group alarms may be arranged on the bridge to indicate machinery faults, but alarms associated with faults requiring speed or power reduction or the automatic shut-down of propulsion machinery are to be identified by separate group alarms or by individual alarms.

4.3 Bridge control for main propulsion machinery

4.3.1 A bridge control system for the main propulsion machinery is to be fitted. The system is to satisfy the requirements of 2.6.

4.4 Control stations for machinery

4.4.1 A control station(s) is to be provided in the space and on the bridge which satisfies the requirements of 2.2.

4.5 Fire detection alarm system

4.5.1 An automatic fire detection system is to be fitted in the space together with an audible and visual alarm system. The system is to satisfy the requirements of 2.8.

4.6 Bilge level detection

4.6.1 An alarm system is to be provided to warn when liquid in machinery space bilges has reached a predetermined level, and is to comply with 2.3. This level is to be sufficiently low to prevent liquid from overflowing from the bilges onto the tank top. The number and location of detectors are to be such that accumulation of liquids will be detected at all angles of heel and trim. In ships above 2000 gross tons there are to be two independent systems of bilge level detection in the machinery space, arranged such that each branch bilge as required by Pt 5, Ch 13 is provided with a level detector.

4.6.2 Local or remote controls of any valve within the space serving a sea inlet, a discharge below the waterline, a bilge injection or a direct bilge system, should be so sited as to be readily accessible and to allow adequate time for operation in case of influx of water to the space, having regard to the time which could be taken to reach and operate such controls, *see also* 2.7 and Pt 5, Ch 13,2 and Ch 13,4.

4.6.3 Where the bilge pumps are arranged to start automatically, means are to be provided to indicate if the influx of liquids is greater than the pump capacity or, if the pump is operating more frequently than would be expected. Special attention should be given to oil pollution prevention requirements.

4.7 Supply of electric power, general

4.7.1 For ships operating with one generator set in service, arrangements are to be such that a standby generator will automatically start and connect to the switchboard in as short a time as practicable, but in any case within 45 seconds, on loss of the service generator. For ships operating with two or more generator sets in service, arrangements are to be such that on loss of one generator the remaining one(s) are to be adequate for continuity of essential services. For the detailed requirements of these arrangements, *see* Ch 2,2.2.

■ *Section 5* Machinery operated from a centralised control station – CCS notation

5.1 General requirements

5.1.1 Where it is proposed to operate the machinery as listed in 4.1.1 with the continuous supervision from a centralised control station, the control station is to be such that the machinery operation will be as effective as it would be under direct supervision.

5.1.2 The arrangements are to be such that corrective actions can be taken at the control station in the event of machinery faults, e.g., stopping of machinery, starting of standby machinery, adjustment of operating parameters, etc. These actions may be effected by either remote manual or automatic control.

5.1.3 The controls, alarms and safeguards required by Section 3 and by 4.6 together with a fire detection system satisfying the requirements of 2.8 are to be provided. However, the automatic operation of machinery and certain safeguards required by Section 3 may be omitted.

5.1.4 Additional requirements for controls, alarms and safeguards are given in 5.2.

5.2 Centralised control station for machinery

5.2.1 A centralised control station which satisfies the requirements of 5.2.2 to 5.2.7 is to be provided at a suitable location.

5.2.2 A system of alarm displays and controls is to be provided which readily ensures identification of faults in the machinery and satisfactory supervision of related equipment. The alarm and control systems are to satisfy the requirements of 2.3 and 2.5, as applicable.

5.2.3 Indication of all essential parameters necessary for the safe and effective operation of the machinery is to be provided, e.g., temperatures, pressures, tank levels, speeds, powers, etc.

5.2.4 Indication of the operational status of running and standby machinery is to be provided.

5.2.5 At the centralised control station, means of communication with the bridge area, the accommodation for engineering personnel and, if necessary, the machinery space are to be provided.

5.2.6 In addition to the communication required by 5.2.5, a second means of communication is to be provided between the bridge and the centralised control station. One of these means is to be independent of the main electrical power supply, *see also* Pt 5, Ch 1.

5.2.7 Arrangements are to be provided in the centralised control station so that the normal supply of electrical power may be restored in the event of failure.

■ *Section 6* Integrated computer control – ICC notation

6.1 General

6.1.1 Integrated Computer Control class notation **ICC** may be assigned where an integrated computer system in compliance with 6.1 to 6.3 provides fault tolerant control and monitoring functions for one or more of the following services:

(a) Propulsion;
(b) Electrical generation and distribution (power management systems);
(c) Cargo and ballast.

6.1.2 A Failure Mode and Effects Analysis (FMEA) is to be carried out in accordance with IEC 60812: *Analysis techniques for system reliability – Procedure for failure mode and effects analysis (FMEA)* and the report and worksheets submitted for consideration. *See also* 2.14.5. The FMEA is to demonstrate that control and monitoring functions required by 6.2 will remain available at each operator station in the event of a single fault of the integrated computer control system, including input error, without adverse effect on the service(s).

6.1.3 Special consideration will be given to integrated computer control systems for other applications, except where these are addressed by other control engineering class notations. In particular, *see* Pt 7, Ch 9 for requirements of the optional class notation **IBS** – Integrated Bridge Navigation Systems.

6.2 General requirements

6.2.1 The integrated computer control system is to comply with the programmable electronic system requirements of 2.10 to 2.13 and the control and monitoring requirements of the Rules applicable to particular equipment, machinery or systems.

6.2.2 Alarm displays are to be provided, in compliance with the requirements of 2.3, which ensure ready identification of faults in the equipment under control.

6.2.3 Alarm and indication functions required by 2.4 are to be provided by the integrated computer control system in response to the activation of any safety function for associated machinery. Systems providing the safety functions are in general to be independent of the integrated computer system. *See also* 2.13.7.

6.2.4 Controls are to be provided, in compliance with 2.5, to ensure the safe and effective operation of equipment and response to faults, e.g., stopping, starting, adjustment of parameters, etc. Indication of operational status and other such parameters necessary to satisfy this requirement, is to be provided for all equipment under control by the integrated computer control system.

6.3 Operator stations

6.3.1 Each operator station allowing control of equipment is to be provided with a minimum of two multi-function display and control units. The number of units is to be sufficient to allow simultaneous access to control and monitoring functions required by 6.2.2 to 6.2.4. *See also* 2.10.19 to 2.10.16.

6.3.2 Each multi-function display and control unit is to include a monitor, keyboard and tracker ball. Alternative arrangements will be considered where these enable each unit to be configured by the user to provide required control or monitoring functions.

6.3.3 Where the integrated computer control system is arranged such that control and monitoring functions may be accessed at more than one operator station, the selected mode of operation of each station (e.g., in control, standby, etc.) is to be clearly indicated. *See also* 2.2.

6.3.4 Means of communication are to be provided between operator stations and any other stations from which the equipment may be controlled. The arrangements are to be permanently installed and are to remain operational in the event of failure of the main electrical power supply to the integrated control system.

■ *Section 7* Trials

7.1 General

7.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, trials are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are to be based on the approved test schedules list as required by 1.2.2. In the case of new construction it will be expected that most of these trials will be carried out before the official sea trials of the ship. During sea trials, system dynamic tests are to be carried out to demonstrate overall satisfactory performance of the control engineering installation.

7.1.2 Means are to be provided to facilitate testing during normal machinery operation, e.g., by the provision of three-way test valves or equivalent.

7.1.3 Acceptance tests and trials for programmable electronic systems are to include verification of software lifecycle activities appropriate to the stage in the system's lifecycle at the time of system examination. The documentation required by 1.2.6 is to be in accordance with the current configuration and the testing and trials are to address software modifications and configuration management procedures to the Surveyor's satisfaction.

7.1.4 Wireless data communication links are to be operational and tested during trials. Tests are to demonstrate that radio-frequency transmission does not interfere with the operation of equipment required by this Chapter or other Sections of the Rules and does not itself malfunction as a result of electromagnetic interference during expected operating conditions. Reversionary modes are to be activated to demonstrate continued safe and effective operation in the event of fault conditions.

7.2 Unattended machinery space operation – UMS notation

7.2.1 In addition to the tests required by 7.1 the suitability of the installation for operation in the unattended mode is to be demonstrated during sea trials over a four to six hour period observing the following:

(a) Occurring alarms and the frequency of operation both during steady steaming and under manoeuvring conditions using bridge control.
(b) Any intervention by personnel in the operation of the machinery.

7.3 Operation from a centralised control station – CCS notation

7.3.1 In addition to the tests required by 7.1, the suitability of the installation for operation from the centralised control station is to be demonstrated during sea trials.

7.4 Record of trials

7.4.1 Two copies of the alarm and control equipment test schedules signed by the Surveyor and Builder are to be provided on completion of the survey. One copy is to be placed on board the vessel and the other submitted to LR.

■ *Section 1* General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to passenger ships and cargo ships except where otherwise stated.

1.1.2 Whilst these requirements are considered to meet those of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments, attention should also be given to any relevant Statutory Regulations of the National Administration of the country in which the ship is to be registered. Compliance with the Statutory Regulations of the National Administration may be accepted as meeting the requirements of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments.

1.1.3 Electrical services required to maintain the ship in a normal sea-going, operational and habitable condition are to be capable of being maintained without recourse to the emergency source of electrical power.

1.1.4 Electrical services essential for safety are to be maintained under declared normal and reasonably foreseeable abnormal conditions.

1.1.5 The safety of passengers, crew and ship from electrical hazards is to be ensured.

1.1.6 Electrical installations on passenger ships having a length of 120 m or more or having three or more main vertical zones (*see* Pt 5, Ch 23,1.2.4 for definitions) are, in addition to the requirements of this Chapter, to be located, designed and arranged to comply with Pt 5, Ch 23, as applicable.

1.1.7 Lloyd's Register (hereinafter referred to as 'LR') will be prepared to give consideration to special cases or to arrangements which are equivalent to the Rules. For unconventional designs, *see also* Pt 7, Ch 15. Consideration will also be given to electrical arrangements of small ships and ships to be assigned class notation for restricted or special services.

1.2 Documentation required for design review

1.2.1 The documentation described in 1.2.2 to 1.2.17 is to be submitted for design review.

1.2.2 Single line diagrams of main, emergency and transitional power and lighting systems which are to include:
(a) ratings of machines, transformers, batteries and semi-conductor converters;
(b) all feeders connected to the main and emergency switchboards;
(c) section boards and distribution boards;
(d) insulation type, size and current loadings of cables;
(e) make, type and rating of circuit-breakers and fuses;
(f) details of harmonic filters (where fitted); and
(g) details of power supply arrangements used for control systems.

1.2.3 A functional description of operation of the main, emergency and transitional electrical power systems, which is to include:
(a) the operating philosophy of the main, emergency and transitional electrical power systems under normal and reasonably foreseeable abnormal conditions;
(b) degraded modes of operation;
(c) load management and load sharing philosophy; and
(d) protection philosophy.

1.2.4 An earthing philosophy document that defines the basic approach to be taken for earthing the electrical power systems and all electrical loads.

1.2.5 Simplified diagrams of generator circuits, interconnector circuits and feeder circuits showing:
(a) protective devices, e.g., short-circuit, overload, reverse power protection;
(b) instrumentation and synchronising devices;
(c) preference tripping;
(d) remote stops and fire safety stops; and
(e) earth fault indication/protection.

1.2.6 Calculations of short-circuit currents at main, emergency and transitional switchboards and section boards including those fed from transformers, details of circuit-breaker and fuse operating times and discrimination curves showing compliance with 6.1 and 11.6.2.

1.2.7 Where required by 8.1.1, the hazards resulting from electric arcs within electrical equipment and their consequences for personnel are to be identified, and at least the following supporting evidence is to be submitted:
(a) system design;
(b) operating philosophies, e.g., manual or automatic control, local or remote operation;
(c) general arrangement plans for switchboards, section boards and distribution boards, *see also* 1.3.4;
(d) general arrangement plans for the space in which the electrical equipment to be assessed are located showing:
  (i) access to adjacent spaces;
  (ii) the location of the electrical equipment;
  (iii) ventilation arrangements for air conditioning and/or the extraction of smoke, gas and vapours resulting from electric arcs; and
  (iv) positions within the space in which the electrical equipment is located where personnel will be performing tasks, e.g., switching, equipment maintenance, instrument observation or cleaning, or where personnel could reasonably be expected to enter;
(e) calculations in accordance with 8.3;
(f) system operating procedures; and
(g) details of defined additional safety measures to be taken during activities.

1.2.8 For ships in which explosive gas atmospheres and/or combustible dusts occur, a general arrangement of the ship showing hazardous zones and spaces, as defined within Section 14, is to be submitted. Where the explosive gas or combustible dust is not associated with the ship's cargo, arrangement drawings for the hazardous locations only may be submitted in place of the complete ship general arrangement.

1.2.9 A schedule of electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts giving details, as appropriate, of:
(a) type of equipment;
(b) type of protection, e.g., Ex 'd';
(c) apparatus group, e.g., IIB;
(d) temperature class, e.g., T3;
(e) enclosure ingress protection, e.g., IP55;
(f) certifying authority;
(g) certificate number;
(h) location of equipment.
Details may be included on arrangement drawings for the hazardous locations, in place of a separate schedule. Where uncertified equipment is permitted by 14.2 or 14.3 or the Rules relevant to the specific type of ship, details of other documentation confirming (b) to (d) may be submitted in place of those listed under (f) and (g).

1.2.10 For ships with electrical propulsion systems, a functional description is to be provided which includes:
(a) the operating philosophy of the propulsion control systems under normal and reasonably foreseeable abnormal operating conditions;
(b) degraded modes of operation;
(c) protection philosophy;
(d) earthing philosophy; and
(e) harmonic analysis, including loss of harmonic filters. *See also* 1.8.3.

1.2.11 Simplified circuit diagram of electrical propulsion system (where fitted) giving details of:
(a) ratings of electrical machines, transformers, batteries, harmonic filters, dynamic braking assemblies and semi-conductor converters;
(b) lubrication and cooling arrangements, where provided;
(c) insulation type, size and current loadings of cables;
(d) make, type and rating of circuit-breakers and fuses;
(e) instrumentation and protective devices;
(f) earth fault indication/protection;
(g) propulsion control systems, and the procedures used to ensure that there is satisfactory control of the design in relation to the requirements of Section 16,4; and
(h) harmonic analysis.

1.2.12 Details of electrically operated fire, ship, crew and passenger emergency safety systems which are to include typical single line diagrams and arrangements, showing main vertical and, where applicable, horizontal fire zones, spaces along the ship bottom that are not fitted with a double bottom and the location of equipment and cable routes, including identification of relevant high fire risk areas, to be employed for:
(a) emergency lighting;
(b) accommodation fire detection, alarm and extinction systems;
(c) fixed water-based local application fire-fighting systems;
(d) public address system;
(e) general emergency alarm;
(f) watertight doors, bow, stern and shell doors and other electrically operated closing appliances; and
(g) low location lighting.

NOTE
A general arrangement plan of the complete ship showing the main vertical fire zones, spaces along the ship bottom that are not fitted with a double bottom and the location of equipment and cable routes, including identification of relevant high fire risk areas, for the above systems, is to be made available for the use of the Surveyor on board.

1.2.13 Evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas, as required by 17.3.9 and 17.3.10, including a schedule of electrical and electronic equipment located in protected areas and adjacent areas, and general arrangement plans showing the coverage of the protected areas and adjacent areas. *See also* 1.11.

1.2.14 For battery installations, arrangement plans and calculations are to show compliance with 12.5.

1.2.15 A schedule of batteries fitted for use for emergency and essential services, giving details of:

- type and manufacturer's type designation;
- voltage and ampere-hour rating;
- location;
- equipment and/or system(s) served;
- maintenance/replacement cycle dates;
- date(s) of maintenance and/or replacement; and
- for replacement batteries in storage, the date of manufacture and shelf life; with accompanying battery replacement procedure documentation to show compliance with 12.7.

NOTE

The above includes all batteries fitted as part of an uninterruptible power system (UPS) used for any essential or emergency services.

1.2.16 For high voltage rotating machines, type test reports for stator insulation systems, *see* 9.1.14.

1.3 Documentation required for supporting evidence

1.3.1 The documentation and particulars in 1.3.2 to 1.3.5 are to be submitted as supporting evidence.

1.3.2 Plans for all cables that pass through atria or equivalent spaces, and for vertical runs in trunks or other restricted spaces. The information supplied is to show compliance with 11.8.10.

1.3.3 In order to establish compliance with 1.11.2 and 5.1.4 to 5.1.6, a general arrangement plan of the ship showing the location of major items of electrical equipment, for example:

- main and emergency generators;
- transitional source of supply (where fitted);
- switchboards;
- section boards and distribution boards supplying essential and emergency services;
- emergency batteries;
- motors for emergency services;
- propulsion motors;
- propulsion transformers;
- propulsions semiconductor converters;
- dynamic braking equipment;
- reactors;
- harmonic filters; and
- cable routes between these items of equipment.

1.3.4 Arrangement plans of main and emergency switchboards, section boards and documentation that demonstrates that creepage and clearance distances are in accordance with 7.5. The form factor of internal separation of low-voltage switchgear and controlgear assemblies is to be in accordance with IEC 61439-2: *Low-voltage switchgear and controlgear assemblies — Part 2: Power switchgear and controlgear assemblies*, or an alternative acceptable and relevant National Standard. The form factor is to be stated, and the arrangement plans are to show how the form factor has been achieved.

1.3.5 Schedule of normal and emergency operating loads on the system estimated for the different operating conditions expected. The following details are to be provided to meet this requirement:

(a) a description of the expected operating profiles (e.g., the number of generating sets connected when manoeuvring at sea, etc.), including that required by Pt 5, Ch 2,1.1.1; and

(b) a schedule of the normal and emergency operating loads, which is to state the kilowatt rating of each load and a load factor between 0 and 1 that reflects:

  (i) the duty cycle of the load; and

  (ii) the proportion of its maximum rating at which the load is expected to operate.

1.3.6 In order to establish compliance with the requirements of 1.7.3, when requested, evidence is to be submitted to demonstrate the suitability of electrical equipment for its intended purpose in the conditions in which it is expected to operate.

1.3.7 For non-metallic cable support systems or protective casings, test evidence, details of installation procedures and manufacturer's recommendations that show compliance with 11.13.

1.4 Surveys

1.4.1 Electrical propelling machinery and associated equipment together with auxiliary services essential for the safety of the ship are to be installed in accordance with the relevant requirements of this Chapter, surveyed and have tests witnessed by the Surveyors.

1.4.2 The following equipment, where intended for use for essential and emergency services, is to be surveyed by the Surveyors during manufacture and testing:

- Converting equipment of 100 kW and over;
- Rotating machines of 100 kW and over;
- Switchboards and section boards; and
- UPS units of 50 kVA and over.

1.4.3 For electric propulsion systems, in addition to the equipment listed in 1.4.2, the following equipment is to be surveyed by the Surveyors during manufacture and testing:

- dynamic braking assemblies, *see* 16.5.8;
- exciters;
- filters;
- reactors;
- pre-magnetisation transformers; and
- slip ring assemblies.

1.4.4 For refrigerating cargo installations having an **RMC** notation, motors are to be tested and certificates furnished by the manufacturer. Motors of 100 kW or over are to be surveyed by the Surveyors during manufacture and testing.

1.4.5 All other electrical equipment, not specifically referenced in 1.4.2 to 1.4.4, intended for use for essential or emergency services is to be supplied with a manufacturer's works test certificate showing compliance with the constructional Standard(s) as referenced by the relevant requirements of this Chapter.

1.5 Additions or alterations

1.5.1 No addition, temporary or permanent, is to be made to the approved load of an existing installation until it has been ascertained that the current carrying capacity and the condition of the existing equipment including cables and switchgear are adequate for the increased load.

1.5.2 Plans are to be submitted for consideration, and the alterations or additions are to be carried out under the survey, and to the satisfaction of the Surveyors.

1.5.3 When it is proposed to replace permanently installed secondary valve-regulated sealed batteries with vented batteries, details are to be submitted for consideration to ensure continued safety in the presence of the products of electrolysis and evaporation being allowed to escape freely from the cells to the atmosphere. These details are to demonstrate that there will be adequate ventilation in accordance with 12.5.9 and that the location and installation requirements of 12.3 and 12.4 are complied with.

1.5.4 Proposed modifications to the electrical protection settings are to be developed in accordance with 6.1.4 and plans submitted are also to address the updating of approved version of the details required by 1.2.5 and 1.2.6.

1.5.5 Where it is intended to replace an existing incandescent lamp type navigation light with a light emitting diode type navigation light, details are to be submitted for consideration that demonstrate compliance with 15.6. Light emitting diode type navigation lights failure detection arrangements are to satisfy the requirements of 15.6.5 and 15.6.6.

1.6 Definitions

1.6.1 Essential services are those necessary for the propulsion and safety of the ship, such as the following:

- air compressors for oil engines;
- air pumps;
- automatic sprinkler systems;
- ballast pumps;
- bilge pumps;
- circulating and cooling water pumps;
- communication systems;
- condenser circulating pumps;
- electric propulsion equipment;
- electric starting systems for oil engines;
- extraction pumps;
- fans for forced draught to boilers;
- feed water pumps;
- fire detection and alarm systems;
- fuel valve cooling pumps;
- hydraulic pumps for controllable pitch propellers and those serving essential services here listed that would otherwise be directly electrically driven;
- lubricating oil pumps;
- inert gas fans and scrubber and deck seal pumps;
- lighting systems for those parts of the ship normally accessible to and used by personnel and passengers;
- liquefied gas cargo handling;
- navigational aids where required by Statutory Regulations;
- navigation lights and special purpose lights where required by Statutory Regulations;
- oil fuel pumps and oil fuel burning units;
- oil separators;
- pumps for fire-extinguishing systems;
- scavenge blowers;
- steering gear;
- thrusters for dynamic positioning;
- valves which are required to be remotely operated;
- ventilating fans for engine and boiler rooms;
- watertight doors, shell doors and other electrical operated closing appliances;
- windlasses;
- power sources and supply systems for supplying the above services; and
- steam raising plant, where steam is required for other essential services.

1.6.2 Services such as the following are considered necessary for minimum comfortable conditions of habitability:

- cooking;
- heating;
- domestic refrigeration;
- mechanical ventilation;
- sanitary and fresh water.

1.6.3 Services such as the following, which are additional to those in 1.6.1 and 1.6.2, are considered necessary to maintain the ship in a normal sea-going operational and habitable condition:

- cargo handling and cargo care equipment;
- hotel services, other than those required for habitable conditions;
- thrusters, other than those for dynamic positioning.

1.6.4 A 'high voltage' is a voltage exceeding 1000 V a.c. or 1500 V d.c. between conductors, *see also* 5.1.3.

1.6.5 A 'switchboard' is a switchgear and controlgear assembly for the control of power generated by a source of electrical power and its distribution to electrical consumers.

1.6.6 A 'section board' is a switchgear and controlgear assembly for controlling the supply of electrical power from a switchboard and distributing it to other section boards, distribution boards or final sub-circuits.

1.6.7 A 'distribution board' is an assembly of one or more protective devices arranged for the distribution of electrical power to final sub-circuits.

1.6.8 A 'final sub-circuit' is that portion of a wiring system extending beyond the final overcurrent device of a board.

1.6.9 'Special category spaces' are those enclosed spaces above or below the bulkhead deck intended for the carriage of motor vehicles with fuel, for their own propulsion, in their tanks, into and from which such vehicles can be driven, and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m.

1.6.10 'Machinery spaces of Category A' are those spaces and trunks to such spaces which contain:
(a) internal combustion machinery used for main propulsion; or
(b) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
(c) any oil-fired boiler or oil fuel unit.

1.6.11 'Dead ship condition' means that the entire machinery installation, including the power supply, is out of operation and that the auxiliary services for bringing the main propulsion systems into operation (e.g., compressed air, starting current from batteries, etc.) and for the restoration of the main power supply are not available. Means are to be available to start the emergency generator at all times, *see* Pt 5, Ch 2,9.4.

1.6.12 Protected space is a machinery space where a fixed water-based local application fire-fighting system is installed.

1.6.13 Protected areas are areas within a protected space which are protected by a fixed water-based local application fire-fighting system.

1.6.14 Adjacent areas are areas, other than protected areas, exposed to direct spray or other areas where water may extend when a fixed water-based local application fire-fighting system is activated.

1.6.15 For emergency services and their emergency power supplies required to be capable of being operated under fire conditions, 'high fire risk areas' are:
(a) machinery spaces, as defined by SOLAS 1974 as amended, Ch II-2;
(b) spaces containing fuel treatment equipment;
(c) galleys and pantries containing cooking appliances;
(d) laundries containing drying equipment;
(e) hazardous zones and spaces; and
(f) for passenger ships carrying more than 36 passengers:
  (i) public spaces containing furniture and furnishings of other than restricted fire risk and having a deck area of 50 m^2 or more;
  (ii) barber shops and beauty parlours; and
  (iii) saunas.

Requests to exempt spaces identified in (f) may be considered when evidence is submitted that demonstrates emergency services will remain available in the event of a fire in the space (e.g., studies of fire protection measures, installation locations, system redundancy, etc.).

1.6.16 An 'electric arc' is an electrical discharge or a short-circuit through ionised air caused by isolation or insulation integrity failure.

1.6.17 'Incident energy' is the amount of energy impressed on a surface, a certain distance from the source, generated during an electric arc event.

1.7 Design and construction

1.7.1 Electrical propelling machinery and associated equipment together with equipment for services essential for the propulsion and safety of the ship are to be constructed in accordance with the relevant requirements of this Chapter.

1.7.2 The design and installation of other equipment is to be such that risk of fire due to its failure is minimised. It is, as a minimum, to comply with a National or International Standard revised where necessary for ambient conditions.

1.7.3 Electrical equipment is to be suitable for its intended purpose and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the Procedure for LR Type Approval System will be supplied on application.

1.7.4 For areas susceptible to deluge or submersion, cable entries are to prevent water ingress. In general, cable entries are to be in accordance with IEC 60092-101: *Electrical Installations in Ships – Part 101: Definitions and General Requirements*.

1.8 Quality of power supplies

1.8.1 All electrical equipment supplied from the main and emergency sources of electrical power and electrical equipment for essential and emergency services supplied from d.c. sources of electrical power is to be so designed and manufactured that it is capable of operating satisfactorily under normally occurring variations of voltage and frequency.

1.8.2 Unless specified otherwise, a.c. electrical equipment is to operate satisfactorily with the following simultaneous variations, from their nominal value, when measured at the consumer input terminals:
(a) voltage:
permanent variations +6 per cent, –10 per cent
transient variations due to step changes in load ±20 per cent
recovery time 1,5 seconds
(b) frequency:
permanent variations ±5 per cent
transient variations due to step changes in load ±10 per cent
recovery time 5 seconds
A maximum rate of change of frequency not exceeding ±1,5 Hz per second during cyclic frequency fluctuations.

1.8.3 **Harmonics**. Unless specified otherwise, the total harmonic distortion (THD) of the voltage waveform at any a.c. switchboard or section board is not to exceed 8 per cent of the fundamental for all frequencies up to 50 times the supply frequency and no voltage at a frequency above 25 times supply frequency is to exceed 1,5 per cent of the fundamental of the supply voltage. THD is the ratio of the rms value of the harmonic content to the rms value of the fundamental, expressed in per cent and may be calculated using the expression:

$$THD = \frac{\sqrt{\sum_{h=2}^{\infty} V_h^2}}{V_1} \times 100$$

where

V_h = rms amplitude of a harmonic voltage of order h

V_1 = rms amplitude of the fundamental voltage.

1.8.4 Unless specified otherwise, d.c. electrical equipment is to operate satisfactorily with the following simultaneous variations from its nominal value, when measured at the consumer input terminals:

(a) When supplied by d.c. generator(s) or a rectified a.c. supply:

Voltage tolerance (continuous)	±10 per cent
Voltage cyclic variation deviation	5 per cent
Voltage ripple	10 per cent

(a.c. rms over steady state d.c. voltage);

(b) When supplied by batteries:
  (i) Equipment connected to the batteries during charging:
  Voltage tolerance +30 per cent, –25 per cent;
  (ii) Equipment not connected to batteries during charging:
  Voltage tolerance +20 per cent, –25 per cent.

Different voltage variations as determined by the charging/discharging characteristics, including ripple voltage from the charging device, may be considered. When battery chargers/battery combinations are used as d.c. power supply systems adequate measures are to be taken to keep the voltage within the specified limits during charging, boost charging and discharging of the battery.

1.9 Ambient reference and operating conditions

1.9.1 The rating for classification purposes of essential electrical equipment intended for installation in ships to be classed for unrestricted (geographical) service is to be based on an engine room ambient temperature of 45°C, and a sea-water temperature at the inlet of 32°C. The equipment manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

1.9.2 In the case of a ship to be classed for restricted service, the rating is to be suitable for the ambient conditions associated with the geographical limits of the restricted service, *see* Pt 1, Ch 2.

1.9.3 Main and essential auxiliary machinery and equipment is to operate satisfactorily under the conditions shown in Pt 5, Ch 1,3.6. Electrical equipment satisfying alternative ambient operating condition requirements for installation on ships contained in an acceptable and relevant National or International Standard may be considered to satisfy this requirement.

NOTE

Details of local environmental conditions are stated in Annex B of IEC 60092-101-2002: *Electrical installations in ships – Part 101: Definitions and general requirements*.

1.9.4 Where electrical equipment is installed within environmentally controlled spaces, the ambient temperature for which the equipment is suitable for operation at its rated capacity may be reduced to a value not less than 35°C provided:

- the equipment is not for use for emergency services and is located outside of machinery space(s);
- temperature control is achieved by at least two cooling units so arranged that, in the event of loss of one cooling unit, for any reason, the remaining unit(s) will be capable of satisfactorily maintaining the design temperature;
- the equipment is able to be initially set to work safely within a 45°C ambient temperature until such a time that the lesser ambient temperature may be achieved; the cooling equipment is to be rated for an ambient temperature of not less than 45°C; and
- alarms are provided, at a continually attended control station, to indicate any malfunction of the cooling units.

See also Ch 1,1.3.3.

1.9.5 Where equipment is to comply with 1.9.4, it is to be ensured that electrical cables for their entire length are adequately rated for the maximum ambient temperature to which they are exposed along their length.

1.9.6 Equipment used for cooling and maintaining the lesser ambient temperature in accordance with 1.9.4 are considered essential services and are to satisfy the requirements of 5.2.

1.10 Inclination of ship

1.10.1 Emergency and essential electrical equipment is to operate satisfactorily under the conditions as shown in Table 2.1.1.

1.10.2 In ships for the carriage of liquefied gas the emergency source of electrical power is also to remain operable under the conditions described in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases), Chapter 10, LR 10.1-05 General. In ships for the carriage of liquid chemicals the emergency source of electrical power is also to remain operable under the conditions described in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals), Chapter 10, LR 10.1(e) General.

Table 2.1.1 Inclination of ship

Installations, components	Angle of inclination, degrees, *see* Note 2			
	Athwartships		Fore-and-aft	
	static	dynamic	static	dynamic
Essential electrical equipment	15	22,5	5 *see* Note 3	7,5
Safety systems, e.g., emergency power installations, crew and passenger safety systems Switchgear, electrical and electronic appliances *see* Note 1	22,5	22,5	10	10

NOTES
1. Up to an angle of 45° no undesired switching operations or operational changes may occur.
2. Athwartships and fore-and-aft inclinations may occur simultaneously.
3. Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as:

$\frac{500}{L}$ degrees

where L = Rule length, in metres, *see* Pt 3, Ch 1,6.1.

1.10.3 Any proposal to deviate from the angles given in Table 2.1.1 will be specially considered taking into account the type, size and service of the ship.

1.10.4 The dynamic angles of inclination in Table 2.1.1 may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the electrical equipment is capable of operating under these angles of inclination.

1.11 Location and construction

1.11.1 All electrical equipment is to be constructed or selected, and installed such that:

(a) live parts cannot be inadvertently touched, unless they are supplied at the safety voltage specified in 1.12.2(h);

(b) it does not cause injury when handled or touched in the normal manner; and

(c) it is unaffected by any water, steam or oil and oil vapour to which it is likely to be exposed.

Electrical equipment having, as a minimum, the degrees of protection as specified in IEC 60092-201: *Electrical installations in ships – Part 201: System design – General* for the relevant location will satisfy these requirements.

1.11.2 Switchboards, section boards and distribution boards supplying essential and emergency services, as well as cables from the respective generators to and between these boards, are to be arranged to avoid areas of high fire risk and elevated temperatures, for example, in close proximity to incinerators and boilers.

1.11.3 Electrical equipment, as far as is practicable, is to be located:

(a) such that it is accessible for the purpose of maintenance and survey;

(b) clear of flammable material;

(c) in spaces adequately ventilated to remove the waste heat liberated by the equipment under full load conditions, at the ambient conditions specified in 1.9;

(d) where flammable gases cannot accumulate. If this is not practicable, electrical equipment is to be of the appropriate 'safe-type', *see* Section 14;

(e) where it is not exposed to the risk of mechanical injury or damage from water, steam or oil.

1.11.4 Equipment design and the choice of materials are to reduce the likelihood of fire, ensuring that:

(a) where the electrical energised part can cause ignition and fire, it is contained within the bounds of the enclosure of the electrotechnical product;

(b) the design, material(s) and construction of the enclosure minimises, as far as is practicable, any internal ignition causing ignition of adjacent materials; and

(c) where surfaces of the electrotechnical products can be exposed to external fire, they do not, as far as practicable, contribute to the fire growth.

NOTE

Compliance with IEC 60695: *Fire hazard testing* (all parts), or an alternative and acceptable Standard, will satisfy this require-ment.

1.11.5 Insulating materials and insulated windings are to be resistant to tracking, moisture, sea air, oil and oil vapour unless special precautions are taken to protect them.

1.11.6 The minimum creepage and clearance distances provided for electrical connections, terminals and similar bare live parts are to be in accordance with a relevant International or National Standard for the equipment or apparatus concerned. In cases where the rated voltage is outside that given in the Standard or where no Standard is available, the minimum creepage and clearance distances provided are to be in accordance with 7.5. Details of alternatives proposals including supporting design rationale and demonstration may be submitted for consideration.

1.11.7 Studs, screw-type or spring-type clamp terminations, satisfactory for the normal operating currents and voltages, are to be provided in electrical equipment for the connection of external cable, or busbar conductors, as appropriate, *see also* 11.15. There is to be adequate space and access for the terminations.

1.11.8 The design of equipment is to enable ease of access to all parts requiring inspection or replacement in service.

1.11.9 Equipment is not to remain alive through the control circuits and/or pilot lamps when switched off by the control switch. This does not apply to synchronising switches and/or plugs.

1.11.10 The operation of all electrical equipment and the lubrication arrangements are to be efficient under such conditions of vibration and shock as arise in normal practice.

1.11.11 All nuts, screws and clamping devices used in connection with current-carrying, supporting and working parts are to be provided with means to ensure that they cannot work loose by vibration and shock as arise in normal practice.

1.11.12 To allow ease of access, connectors are to be spaced far enough apart to permit connection and disconnection. At test points, adequate clearance is to be provided between connection points and controls to provide access for testing.

1.11.13 Conductors and equipment are to be placed at such a distance from the magnetic compasses, or are to be so disposed, that the interfering magnetic field is negligible when circuits are switched on and off.

1.11.14 Where electrical power is used for propulsion, the equipment is to be so arranged that it will operate satisfactorily in the event of partial flooding by bilge water above the tank top up to the bottom floor plate level, under the normal angles of inclination given in 1.9 for essential electrical equipment, *see* Pt 5, Ch 13.

1.12 Earthing of non-current carrying parts

1.12.1 Except where exempted by 1.12.2, all non-current-carrying exposed metal parts of electrical equipment and cables are to be earthed for personal protection against electric shock.

1.12.2 The following parts may be exempted from the requirements of 1.12.1:
(a) lamp-caps, where suitably shrouded;
(b) shades, reflectors and guards supported on lampholders or light fittings constructed of, or shrouded in, non-conducting material;
(c) metal parts on, or screws in or through, non-conducting materials, which are separated by such material from current-carrying parts and from earthed non-current carrying parts in such a way that in normal use they cannot become live or come into contact with earthed parts;
(d) apparatus which is constructed in accordance with the principle of double insulation;
(e) bearing housings which are insulated in order to prevent circulation of current in the bearings;
(f) clips for fluorescent lamps;
(g) cable clips and short lengths of pipes for cable protection;
(h) apparatus supplied at a safety voltage not exceeding 50 V d.c. or 50 V a.c., between conductors, or between any conductor and earth in a circuit isolated from the supply. Autotransformers are not to be used for the purpose of achieving the alternating current voltage;
(j) apparatus or parts of apparatus which although not shrouded in insulating material is nevertheless otherwise so guarded that it cannot be touched and cannot come in contact with exposed metal.

1.12.3 Where extraneous-conductive parts (i.e., parts not forming part of the electrical installation and liable to introduce an electric potential) are not bonded by separate earthing conductors, details are to be submitted that demonstrate that a permanent, metal-to-metal connection of negligible impedance, which will not degrade due to corrosion or vibration, will be achieved.

1.12.4 Armouring, braiding and other metal coverings of cables are to be effectively earthed. Where the armouring, braiding and other metal coverings are earthed at one end only, they are to be adequately protected and insulated at the unearthed end with the insulation being suitable for the maximum voltage that may be induced. *See* 14.9.3 for earthing of cables in hazardous zones or spaces.

1.12.5 The electrical continuity of all metal coverings of cables throughout the length of the cable, particularly at joints and tappings, is to be ensured.

1.12.6 Metal parts of portable appliances, other than current-carrying parts and parts exempted by 1.12.2 are to be earthed by means of an earth-continuity conductor in the flexible cable or cord through the associated plug and socket-outlet.

1.12.7 Earthing conductors are to be of copper or other corrosion-resistant material and be securely installed and protected where necessary against damage and also, where necessary, against electrolytic corrosion. Connections are to be so secured that they cannot work loose under vibration.

1.12.8 The nominal cross-section areas of copper earthing conductors for electrical equipment are in general to be equal to the cross-section of the current-carrying conductor up to 16 mm^2, with a minimum of 1,5 mm^2. Above this figure they are to be equal to at least half the cross-section of the current-carrying conductor with a minimum of 16 mm^2.

1.12.9 The nominal cross-section areas of copper earthing conductors for armouring, braiding and other metal coverings of cables are, in general, to be equal to the equivalent cross-section of the armouring, braiding and other metal coverings with a minimum of 1,5 mm^2.

1.12.10 Earthing conductors of materials other than copper are to have a conductance not less than that specified for an equivalent copper earthing conductor.

1.12.11 The connection of the earthing conductor to the hull of the ship is to be made in an accessible position, and is to be secured by a screw or stud of a diameter appropriate for the size of earthing conductor, but not less than 6 mm, which is to be used for this purpose only. Bright metallic surfaces at the contact areas are to be ensured immediately before the nut or screw is tightened and, where necessary, the joint is to be protected against electrolytic corrosion. The connection is to remain unpainted.

1.13 Bonding for the control of static electricity

1.13.1 Bonding straps for the control of static electricity are required for cargo tanks, process plant and piping systems, for flammable products and solids liable to release flammable gas and/or combustible dust, which are not permanently connected to the hull of the ship either directly or via their bolted or welded supports and where the resistance between them and the hull exceeds 1 MΩ.

1.13.2 Where bonding straps are required for the control of static electricity, they are to be robust, that is, having a cross-sectional area of at least 10 mm^2, and are to comply with 1.12.7 and 1.12.11.

1.14 Alarms

1.14.1 Where alarms are required by this Chapter they are to be arranged in accordance with Ch 1,2.3. Sound signal equipment, fire and general alarm bells are not required to be supplemented by visual indications, except in areas having high levels of background noise, such as machinery spaces.

1.14.2 The alarms in this Chapter are additional to those required by Chapter 1. They may however form part of the alarm system that is required by Chapter 1.

1.14.3 Cables for emergency alarms and their power sources are to be in accordance with 1.16.

1.14.4 Electrical equipment and cables for emergency alarms are to be so arranged that the loss of alarms in any one area due to localised fire, collision, flooding or similar damage is minimised, *see* 1.16 and 1.17.

1.14.5 Electric system: Alarms and safeguards are indicated in Table 2.1.2.

Table 2.1.2 Electric system: Alarms and safeguards

Item	Alarm	Note
Busbar voltage	High and low	–
Busbar frequency	Low	–
Operation of load shedding	Warning	–
Generator cooling air temperature	High	For closed air circuit water-cooled machines

1.15 Labels, signs and notices

1.15.1 Labels, signs and notices required by this Chapter are to be positioned in clearly visible locations which will not be obscured.

1.15.2 Labels, signs and notices are to be easy to read under the expected operating conditions. Character height in accordance with Table 2.1.3 will be considered to satisfy this requirement.

Table 2.1.3 Character height and viewing distance

Viewing distance (mm)	Minimum character height (mm)
Less than 500	2,3
500 – 1000	4,7
1000 – 2000	9,4
2000 – 4000	19
4000 – 8000	38

1.15.3 Controls, indicators and displays required by this Chapter are to be labelled to indicate their function. Labels are to be positioned in a manner that associates the label with the item being labelled.

1.15.4 Labels, signs and notices are to use short, clear messages. In general, warning signs and notices are to comprise:
- a signal word to convey the gravity of the risk (e.g., Danger, Warning or Caution);
- a statement of the nature and/or consequence of the hazard; and
- wherever practical, an instruction giving appropriate behaviour to avoid the hazard.

1.16 Operation under fire conditions

1.16.1 As a minimum, the following emergency services and their emergency power supplies, are required to be capable of being operated under fire conditions:
- Control and power systems to power-operated fire doors and status indication for all fire doors.
- Control and power systems to power-operated watertight doors and their status indication.
- Emergency lighting.
- Fire and general emergency alarms.
- Fire detection systems.
- Fire-extinguishing systems and fire-extinguishing media release alarms.
- Fire safety stops, *see also* 17.6.
- Low location lighting, *see also* 18.4.3.
- Public address systems.
- Emergency fire pump.

1.16.2 Where cables for the emergency services listed in 1.16.1 pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be so arranged that a fire in any of these areas or zones does not affect the operation of the emergency service in any other area or zone. This may be achieved either by:
- cables being of a fire resistant type complying with 11.5.3, and at least extending from the main control/monitoring panel to the nearest local distribution panel serving the relevant area or zone; or
- there being at least two-loops/radial distributions run as widely apart as is practicable and so arranged that in the event of damage by fire at least one of the loops/radial distributions remains operational.

1.16.3 Where the cables for the power supplies for the emergency services listed in 1.16.1 pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be of a fire resistant type complying with 11.5.3, extending at least to the local distribution panel serving the relevant area or zone.

1.16.4 Fire resistant electrical cables for the emergency services listed in 1.16.1, including their power supplies, are to be run as directly as is practicable, having regard to any special installation requirements, for example those concerning minimum bend radii.

1.16.5 In addition to 1.11.4, materials used for electrical equipment, cables and accessories within passenger accommodation areas are not to be capable of producing excessive quantities of smoke and toxic products.

NOTE

Compliance with IEC 60695: *Fire hazard testing* (all parts), or an alternative and acceptable Standard, will satisfy this requirement.

1.17 Operation under flooding conditions

1.17.1 Flooding of spaces along the ship bottom that are not fitted with a double bottom is not to result in the loss of the ability to provide electrically operated fire, ship, crew and passenger emergency safety systems outside of the spaces.

1.17.2 Installation of electrical equipment necessary to provide fire, ship, crew and passenger emergency safety systems in spaces along the ship bottom not fitted with a double bottom is to be avoided, wherever practical. Where it is proposed to install electrical equipment, including cabling, necessary to provide fire, ship, crew and passenger emergency safety systems in such spaces, evidence is to be submitted to demonstrate that required emergency services will be available in other spaces in the event of flooding of the space not fitted with a double bottom.

1.18 Protection of electrical equipment against the effects of lightning strikes

1.18.1 Precautions are to be taken to protect essential electronic equipment that may be susceptible to damage from voltage pulses attributable to the secondary effects of lightning. This may be achieved by suitable design and/or the use of additional protective devices, such as surge arrestors. Resultant induced voltages may be further reduced by the use of earthed metallic screened cables. *See also* Section 19.

1.19 Programmable electronic systems

1.19.1 Where programmable electronic systems are implemented and used to control the electrical installation, or to provide safety functions in accordance with the requirements of this Chapter (e.g., electric propulsion, circuit-breaker settings, switchgear and controlgear controllers, etc.), the arrangements are to satisfy the applicable requirements of Ch 1,2.10 to 2.13.

1.19.2 Where 1.18.1 applies, proposed modifications to software and acceptance testing and trials are to be in accordance with Ch 1,1.4 and Section 7 as applicable.

■ *Section 2* Main source of electrical power

2.1 General

2.1.1 The main source of electrical power is to comply with the requirements of this Section without recourse to the emergency source of electrical power.

2.2 Number and rating of generators and converting equipment

2.2.1 Under sea-going conditions, the number and rating of service generating sets and converting sets, such as transformers and semi-conductor converters, when any one generating set or converting set is out of action, are:

(a) to be sufficient to ensure the operation of electrical services for essential equipment, habitable conditions, cargo refrigeration machinery of ships having a **RMC** notation and the container socket outlets and ventilation system of container ships having a **CRC** notation. *See* 16.3.5 for electric propulsion systems;

(b) to have sufficient reserve capacity to permit the starting of the largest motor without causing any motor to stall or any device to fail due to excessive voltage drop on the system;

(c) to be capable of providing the electrical services necessary to start the main propulsion machinery from a dead ship condition. The emergency source of electrical power may be used to assist if it can provide power at the same time to those services required to be supplied by Section 3, *see also* 2.3.2.

2.2.2 The arrangement of the ship's main source of power is to be such that the operation of electrical services for essential equipment, habitable conditions and cargo refrigeration machinery of ships having a **RMC** notation can be maintained regardless of the speed and direction of the propulsion machinery shafting.

2.2.3 Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by one generating set, arrangements are to be provided to prevent overloading of the running generator, *see* 6.9. On loss of power there is to be provision for automatic starting and connecting to the main switchboard of the standby set in as short a time as practicable, but in any case within 45 seconds, and automatic sequential restarting of essential services, *see* 1.6.1, in as short a time as is practicable.

NOTE

Where the prime mover starting time will result in exceeding this starting and connection time, details are to be submitted for consideration.

2.3 Starting arrangements

2.3.1 The starting arrangements of the generating sets prime movers are to comply with the requirements of Pt 5, Ch 2,16 as applicable.

2.3.2 Where the emergency source of electrical power is required to be used to restore propulsion from a 'dead ship condition', the emergency generator is to be capable of providing initial starting energy for the propulsion machinery within 30 minutes of the 'dead ship condition'. The emergency generator capacity is to be sufficient for restoring propulsion in addition to supplying those services in 3.2.7(a), 3.2.7(b), 3.2.7(c) for passenger ships and 3.3.7(a), 3.3.7(b), 3.3.7(c) and 3.3.7(d) for cargo ships. *See* Pt 5, Ch 2,9.11.1 for dead ship condition starting arrangements.

2.4 Prime mover governors

2.4.1 The governing accuracy of the generating sets prime movers is to meet the requirements of Pt 5, Ch 2,7.3.

2.4.2 The maximum electrical step load switched on or off is not to cause the frequency variation of the electrical supply to exceed the parameters given in 1.8.2.

2.5 Main propulsion driven generators not forming part of the main source of electrical power

2.5.1 Generators and generator systems having the ship's propulsion machinery as their prime mover but not forming part of the ship's main source of electrical power may be used whilst the ship is at sea to supply electrical services required for normal operational and habitable conditions provided that the requirements of 2.5.2 to 2.5.4 are satisfied.

2.5.2 Within the declared operating range of the generators and/or generator system, the specified voltage and frequency variations of the Rules are to be met.

2.5.3 Where there is remote control of the propulsion machinery, arrangements are to ensure that essential machinery power supplies are maintained during manoeuvring conditions in order to prevent a blackout situation.

2.5.4 In addition to the requirements of 2.2.3, arrangements are to be fitted to automatically start one of the generators forming the main source of power should the frequency variations exceed those permitted by the Rules.

■ *Section 3*
Emergency source of electrical power

3.1 General

3.1.1 The requirements of this Section apply to passenger and cargo ships to be classed for unrestricted service. They do not apply to cargo ships of less than 500 tons gross tonnage.

3.1.2 For ships assigned a Service Restriction Notation in accordance with Pt 1, Ch 2, a lesser period than the 36 hour period and 18 hour period specified in 3.2.7 and 3.3.7 respectively may be considered, but not less than 12 hours.

3.1.3 The emergency source of power for cargo ships of less than 500 tons gross tonnage will be the subject of special consideration.

3.2 Emergency source of electrical power in passenger ships

3.2.1 A self-contained emergency source of electrical power is to be provided.

3.2.2 The emergency source of electrical power, associated transforming equipment, if any, transitional source of emergency power, emergency switchboard and emergency lighting switchboard are to be located above the uppermost continuous deck and be readily accessible from the open deck. They are not to be located forward of the collision bulkhead.

3.2.3 The location of:
- the emergency source of electrical power and associated transforming equipment, if any;
- the transitional source of emergency power;
- the emergency switchboard; and
- the emergency lighting switchboard;

in relation to:
- the main source of electrical power, associated transforming equipment, if any; and
- the main switchboard;

is to be such as to ensure that a fire or other casualty in spaces containing:
- the main source of electrical power, associated transforming equipment, if any, and the main switchboard; or
- in any machinery space of Category A;

will not interfere with the supply, control and distribution of emergency electrical power.

3.2.4 The space containing:

- the emergency source of electrical power, associated transforming equipment, if any;
- the transitional source of emergency electrical power; and
- the emergency switchboard;

is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing:

- the main source of electrical power, associated transforming equipment, if any; or
- the main switchboard.

3.2.5 Where compliance with 3.2.3 or 3.2.4 is not practicable, details of the proposed arrangements are to be submitted.

3.2.6 Provided that suitable measures are taken for safeguarding independent emergency operation under all circumstances, the emergency generator may be used exceptionally, and for short periods, to supply non-emergency circuits.

3.2.7 The electrical power available is to be sufficient to supply all those services that are essential for safety in an emergency, due regard being paid to such services as may have to be operated simultaneously. The emergency source of electrical power is to be capable, having regard to starting currents and the transitory nature of certain loads, of supplying simultaneously at least the following services for the periods specified hereinafter, if they depend upon an electrical source for their operation:

(a) For a period of 36 hours, emergency lighting:
 (i) at every survival craft preparation station, muster and embarkation station and oversides;
 (ii) in alleyways, stairways and exits, giving access to the muster and embarkation stations;
 (iii) in all service and accommodation alleyways, stairways and exits, personnel lift cars;
 (iv) in the machinery spaces and main generating stations including their control positions;
 (v) in all control stations, machinery control rooms, and at each main and emergency switchboard;
 (vi) at all stowage positions for fireman's outfits;
 (vii) at the steering gear; and
 (viii) at the fire pump, the sprinkler pump and the emergency bilge pump and at the starting position of their motors;

(b) For a period of 36 hours:
 (i) the navigation lights and other lights, as required by the *International Regulations for Preventing Collisions at Sea* in force; and
 (ii) the radiocommunications, as required by Amendments to SOLAS 1974, Chapter IV.

(c) For a period of 36 hours:
 (i) all internal communication equipment required in an emergency;
 (ii) the navigational aids as required by Amendments to SOLAS 1974 Reg V/19 ; where such provision is unreasonable or impracticable this requirement may be waived for ships of less than 5000 tons gross;
 (iii) the fire detection, fire alarm and sample extraction smoke detection systems, and the fire door holding and release system; and
 (iv) for intermittent operation of the daylight signalling lamp, the ship's whistle, the manually operated call points and all internal signals that are required in an emergency;

 unless such services have an independent supply for the period of 36 hours from an accumulator battery suitably located for use in an emergency.

(d) For a period of 36 hours:
 (i) emergency fire pump;
 (ii) the automatic sprinkler pump, if any; and
 (iii) the emergency bilge pump and all the equipment essential for the operation of electrically powered remote controlled bilge valves.

(e) The steering gear for the period of time required by Pt 5, Ch 19,6.

(f) For a period of half an hour:
 (i) any watertight doors if electrically operated together with their control, indication and alarm circuits;
 (ii) the emergency arrangements to bring the lift cars to deck level for the escape of persons. The passenger lift cars may be brought to deck level sequentially in an emergency.

(g) Where applicable, the services required by 2.3.2.

(h) Where connected, the supplementary lighting required by 3.2.16 and, where applicable, the air compressors for breathing apparatus cylinders referred to in 17.11.1.

3.2.8 The emergency source of electrical power may be either a generator or an accumulator battery, which are to comply with the following:

(a) Where the emergency source of electrical power is a generator it is to be:
 (i) driven by a suitable prime mover with an independent supply of fuel having a flashpoint (closed-cup test) of not less than 43°C;
 (ii) started automatically upon failure of the electrical supply from the main source of electrical power and is to be automatically connected to the emergency switchboard; those services referred to in 3.2.7 are then to be transferred automatically to the emergency generating set. The automatic starting system and the characteristics of the prime mover are to be such as to permit the emergency generator to carry its full rated load as quickly as is safe and practicable, subject to a maximum of 45 seconds; and
 (iii) provided with a transitional source of emergency electrical power according to 3.2.9.

(b) Where the emergency source of electrical power is an accumulator battery, it is to be capable of:
 (i) carrying the emergency electrical load without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage;
 (ii) automatically connecting to the emergency switchboard in the event of failure of the main source of electrical power; and
 (iii) immediately supplying at least those services specified in 3.2.9.

3.2.9 The transitional source of emergency electrical power required by 3.2.8 is to consist of an accumulator battery suitably located for use in an emergency which is to operate without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage and be of sufficient capacity and so arranged as to supply automatically in the event of failure of either the main or emergency source of electrical power for half an hour at least the following services, if they depend upon an electrical source for their operation:

(a) the lighting required by 3.2.7(a) and (b);
(b) all services required by 3.2.7(c)(i), (iii) and (iv) unless such services have an independent supply for the period specified from an accumulator battery suitably located for use in an emergency.
(c) Where connected, the supplementary lighting required by 3.2.16.
(d) Power to operate the watertight doors at least three times, i.e., closed-open-closed against an adverse list of 15°, but not necessarily all of them simultaneously, together with their control, indication and alarm circuits as required by 3.2.7(f)(i).

3.2.10 The emergency switchboard is to be installed as near as is practicable to the emergency source of electrical power.

3.2.11 Where the emergency source of electrical power is a generator, the emergency switchboard is to be located in the same space unless the operation of the emergency switchboard would thereby be impaired.

3.2.12 No accumulator battery except for engine starting, fitted in accordance with this Section, is to be installed in the same space as the emergency switchboard. An indicator is to be mounted in a suitable place on the main switchboard or in the machinery control room to indicate when the batteries constituting either the emergency source of electrical power or the transitional source of emergency electrical power are being discharged.

3.2.13 The emergency switchboard is to be supplied during normal operation from the main switchboard by an interconnector feeder which is to be adequately protected at the main switchboard against overload and short-circuit and which is to be disconnected automatically at the emergency switchboard upon failure of the main source of electrical power. Where the system is arranged for feedback operation, the interconnector feeder is also to be protected at the emergency switchboard at least against short-circuit.

3.2.14 In order to ensure the ready availability of the emergency source of electrical power to supply circuits required to provide emergency services, arrangements are to be made, where necessary, to automatically disconnect non-emergency circuits from the emergency switchboard in the event of overloading to ensure that electrical power is available to the emergency circuits.

3.2.15 Provision is to be made for the periodic testing of the complete emergency system and is to include the testing of automatic starting arrangements.

3.2.16 In passenger ships, supplementary lighting is to be provided in all cabins to indicate the exit clearly so that occupants will be able to find their way to the door. Such lighting, which may be connected to an emergency source of power or have a self-contained source of electrical power in each cabin, is to illuminate automatically when power to the normal cabin lighting is lost and remain on for a minimum of half an hour.

3.2.17 In addition to the emergency lighting required by 3.2.7(a) passenger ships with roll on-roll off cargo spaces or special category spaces are to be provided with the following:

(a) in all passenger public spaces and alleyways supplementary electric lighting that can operate for at least three hours when all other sources of electric power have failed and under any condition of heel. The illumination provided is to be such that the approach to the means of escape can be readily seen. The source of power for the supplementary lighting is to consist of accumulator batteries within the lighting units that are continuously charged where practicable, from the emergency switchboard. Consideration may be given to other means of lighting which is at least as effective. The supplementary lighting is to be such that any failure of the lamp will be immediately apparent. Any accumulator battery provided is to be replaced at intervals having regard to the specified service life in the ambient conditions that they are subject to in service.
(b) A portable rechargeable battery operated lamp is to be provided in every crew space alleyway, recreational space and every working space which is normally occupied unless supplementary emergency lighting, as required by (a) is provided.

3.3 Emergency source of electrical power in cargo ships

3.3.1 A self-contained emergency source of electrical power is to be provided.

3.3.2 The emergency source of electrical power, associated transforming equipment, if any, transitional source of emergency power, emergency switchboard and emergency lighting switchboard are to be located above the uppermost continuous deck and be readily accessible from the open deck. They are not to be located forward of the collision bulkhead.

3.3.3 The location of:

- the emergency source of electrical power and associated transforming equipment, if any;
- the transitional source of emergency power;
- the emergency switchboard; and
- the emergency lighting switchboard;

in relation to:

- the main source of electrical power, associated transforming equipment, if any; and
- the main switchboard;

is to be such as to ensure that a fire or other casualty in spaces containing:

- the main source of electrical power, associated transforming equipment, if any, and the main switchboard; or

- in any machinery space of Category A;

will not interfere with the supply, control and distribution of emergency electrical power.

3.3.4 The space containing:
- the emergency source of electrical power, associated transforming equipment, if any;
- the transitional source of emergency electrical power; and
- the emergency switchboard;

is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing:
- the main source of electrical power, associated transforming equipment, if any; or
- the main switchboard.

3.3.5 Where compliance with 3.3.3 or 3.3.4 is not practicable, details of the proposed arrangements are to be submitted.

3.3.6 Provided that suitable measures are taken for safeguarding independent emergency operation under all circumstances, the emergency generator may be used, exceptionally, and for short periods, to supply non-emergency circuits.

3.3.7 The electrical power available is to be sufficient to supply all those services that are essential for safety in an emergency, due regard being paid to such services as may have to be operated simultaneously. The emergency source of electrical power is to be capable, having regard to starting currents and the transitory nature of certain loads, of supplying simultaneously at least the following services for the periods specified hereinafter, if they depend upon an electrical source for their operation:

(a) For a period of three hours, emergency lighting at every survival craft preparation station, muster and embarkation station and over the sides. Remotely located stations for a liferaft installed in accordance with SOLAS 1974 as amended, CH III/B, Regulation 31.1.4 that is provided with portable means of illumination acceptable to the National Administration with which the Ship is registered may be considered to satisfy this requirement;

(b) For a period of 18 hours, emergency lighting:
   - (i) in all service and accommodation alleyways, stairways and exits, personnel lift cars and personnel lift trunks;
   - (ii) in the machinery spaces and main generating stations including their control positions;
   - (iii) in all control stations, machinery control rooms, and at each main and emergency switchboard;
   - (iv) at all stowage positions for fireman's outfits;
   - (v) at the steering gear; and
   - (vi) at the emergency fire pump, at the sprinkler pump, if any, and at the emergency bilge pump, if any, and at the starting positions of their motors;
   - (vii) in all cargo pump-rooms of tankers.

(c) For a period of 18 hours:
   - (i) the navigation lights and other lights, as required by the *International Regulations for Preventing Collisions at Sea* in force; and
   - (ii) the radiocommunications, as required by Amendments to SOLAS 1974, Chapter IV.

(d) For a period of 18 hours:
   - (i) all internal communication equipment as required in an emergency;
   - (ii) the navigational aids as required by Amendments to SOLAS 1974 Reg V/19; where such provision is unreasonable or impracticable this requirement may be waived for ships of less than 5000 tons gross;
   - (iii) the fire detection and fire-alarm system; and
   - (iv) intermittent operation of the daylight signalling lamp, the ship's whistle, the manually operated call points and all internal signals that are required in an emergency;

   unless such services have an independent supply for the period of 18 hours from an accumulator battery suitably located for use in an emergency.

(e) For a period of 18 hours the emergency fire pump if dependent upon the emergency generator for its source of power.

(f) The steering gear for the period of time required by Pt 5, Ch 19,6.

(g) Where applicable, the services required by 2.3.2.

3.3.8 The emergency source of electrical power may be either a generator or an accumulator battery, which is to comply with the following:

(a) Where the emergency source of electrical power is a generator it is to be:
   - (i) driven by a suitable prime mover with an independent supply of fuel, having a flashpoint (closed-cup test) of not less than 43°C;
   - (ii) started automatically upon failure of the main source of electrical power supply unless a transitional source of emergency electrical power in accordance with 3.3.9 is provided; where the emergency generator is automatically started, it is to be automatically connected to the emergency switchboard; those services referred to in 3.3.9 are to be connected automatically to the emergency generator; and
   - (iii) provided with a transitional source of emergency electrical power as specified in 3.3.9 unless an emergency generator is provided capable both of supplying the services mentioned in that paragraph and of being automatically started and supplying the required load as quickly as is safe and practicable subject to a maximum of 45 seconds.

(b) Where the emergency source of electrical power is an accumulator battery it is to be capable of:
   - (i) carrying the emergency electrical load without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage;
   - (ii) automatically connecting to the emergency switchboard in the event of failure of the main source of electrical power; and
   - (iii) immediately supplying at least those services specified in 3.3.9.

3.3.9 The transitional source of emergency electrical power where required by 3.3.8 is to consist of an accumulator battery suitably located for use in an emergency which is to operate without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage and be of sufficient capacity and is to be so arranged as to supply automatically in the event of failure of either the main or the emergency source of electrical power for half an hour at least the following services if they depend upon an electrical source for their operation:

(a) the lighting required by 3.3.7(a), (b) and (c). For this transitional phase, the required emergency electric lighting, in respect of the machinery space and accommodation and service spaces may be provided by permanently fixed, individual, automatically charged, relay operated accumulator lamps; and
(b) all services required by 3.3.7(d)(i), (iii) and (iv) unless such services have an independent supply for the period specified from an accumulator battery suitably located for use in an emergency.

3.3.10 The emergency switchboard is to be installed as near as is practicable to the emergency source of electrical power.

3.3.11 Where the emergency source of electrical power is a generator, the emergency switchboard is to be located in the same space unless the operation of the emergency switchboard would thereby be impaired.

3.3.12 No accumulator battery fitted in accordance with this Section, unless for engine starting, is to be installed in the same space as the emergency switchboard. An indicator shall be mounted in a suitable place on the main switchboard or in the machinery control room to indicate when the batteries constituting either the emergency source of electrical power or the transitional source of electrical power are being discharged.

3.3.13 The emergency switchboard is to be supplied during normal operation from the main switchboard by an interconnector feeder which is to be adequately protected at the main switchboard against overload and short-circuit and which is to be disconnected automatically at the emergency switchboard upon failure of the main source of electrical power. Where the system is arranged for feedback operation, the interconnector feeder is also to be protected at the emergency switchboard at least against short-circuit.

3.3.14 In order to ensure the ready availability of the emergency source of electrical power to supply circuits required to provide emergency services, arrangements are to be made, where necessary, to disconnect automatically non-emergency circuits from the emergency switchboard in the event of overloading to ensure that electrical power is available to the emergency circuits.

3.3.15 Provision is to be made for the periodic testing of the complete emergency system and is to include the testing of automatic starting arrangements.

3.4 Starting arrangements

3.4.1 Where the emergency source of power is a generator, the starting arrangements are to comply with the requirements given in Pt 5, Ch 2,9.4.

3.5 Prime mover governor

3.5.1 Where the emergency source of power is a generator, the governor is to comply with 2.4.

3.6 Radio installation

3.6.1 Every radio installation as required by SOLAS 1974 as amended, Chapter IV, Part C, is to be provided with reliable, permanently arranged electrical lighting, independent of the main and emergency sources of electrical power, for the adequate illumination of the radio controls for operating the radio installation.

3.6.2 A reserve source or sources of energy is to be provided on every ship, for the purpose of conducting distress and safety radiocommunications, in the event of failure of the ship's main and emergency sources of electrical power. The reserve source or sources of energy is to be capable of simultaneously operating the VHF radio installation and, as appropriate for the sea or sea area for which the ship is equipped, either the MF radio installation, the MF/HF radio installation, or the INMARSAT ship earth station and any of the additional loads mentioned in 3.6.4, 3.6.5 and 3.6.7 for a period of at least one hour. The reserve source or sources of energy need not supply independent HF and MF radio installations at the same time.

3.6.3 The reserve source or sources of energy is to be independent of the propelling power of the ship and the ship's electrical system.

3.6.4 Where, in addition to the VHF radio installation, two or more of the other radio installations, referred to in 3.6.2, can be connected to the reserve source or sources of energy, the reserve source or sources are to be capable of simultaneously supplying, for the period specified by 3.6.2, the VHF radio installation and:

(a) all other radio installations which can be connected to the reserve source or sources of energy at the same time; or
(b) whichever of the other radio installations will consume the most power, if only one of the other radio installations can be connected to the reserve source or sources of energy at the same time as the VHF radio installation.

3.6.5 The reserve source or sources of energy may be used to supply the electrical lighting required by 3.6.1.

3.6.6 Where a reserve source of energy consists of a rechargeable accumulator battery or batteries a means of automatically charging the batteries is to be provided which is to be capable of recharging them to minimum capacity requirements within 10 hours.

3.6.7 If an uninterrupted input of information from the ship's navigational or other equipment to a radio installation as referred to in 3.6.2 is needed to ensure its proper performance, means are to be provided to ensure the continuous supply of such information in the event of failure of the ship's main or emergency source of electrical power.

■ *Section 4* External source of electrical power

4.1 Temporary external supply

4.1.1 Where arrangements are made for the supply of electricity from a source on shore or elsewhere, a connection box is to be installed in a position suitable for the convenient reception of flexible cables from the external source and containing a circuit-breaker or isolating switch and fuses and terminals including one earthed, of ample size and suitable shape to facilitate a satisfactory connection of three-phase external supplies with earthed neutrals.

4.1.2 Suitable cables, permanently fixed, are to be provided, connecting the terminals in the connection box to a linked switch and/or a circuit-breaker at the main switchboard. An indicator is to be provided at the main switchboard in order to show when the cables are energised.

4.1.3 Means are to be provided for checking the phase sequence of the incoming supply.

4.1.4 At the connection box a notice is to be provided giving full information on the system of supply, the normal voltage and frequency of the installation's system and the procedure for carrying out the connection.

4.1.5 Alternative arrangements may be submitted for consideration. *See also* Pt 7, Ch 13 for class notation **OPS**.

4.2 Permanent external supply

4.2.1 Details are to be submitted.

■ *Section 5* Supply and distribution

5.1 Systems of supply and distribution

5.1.1 The following systems of generation and distribution are acceptable, other than for tankers intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test):

(a) d.c., two-wire;
(b) a.c., single-phase, two-wire;
(c) a.c., three-phase:
  (i) three-wire;
  (ii) four-wire with neutral solidly earthed but without hull return.

5.1.2 For tankers intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test) only the following systems of generation and distribution are acceptable:

(a) d.c., two-wire, insulated;
(b) a.c., single-phase, two-wire, insulated;
(c) a.c., three-phase, three-wire, insulated;
(d) earthed systems, a.c. or d.c., limited to areas outside any hazardous space or zone, and arranged so that no current arising from an earth-fault in any part of the system could pass through a hazardous space or zone;
(e) earthed systems, complying with 5.1.1 and 5.5.7, provided the Government of the Flag State permits such an arrangement in accordance with the '*Equivalents*' provisions of SOLAS Chapter I, Regulation 5, *see* Ch 1,1.4 of the Rules for Ships for Liquid Chemicals and/or the Rules for Ships for Liquefied Gases, as appropriate, *see also* 14.1.2.

Earthed intrinsically safe circuits are permitted to pass into and through hazardous spaces and zones.

5.1.3 System voltages for both alternating current and direct current in general are not to exceed:

- 15 000 V for generation and power distribution;
- 500 V for cooking and heating equipment permanently connected to fixed wiring;
- 250 V for lighting, heaters in cabins and public rooms, and other applications not mentioned above.

Voltages above these will be the subject of special consideration.

5.1.4 The arrangement of the main system of supply is to be such that a fire or other casualty in any space containing the main source of electrical power, associated converting equipment, if any, the main switchboard and the main lighting switchboard will not render inoperable any emergency service, other than those located within the space where the fire or casualty has occurred.

5.1.5 The main switchboard is to be so placed relative to the main source of power that, as far as is practicable, the integrity of the main system of supply will be affected only by a fire or other casualty in one space.

5.1.6 The arrangement of the emergency system of supply is to be such that a fire or other casualty in spaces containing the emergency source of electrical power, associated converting equipment, if any, the emergency switchboard and the emergency lighting switchboard, will not cause loss of services required to maintain the propulsion and safety of the ship.

5.1.7 Distribution systems required in an emergency are to be so arranged that a fire in any one main fire zone, as defined by SOLAS 1974 as amended Reg II-2/A, 3.32, will not interfere with the emergency distribution in any other such zone.

5.2 Essential services

5.2.1 Essential services that are required by Part 5 to be duplicated are to be served by individual circuits, separated in their switchboard or section board and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies, so that any single fault will not cause the loss of both services.

5.2.2 Where 5.2.1 is applicable the main busbars of the switchboard, or section boards, are to be capable of being split, by a multipole linked circuit-breaker, disconnector or switch-disconnector, into at least two independent sections, each supplied by at least one generator, either directly or through a converter. The essential services are to be equally divided, as far as is practicable, between the independent sections.

5.2.3 Where 5.2.2 is applicable provision is to be made to transfer to a temporary circuit those essential services which are not required to be, and have not been, duplicated in the event of loss of their normal section of switchboard or section board.

5.3 Isolation and switching

5.3.1 The incoming and outgoing circuits from every switchboard or section board are to be provided with a means of isolation and switching to permit each circuit to be switched off:
(a) on load;
(b) for mechanical maintenance;
(c) in an emergency to prevent or remove danger.
In addition the requirements of 5.3.2 and 5.3.3 are to be complied with.

5.3.2 Isolation and switching is to be by means of a circuit-breaker or switch arranged to open and close simultaneously all insulated poles. Where a switch is used as the means of isolation and switching, it is to be capable of:
(a) switching off the circuit on load;
(b) withstanding, without damage, the overcurrents which may arise during overloads and short-circuit.
In addition, these requirements do not preclude the provision of single pole control switches in final sub-circuits, for example light switches. For circuit-breakers, *see* 6.5 and 7.3.

5.3.3 Provision is to be made, in accordance with one of the following, to prevent any circuit being inadvertently energised:
(a) the circuit-breaker or switch can be withdrawn, or locked in the open position;
(b) the operating handle of the circuit-breaker or switch can be removed;
(c) the circuit fuses, where fitted, can be readily removed and retained by authorised personnel.

5.3.4 Where arrangements are in place for automatic changeover between two or more supplies of electrical power in the event of failure of one supply, the arrangements are to be such that a fault in one feeder does not result in the loss of all supplies to the automatic changeover switch.

5.3.5 Where a section board, distribution board or item of equipment can be supplied by more than one circuit, a switching device is to be provided to permit each incoming circuit to be isolated and the supply transferred to the alternative circuit. In addition, the requirements of 5.3.6 and 5.3.7 are to be complied with.

5.3.6 The switching device required by 5.3.5 is to be situated within or adjacent to the section board, distribution board or item of equipment. Where necessary, interlocking arrangements are to be provided to prevent circuits being inadvertently energised.

5.3.7 A notice is to be fixed to any section board, distribution board or item of equipment to which 5.3.5 applies warning personnel before gaining access to live parts of the need to open the appropriate circuit-breakers or switches, unless an interlocking arrangement is provided so that all circuits concerned are isolated before access is gained.

5.3.8 Tankers designed in accordance with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features, see* 14.1.2, are to meet the requirements of 5.3 of that Standard.

5.3.9 Where high voltage equipment is contained in a room or protected area which also forms its enclosure, the access door(s) of the space is to be so interlocked that it cannot be opened until:
- the high voltage supply(ies) to the equipment is switched off;
- the equipment and its cable(s) are earthed down to dissipate stored energy sufficient to ensure personnel safety.

5.3.10 The access to the space(s) described in 5.3.9 are to be suitably marked to indicate the danger of high voltage.

5.4 Insulated distribution systems

5.4.1 A device(s) is to be installed for every insulated distribution system, whether primary or secondary, for power, heating and lighting circuits, to continuously monitor the insulation level to earth and to operate an alarm in the engine control room, or equivalent attended position, in the event of an abnormally low level of insulation resistance, *see also* Ch 1,4.2.

5.4.2 Where any insulated lower voltage system is supplied through transformers from a high voltage system, adequate precautions are to be taken to prevent the low voltage system being charged by capacitive leakage from the high voltage system.

5.4.3 Tankers designed in accordance with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features* (*see* 14.1.2) are to meet the requirements of 5.3 of that Standard.

5.4.4 Where filters are fitted, for example to reduce EMC susceptibility, these are not to cause distribution systems to be unintentionally connected to earth.

5.5 Earthed distribution systems

5.5.1 No fuse, non-linked switch or non-linked circuit-breaker is to be inserted in an earthed conductor. Any switch or circuit-breaker fitted is to operate simultaneously in the earthed conductor and the insulated conductors. These requirements do not preclude the provision (for test purposes) of an isolating link to be used only when the other conductors are isolated.

5.5.2 For high voltage systems, where the earthed neutral system of generation and primary distribution is used, earthing is to be through an impedance in order to limit the total earth fault current to a magnitude which does not exceed that of the three phase short-circuit current for which the generators are designed.

5.5.3 Generator neutrals may be connected in common, provided that the third harmonic content of the voltage waveform of each generator does not exceed five per cent.

5.5.4 Where a switchboard is split into sections operated independently or where there are separate switchboards, neutral earthing is to be provided for each section or for each switchboard. Means are to be provided to ensure that the earth connection is not removed when generators are isolated.

5.5.5 A means of isolation is to be fitted in the earthing connection of each generator so that generators can be completely isolated for maintenance.

5.5.6 All earthing impedances are to be connected to the hull. The connections to the hull are to be so arranged that any circulating currents in the earth connections do not interfere with radio, radar, communication and control equipment circuits.

5.5.7 Tankers designed in accordance with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features* (*see* 14.1.2) are to meet the requirements of 5.3 of that Standard.

5.6 Diversity factor

5.6.1 Circuits supplying two or more final sub-circuits are to be rated in accordance with the total connected load subject, where justified, to the application of a diversity factor. Where spare ways are provided on a section or distribution board, an allowance for future increase of load is to be added to the total connected load before application of any diversity factor.

5.6.2 A diversity factor may be applied to the calculation for size of cable and rating of switchgear and fusegear, taking into account the duty cycle of the connected loads and the frequency and duration of any motor starting loads.

5.6.3 For winches and crane motors the diversity factor is to be calculated and submitted when required.

5.7 Lighting circuits

5.7.1 Lighting circuits are to be supplied by final sub-circuits separate from those for heating and power. This does not preclude the supply from a lighting circuit supplying a single fixed appliance, such as a cabin fan, a dry shaver, a wardrobe or anti-condensation heater, taking a maximum current of 2 A.

5.7.2 Lighting for the following spaces is to be supplied from at least two final sub-circuits in such a way that failure of one of the circuits does not leave the space in darkness. One of these circuits may be an emergency circuit provided it is normally energised.

- Spaces that are required to be lit for the safe working of the ship, such as control stations, normal working spaces, etc.
- Spaces where there may be a hazard due to movement of crew, passengers and/or equipment, such as in corridors, working passage ways, stairways leading to boat decks, public rooms, etc.
- Spaces where there may be a hazard due to moving machinery and hot parts, such as in machinery spaces, workshops, large galleys, laundries, etc.

5.7.3 Lighting for enclosed hazardous spaces is to be supplied from at least two final sub-circuits to permit light from one circuit to be retained while maintenance is carried out on the other. One of these circuits may be an emergency circuit, provided it is normally energised in which case the arrangements are to comply with Section 3.

5.7.4 Emergency lighting is to be fitted in accordance with Section 3, *see also* Section 18.

5.7.5 Lighting of unattended spaces, such as cargo spaces, is to be controlled by multipole linked switches situated outside such spaces. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

5.7.6 Where lighting circuits in the cargo pump-rooms of tankers are also used for emergency lighting, and have been interlocked with the ventilation, the interlocking arrangements are:

- not to cause the lighting to go out following a failure of the ventilation system; and
- not to prevent operation of the emergency lighting following the loss of the main source of electrical power.

5.8 Motor circuits

5.8.1 A separate final sub-circuit is to be provided for every motor for essential services, *see* 1.6.1.

5.9 Motor control

5.9.1 Every electric motor is to be provided with efficient means for starting and stopping so placed as to be easily operated by the person controlling the motor. Every motor above 0,5 kW is to be provided with control apparatus as given in 5.9.2 to 5.9.4.

5.9.2 Means to prevent undesired restarting after a stoppage due to low volts or complete loss of volts are to be provided. This does not apply to motors where a dangerous condition might result from the failure to restart automatically, e.g., steering gear motor.

5.9.3 Means for automatic disconnection of the supply in the event of excess current due to mechanical overloading of the motor are to be provided, *see also* 6.10.

5.9.4 Motor controlgear is to be suitable for the starting current and for the full load rated current of the motor.

■ *Section 6* System design – Protection

6.1 General

6.1.1 Installations are to be protected against over-currents including short-circuits, and other electrical faults. The tripping/fault clearance times of the protective devices are to provide complete and co-ordinated protection to ensure:

(a) availability of essential and emergency services under fault conditions through discriminative action of the protective devices; as far as practicable the arrangements are also to secure the availability of other services;
(b) elimination of the fault to reduce damage to the system and hazard of fire.

6.1.2 Short-circuit and overload protection are to be provided in each non-earthed line of each system of supply and distribution, unless exempted under the provisions of any paragraph in this Section.

6.1.3 The protection of circuits is to be such that a fault in a circuit does not cause the interruption of supplies used to provide emergency or essential services other than those dependent on the circuit where the fault occurred. For circuits used to provide essential services which need not necessarily be in continuous operation to maintain propulsion and steering but which are necessary for maintaining the vessel's safety, arrangements that ensure that a fault in a circuit does not cause the sustained interruption of supply to healthy circuits may be accepted. Such arrangements are to ensure the supply to healthy circuits is automatically re-established in sufficient time after a fault in a circuit.

6.1.4 Protection systems are to be developed using a systematic design procedure incorporating verification and validation methods to ensure successful implementation of the requirements above. Details of the procedures used are to be submitted when requested. An approved copy of the details required by 1.2.5 and 1.2.6 is to be retained on board and made available to the Surveyor on request. Access to protection relays setpoints is to be restricted, such that they will generally only be adjusted by authorised personnel to avoid accidental operation. A record is to be kept of the initial setpoints and any subsequent changes made to them. These details are to be made available to the Surveyor on request.

6.1.5 Short-circuit protection is to be provided for each source of power and at each point at which a distribution circuit branches into two or more subsidiary circuits.

6.1.6 Where protection for generator power circuits is provided at the associated switchboard, the cabling between generator and switchboard is to be of a type, and installed in a manner such as to minimise the risk of short-circuit.

6.1.7 Protection for battery circuits is to be provided at a position external and adjacent to the battery compartments. Where arrangements comply with 12.3.5, the protection may be installed at a suitable location in the battery compartment.

6.1.8 Protection may be omitted from the following:

(a) Engine starting battery circuits.
(b) Circuits for which it can be shown that the risk resulting from spurious operation of the protective device may be greater than that resulting from a fault.

6.1.9 Short-circuit protection may be omitted from cabling or wiring to items of equipment internally protected against short-circuit or where it can be shown that they are unlikely to fail to a short-circuit condition and where the cabling or wiring is installed in a manner such as to minimise the risk of short-circuit.

6.1.10 Overload protection may be omitted from the following:

(a) one line of circuits of the insulated type;
(b) circuits supplying equipment incapable of being overloaded, or overloading the associated supply cable, under normal conditions, and unlikely to fail to an overload condition.

6.2 Protection against short-circuit

6.2.1 Protection against short-circuit currents is to be provided by circuit-breakers or fuses.

6.2.2 The rated short-circuit making and breaking capacity of every protective device is to be adequate for the prospective fault level at its point of installation; the requirements for circuit-breakers and fuses are detailed in 6.5 and 6.6 respectively.

6.2.3 The prospective fault current is to be calculated for the following set of conditions:

(a) all generators, motors and, where applicable, all transformers, connected as far as permitted by any interlocking arrangements;
(b) a fault of negligible impedance close up to the load side of the protective device.

6.2.4 In the absence of precise data, the prospective fault current may be taken to be:

(a) for alternating current systems at the main switchboard: 10 x f.l.c. (rated full load current) for each generator that may be connected, or, if the subtransient direct axis reactance, X''_d, of each generator is known,

$$\frac{\text{f.l.c.}}{X''_d\ \text{(p.u.)}}$$ for each generator, and 3 x f.l.c. for motors simultaneously in service.

The value derived from the above is an approximation to the r.m.s. symmetrical fault current; the peak asymmetrical fault current may be estimated to be 2,5 times this figure (corresponding to a fault power factor of approximately 0,1).

(b) battery-fed direct current systems at the battery terminals:
  (i) 15 times ampere hour rating of the battery for vented lead-acid cells, or of alkaline type intended for discharge at low rates corresponding to a battery duration exceeding three hours, or
  (ii) 30 times ampere hour rating of the battery for sealed lead-acid cells having a capacity of 100 ampere hours or more, or of alkaline type intended for discharge at high rates corresponding to a battery duration not exceeding three hours and,
  (iii) 6 x f.l.c. for motors simultaneously in service (if applicable).

6.3 Protection against overload

6.3.1 The characteristics of protective devices provided for overload protection are to ensure that cabling and electrical machinery are protected against overheating resulting from mechanical or electrical overload.

6.3.2 Fuses of a type intended for short-circuit protection only (e.g., fuse links complying with IEC 60269-1: *Low-voltage fuses – Part 1: General requirements*, of type 'a') are not to be used for overload protection.

6.4 Protection against earth faults

6.4.1 Every distribution system that has an intentional connection to earth, by way of an impedance, is to be provided with a means to continuously monitor and indicate the current flowing in the earth connection.

6.4.2 If the current in the earth connection exceeds 5 A there is to be an alarm and the fault current is to be automatically interrupted or limited to a safe value.

6.4.3 The rated short-circuit capacity of any device used for interrupting earth fault currents is to be not less than the prospective earth fault current at its point of installation.

6.4.4 Insulated neutral systems with harmonic distortion of the voltage waveform, which may result in earth fault currents exceeding the level given in 6.4.2 because of capacitive effects, are to be provided with arrangements to isolate the faulty circuit(s).

6.5 Circuit-breakers

6.5.1 Circuit-breakers for alternating current systems are to satisfy the following conditions:

(a) the r.m.s. symmetrical breaking current for which the device is rated is to be not less than the r.m.s. value of the a.c. component of the prospective fault current, at the instant of contact separation (i.e., first half cycle, or time of interruption where an intentional time delay is provided to ensure suitability);

(b) the peak asymmetrical making current for which the device is rated is not to be less than the peak value of the prospective fault current at the first half cycle, allowing for maximum asymmetry;

(c) the power factor at which the device short-circuit ratings are assigned is to be no greater than that of the prospective fault current; alternatively for high voltage, the rated percentage d.c. component of the short-circuit breaking current of the device is to be not less than that of the prospective fault current.

6.5.2 Circuit-breakers for d.c. systems are to have a breaking current not less than the initial prospective fault current. The time constant of the fault current is not to be greater than that for which the circuit-breaker was tested.

6.5.3 The fault ratings considered in 6.5.1 and 6.5.2, are to be assigned on the basis that the device is suitable for further use after fault clearance.

6.5.4 Circuit-breaker selection is, and ratings are, to be in accordance with the relevant requirements of IEC 60092-202: *Electrical installations in ships – Part 202: System design – Protection*. Alternative methods acceptable to LR of selecting suitable circuit-breakers may be considered.

6.6 Fuses

6.6.1 Fuses for a.c. systems are to have a breaking current rating not less than the initial r.m.s. value of the a.c. component of the prospective fault current.

6.6.2 Fuses for d.c. systems are to have a d.c. breaking current rating not less than the initial value of the prospective fault current.

6.7 Circuit-breakers requiring back-up by fuse or other device

6.7.1 The use of a circuit-breaker having a short-circuit current capacity less than the prospective short-circuit current at the point of installation is permitted, provided that it is preceded by a device having at least the necessary short-circuit capacity. The generator circuit-breakers are not to be used for this purpose.

6.7.2 The same device may back up more than one circuit-breaker provided that no essential or emergency service is supplied from there, or that any such service is duplicated by arrangements unaffected by tripping of the device.

6.7.3 The combination of back-up device and circuit-breaker is to have a short-circuit performance at least equal to that of a single circuit-breaker satisfying the requirements of 6.5.

6.7.4 Evidence of testing of the combination is to be submitted for consideration; alternatively, consideration may be given to arrangements where it can be shown that:

(a) the takeover current, above which the back-up device would clear a fault, is not greater than the rated short-circuit breaking capacity of the circuit-breaker and;
(b) the characteristics of the back-up device, and the prospective fault level, are such that the peak fault current rating of the circuit-breaker cannot be exceeded and;
(c) the Joule integral of the let-through current of the back-up device does not exceed that corresponding to the rated breaking current and opening time of the circuit-breaker.

6.8 Protection of generators

6.8.1 The protective gear required by 6.8.2 and 6.8.3 is to be provided as a minimum.

6.8.2 Generators not arranged to run in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of short-circuit, overload or under-voltage, all insulated poles. In the case of generators rated at less than 50 kW, a multipole linked switch with a fuse, complying with 5.3.2, in each insulated pole will be acceptable.

6.8.3 Generators arranged to operate in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an under-voltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in accordance with the characteristics of the prime mover; a fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the breakers.

6.8.4 The generator circuit-breaker short-circuit and overload tripping arrangements, or fuse characteristics, are to be such that the machine's thermal withstand capability is not exceeded.

6.8.5 Generators having a capacity of 1500 kVA or above are to be equipped with a protective device which, in the event of a short-circuit in the generator or in the cables between the generator and its circuit-breaker, will instantaneously open the circuit-breaker and de-excite the generator.

6.8.6 The voltage and time delay settings of the under-voltage release mechanism(s) required by 6.8.2 and 6.8.3 are to be chosen to ensure that the discriminative action required by 6.1.1(a) is maintained.

6.9 Load management

6.9.1 Arrangements are to be made to disconnect automatically, after an appropriate time delay, circuits of the following categories, when the generator(s) is/are overloaded, sufficient to ensure the connected generating set(s) is/are not overloaded:
(a) non-essential circuits;
(b) circuits feeding services for habitability, *see* 1.6.2;
(c) in cargo ships, circuits for cargo refrigeration.

NOTE
For emergency generators *see* 3.2.14 and 3.3.14 as applicable.

6.9.2 If required, this load switching may be carried out in one or more stages, in which case the non-essential circuits are to be included in the first group to be disconnected.

6.9.3 The load management of power systems supplying electric propulsion motors is to satisfy the requirements of 16.3.

6.9.4 Consideration is to be given to providing means to inhibit automatically the starting of large motors, or the connection of other large loads, until sufficient generating capacity is available to supply them.

6.10 Feeder circuits

6.10.1 Isolation and protection of each feeder circuit is to be ensured by a multipole circuit-breaker or linked switch with a fuse in each insulated conductor. Protection is to be in accordance with 6.2 and 6.3. The protective devices are to allow excess current to pass during the normal accelerating period of motors.

6.11 Motor circuits

6.11.1 Motors of rating exceeding 0,5 kW and all motors for essential services are to be protected individually against overload and short-circuit. For motors which for essential services are duplicated, the overload protection may be replaced by an overload alarm; arrangements for steering gear motors are to comply with 14.1.

6.11.2 Protection for both the motor and its supply cable may be provided by the same device, provided that due account is taken of any differences between ratings of cable and motor.

6.11.3 Where operation of an item of equipment is dependent upon a number of motors, consideration may be given to the provision of a common means of short-circuit protection.

6.11.4 For motors for intermittent service, the characteristics of the arrangements for overload protection are to be chosen in relation to the load factor(s) of the motor(s).

6.11.5 Where fuses are used to protect polyphase motor circuits, means are to be provided to protect the motor from unacceptable overcurrent in the case of single phasing.

6.12 Protection of transformers

6.12.1 Short-circuit protection for transformers is to be provided by circuit-breakers or fuses in the primary circuit and in addition, overload protection is to be provided either in the primary or secondary circuit.

6.12.2 Arrangements are to be made to prevent the primary windings of transformers being inadvertently energised from their secondary side when disconnected from their source of supply.

6.13 Harmonic filters

6.13.1 Harmonic filters' final sub-circuits are to be protected individually against overload and short-circuit.

6.13.2 An alarm is to be initiated in the event of protective device operation.

6.13.3 Where parallel harmonic filters are used, an alarm is to be initiated in the event of current imbalance that could lead to failure of a harmonic filter.

■ *Section 7* Switchgear and controlgear assemblies

7.1 General requirements

7.1.1 Switchgear and controlgear assemblies and their components are to comply with one of the following standards, amended where necessary for ambient temperature and other environmental conditions:

(a) IEC 61439: *Low-voltage switchgear and controlgear assemblies* (relevant parts);
(b) IEC *62271-200: High-voltage switchgear and controlgear – Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV*;
(c) IEC 62271-201: *High-voltage switchgear and controlgear — Part 201: AC insulation-enclosed switchgear and control gear for rated voltages above 1 kV and up to and including 52 kV;*
(d) IEC 60255: *Measuring relays and protection equipment*;
(e) acceptable and relevant National Standard.

In addition, the requirements of 7.2 to 7.19 are to be complied with.

7.2 Busbars

7.2.1 Busbars and their connections are to be of copper or aluminium, all connections being so made as to inhibit corrosion/oxidisation between current-carrying mating faces, which may result in poor electrical contact giving rise to overheating. Busbars and their supports are to be designed to withstand the mechanical stresses which may arise during short-circuits. A test report or calculation to verify the short-circuit withstand strength of the busbar system is to be submitted for consideration when required.

7.2.2 For bare conductors, where no precautions are taken against surface oxidisation, the temperature rise limit at rated normal current is not to exceed 45°C. Where suitable precautions are taken against surface oxidisation, e.g., by using silver, nickel or tin coated terminations, a temperature rise limit not exceeding 60°C is permitted. Where the busbar temperature rises are above 45°C it is to be ensured that there is no adverse effect on equipment adjacent to and/or connected to the busbars and that the temperature rise limits of any materials in contact with the busbars are not exceeded. A test report or calculation to verify the rated current assigned to the busbar system is to be submitted for consideration when required.

7.3 Circuit-breakers

7.3.1 Circuit-breakers are to comply with one of the following standards amended where necessary for ambient temperature:

(a) IEC 60947-2: *Low-voltage switchgear and controlgear – Part 2: Circuit-Breakers*; or
(b) IEC 62271-100: *High-voltage switchgear and controlgear – Part 100: Alternating current circuit-breakers;* or
(c) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a circuit-breaker are to be submitted for consideration when required.

7.3.2 Circuit-breakers are to be capable of isolation.

7.3.3 Circuit-breakers are to be of the trip free type and, where applicable, be fitted with anti-pumping control.

7.3.4 High-voltage circuit-breakers are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

7.3.5 Where the means of setting adjustable protection characteristics are not durably marked and locked in position and cannot be visually inspected (e.g., electronic storage), the settings of characteristics are to be recorded and a copy of the records included in the details retained on board, *see* 6.1.4.

7.3.6 Air circuit-breakers for essential or emergency services and rated at 800 A and above are to have a cumulative count kept of the switching operations of the electrical contacts. This count, along with the manufacturer's details for the circuit-breaker, including the maximum number of switching operations for the electrical contacts, is to be retained on board. These details are to be made available to the Surveyor on request.

7.4 Contactors

7.4.1 High-voltage contactors are to comply with one of the following standards amended where necessary for ambient temperature:

(a) IEC 62271-106: *High-voltage switchgear and controlgear – Part 106: Alternating current contactors, contactor-based controllers and motor-starters*; or
(b) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a contactor are to be submitted for consideration when required.

7.4.2 High-voltage contactors are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

7.5 Creepage and clearance distances

7.5.1 The shortest distances between conductive parts and between conductive parts and earth, in air or along the surface of an insulating material, are to be suitable for the rated voltage having regard to:

- the nature of the insulating material;
- the transient over voltages developed by switching and fault conditions; and
- the environment into which the assembly will be installed.

Each assembly type is to be subjected to an impulse voltage test in accordance with its constructional Standard or, alternatively, the minimum distances for bare conductive parts in switchgear and control gear assemblies given in Table 2.7.1 are to be used.

Table 2.7.1 Minimum clearance distances

Nominal voltage (V)	Minimum clearance distance (mm)		
	Verified assemblies, *see* Note 2		Non-verified assemblies
	Main switchboards	Other switchgear and control gear	Main switchboards and other switch and control gear
≤ 250 (*see* Note 1)	8	8	15
≤ 690 (*see* Note 1)	8	8	20
≤ 1000 (*see* Note 1)	8	8	25
< 3,300	32	26	55
< 6,600	60	50	90
< 11,000	100	80	120
≤15,000	*See* Note 3	*See* Note 3	160

NOTES
1. For assemblies installed in spaces where the pollution degree is > 3, *see* 7.5.2.
2. For the verification requirements for a verified assembly refer to IEC 61439-2.
3. Clearance distances with reference to the applicable relevant National or International Standards, are to be submitted for approval, *see* 1.3.4.

7.5.2 For assemblies with a rated voltage of up to and including 1kV, the requirement of 7.5.1 may be met by complying with IEC 60092-302 *Electrical installations in ships – Part 302: Low-voltage switchgear and control gear assemblies*.

- Tables 2.7.1 and 2.7.2 indicate the minimum clearance and creepage distances normally allowed.
- For assemblies installed in spaces where the environmental conditions are in excess of pollution degree 3 (that is conductive pollution occurs or dry, non conductive pollution occurs which is expected to be conductive due to condensation) as defined in IEC 61439-1, *Low-voltage switchgear and control gear assemblies – Part 1: General requirements*; the clearance distances for non-verified assemblies are to be used.
- A minimum creepage distance of 16 mm is permitted for assemblies verified in accordance with the requirements of IEC 61439-2, *Low-voltage switchgear and control gear assemblies – Part 2: Power switchgear and control gear assemblies*.
- An alternative relevant National or International Standard may be used when an acceptable justification is submitted as part of the documentation required by 1.3.4.

7.5.3 For assemblies with a rated voltage above 1kV, the requirement of 7.5.1 may be met by complying with IEC 60092-503 *Electrical installations in ships – Part 503: Special features – AC supply systems with voltages in the range of above 1 kV up to and including 15 kV*.

- Tables 2.7.1 and 2.7.2 indicate the minimum clearance and creepage distances normally allowed.
- For main switchboards rated at above 1kV, a minimum clearance distance of 25 mm is required for busbars and other bare conductors.

An alternative relevant National or International Standard may be used when an acceptable justification is submitted as part of the documentation required by 1.3.4.

Table 2.7.2 Minimum creepage distances

Nominal voltage (V)	Minimum creepage distance (mm)	
	Main switchboards	Other switchgear and control gear
≤ 250 (*see* Note 1)	20	20
≤ 690 (*see* Note 1)	25	25
≤ 1000 (*see* Note 1)	35	35
< 3,300	48	*See* Note 2
< 6,600	90	70
< 11,000	150	120
≤15,000	*See* Note 2	*See* Note 2

NOTES
1. For verified assemblies a minimum creepage distance of 16 mm is permitted for LV switchboards, *see* 7.5.2.
2. Creepage distances, with reference to the applicable relevant National or International Standards, are to be submitted for approval, *see* 1.3.3.

7.5.4 Suitable shrouding or barriers are to be provided in way of connections to equipment, where necessary, to maintain the minimum distances in Table 2.7.1.

7.6 Degree of protection

7.6.1 Low voltage assemblies where the rated voltage between conductors or to earth exceeds 55 V a.c. or 250 V d.c. are to be of the deadfront or enclosed type. High-voltage assemblies are to be of the enclosed type.

7.6.2 Where switchboards or section boards are required to comply with 5.2.2, barriers are to be installed to provide protection for the independent sections against contamination due to the products of arcing, which may result in a fault.

7.7 Distribution boards

7.7.1 Distribution boards are to be suitably enclosed unless they are installed in a cupboard or compartment to which only authorised persons have access in which case the cupboard may serve as an enclosure, *see* 7.16.4.

7.8 Earthing of high-voltage switchboards

7.8.1 High-voltage switchboards are to be provided with suitable means to earth isolated circuits so that they are discharged and so maintained that they are safe to touch.

7.8.2 Protective shutters associated with withdrawable parts are to be clearly marked to indicate the incoming and outgoing circuits and bus tie connections. The colour coding shall be as follows:
- Incoming (busbar side) – red;
- Outgoing (circuit side) – yellow; and
- Bus ties – red.

7.9 Fuses

7.9.1 Fuses are to comply with one of the following Standards, amended where necessary for ambient temperature:
(a) IEC 60269 (all parts): *Low-voltage fuses*;
(b) IEC 60282-1: *High-voltage fuses – Part 1: Current-limiting fuses*;
(c) acceptable and relevant National Standard for enclosed current-limiting fuses.
Type test reports to verify the characteristics of a fuse are to be submitted for consideration when required.

7.10 Handrails or handles

7.10.1 All main and emergency switchboards are to be provided with an insulated handrail or insulated handles suitably fitted on the front of the switchboard. Where access to the rear is required, a horizontal insulated handrail is to be suitably fitted on the rear of the switchboard.

7.11 Instruments for alternating current generators

7.11.1 For alternating current generators not operated in parallel, each generator is to be provided with at least one voltmeter, one frequency meter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase. Generators above 50 kVA are also to be provided with a wattmeter.

7.11.2 For alternating current generators operated in parallel, each generator is to be provided with a wattmeter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase.

7.11.3 For parallelling purposes, two voltmeters, two frequency meters and two synchronising devices, of which one at least is to be a synchroscope or a set of lamps are to be provided. One voltmeter and one frequency meter are to be connected to the busbars, the other voltmeter and frequency meter are to be switched to enable the voltage and frequency of any generator to be measured. Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by two or more generators operating in parallel, the two synchronising devices are to be independent of each other *see also* 2.2.1.

7.11.4 The indicators and displays required by 7.11.1 to 7.11.3 are to be located and arranged such that they may be viewed at a single operating position. Where manual paralleling is provided, generators are to have controls to adjust their voltage and frequency located at the single operating position. Access to voltage adjustment is to be restricted, such that it will generally only be used by authorised personnel to avoid accidental operation.

7.11.5 Where the indications of voltage, frequency, current and power are displayed digitally, the indications are to be separately displayed.

7.12 Instrument scales

7.12.1 The upper limit of the scale of every voltmeter is to be approximately 120 per cent of the nominal voltage of the circuit, and the nominal voltage is to be clearly indicated.

7.12.2 The upper limit of the scale of every ammeter is to be approximately 130 per cent of the normal rating of the circuit in which it is installed. Normal full load is to be clearly indicated.

7.12.3 Kilowatt meters for use with alternating current generators which may be operated in parallel are to be capable of indicating 15 per cent reverse power.

7.12.4 Where the indications provided by the instrumentation required by 7.11 are displayed digitally, nominal voltage, over voltage, over current and reverse power indications are to be indicated by an appropriate means. The information provided is to be clearly visible and immediately available.

7.12.5 In general, indications provided by instrumentation which are displayed digitally are not to change more frequently than twice per second.

7.13 Labels

7.13.1 The identification of individual circuits and their devices is to be made on labels of durable material. The ratings of fuses and settings of protective devices are also to

be indicated. Section and distribution boards are to be marked with the rated voltage.

7.14 Protection

7.14.1 *See* Section 6.

7.15 Wiring

7.15.1 Insulated wiring connecting components are to be stranded, flame retardant and manufactured in accordance with a relevant and acceptable National Standard.

7.16 Position of switchboards

7.16.1 An unobstructed space not less than 1 m wide is to be provided in front of switchboards and section boards. When switchboards and section boards contain withdrawable equipment the unobstructed space is to be not less than 0,4 m wide with this equipment in its fully withdrawn position.

7.16.2 Where necessary, the space at the rear of switchboards and section boards is to be ample to permit maintenance and in general not less than 0,6 m except that this may be reduced to 0,5 m in way of stiffeners or frames.

7.16.3 The spaces defined in 7.16.1 and 7.16.2 are to have non-slip surfaces. Where access to live parts within switchboards and section boards is normally possible the surface is, in addition, to be electrically insulated.

7.16.4 So far as is practicable, pipes are not to be installed directly above or in front of or behind switchboards, section boards and distribution boards. If such placing is unavoidable, suitable protection is to be provided in these positions, *see* Pt 5, Ch 13,2.

7.16.5 For switchgear and controlgear assemblies, for rated voltages above 1 kV, arrangements are to be made to protect personnel in the event of gases or vapours escaping under pressure as the result of arcing due to an internal fault. Where personnel may be in the vicinity of the equipment when it is energised, this may be achieved by an assembly that has been tested in accordance with Annex A of IEC 62271-200:2011: *High-voltage switchgear and controlgear – Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV* and qualified for classification **IAC** (internal arc classification).

7.17 Switchboard auxiliary power supplies

7.17.1 Where the operation of a protective device relies upon a power supply, an alarm is to be provided to indicate failure of the power supply, unless its failure causes automatic tripping of the protected circuit.

7.18 Testing

7.18.1 Tests in accordance with 7.18.2 to 7.18.4 are to be satisfactorily carried out on all assemblies, complete or in sections, at the manufacturer's premises, and a test report issued by the manufacturer, *see also* 1.4.2.

7.18.2 A high voltage test, *see* Section 21.

7.18.3 Calibration of protective devices and indicating instruments is to be verified by means of current and/or voltage injection.

7.18.4 Demonstration of the satisfactory operation of protection circuits, control circuits and interlocks by means of simulated functional tests.

7.18.5 For switchgear and controlgear assemblies, for rated voltages above 1 kV, type tests are to be carried out, in accordance with Annex A of IEC 62271-200:2011: *High-voltage switchgear and controlgear – Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV* and **IAC** (internal arc classification) assigned, to verify that the assembly will withstand the effects of an internal arc occurring within the enclosure at a prospective fault level equal to, or in excess of, that of the installation.

7.19 Disconnectors and switch-disconnectors

7.19.1 Disconnectors, switch-disconnectors and their components are to comply with one of the following standards, amended where necessary for ambient temperature and other environmental conditions:

(a) IEC 60947-3: *Low-voltage switchgear and controlgear – Part 3: Switches, disconnectors, switch-disconnectors and fuse-combination units*;
(b) IEC 62271-102: *High-voltage switchgear and controlgear – Part 102: High-voltage alternating current disconnectors and earthing switches*;
(c) acceptable and relevant National Standard.

Type test reports to verify the characteristics of a disconnector or switch-disconnector are to be submitted for consideration when required.

Section 8
Protection from electric arc hazards within electrical equipment

8.1 General

8.1.1 An assessment is to be carried out in accordance with 8.2.1 for all electrical equipment within which an arcing fault could occur, such as:
- harmonic filters;
- motor starter panels;
- semiconductor converters;
- switchboards, section boards and distribution boards; or
- transformers.

8.2 Hazard identification and assessment

8.2.1 An assessment is to be carried out to identify the hazards and their consequences for personnel resulting from electric arcs within the electrical equipment identified in 8.1.1. The purpose of the assessment is to demonstrate that the design incorporates adequate measures to reduce the risk of injury to personnel should an arcing fault occur within the electrical equipment, and that this will help to ensure both personnel and ship safety.
Details of the following are to be submitted:
(a) each task to be performed, e.g., switching, equipment maintenance, instrument observation or cleaning;
(b) the hazards to personnel that could result from an electric arc occurring during each task, and the hazards to personnel that could result from the electric arc;
(c) the methods to be used to help to prevent electric arcs; and
(d) the methods to be used to protect personnel from hazards resulting from electric arcs within electrical equipment.

8.3 Calculations to be submitted

8.3.1 The following calculations are to be conducted and used in the hazard identification and assessment:
(a) calculations of the maximum current that would flow through an electric arc between each conductor and its adjacent conductor, and between each conductor and the exposed conductive parts of the enclosure, in the case of an arcing fault;
(b) the maximum incident energy at the intended working distance in the case of an arcing fault; and
(c) the distance from each conductor at which the incident energy would be 5 Joules (1,2 calories) per centimetre squared in the case of an arcing fault when the enclosure door is open.
These calculations may be made in accordance with a relevant Standard acceptable to LR, for example, IEEE Standard 1584, *IEEE Guide for Performing Arc-Flash Hazard Calculations*.

8.4 Testing and trials

8.4.1 It is to be demonstrated that, where provided, arrangements to detect arcing faults function correctly.

Section 9
Rotating machines

9.1 General requirements

9.1.1 Rotating machines are to comply with the relevant parts of IEC 60092: *Electrical installations in ships* or an acceptable and relevant National Standard, and the requirements of this Section.

9.1.2 For all the rotating machines a manufacturer's test certificate is to be provided, *see also* 1.4.2 to 1.4.4.

9.1.3 All machines of 100 kW and over, intended for essential services, are to be surveyed by the Surveyor during manufacture and test.

9.1.4 Shaft materials for rotating machines for essential services are to comply with the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) and be manufactured under LR survey for the following applications:
(a) shaft material for dynamic positioning and electric propulsion motors;
(b) shaft material for main engine driven generators where the shaft is part of the propulsion shafting; and
(c) shaft material for machines with power ratings of 250 kW or greater.
Shaft material for machines with power ratings less than 250 kW is to have a manufacturer's certificate as detailed in Chapter 1 of the Rules for Materials.

9.1.5 Where welding is applied to shafts of machines for securing arms or spiders, stress relieving is to be carried out after welding. The finalised assembly is to be visually examined by the Surveyors, crack detection carried out by an appropriate method and the finished welds found sound and free from cracks.

9.1.6 The rotating parts of machines are to be so balanced that when running at any speed in the normal working range the vibration does not exceed the levels of IEC 60034-14: *Rotating electrical machines – Part 14: Mechanical vibration of certain machines with shaft heights 56 mm and higher – Measurement, evaluation and limits of vibration severity*.

9.1.7 The lubrication arrangement for bearings are to be effective under all operating conditions including the maximum ship inclinations defined by 1.10 and there are to be effective means provided to ensure that lubricant does not reach the machine windings or other conductors and insulators.

9.1.8 Means are to be taken to prevent the ill effects of the flow of currents circulating between the shaft and machine bearings or bearings of connected machinery.

9.1.9 Alternating current machines are to be constructed such that, under any operating conditions, they are capable of withstanding the effects of a sudden short-circuit at their terminals without damage.

9.1.10 Propulsion motors, and generators that form part of electrical propulsion systems, are to have at least one embedded temperature detector (ETD) in each phase of the machine winding in locations which may be subjected to the highest temperature. Where there are two coil sides per slot the ETD's are to be located between the insulated coil sides in the slot, *see* 16.1.3.

9.1.11 A high bearing temperature alarm is to be provided for generators of 100 kW and above, and electric propulsion motors, which are supplied with forced lubrication.

9.1.12 A low lubricating oil pressure alarm is to be provided for generators and electric propulsion motors that are supplied with forced lubrication.

9.1.13 A high lubricating oil temperature alarm is to be provided for electric propulsion motors that are supplied with forced lubrication.

9.1.14 For high voltage machines, the stator insulation system is to be of a type that has undergone sample testing in accordance with the following International Standards, or relevant alternatives acceptable to LR, to demonstrate its suitability for the operating voltage in the presence of an LR Surveyor:

(a) IEC 60894, *Guide for test procedure for the measurement of loss tangent of coils and bars for machine windings*, at the insulation class rated temperature; and
(b) IEC 60034-15: *Rotating electrical machines – Part 15: Impulse voltage withstand levels of form-wound stator coils for rotating a.c. machines*, with power-frequency voltage withstand testing conducted.

Test samples are to be representative in terms of the number and size of conductors, coil construction, combination of materials and manufacturing process.

9.1.15 For testing required by 9.1.14 on coils relating to global vacuum pressure impregnated systems, test samples representing the unimpregnated state and the impregnated state of the final winding and stator core are to be used as appropriate for testing.

9.2 Rating

9.2.1 Generators, including their excitation systems, and continuously rated motors are to be suitable for continuous duty at their full rated output at maximum cooling air or water temperature for an unlimited period, without the limits of temperature rise in 9.3 being exceeded. Generators are to be capable of an overload power of not less than 10 per cent at their rated power factor for a period of 15 minutes without injurious heating. Other machines are to be rated in accordance with the duty which they have to perform and, when tested under rated load conditions, the temperature rise is not to exceed the values in 9.3.

9.2.2 When a rotating machine is connected to a supply system with harmonic distortion the rating of the machine is to allow for the increased heating effect of the harmonic loading.

9.2.3 The design and construction of smoke extraction fan motors are to be suitable for the ambient temperature and operating time required. Type test reports to verify the performance of the electric motor are to be submitted for consideration.

9.3 Temperature rise

9.3.1 The limits of temperature rise specified in Table 2.9.1, are based on the cooling air temperature and cooling water temperature given in 1.9.

9.3.2 If it is known that the temperature of cooling medium exceeds the values given in 1.9 the permissible temperature rise is to be reduced by an amount equal to the excess temperature of the cooling medium.

9.3.3 If it is known that the temperature of cooling medium will be permanently less than the values given in 1.9 the permissible temperature rise may be increased by an amount equal to the difference between the declared temperature and that given in 1.9 up to a maximum of 15°C.

9.4 Generator control

9.4.1 Each alternating current generator, unless of the self-regulating type, is to be provided with automatic means of voltage regulation; voltage build-up is not to require an external source of power. Provision is to be made to safeguard the distribution system should there be a failure of the voltage regulating system resulting in a high voltage.

9.4.2 The voltage regulation of any alternating current generator with its regulating equipment is to be such that at all loads, from zero to full load at rated power factor, the rated voltage is maintained within ±2,5 per cent under steady conditions. There is to be provision at the voltage regulator to adjust the generator no load voltage.

9.4.3 Generators, and their excitation systems, when operating at rated speed and voltage on no-load are to be capable of absorbing the suddenly switched, balanced, current demand of the largest motor or load at a power factor not greater than 0,4 with a transient voltage dip which does not exceed 15 per cent of rated voltage. The voltage is to recover to rated voltage within a time not exceeding 1,5 seconds.

9.4.4 The transient voltage rise at the terminals of a generator is not to exceed 20 per cent of rated voltage when rated kVA at a power factor not greater than 0,8 is thrown off.

Table 2.9.1 Limits of temperature rise of machines cooled by air

Limits of temperature rise of machines cooled by air, °C						
Part of machine	Method of temperature measurement	Insulation class				
		A	E	B	F	H
1. (a) a.c. windings of machines having output of 5000 kVA or more	ETD R	55 50	– –	75 70	95 90	115 110
(b) a.c. windings of machines having output of less than 5000 kVA	ETD R	55 50	– 65	80 70	100 95	115 110
2. Windings of armatures having commutators	R T	50 40	65 55	70 60	95 75	115 95
3. Field windings of a.c. and d.c. machines having d.c. excitation other than those in item 4	R T	50 40	65 55	70 60	95 75	115 95
4. (a) Field windings of synchronous machines with cylindrical rotors having d.c. excitation	R	–	–	80	100	125
(b) Stationary field windings of d.c. machines having more than one layer	R T	50 40	65 55	70 60	95 75	115 95
(c) Low resistance field windings of a.c. and d.c. machine and compensating windings of d.c. machines having more than one layer	R, T	50	65	70	90	115
(d) Single-layer windings of a.c. and d.c. machines with exposed bare or varnished metal surfaces and single-layer compensating windings of d.c. machines	R, T	55	70	80	100	125
5. Permanently short-circuited insulated windings	T	50	65	70	90	115
6. Permanently short-circuited uninsulated windings	T	The temperature rise of these parts shall in no case reach such a value that there is a risk to any insulation or other materials on adjacent parts or to the item itself				
7. Magnetic cores and other parts not in contact with windings	T					
8. Magnetic cores and other parts in contact with windings	T	50	65	70	90	110
9. Commutators and slip-rings open and enclosed	T	50	60	70	80	90

NOTES
1. Where water cooled heat exchangers are used in the machine cooling circuit the temperature rises are to be measured with respect to the temperature of the cooling water at the inlet to the heat exchanger and the temperature rises given in this Table shall be increased by 10°C provided the inlet water temperature does not exceed the values given in 1.9.
2. T = thermometer method
   R = resistance method
   ETD = embedded temperature detector.
3. Temperature rise measurements are to use the resistance method whenever practicable.
4. The ETD method may only be used when the ETDs are located between coil sides in the slot.

9.4.5 Generators and their voltage regulation systems are to be capable of maintaining, without damage, under steady state short-circuit conditions a current of at least three times the full load rated current for a duration of at least two seconds or where precise data is available for the duration of any time delay which may be provided by a tripping device for discrimination purposes.

9.4.6 Generators required to run in parallel are to be stable from no load (kW) up to the total combined full load (kW) of the group, and load sharing is to be such that the load on any generator does not normally differ from its proportionate share of the total load by more than 15 per cent of the rated output (kW) of the largest machine or 25 per cent of the rated output (kW) of the individual machine, whichever is less.

9.4.7 When generators are operated in parallel, the kVA loads of the individual generating sets are not to differ from the proportionate share of the total kVA load by more than five per cent of the rated kVA output of the largest machines.

9.5 Overloads

9.5.1 Machines are to withstand on test, without injury, the following momentary overloads:

(a) **Generators**. An excess current of 50 per cent for 15 seconds after attaining the temperature rise corresponding to rated load, the terminal voltage being maintained as near the rated value as possible. The foregoing does not apply to the overload torque capacity of the prime mover.

(b) **Motors**. At rated speed or, in the case of a range of speeds, at the highest and lowest speeds, under gradual increase of torque, the appropriate excess torque given below. Synchronous motors and synchronous induction motors are required to withstand the excess torque without falling out of synchronism and without adjustment of the excitation circuit preset at the value corresponding to rated load:

d.c. motors	50 per cent for 15 seconds;
polyphase a.c. synchronous motors	50 per cent for 15 seconds;
polyphase a.c. synchronous induction motors	35 per cent for 15 seconds;
polyphase a.c. induction motors	60 per cent for 15 seconds.

(c) **Propulsion machines**. The overload tests for propulsion machines will be specially considered for each installation.

(d) **Windlasses**. For the design and testing of windlass electric motors, *see* Pt 3, Ch 13,8.8.

9.6 Machine enclosure

9.6.1 Where liquid-cooled heat exchangers are used in the machine cooling circuit there is to be provision to detect leakage of the liquid, and the system is to be arranged so as to prevent the entry of liquid into the machine.

9.7 Direct current machines

9.7.1 The final running position of brushgear is to be clearly and permanently marked.

9.7.2 Direct current machines are to work with fixed brush setting from no load to the momentary overload specified without injurious sparking.

9.8 Survey and testing

9.8.1 On machines for essential services tests are to be carried out and a certificate furnished by the manufacturer. The tests are to include temperature rise, momentary overload, high voltage, and commutation. The insulation resistance and the temperature at which it was measured are to be recorded, *see also* 1.4.2 to 1.4.4.

9.8.2 In the case of duplicate machines, type tests of temperature rise, excess current and torque and commutation taken on a machine identical in rating and in all other essential details may be accepted in conjunction with abbreviated tests on each machine. Type tests for propulsion machines will be specially considered, *see also* Section 16. For the abbreviated tests, each machine is to be run and is to be found electrically and mechanically sound and is to have a high voltage test and insulation resistance recorded.

9.8.3 A high voltage test, in accordance with Section 21, is to be applied to new machines, preferably at the conclusion of the temperature rise test. Where both ends of each phase are brought out to accessible separate terminals each phase is to be tested separately.

9.8.4 Survey during manufacture, *see* 1.4, is to be conducted prior to testing of the completed machine and is to include inspection of rotor and stator assemblies to assess compliance with the constructional requirements of the relevant standards and this Section.

9.8.5 For high voltage machines, a description of rotor and stator insulation system application procedures (taping, impregnation, pressing and curing, etc.) with application process records, including details of checks and tests conducted to verify successful application, is to be made available to the LR Surveyor during manufacture, *see also* 9.1.14.

9.8.6 Routine impulse tests are to be carried out on the coils of high voltage machines in accordance with IEC 60034-15: *Rotating electrical machines – Part 15: Impulse voltage withstand levels of form-wound stator coils for rotating a.c. machines*, in order to demonstrate a satisfactory withstand level of the inter-turn insulation to voltage surges. The test is to be carried out on all coils after they have been inserted in the slots and after wedging and bracing. Each coil shall be subjected to at least five impulses of injected voltage, the peak value of the injected voltage being given by the formula:

$V_{peak} = 2,45V$

where

V = rated line voltage r.m.s.

Alternative proposals to demonstrate the withstand level of inter-turn insulation will be considered.

■ Section 10
Converter equipment

10.1 Transformers

10.1.1 Paragraphs 10.1.2 to 10.1.13 apply to transformers rated for 5 kVA upwards.

10.1.2 Transformers are to comply with the requirements of IEC 60076 (all parts): *Power transformers*, or an acceptable and relevant National Standard amended where necessary for ambient temperature, *see* 1.9.

10.1.3 Transformers may be of the dry type, encapsulated or liquid-filled type.

10.1.4 The temperature rise of the winding of transformers above the ambient temperatures given in 1.9, when measured by resistance during continuous operation at the maximum rating, is not to exceed:

(a) For dry type transformers, air cooled:
insulation of Class A – 50°C
insulation of Class E – 60°C
insulation of Class B – 70°C
insulation of Class F – 90°C
insulation of Class H – 110°C

(b) For liquid filled transformers:
50°C – where air provides cooling of the fluid
65°C – where water provides cooling of the fluid.

10.1.5 When a transformer is connected to a supply system with harmonic distortion, the rating of the transformer is to allow for the increased heating effect of the harmonic loading. Special attention is to be given to transformers connected for the purpose of reducing harmonic distortion.

10.1.6 The inherent regulation of transformers at their rated output is to be such that the total voltage drop to any point in the installation does not exceed that allowed by 1.8.

10.1.7 Transformers, except those for motor starting, are to be double wound.

10.1.8 Liquid fillings for transformers are to be non-toxic and of a type which does not readily support combustion. Liquid filled transformers are to have a pressure relief device with an alarm and there is to be a suitable means provided to contain any liquid which may escape from the transformer due to the operation of the relief device or damage to the tank.

10.1.9 All transformers are to be capable of withstanding for two seconds, without damage, the thermal and mechanical effects of a short-circuit at the terminals of any winding.

10.1.10 When forced cooling is used, whether air or liquid, there is to be monitoring of the cooling medium and transformer winding temperatures with an alarm should these exceed preset limits. There are to be arrangements so that the load may be reduced to a level commensurate with the cooling available.

10.1.11 Transformers for propulsion power are to be provided with arrangements such that, in the event of excessive winding temperature, an alarm is initiated and:
- the load is reduced to a level commensurate with the cooling arrangements; or
- automatic shut-down of the transformer occurs.

10.1.12 Where liquid-cooled heat exchangers are used in transformer cooling circuits, there is to be provision to detect leakage of the liquid and the system is to be arranged so as to prevent the entry of liquid into the transformer.

10.1.13 The following tests are to be carried out on all transformers at the manufacturer's works, and a certificate of tests issued by the manufacturer, *see also* 1.4.2 and 1.4.3:
(a) measurement of winding resistances, voltage ratio, impedance voltage, short-circuit impedance, insulation resistance, load loss, no load loss and current;
(b) dielectric tests;
(c) temperature rise test on one transformer of each size and type; and
(d) where evidence of compliance with 10.1.9 is not submitted for consideration, short-circuit withstand on one transformer of each size and type.

10.2 Semiconductor converters

10.2.1 The requirements of 10.2.2 to 10.2.18 apply to semiconductor converters rated for 5 kW upwards.

10.2.2 Semiconductor converters are to comply with the requirements of IEC 60146 (all parts): *Semiconductor converters*, or an acceptable and relevant National Standard amended where necessary for ambient temperature, *see* 1.9.

10.2.3 Semiconductor static power converters are to be rated for the required duty having regard to peak loads, system transients and overvoltage.

10.2.4 Converter equipment may be air or liquid cooled and is to be so arranged that it cannot remain loaded unless effective cooling is maintained. Alternatively the load may be automatically reduced to a level commensurate with the cooling available.

10.2.5 Liquid cooled converter equipment is to be provided with leakage alarms and there is to be a suitable means provided to contain any liquid which may leak from the system in order to ensure that it does not cause an electrical failure of the equipment. Where the semiconductors and other current carrying parts are in direct contact with the cooling liquid, the liquid is to be monitored for satisfactory resistivity and an alarm initiated at the relevant control station should the resistivity be outside the agreed limits.

10.2.6 Where forced cooling is used there is to be temperature monitoring of the heated cooling medium with an alarm and shut-down when the temperature exceeds a preset value.

10.2.7 Cooling fluids are to be non-toxic and of low flammability.

10.2.8 Converter equipment is to be so arranged that the semiconductor devices, fuses, control and firing circuit boards may be readily removed from the equipment for repair or replacement.

10.2.9 Test and monitoring facilities are to be provided to permit identification of control circuit faults and faulty components.

10.2.10 Protection devices fitted for converter equipment protection are to ensure that, under fault conditions, the protective action of circuit-breakers, fuses or control systems is such that there is no further damage to the converter or the installation.

10.2.11 Converter equipment, including any associated transformers, reactors, capacitors and filters, if provided, is to be so arranged that the harmonic distortion, and voltage spikes, introduced in to the ship's electrical system are within the limits of 1.8.3 or restricted to a lower level necessary to ensure that it causes no malfunction of equipment connected to the electrical installation.

10.2.12 Overvoltage spikes or oscillations caused by commutation or other phenomena, are not to result in the supply voltage waveform deviating from a superimposed equivalent sine wave by more than 10 per cent of the maximum value of the equivalent sine wave.

10.2.13 When converter equipment is operated in parallel, load sharing is to be such that under normal operating conditions overloading of any unit does not occur and the

combination of paralleled equipment is stable throughout the operating range.

10.2.14 When converter equipment has parallel circuits there is to be provision to ensure that the load is distributed uniformly between the parallel paths.

10.2.15 Transformers, reactors, capacitors and other circuit devices associated with converter equipment, or associated filters, are to be suitable for the distorted voltage and current waveforms to which they may be subjected and filter circuits are to be provided with facilities to ensure that their capacitors are discharged before the circuits are energised.

10.2.16 Any regenerated power developed during the operation of converter equipment is not to result in disturbances to the supply system voltage and frequency which exceeds the limits of 1.8.

10.2.17 Where control systems form an integral part of semiconductor equipment, they are to be designed and manufactured with regard to the environmental conditions to which they will be exposed in service and their performance is to be demonstrated during the test and trials programme.

10.2.18 Tests at the manufacturer's works of converter equipment and any associated reactors or filters are to include the high voltage test of 21.1, a temperature rise test on one of each size and type of converter equipment, and such other tests as may be necessary to demonstrate the suitability of the equipment for its intended duty. Details of tests are to be submitted for consideration when required, *see also* 1.4.2.

10.3 Uninterruptible power systems

10.3.1 The requirements of this sub-Section apply to all uninterruptible power systems (UPS) intended to maintain essential services or provide emergency services. This sub-Section is in addition to the requirements of 10.1 to 10.2 and Section 12, as applicable.

10.3.2 UPS units are to be constructed in accordance with IEC 62040: *Uninterruptible power systems (UPS)* (all parts), or an acceptable and relevant National or International Standard.

10.3.3 The operation of a UPS is not to depend upon external services.

10.3.4 The type of UPS unit employed, whether off-line, line-interactive or on-line, is to be appropriate to the power supply requirements of the connected load equipment.

10.3.5 An external bypass, that is hardwired and manually operated, is to be provided for UPS to allow isolation of UPS for safety during maintenance and maintain continuity of load power.

10.3.6 UPS units are to be monitored and an audible and visual alarm is to be initiated in the navigating bridge or the engine control room, or an equivalent attended location for:

- power supply failure (voltage and frequency) to the connected load;
- earth fault;
- operation of battery protective device;
- battery discharge; and
- bypass in operation for on-line UPS units.

10.3.7 UPS units required to provide emergency services are to be suitably located for use in an emergency.

10.3.8 UPS units utilising valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the arrangements comply with 12.3.5. Ventilation arrangements in accordance with IEC 62040-1: *Uninterruptible power systems (UPS) – Part 1: General and safety requirements for UPS*, or an acceptable and relevant National or International Standard, may be considered to satisfy the requirements of 12.5.10.

10.3.9 Output power is to be maintained for the duration required for the connected equipment.

10.3.10 The UPS battery capacity is, at all times, to be capable of supplying the designated loads for the time specified. Where it is proposed that additional circuits are connected to the UPS unit, details verifying that the UPS unit has adequate capacity are to be submitted for consideration, *see* 1.5.

10.3.11 On restoration of the input power, the rating of the charge unit is to be sufficient to recharge the batteries while maintaining the output supply to the load equipment.

10.3.12 Tests at the manufacturer's works or after installation on board are to include such tests necessary to demonstrate, to the Surveyor's satisfaction, the suitability of the UPS unit for its intended duty and location. As a minimum the following tests are required:

- a temperature rise test;
- a battery capacity test;
- a ventilation rate test of both the equipment housing and the space into which it is to be located, *see also* 12.5; and
- functional testing, including operation of alarms.

Details of tests are to be submitted for consideration when required, *see also* 1.4.2.

10.3.13 Where the supply is to be maintained without a break following a power input failure, this is to be verified after installation by practical testing.

Section 11
Electric cables, optical fibre cables and busbar trunking systems (busways)

11.1 General

11.1.1 The requirements of 11.1 to 11.16 apply to all electric and optical fibre cables for fixed wiring unless otherwise exempted. The requirements of 11.17 apply to busbar trunking systems (busways) where they are used in place of electric cables.

11.1.2 Electric cables for fixed wiring are to be designed, manufactured and tested in accordance with the relevant IEC Standard stated in Table 2.11.1 or an acceptable and relevant National Standard.

Table 2.11.1 Electric cables

Application	IEC Standard	Title
General constructional and testing requirements	60092–350	Electrical installations in ships – Part 350: General construction and test methods of power, control and instrumentation cables for shipboard and offshore applications
Fixed power and control circuits	60092–353	Electrical installations in ships – Part 353: Power cables for rated voltages 1 kV and 3 kV
Fixed power circuits	60092–354	Electrical installations in ships – Part 354: Single- and three-core power cables with extruded solid insulation for rated voltages 6 kV (Um = 7,2 kV) up to 30 kV (Um = 36 kV)
Instrumentation, control and communication circuits up to 60 V	60092-370	Electrical installations in ships – Part 370: Guidance on the selection of cables for telecommunication and data transfer including radio-frequency cables
Control circuits and instrumentation up to 250 V	60092–376	Electrical installations in ships – Part 376: Cables for control and instrumentation circuits 150/250 V (300 V)
Mineral insulated	60702 (all parts)	Mineral insulated cables and their terminations with a rated voltage not exceeding 750 V

11.1.3 Details of optical fibre cables for fixed installation are to be submitted to assess compliance with applicable international or National Standards. These are to include:

- Flame retardancy;
- Fire resistance (if applicable);
- Smoke density;
- Halogen content;
- Mechanical properties;

Suitability for use in the marine environment.

11.1.4 Electric cables for electric propulsion systems are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 3* or, alternatively, surveyed by the Surveyors during manufacture and testing to assess compliance with the applicable International or National Standards and application of an acceptable quality management system.

11.1.5 Provided that adequate flexibility of the finished cable is assured, conductors of nominal cross-section area 2,5 mm^2 and less need not be stranded.

11.1.6 Electric and optical fibre cables for non-fixed applications are to comply with a relevant National or International Standard.

11.1.7 For the purpose of this Section, pipes, conduits, trunking or any other system for the additional mechanical protection of cables are hereafter referred to under the generic name 'protective casings'.

11.1.8 Electrical cables for telecommunications and data transfer are, whenever practicable, to be selected in accordance with the recommendations of IEC TR 60092-370: *Guidance on the selection of cables for telecommunication and data transfer including radio-frequency cables*.

11.2 Testing

11.2.1 Routine tests, consisting of at least:

(a) measurement of electrical resistance of conductors;
(b) high voltage test, *see also* Section 21;
(c) insulation resistance measurement;
(d) for high voltage cables, partial discharge tests are to be made in accordance with the requirements of IEC 60885-2: *Electrical test methods for electric cables – Part 2: Partial discharge tests*, or an acceptable and relevant National Standard, at the manufacturer's works prior to despatch.

Evidence of successful completion of routine tests is to be provided by the manufacturer, *see also* 11.1.4.

11.2.2 Particular, special and type tests are to be made, when required, in accordance with the requirements of the relevant publication or National Standard referred to in 11.1.2 and a test report issued by the manufacturer.

11.3 Voltage rating

11.3.1 The rated voltage of any electric cable is to be not lower than the nominal voltage of the circuit for which it is used. The maximum sustained voltage of the circuit is not to exceed the maximum voltage for which the cable has been designed.

11.3.2 Electric cables used in unearthed systems are to be suitably rated to withstand the additional stresses imposed on the insulation due to an earth fault.

11.4 Operating temperature

11.4.1 The maximum rated conductor temperature of the insulating material for normal operation is to be at least 10°C higher than the maximum ambient temperature liable to be produced in the space where the cable is installed.

11.4.2 The maximum rated conductor temperatures for normal and short-circuit operation, for the insulating materials included within the standards referred to in 11.1.2 is not to exceed the values stated in Table 2.11.2.

11.4.3 Electric cables constructed of an insulating material not included in Table 2.11.2 are to be rated in accordance with the National Standard chosen in compliance with 11.1.2.

Table 2.11.2 Maximum rated conductor temperature

Type of insulating compound	Maximum rated conductor temperature, °C	
	Normal operation	Short-circuit
Thermoplastic, based upon:		
Polyvinyl chloride or co-polymer of vinyl chloride and vinyl acetate	70	150
Elastomeric or thermosetting, based upon:		
Ethylene-propylene rubber or similar (EPM or EPDM)	90	250
High modulus or hard grade ethylene propylene rubber	90	250
Cross-linked polyethylene	90	250
Ethylene-propylene rubber or similar (EPM or EPDM) halogen free	90	250
High modulus or hard grade halogen-free ethylene propylene rubber	90	250
Halogen-free cross-linked polyethylene	90	250
Cross-linked polyolefin material for halogen-free cables	90	250
Silicone rubber	95	350
Halogen-free silicone rubber	95	350

11.5 Construction

11.5.1 Electric and optical fibre cables are to be at least of a flame-retardant type. IEC 60332-1-2: *Tests on electric and optical fibre cables under fire conditions – Part 1-2: Test for vertical flame propagation for a single insulated wire or cable – Procedure for 1 kW pre-mixed flame*,will be acceptable.

11.5.2 Exemption from the requirements of 11.5.1 for applications such as radio frequency or digital communication systems, which require the use of particular types of cable, will be subject to special consideration.

11.5.3 Where electric or optical fibre cables are required to be of a 'fire resistant type', they are in addition to be easily distinguishable and comply with the performance requirements of the appropriate part of IEC 60331: *Tests for electric cables under fire conditions – Circuit integrity,* when tested with a minimum flame application time of 90 minutes, as follows:

- IEC 60331-1: *Tests for electric cables under fire conditions – Circuit integrity – Part 1: Test method for fire with shock at a temperature of at least 830°C for cables of rated voltage up to and including 0,6/1,0 kV and with an overall diameter exceeding 20 mm*;
- IEC 60331-21: *Tests for electric cables under fire conditions – Circuit integrity – Part 21: Procedures and requirements – Cables of rated voltage up to and including 0,6/1,0 kV*;
- IEC 60331-23: *Tests for electric cables under fire conditions – Circuit integrity – Part 23: Procedures and requirements – Electric data cables*; or
- IEC 60331-25: *Tests for electric cables under fire conditions – Circuit integrity – Part 25: Procedures and requirements – Optical fibre cables*.

11.5.4 Where electric or optical fibre cables are installed in locations exposed to the weather, in damp and in wet situations, in machinery compartments, refrigerated spaces or exposed to harmful vapours including oil vapour they are to have the conductor insulating materials or optical fibres enclosed in an impervious sheath of material appropriate to the expected ambient conditions.

11.5.5 Where electric or optical fibre cables are installed in locations which are totally submerged for extended periods of time, they are to have the conductor insulating materials or fibres enclosed in an impervious sheath of material appropriate to the expected submerged conditions and duration.

11.5.6 Where it is required that the construction of electric or optical fibre cables includes metallic sheaths, armouring or braids, they are to be provided with an overall impervious sheath or other means to protect the metallic elements against corrosion, *see also* 11.8.7 and 11.8.8.

11.5.7 Where cables are installed in an area where contamination by oil is likely to occur, the oversheath is to be of an enhanced oil resistance grade.

11.5.8 Where single core electric cables are used in circuits rated in excess of 20 Amps and are armoured the armour is to be of a non-magnetic material.

11.5.9 Electric cables are to be constructed such that they are capable of withstanding the mechanical and thermal effects of the maximum short-circuit current which can flow in any part of the circuit in which they are installed, taking into consideration not only the time/current characteristics of the circuit protective device but also the peak value of the prospective short-circuit current. Where electric cables are to be used in circuits with a maximum short-circuit current in excess of 70 kA, evidence is to be submitted for consideration when required demonstrating that the cable construction can withstand the effects of the short-circuit current.

11.5.10 All high voltage electric cables are to be readily identified by suitable marking.

11.6 Conductor size

11.6.1 The maximum continuous load carried by a cable is not to exceed its continuous current rating. It is to be chosen such that the maximum rated conductor temperature for normal operation for the insulation is not exceeded. In assessing the current rating the correction factors in 11.7 may be applied as required.

11.6.2 The cross-sectional area of the conductors is to be sufficient to ensure that, under short-circuit conditions, the maximum rated conductor temperature for short-circuit operation is not exceeded, taking into consideration the time current characteristics of the circuit protective device and the peak value of the prospective short-circuit current.

11.6.3 The cable current ratings given in Tables 2.11.3 and 2.11.4 are based on the maximum rated conductor temperatures given in Table 2.11.2. When cable sizes are selected on the basis of precise evaluation of current rating based upon experimental and calculated data, details are to be submitted for consideration. Alternative short-circuit temperature limits, other than those given in Table 2.11.4, may be applied using the data provided in:

- IEC 60724: *Short-circuit temperature limits of electric cables with rated voltages of 1kV (Um=1,2kV) and 3kV (Um=3,6kV);* or
- IEC 60986: *Short-circuit temperature limits of electric cables with rated voltages from 6kV (Um=7,2kV) and up to 30kV (Um=36kV)*.

Alternative short-circuit temperature limits provided in an acceptable and relevant National Standard may also be considered.

Table 2.11.3 Electric cable current ratings, normal operation, based on ambient 45°C

Nominal cross-section (mm^2)	Continuous r.m.s current rating, in amperes								
	Thermoplastic, (70°C)			Elastomeric (90°C)			Elastomeric or thermosetting, based on silicon rubber (95°C)		
	Single Core	2 core	3 or 4 core	Single Core	2 core	3 or 4 core	Single Core	2 core	3 or 4 core

150	16,4	23,2	51,8	21,5	30,4	67,9	25,7	36,3	81,2
185	20,2	28,6	63,9	26,5	37,4	83,7	31,7	44,8	100,1
200	21,8	30,9	69,0	28,6	40,5	90,5	34,2	48,4	108,2
240	26,2	37,0	82,8	34,3	48,6	108,6	41,1	58,1	129,9
300	32,7	46,3	103,6	42,9	60,7	135,7	51,3	72,6	162,3

11.6.4 The cross-sectional area of the conductors is to be sufficient to ensure that at no point in the installation will the voltage variations stated in 1.8 be exceeded when the conductors are carrying the maximum current under their normal conditions of service.

11.6.5 The size of earth conductors is to comply with 1.12.8.

11.6.6 The cross-sectional area of conductors used in circuits supplying cyclic or non-continuous loads is to be sufficient to ensure that the cables maximum rated conductor temperature for normal operation is not exceeded when the conductors are operating under their normal conditions of service, *see* 11.7.4.

11.7 Correction factors for cable current rating

11.7.1 The correction factors of 11.7.2 to 11.7.5 provide a guide for general applications in assessing a current rating. A more precise evaluation based upon experimental and calculated data may be submitted for consideration.

11.7.2 **Bunching of cables**. Where more than six electric cables, which may be expected to operate simultaneously at their full rated capacity, are laid close together in a cable bunch in such a way that there is an absence of free air circulation around them, a correction factor of 0,85 is to be applied. Signal cables may be exempted from this requirement.

11.7.3 **Ambient temperature**. The current ratings of Table 2.11.3 are based on an ambient temperature of 45°C. For other values of ambient temperature the correction factors shown in Table 2.11.5 are to be applied.

11.7.4 **Short time duty**. When the load is not continuous, i.e., operates for periods of half an hour or one hour and the periods of no load are longer than three times the cable's time constant, T in minutes, the cable's continuous rating may be increased by a duty factor, calculated in accordance with:

$$\text{Duty factor} = \sqrt{\frac{1{,}12}{1 - e^{\frac{-t_s}{T}}}}$$

When the load is not continuous, is repetitive and has periods of no-load less than three times the cable's time constant, so that the cable has insufficient time to cool down between the applications of load, the cable's continuous rating may be increased by an intermittent factor, calculated in accordance with:

Table 2.11.5 Correction factors

Insulation material	Correction factor for ambient air temperature of °C										
	35	40	45	50	55	60	65	70	75	80	85
Thermoplastic (70°C)	1,18	1,10	1,00	0,89	0,77	0,63	—	—	—	—	—
Elastomeric or thermosetting (90°C)	1,10	1,05	1,00	0,94	0,88	0,82	0,74	0,67	0,58	0,47	—
Elastomeric or thermosetting, based on silicone rubber (95°C)	1,10	1,05	1,00	0,95	0,89	0,84	0,77	0,71	0,63	0,55	0,45

$$\text{Intermittent factor} = \sqrt{\frac{1 - e^{\frac{-t_p}{T}}}{1 - e^{\frac{-t_s}{T}}}}$$

where

t_p = the intermittent period, in minutes, i.e., the total period of load and no-load before the cycle is repeated

T = $0{,}245d^{1{,}35}$ where d is the overall diameter of the cable, in mm

t_s = the service time of the load current in minutes

11.7.5 **Diversity**. Where cables are used to supply two or more final sub-circuits account may be taken of any diversity factors which may apply, *see* 5.6.

11.8 Installation of electric cables

11.8.1 Electric and optical fibre cable runs are to be as far as practicable fixed in straight lines and in accessible positions.

11.8.2 Bends in fixed electric and optical fibre cable runs are to be in accordance with the cable manufacturer's recommendations. The minimum internal radius of bend for the installation of fixed electric cables is to be chosen according to the construction and size of the cable and is not to be less than the values given in Table 2.11.6.

11.8.3 The installation of electric and optical fibre cables across expansion joints in any structure is to be avoided. Where this is not practicable, a loop of electric cable of length sufficient to accommodate the expansion of the joint is to be provided. For electric cables, the internal radius of the loop is to be at least 12 times the external diameter of the cable. For optical fibre cables, the internal radius of the loop is to meet the manufacturers' minimum recommendations.

Table 2.11.6 Minimum internal radii of bends in cables for fixed wiring

Cable construction		Overall diameter of cable	Minimum internal radius of bend (times overall diameter of cable)
Insulation	Outer covering		
Thermoplastic and elastomeric 600/1000 V and below	Metal sheathed Armoured and braided	Any	6*D*
	Other finishes	≤ 25 mm > 25 mm	4*D* 6*D*
Mineral	Hard metal sheathed	Any	6*D*
Thermoplastic and elastomeric above 600/1000 V – single core	Any	Any	12*D*
– multicore	Any	Any	9*D*

11.8.4 Electric and optical fibre cables for essential and emergency services are to be arranged, so far as is practicable, to avoid galleys, machinery spaces and other enclosed spaces and high fire risk areas except as is necessary for the service being supplied. Such cables are also, so far as reasonably practicable, to be routed clear of bulkheads to preclude their being rendered unserviceable by heating of the bulkheads that may be caused by a fire in an adjacent space.

11.8.5 Electric cables having insulating materials with different maximum rated conductor temperatures are to be so installed that the maximum rated conductor temperature for normal operation of each cable is not exceeded.

11.8.6 Electric and optical fibre cables having a protective covering which may damage the covering of other cables are not to be bunched with those other cables.

11.8.7 Cables having an exposed metallic screen, braid or armour are to be installed in such a manner that galvanic corrosion by contact with other metals is prevented. Sufficient measures are also to be taken to prevent damage to exposed galvanised coatings during installation.

11.8.8 Protection is to be provided for cable oversheaths in areas where cables are likely to be exposed to damaging substances under normal circumstances or areas where the spillage or release of harmful substances is likely.

11.8.9 Electric and optical fibre cables are to be as far as practicable installed remote from sources of heat. Where installation of cables near sources of heat cannot be avoided and where there is consequently a risk of damage to the cables by heat, suitable shields, insulation or other precautions are to be installed between the cables and the heat source. The free air circulation around the cables is not to be impaired.

11.8.10 Where electric and optical fibre cables are installed in bunches, provision is to be made to limit the propagation of fire. This requirement is considered satisfied when cables of the bunch have been tested in accordance with the requirements of IEC 60332-3-22: *Tests on electric and optical fibre cables under fire conditions – Part 3-22: Test for vertical flame spread of vertically-mounted bunched wires or cables – Category A*, and are installed in the same configuration(s) as are used for the test(s). If the cables are not so installed, information is to be submitted to demonstrate satisfactorily that suitable measures have been taken to ensure that an equivalent limit of fire propagation will be achieved for the configurations to be used. Particular attention is to be given to cables in:

- atria or equivalent spaces; and
- vertical runs in trunks and other restricted spaces.

In addition, cables that comply with the requirements of IEC 60332-3-22 are also required to meet the requirements of IEC 60332-1-2: *Tests on electric and optical fibre cables under fire conditions – Part 1-2: Test for vertical flame propagation for a single insulated wire or cable – Procedure for 1 kW pre-mixed flame*.

11.8.11 Electric and optical fibre cables are not to be coated or painted with materials which may adversely affect their sheath or their fire performance.

11.8.12 Where electric and optical fibre cables are installed in refrigerated spaces they are not to be covered with thermal insulation but may be placed directly on the face of the refrigeration chamber, provided that precautions are taken to prevent the electric cables being used as casual means of suspension.

11.8.13 All metal coverings of electric and optical fibre cables are to be earthed in accordance with 1.12.

11.8.14 High voltage cables may be installed as follows:

(a) in the open, (e.g., on carrier plating), when they are to be provided with a continuous metallic sheath or armour which is effectively bonded to earth to reduce danger to personnel. The metallic sheath or armour may be omitted provided that the cable sheathing material has a longitudinal electric resistance high enough to prevent sheath currents which may be hazardous to personnel;

(b) contained in earthed metallic protective casings when the cables may be as in (a) or the armour or metal sheath may be omitted. In the latter case care is to be taken to ensure that protective casings are electrically continuous and that short lengths of cable are not left unprotected.

11.8.15 High voltage electric cables are not to be run in the open through accommodation spaces.

11.8.16 High voltage electric cables are to be segregated as far as is practicable from electric cables operating at lower voltages.

11.8.17 Electric and optical fibre cables are to be, so far as reasonably practicable, installed remote from sources of mechanical damage. Where necessary the cables are to be protected in accordance with the requirements of 11.9.

11.8.18 Electric and optical fibre cables with the exception of those for portable appliances and those installed in protective casings are to be fixed securely in accordance with the requirements of 11.10.

11.8.19 Electric and optical fibre cables serving any essential services and any glands through which they pass must be able to withstand flooding for a period of 36 hours, based on the water pressure that may occur at the location.

11.8.20 Where electric and optical fibre cables penetrate bulkheads and decks the requirements of 11.11 are to be complied with.

11.8.21 Where electric and optical fibre cables are installed in protective casings the requirements of 11.12 are to be complied with.

11.8.22 a.c. wiring is to be carried out using multicore cables wherever reasonably practicable. Where it is necessary to install single core electric cables for alternating current circuits in excess of 20 Amps the requirements of 11.14 are to be complied with, *see also* 11.5.8.

11.9 Mechanical protection of cables

11.9.1 Electric cables exposed to risk of mechanical damage are to be protected by suitable protective casings unless the protective covering (e.g., armour or sheath) is sufficient to withstand the possible cause of damage.

11.9.2 Electric cables installed in spaces where there is exceptional risk of mechanical damage such as holds, storage spaces, cargo spaces, etc., are to be suitably protected by metallic protective casings, even when armoured, unless the ship's structure affords adequate protection.

11.9.3 Metal protective casings are to be efficiently protected against corrosion, and effectively earthed in accordance with 1.12.

11.10 Cable support systems

11.10.1 Electric cables are to be effectively supported and secured, without being damaged, to the ship's structure, either indirectly by a cable support system, or directly by means of clips, saddles or straps to bulkheads etc., *see* 11.8.4.

11.10.2 Cable support systems, which may be in the form of trays or plates, separate support brackets, hangers or ladder racks, together with their fixings and accessories, are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The cable support system is to be effectively secured to the ship's structure, the spacing of the fixings taking account of the probability of vibration and any heavy external forces, e.g., where located in areas subject to impact by sea-water.

11.10.3 The distances between the points at which the cable is supported (e.g., distances between ladder rungs, support brackets, hangers, etc.) are to be chosen according to the construction of cable (i.e., size and rigidity) and the probability of vibration and are to be generally in accordance with those given in Table 2.11.7.

Table 2.11.7 Maximum spacing of supports or fixings for securing cables

External diameter of cable		Non-armoured cables	Armoured cables
exceeding	not exceeding		
mm	mm	mm	mm
–	8	200	250
8	13	250	300
13	20	300	350
20	30	350	400
30	–	400	450

11.10.4 Where the cables are laid on top of their support system, the spacings of fixings may be increased beyond those given in Table 2.11.7, but should take account of the probability of movement and vibration and in general is not to exceed 900 mm. This relaxation is not to be applied where cables can be subjected to heavy external forces, e.g., where they are run on, or above, open deck or in areas subject to impact by sea-water.

11.10.5 Single core electric cables are to be firmly fixed, using supports of strength adequate to withstand forces corresponding to the values of the peak prospective short-circuit current.

11.11 Penetration of bulkheads and decks by cables

11.11.1 Where electric or optical fibre cables pass through watertight, fire insulated or gastight bulkheads or decks separating hazardous zones or spaces from non-hazardous zones or spaces, the arrangements are to be such as to ensure the integrity of the bulkhead or deck is not impaired. The arrangements chosen are to ensure that the cables are not adversely affected.

11.11.2 Where cables pass through non-watertight bulkheads or structural steel, the holes are to be bushed with suitable material. If the steel is at least 6 mm thick, adequately rounded edges may be accepted as the equivalent of bushing.

11.11.3 Electric and optical fibre cables passing through decks are to be protected by deck tubes or ducts.

11.11.4 Where cables pass through thermal insulation they are to do so at right angles, in tubes sealed at both ends.

11.12 Installation of electric and optical fibre cables in protective casings

11.12.1 Protective casings are to be mechanically continuous across joints and effectively supported and secured to prevent damage to the electric or optical fibre cables.

11.12.2 Protective casings are to be suitably smooth on the interior and have their ends shaped or bushed in such a manner as not to damage the cables.

11.12.3 The internal radius of bends of protective casings are to be not less than that required for the largest cable installed therein, *see* 11.8.2.

11.12.4 The space factor (ratio of the sum of the cross-sectional areas corresponding to the external diameters of the cables to the internal cross-sectional area of the protective casings) is not to exceed 0,4.

11.12.5 Where necessary, ventilation openings are to be provided at the highest and lowest points of protective casings to permit air circulation and to prevent accumulation of water.

11.12.6 Expansion joints are to be provided in protective casings where necessary.

11.12.7 Protective casings containing high voltage electric cables are not to contain other electric or optical fibre cables and are to be clearly identified, defining their function and voltage.

11.13 Non-metallic cable support systems, protective casings and fixings

11.13.1 Where it is proposed to use non-metallic cable support systems, protective casings or fixings, the additional requirements of this sub-Section apply. For high voltage installations, metallic protective casings are required where 11.8.14(b) applies.

11.13.2 Non-metallic cable support systems and protective casings are to be installed in accordance with the manufacturer's recommendations. The support systems and protective casings are to have been tested in accordance with an acceptable test procedure for:

(a) ambient operating temperatures;
(b) safe working load;
(c) impact resistance;
(d) flame retardancy;
(e) smoke and toxicity; and
(f) use in explosive gas atmospheres or in the presence of combustible dusts, electrical conductivity;

with satisfactory results.

11.13.3 Non-metallic cable support systems, protective casings and fixings installed on the open deck are to be protected from degradation caused by exposure to solar radiation.

11.13.4 Where the cable support system, protective casing or fixings are manufactured from a material other than metal, suitable supplementary metallic fixings or straps spaced at regular distances are to be provided such that, in the event of a fire or failure, the cable support system, protective casing and the affixed cables are prevented from falling and causing an injury to personnel and/or an obstruction to any escape route. Alternatively, the cables may be routed away from such areas.

11.13.5 The load on non-metallic cable support systems or protective casings is not to exceed the tested safe working load.

11.13.6 When a cable support system or protective casing is secured by means of clips or straps manufactured from a material other than metal the fixings are to be supplemented by suitable metal clips or straps spaced at regular distances each not exceeding 2 m and, for non-metallic cable support systems or protective casings, that used during safe working load testing.

11.13.7 Non-metallic fixings are to be flame retardant in accordance with the requirements of IEC 60092-101: *Electrical installations in ships – Part 101: Definitions and general requirements* or an alternative relevant National or International Standard.

11.14 Single-core electric cables for alternating current

11.14.1 When installed in protective casings, electric cables belonging to the same circuit are to be installed in the same casing, unless the casing is of non-magnetic material.

11.14.2 Cable clips are to include electric cables of all phases of a circuit unless the clips are of non-magnetic material.

11.14.3 Single-core cables of the same circuit are to be in contact with one another, as far as possible. In any event the distance between adjacent electric cables is not to be greater than one cable diameter.

11.14.4 If single-core cables of current rating greater than 250 A are installed near a steel bulkhead, the clearance between the cables and the bulkhead is to be at least 50 mm unless the cables belonging to the same a.c. circuit are installed in trefoil formation.

11.14.5 Magnetic material is not to be used between single core cables of a group. Where cables pass through steel plates, all the conductors of the same circuit are to pass through a plate or gland, so made that there is no magnetic material between the cables, and the clearance between the cables and the magnetic material is not to be less than 75 mm, unless the cables belonging to the same a.c. circuit are installed in trefoil formation.

11.14.6 Electric cables are to be installed such that the induced voltages, and any circulating currents, in the sheath or armour are limited to safe values.

11.15 Electric cable ends

11.15.1 Where screw-clamp or spring-clamp type terminations are used in electrical apparatus for external cable connections, *see* 1.11.7, cable conductors of the solid or stranded type may be inserted directly into the terminals. Where flexible conductors are used, a suitable termination is to be fitted to the cable conductor to prevent 'whiskering' of the strands.

11.15.2 If compression type conductor terminations are used on the cable ends, they are to be of a size to match the conductor and to be made with a compression type tool with the dies selected to suit the termination and conductor sizes and having a ratchet action to ensure completion of the compression action.

11.15.3 Soldered sockets may be used in conjunction with non corrosive fluxes provided that the maximum conductor temperature at the joint, under short-circuit conditions, does not exceed 160°C.

11.15.4 High voltage cables of the radial field type (i.e., having a conducting layer to control the electric field within the insulation) are to have terminations which provide electrical stress control.

11.15.5 Electric cables having hygroscopic insulation (e.g., mineral insulated) are to have their ends sealed against ingress of moisture.

11.15.6 Cable terminations are to be of such a design and dimensions that the maximum current likely to flow through them will not result in degradation of the contacts or damage to insulation as the result of overheating.

11.15.7 The fixing of conductors in terminals at joints and at tappings is to be capable of withstanding the thermal and mechanical effects of short-circuit currents.

11.16 Joints and branch circuits in cable systems

11.16.1 If a joint is necessary it is to be carried out so that all conductors or fibres are adequately secured, insulated and protected from atmospheric action. The flame retardant properties of the cable are to be retained, the continuity of metallic sheath, braid or armour is to be maintained and the current carrying capacity or transmission of data through the cable is not to be impaired.

11.16.2 Tappings (branch circuits) are to be made in suitable boxes of such a design that the conductors and fibres remain suitably insulated, protected from atmospheric action and fitted with terminals or busbars of dimensions appropriate to the current rating.

11.16.3 Tappings and splices of optical fibre cables are to be made in accordance with the manufacturers' recommendations and to be provided with appropriate fittings. In addition they are to be located within suitably designed enclosures to ensure that the protection of the optical fibres is maintained.

11.16.4 Cables of a fire resistant type, *see* 11.5.3, are to be installed so that they are continuous throughout their length without any joints or tappings.

11.17 Busbar trunking systems (bustrunks)

11.17.1 Where busbar trunking systems are used in place of electric cables, they are to comply with the requirements of 11.17.2 to 11.17.6, in addition to the applicable requirements in Section 7.

11.17.2 The busbar trunking, or enclosure system, is to have a minimum ingress protection of IP54, according to IEC60529: *Degrees of protection provided by enclosures* (IP Code).

11.17.3 The internal and external arrangements of the busbar trunking, or enclosure system, are to ensure that the fire and/or watertight integrity of any structure through which it passes is not impaired.

11.17.4 Where the busbar trunking system is employed for circuits on and below the bulkhead deck, arrangements are to be made to ensure that circuits on other decks are not affected in the event of partial flooding under the normal angles of inclination given in 1.10 for essential electrical equipment.

11.17.5 Supports and accessories are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The support system is to effectively secure the busbar trunking system to the ship's structure.

11.17.6 When accessories are fixed to the busbar system by means of clips or straps manufactured from a material other than metal, the fixings are to be supplemented by suitable metal clips or straps, such that, in the event of a fire or failure, the accessories are prevented from falling and causing injury to personnel and/or an obstruction to any escape route. Alternatively, the busbar system may be routed away from such areas.

■ *Section 12* **Batteries**

12.1 General

12.1.1 The requirements of this Section apply to permanently installed secondary batteries of the vented and valve-regulated sealed type.

12.1.2 A vented battery is one in which the cells have a cover provided with an opening through which the products of electrolysis and evaporation are allowed to escape freely from the cells to the atmosphere.

12.1.3 A valve-regulated sealed battery is one in which the cells are closed but have an arrangement (valve) which allows the escape of gas if the internal pressure exceeds a predetermined value. The electrolyte cannot normally be replaced.

12.2 Construction

12.2.1 Batteries are to be constructed so as to prevent spilling of the electrolyte due to motion and to minimise the emission of electrolyte spray.

12.3 Location

12.3.1 Vented batteries connected to a charging device with a power output of more than 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be housed in an adequately ventilated compartment assigned to batteries only, or in an adequately ventilated suitable box on open deck.

12.3.2 Vented batteries connected to a charging device with a power output within the range 0,2 kW to 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be installed in accordance with 12.3.1, or may be installed within a well ventilated machinery or similar space.

12.3.3 Vented batteries connected to a charging device with a power output of less than 0,2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, may be installed in an open position or in a battery box in any suitable space.

12.3.4 Where more than one charging device is installed for any battery or group of batteries in one location, the total power output is to be used to determine the installation requirements of 12.3.1, 12.3.2 or 12.3.3.

12.3.5 Valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the ventilation requirements of 12.5.11 and the charging requirements of 12.6.4 and 12.6.5 are complied with. Equipment that may produce arcs, sparks or high temperatures in normal operation is not to be in close proximity to battery vent plugs or pressure relief valve outlets.

12.3.6 Where lead-acid and nickel-cadmium batteries are installed in the same compartment precautions are to be taken, such as the provision of screens, to prevent possible contamination of electrolytes.

12.3.7 Where batteries may be exposed to the risk of mechanical damage or falling objects they are to be suitably protected.

12.3.8 Batteries installed in crew and passenger cabins, together with their associated corridors, are to be of the hermetically sealed type.

12.3.9 A permanent notice prohibiting smoking and the use of naked lights or equipment capable of creating a source of ignition is to be prominently displayed adjacent to the entrances of all compartments containing batteries.

12.3.10 Only electrical equipment necessary for operational reasons and for the provision of lighting is to be installed in compartments provided in compliance with 12.3.1, the compartment ventilation exhaust ducts and zones within a 1,5 m radius of the ventilation outlet(s). Such electrical equipment is to be certified for group IIC gases and temperature Class T1 in accordance with the applicable parts of IEC 60079: *Explosive atmospheres*, or an acceptable and relevant National Standard.

12.3.11 A permanent notice is to be prominently displayed adjacent to battery installations advising personnel that replacement batteries are to be of an equivalent performance type. For valve-regulated sealed batteries, the notice is to advise of the requirement for replacement batteries to be suitable with respect to products of electrolysis and evaporation being allowed to escape from cells to the atmosphere, *see also* 1.5.3.

12.4 Installation

12.4.1 Batteries are to be arranged such that each cell or crate of cells is accessible from the top and at least one side and it is to be ensured that they are suitably secured to move with the ship's motion.

12.4.2 The materials used in the construction of a battery rack or stand are to be resistant to the battery electrolyte or suitably protected by paint or a coating.

12.4.3 Measures are to be taken to minimise the effect of any electrolyte spillage and leakage, for example the use of rubber capping around the top of the cells and the provision of a tray of electrolyte-resistant material below the cells, unless the deck is suitably protected with paint or a coating.

12.4.4 The interiors of all compartments for batteries, including crates, trays, boxes, shelves and other structural parts therein, are to be of an electrolyte-resistant material or suitably protected, for example with paint or a coating.

12.5 Ventilation

12.5.1 Battery compartments and boxes are to be ventilated to avoid accumulation of dangerous concentrations of flammable gas.

12.5.2 Where a battery compartment ventilator is required to be fitted with a closing device in accordance with Pt 3, Ch 12,2.3.9, a warning notice clearly stating the purpose of the closing device, for example:

> 'This closing device is to be kept open and only closed in the event of a fire or flooding – Explosive gas atmosphere'

is to be provided at the closing device to mitigate the possibility of inadvertent closing of the ventilator. Furthermore, means to lock the battery compartment ventilators in the open position are to be provided.

12.5.3 Ducted natural ventilation may be employed for battery installations connected to a charging device with a power output of 2 kW or less, provided the exhaust duct can be run directly from the top of the compartment or box to the open air above, with no part of the duct more than 45° from the vertical. A suitable opening is also to be provided below the level of the top of the batteries, so as to ensure a free ventilation air flow. The ventilation duct is to have an area not less than 50 cm^2 for every 1 m^3 of battery compartment or box volume.

12.5.4 Where natural ventilation is impracticable or insufficient, mechanical ventilation is to be provided, with the air inlet located near the floor and the exhaust at the top of the compartment.

12.5.5 Mechanical exhaust ventilation complying with 12.5.9 is to be provided for battery installations connected to a charging device with a total maximum power output of more than 2 kW. Also, to minimise the possibility of oxygen enrichment, compartments and spaces containing batteries with boost charging facilities are to be provided with mechanical exhaust ventilation irrespective of the charging device power output.

12.5.6 The ventilation system for battery compartments and boxes, other than boxes located on open deck or in spaces to which 12.3.2, 12.3.3 and 12.3.5 refer, is to be separate from other ventilation systems. The exhaust ducting is to be led to a location in the open air, where any gases can be safely diluted, away from possible sources of ignition and openings into spaces where gases may accumulate.

12.5.7 Fan motors associated with exhaust ducts from battery compartments are to be placed external to the ducts and the compartments.

12.5.8 Ventilating fans for battery compartments are to be so constructed and be of material such as to minimise risk of sparking in the event of the impeller touching the casing. Non-metallic-impellers are to be of an anti-static material.

12.5.9 Battery boxes are to be provided with sufficient ventilation openings located so as to avoid accumulation of flammable gas whilst preventing the entrance of rain or spray.

12.5.10 The ventilation arrangements for all installations of vented type batteries are to be such that the quantity of air expelled is at least equal to:

$Q = 110 I n$

where

n = number of cells in series

I = maximum current delivered by the charging equipment during gas formation, but not less than 25 per cent of the maximum obtainable charging current in amperes

Q = quantity of air expelled in litres/hr.

12.5.11 The ventilation rate for compartments containing valve-regulated sealed batteries may be reduced to 25 per cent of that given in 12.5.10.

12.6 Charging facilities

12.6.1 Charging facilities are to be provided for all secondary batteries such that they may be completely charged from the completely discharged state in a reasonable time having regard to the service requirements.

12.6.2 Suitable means, including an ammeter and a voltmeter, are to be provided for controlling and monitoring charging of batteries, and to protect them against discharge into the charging circuits.

12.6.3 For floating circuits or any other conditions where the load is connected to the battery whilst it is on charge, the maximum battery voltage is not to exceed the safe value for any connected apparatus.

12.6.4 Where valve-regulated sealed batteries are installed, the charging facilities are to incorporate independent means such as overvoltage protection to prevent gas evolution in excess of the manufacturer's design quantity.

12.6.5 Boost charge facilities, where provided, are to be arranged such that they are automatically disconnected should the battery compartment ventilation system fail.

12.7 Recording of batteries for emergency and essential services

12.7.1 A schedule of batteries fitted for use for essential and emergency services is to be compiled and maintained.

12.7.2 Procedures are to be put in place and documented to ensure that, where batteries are replaced, they are of an equivalent performance type, *see also* 1.5.3.

12.7.3 When additions or alterations are proposed to the existing batteries for essential and emergency services, the schedule and replacement procedure documentation are to be updated to reflect the proposed installation and submitted in accordance with 1.5.2.

12.7.4 The schedule and replacement procedure documentation are to be made available to the LR Surveyor on request.

■ *Section 13*
Equipment – Heating, lighting and accessories

13.1 Heating and cooking equipment

13.1.1 The construction of heaters is to give a degree of protection according to IEC 60529: *Degrees of protection provided by enclosures (IP Code)*, or an acceptable and relevant National Standard, suitable for the intended location.

13.1.2 Heating elements are to be suitably guarded.

13.1.3 Heating and cooking equipment is to be installed such that adjacent bulkheads and decks are not subjected to excessive heating.

13.2 Lighting – General

13.2.1 Lampholders are to be constructed of flame retarding non-hygroscopic materials.

13.2.2 Lighting fittings are to be so arranged as to prevent temperature rises which overheat or damage surrounding materials. They must not impair the integrity of fire divisions.

13.3 Incandescent lighting

13.3.1 Tungsten filament lamps and lampholders are to be in accordance with Table 2.13.1.

13.3.2 Lampholders of type E40 are to be provided with a means of locking the lamp in the lampholder.

13.4 Fluorescent lighting

13.4.1 Fluorescent lamps and lampholders are to be in accordance with Table 2.13.1.

13.4.2 Fittings, reactors, capacitors and other auxiliaries are not to be mounted on surfaces which are subject to high temperatures. If mounted separately they are additionally to be enclosed in an earthed conductive casing.

13.4.3 Where capacitors of 0,5 microfarads and above are installed, means are to be provided to promptly discharge the capacitors on disconnection of the supply.

Table 2.13.1 Lamps and lampholders

Designation	Maximum lamp rating		Maximum lampholder current, A
	Voltage, V	Power, W	
Screw cap lamps			
E40	250	3000	16
E27	250	200	4
E14	250	15	2
E10	24	—	2
Bayonet cap lamps			
B22	250	200	4
B15d	250	15	2
B15s	55	15	2
Tubular fluorescent lamps			
G13	250	115	—
G5	250	80	—
NOTE Other lamp types are to be in accordance with IEC 60092-306: *Electrical installations in ships - Part 306: Equipment - Luminaires and lighting accessories.*			

13.5 Discharge lighting

13.5.1 Discharge lamps operating in excess of 250 V are only acceptable as fixed fittings. Warning notices calling attention to the voltage are to be permanently displayed at points of access to the lamps and where otherwise necessary.

13.6 Socket outlets and plugs

13.6.1 The temperature rise on the live parts of socket outlet and plugs is not to exceed 30°C. Socket outlets and plugs are to be so constructed that they cannot be readily short-circuited whether the plug is in or out, and so that a pin of the plug cannot be made to earth either pole of the socket outlet.

13.6.2 All socket outlets of current rating in excess of 16 A are to be provided with a switch, and be interlocked such that the plug cannot be inserted or withdrawn when the switch is in the ‘on’ position.

13.6.3 Where it is necessary to earth the non-current carrying parts of portable or transportable equipment, an effective means of earthing is to be provided at the socket outlet.

13.6.4 On weather decks, galleys, laundries, machinery spaces and all wet situations socket outlets and plugs are to be effectively shielded against rain and spray and are to be provided with means of maintaining this quality after removal of the plug.

13.7 Enclosures

13.7.1 Enclosures for the containing and mounting of electrical accessories are to be of metal, effectively protected against corrosion, or of flame retardant insulating materials.

■ *Section 14*
Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts

14.1 General

14.1.1 The installation of electrical equipment in spaces and locations in which flammable mixtures are liable to collect, e.g., areas containing flammable gas or vapour and/or combustible dust, is to be minimised as far as is consistent with operational necessity and the provision of lighting, monitoring, alarm or control facilities enhancing the overall safety of the ship.

14.1.2 In order to eliminate potential sources of ignition from spaces and locations in which flammable mixtures are liable to collect, in accordance with SOLAS 1974 as amended, Chapter II-1, Regulation 45, such dangerous or hazardous areas are to be identified and electrical equipment within these areas is to be selected and installed in accordance with the requirements of this Section.

14.1.3 Equipment that is to be installed in an area where both explosive gases and combustible dusts can be present is to be selected in accordance with both 14.2 and 14.3.

14.1.4 For permanent secondary battery installations, *see* Section 12.

14.2 Selection of equipment for use in explosive gas atmospheres

14.2.1 When equipment is to be installed in areas where an explosive gas atmosphere may be present, it is generally to be of a type providing protection against ignition of the gases encountered and compliant with the relevant Parts of IEC 60079: *Explosive atmospheres*, or an acceptable and relevant National Standard, unless permitted otherwise by 14.2.4, 14.2.5 or 14.2.6.

14.2.2 The equipment protection type permitted depends on the hazardous zone where the equipment is to be located, as defined in 14.5. For certain locations on the ship other requirements may limit installations to specific equipment types and/or particular applications.

14.2.3 Equipment for **zone 0** or **zone 1**, with the exception of simple apparatus as defined in 14.2.4 or 14.2.5, is to be certified or approved by a National or other appropriate authority. Equipment without independent certification or approval may be considered for installation in **zone 2**.

14.2.4 In **zone 0**, the following may be considered:
(a) intrinsically safe, category ‘a’ (Ex ‘ia’); or
(b) simple electrical apparatus and components (for example thermocouples, photocells, strain gauges, junction boxes, switching devices), included in intrinsically safe circuits of category ‘ia’, not capable of storing or generating electrical power or energy in excess of the limits given in IEC 60079-14: *Explosive atmospheres — Part 14: Electrical installations design, selection and erection*.

14.2.5 In **zone 1**, the following may be considered:
(a) apparatus permitted within **zone 0**;
(b) intrinsically safe, category ‘b’ (Ex ‘ib’);
(c) simple apparatus as defined above, included in intrinsically safe circuits of category ‘ib’;
(d) increased safety (Ex ‘e’);
(e) flameproof (Ex ‘d’);
(f) pressurised enclosure (Ex ‘p’);
(g) powder filled (Ex ‘q’); or
(h) encapsulated (Ex ‘m’).

14.2.6 In **zone 2**, the following may be considered:
(a) apparatus permitted within **zone 0** or **zone 1**;
(b) type of protection ‘n’ or ‘N’;
(c) equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2: *Explosive atmospheres – Part 2: Equipment protection by pressurized enclosures "p"*or
(d) radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15: *Explosive atmospheres – Part 15: Equipment protection by type of protection "n"*. Additionally, in the case of transmitter aerials, it is to be shown, by detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m, respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment.

14.2.7 Apparatus having type of protection ‘ia’, ‘ib’, or ‘d’, is to be of a Group (IIA, IIB or IIC) meeting or exceeding that required for safe operation in the presence of any gas or vapour that can be present, or is to be certified specifically for such gases or vapours.

14.2.8 All apparatus is to be of a temperature classification (T1 to T6) that confirms, or is to be assessed so as to confirm, that its maximum surface temperature will not reach the ignition temperature of any gas or vapour, or mixture of gases or vapours, which can be present. The surface temperature considered may be that of an internal or external part, according to the type of protection of the apparatus.

14.2.9 Consideration may also be given to other types of protection, selected in accordance with the requirements of IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection* or arrangements complying with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features*, *see also* 14.10 to 14.12.

14.3 Selection of equipment for use in the presence of combustible dusts

14.3.1 Where apparatus is to be installed in **hazardous areas**, as defined by 14.5.3, associated with the presence of combustible dusts, it is, when practicable, to be of a type certified or approved by a National or other appropriate authority for the dusts and, additionally, any explosive gases encountered.

14.3.2 Electrical equipment for use in such **hazardous areas** is to be so designed and installed as to minimise the accumulation of dust which may interfere with the safe dissipation of heat from the enclosure.

14.3.3 Where apparatus is to be installed in **extended hazardous areas**, as defined by 14.5.3, associated with the presence of combustible dust, the following may be considered:
(a) apparatus permitted within a hazardous area associated with the combustible dust(s) that can be present;
(b) apparatus having degree of protection IP5X, or better, and having a surface temperature under normal operating conditions not exceeding the auto-ignition temperature of the dust(s) that can be present; and
(c) apparatus of a type which ensures absence of sparks or arcs and hot spots during normal operation.

14.3.4 Where equipment certified for combustible dusts is not available, consideration will be given to the use of apparatus complying as a minimum, with the following requirements provided no explosive gases will be present:
(a) the enclosure is to be at least dust protected (IP5X) having, when type tested, an ingress of fine dust within the enclosure not exceeding 10 g per m^3 of free air space, and
(b) the surface temperature of the apparatus, under the most onerous combination of normal operating conditions, but in the absence of a dust layer, is not to exceed two-thirds of the minimum ignition temperature in degrees Celsius of the dust/air mixture(s) that can be present, or
(c) the equipment is to be certified intrinsically safe having a temperature classification ensuring compliance with (b), or
(d) pressurised and operated in accordance with procedures ensuring, prior to its re-energisation, the absence of dust within the enclosure following loss of pressurisation and consequent shut-down, and having surface temperature complying with (b), or
(e) simple apparatus included in intrinsically safe circuits or radio aerials, complying with 14.2.5 or 14.2.6 respectively.

14.3.5 Consideration may also be given to arrangements complying with IEC 60092-506: *Electrical Installation in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*.

14.4 Installation of electrical equipment

14.4.1 The method of installation and application of electrical equipment suitable for use in explosive gas atmospheres or in the presence of combustible dusts is to be in accordance with IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*, or the national code of practice relevant to the standard with which the equipment complies. The ambient temperature range for which the apparatus is certified is to be taken to be –20°C to 40°C, unless otherwise stated, and account is to be taken of this when assessing the suitability of the equipment for the auto-ignition temperature of the gases and dusts encountered. Any special requirements laid down by the equipment certification documentation are also to be observed.

14.4.2 All switches and protective devices from which equipment located in hazardous zones or spaces is supplied are to interrupt all poles or phases and, where practicable are to be located in a non-hazardous zone or space. Such equipment, switches and protective devices are to be suitably labelled for identification purposes.

14.5 Hazardous zones and spaces

14.5.1 Hazardous zones or spaces and sources of hazard for ships intended for the carriage in bulk of oil, liquefied gases and other hazardous substances, the requirements for ships carrying vehicles with fuel in their tanks and the requirements for ships with spaces for storing paint, are defined (either directly, or by reference to other documents) in 14.10 to 14.15.

14.5.2 Hazardous areas associated with flammable liquids or gases are classified into zones based upon the frequency of the occurrence and duration of an explosive gas atmosphere, as follows:

- **zone 0**: place in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is present continuously or for long periods or frequently
- **zone 1**: place in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is likely to occur in normal operation occasionally
- **zone 2**: place in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if it does occur, will persist for a short period only.

See IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*.

14.5.3 Hazardous areas associated with solid substances or packaged liquids to which 14.14 applies are classified into zones based upon the frequency of the occurrence and duration of an explosive atmosphere due to the presence of gas and/or dust, as follows:

- **hazardous area**: area in which an explosive atmosphere is likely to occur in normal operation (comparable with **zone 1**)
- **extended hazardous area**: area in which an explosive atmosphere is not likely to occur in normal operation and, if it does occur, is likely to do so only infrequently and will exist for a short period only (comparable with **zone 2**).

See IEC 60079-10-2: *Explosive atmospheres — Part 10-2: Classification of areas – Combustible dust atmospheres*, or IEC 60092-506: *Electrical Installation in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*. An explosive atmosphere may exist due to gas and/or dust.

14.5.4 The following principles are to apply in general, and where any specific arrangement does not fall into any of the categories covered by 14.10 to 14.15.

14.5.5 A hazardous zone or space may arise from the presence of any of the following:

(a) spaces or tanks containing either:
  (i) flammable liquid having a flashpoint (closed-cup test) not exceeding 60°C;
  (ii) flammable liquid having a flashpoint exceeding 60°C, heated or raised by ambient conditions to a temperature within 15°C of its flashpoint; or
  (iii) flammable gas;
(b) piping systems or equipment containing fluid defined by (a) and having flanged joints or glands or other openings through which leakage of fluid may occur under normal operating conditions;
(c) spaces containing solids, such as coal or grain, liable to release flammable gas and/or combustible dust;
(d) spaces containing dangerous goods in packaged form, of the following Classes as defined in the IMDG Code: 1 (with the exception of goods in division 1.4, compatibility group S), 2.1 (inclusive of applicable gas bottles for on board use), 3, 6.1 and 8;
(e) piping systems or equipment associated with processes (such as electrochlorination) generating flammable gas as a by-product and having openings from which the gas may escape under normal operating conditions; or
(f) piping systems or equivalent containing flammable liquids not defined by (a), having flanged joints, glands or other openings through which leakage of fluid in the form of a mist or fine spray may occur under normal operating conditions.

14.5.6 The following zones or spaces are regarded as hazardous, **zone 0**:

(a) the interiors of those spaces, tanks, piping systems and equipment defined by 14.5.5(a) and (b); and
(b) enclosed, unventilated spaces containing pipework or equipment defined by 14.5.5(b) and (e).

14.5.7 The following zones or spaces are regarded as hazardous, **zone 1**:
(a) unventilated spaces separated by a single bulkhead or deck from a cargo defined by 14.5.5(a);
(b) ventilated spaces containing pipework or equipment defined by 14.5.5(b) and (e);
(c) zones within a 1,5 m radius of ventilation outlets, hatches or doorways or other openings into spaces defined by (a) or (b), or within 1,5 m of the ventilation outlets of spaces regarded by 14.7 as open areas and which contain the pipework or equipment defined by 14.5.5(b) or (e). Where the hazard results from flammable gas or vapour having a density relative to that of air of more than 0,75, the hazardous zone is considered to extend vertically downward to solid deck, or for a distance of 9 m, whichever is the lesser;
(d) zones on open deck, or semi-enclosed spaces on open deck, within 3 m of the ventilation outlets of cargo tanks defined in 14.5.5 (a), which permit the flow of small volumes of vapour or gas mixtures caused by thermal variation;
(e) zones within a 1,5 m radius of flanged joints, or glands or other openings defined by 14.5.5(b); in the case of gas or vapour having a relative density of more than 0,75, the hazardous zone is considered to extend vertically downwards as described under (c);
(f) zones within a 1,5 m radius of flanged joints, or glands or other openings defined by 14.5.5(e) and (f);
(g) zones within a 1,5 m radius of bunds or barriers intended to contain spillage of liquids defined by 14.5.5(a);
(h) zones on open deck within a 1,5 m radius of any opening into a space defined by (a); and
(j) enclosed or semi-enclosed spaces with direct opening into a **zone 1** hazardous location.

14.5.8 The following zones or spaces are regarded as hazardous, **zone 2**:
(a) ventilated spaces separated by a single bulkhead or deck from a **zone 0** space;
(b) zones on open deck extending 1,5 m beyond those defined by 14.5.7(c), (d), (e), (f), (g) or (h);
(c) zones on open deck extending 2 m beyond those defined by 14.5.7(d);
(d) zones within a 1,5 m radius of ventilation inlets serving spaces defined by 14.5.7(b); and
(e) enclosed or semi-enclosed spaces with direct opening into a **zone 2** hazardous location.

14.6 Semi-enclosed spaces

14.6.1 Semi-enclosed spaces are considered to be spaces limited by decks and/or bulkheads in such a manner that the natural conditions of ventilation are sensibly different from those obtained on open deck.

14.7 Ventilation

14.7.1 Where an enclosed or semi-enclosed space is provided with mechanical ventilation ensuring at least 12 air changes/hour, and leaving no areas of stagnant air, it may be regarded in consideration of hazardous zones as would otherwise be defined by 14.5.6(b), 14.5.7(b) or (h) and 14.5.8(d), as an open area.

14.7.2 Where the rate of ventilation air flow, in relation to the maximum rate of release of flammable substances reasonably to be expected under normal conditions, is sufficient to prevent the concentration of flammable substances approaching their lower explosive limit, consideration may be given to regarding as non-hazardous, the space, ventilation and other openings into it, and the zone around the equipment contained within.

14.7.3 An alarm is to be provided on the navigating bridge, engine control room, and where applicable, cargo control room to indicate any loss of the required ventilation capacity.

14.8 Pressurisation

14.8.1 A space having access to a hazardous space or zone defined as **zone 1** or **zone 2** may be regarded as non-hazardous if fulfilling all the following conditions:
(a) access is by means of an air-lock, having gastight steel doors, the inner of which as a minimum, is self-closing without any hold-back arrangement;
(b) it is maintained at an overpressure relative to the external hazardous area by ventilation from a non-hazardous area;
(c) the relative air pressure within the space is continuously monitored and so arranged that, in the event of loss of overpressure, an alarm is given and the electrical supply to all equipment not of a type suitable for **zone 1** is automatically disconnected. Where the shut-down of equipment could introduce a hazard, an alarm may be given, in lieu of shutdown, upon loss of overpressure, and a means of disconnection of electrical equipment not of a type suitable for **zone 1**, capable of being controlled from an attended station, provided in conjunction with an agreed operational procedure; where the means of disconnection is located within the space then it is to be effected by equipment of a type suitable for **zone 1**;
(d) any electrical equipment required to operate upon loss of overpressure, lighting fittings (*see* 5.7.3) and equipment within the air-lock, is to be of a type suitable for **zone 1**; and
(e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 1**, being energised until the atmosphere within the space is made safe, by air renewal of at least 10 times the capacity of the space.

14.8.2 A space having access to a hazardous space or zone defined as **zone 2** may be regarded as non-hazardous if fulfilling all the following conditions:
(a) access is by means of a self-closing gastight steel door without any hold-back arrangement;

(b) it is maintained at an overpressure relative to the external hazardous area by ventilation from a non-hazardous area;
(c) the relative air pressure within the space is continuously monitored and so arranged that, in the event of loss of overpressure, an alarm is given. A means of disconnection of electrical equipment not of a type suitable for **zone 2** is to be provided; where the means of disconnection is located within the space then it is to be effected by equipment of a type suitable for **zone 2**;
(d) any electrical equipment required to operate upon loss of overpressure (e.g., lighting fittings, *see* 5.7.3), is to be of a type suitable for **zone 2**.

14.9 Cable and cable installation

14.9.1 Electric cables are not, as far as is practicable, to be installed in hazardous zones or spaces, except where serving equipment installed within the zone or space. Through runs of cable may be accepted in locations classified as **zone 1** or **zone 2**, where alternative routes are impracticable.

14.9.2 In addition to the requirements of Section 11, cables for circuits that are not intrinsically safe, which are located in hazardous zones or spaces, or which may be exposed to cargo oil, oil vapour or gas, are to be either:
(a) mineral insulated with copper sheath, or
(b) armoured or braided for earth detection.
(c) otherwise adequately protected against mechanical or chemical damage, within **zone 2** or non-hazardous locations only, or
(d) as otherwise specifically permitted elsewhere within this Section.

14.9.3 Armouring, braiding and other metal coverings of cables installed in dangerous zones or spaces are to be effectively earthed at least at both ends.

14.9.4 Where there is risk of intermittent contact between armour and exposed metalwork, non-metallic impervious sheath is to be applied over metallic armour of cables.

14.9.5 Cables associated with intrinsically safe circuits are to be used only for such circuits. They are to be physically separated from cables associated with non-intrinsically safe circuits, e.g., neither installed in the same protective casing nor secured by the same fixing clip. Consideration may be given to other arrangements complying with IEC 60079-14, *Explosive atmospheres — Part 14: Electrical installations design,selection and erection*.

14.9.6 In **zone 0**, cable joints may only be used in intrinsically safe circuits.

14.9.7 Cable runs in **zone 1** or **zone 2** are, where practicable, to be uninterrupted. Where discontinuities cannot be avoided, cable joints are, additionally, to:
- be made in an enclosure with a type of protection appropriate to the location; or
- provided the joint is not subject to mechanical stress, be epoxy filled, compound-filled or sleeved with heat-shrunk tubing, in accordance with the manufacturer's instructions.

14.10 Requirements for tankers intended for the carriage in bulk of oil cargoes having a flash point not exceeding 60°C (closed-cup test)

14.10.1 In order to eliminate potential sources of ignition from hazardous areas on board tankers in accordance with SOLAS 1974 as amended, Chapter II-1, Regulation 45.11, electrical equipment is to be selected and installed in accordance with IEC 60092: *Electrical installations in ships – Part 502: Tankers – Special features*.

14.10.2 The relevant group and temperature class for electrical equipment in hazardous zones are, respectively, IIA and T3.

14.11 Requirements for ships for the carriage of liquefied gases in bulk

14.11.1 *See* Chapter 10 of the Rules for Ships for Liquefied Gases.

14.12 Requirements for ships intended for the carriage in bulk of other flammable liquid cargoes

14.12.1 *See* Chapter 10 of the Rules for Ships for Liquid Chemicals.

14.13 Special requirements for ships with spaces for carrying vehicles with fuel in their tanks, for their own propulsion

14.13.1 **Passenger ships with special category spaces above the bulkhead deck for carrying vehicles**:
(a) electrical equipment fitted within a height of 45 cm above the vehicle deck, or any platform on which vehicles are carried, or within the exhaust ventilation trunking for the space, is to be of a type acceptable for **zone 1**;
(b) electrical equipment situated elsewhere within the space is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP55, *see* IEC 60529: *Degrees of protection provided by enclosures (IP Code)*. Smoke and gas detector heads are exempt from this requirement.

14.13.2 **Passenger ships with special category spaces below the bulkhead deck for carrying vehicles**: electrical equipment fitted within the space and within the exhaust ventilation trunking for the space, is to be of a type acceptable for **zone 1**.

14.13.3 **Passenger ships with cargo spaces, other than special category spaces, for carrying vehicles**:
(a) electrical equipment within such a cargo space, or within the exhaust ventilation trunking for the space, is to be of a type acceptable for **zone 1**;

(b) all electrical circuits terminating in the cargo space are to be provided with multipole linked isolating switches located outside the cargo hold. Provision is to be made for locking in the off position. This does not apply to safety circuits such as those for fire, smoke or gas detection.

14.13.4 **Cargo ships with closed ro-ro cargo spaces for carrying vehicles**:

(a) except where exempted by (b) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a type acceptable for **zone 1**;

(b) where the ventilation system required by SOLAS 1974 as amended, Chapter II-2, Regulation 20.3.1.1.1 is arranged to operate continuously and is sufficient to provide at least ten air changes per hour, whenever vehicles are on board, above a height of 45 cm from the vehicle deck, or any platform on which vehicles are carried, electrical equipment is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP 55;

(c) all electrical circuits terminating in the cargo space are to be provided with multipole linked isolating switches located outside the cargo hold. Provision is to be made for locking in the off position. This does not apply to safety circuits such as those for fire, smoke or gas detection.

14.14 Special requirements for ships intended for the carriage of dangerous goods and materials hazardous only in bulk

14.14.1 In order to eliminate potential sources of ignition in enclosed cargo spaces or vehicle spaces in accordance with SOLAS 1974 as amended, Chapter II-2, Regulation 19.3.2, and from associated hazardous areas (*see* 14.5.3), electrical equipment is to be selected in accordance with 14.14.2 and 14.14.3 and installed in accordance with 14.4 and 14.14.4 to 14.14.7.

14.14.2 Electrical equipment essential for the safety and operation of the ship is to be of a type providing protection against ignition of the gases and/or dusts that can be present, selected in accordance with IEC 60092-506: *Electrical installations in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*.

14.14.3 In addition to the requirements of IEC 60092-506: *Electrical installations in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*, pipes such as ventilation and bilge pipes having ends opening into a hazardous area are to be considered a hazardous area. Enclosed spaces such as pipe tunnels and bilge pump-rooms containing such pipes and with equipment and components such as pumps, valves and flanges are to be considered as extended hazardous areas unless protected by overpressure.

14.14.4 Electrical equipment not essential for the safety or operation of the ship and which is not of a type providing protection against ignition of the gases and/or dusts that can be present is to be completely disconnected and protected against unauthorised re-connection. Disconnection is to be made outside the hazardous areas and be effected with isolating links or lockable switches.

14.14.5 Electrical equipment and all cables, including through runs and terminating cables, are to be protected against mechanical damage. Cables are to be either enclosed in screwed heavy gauge steel drawn or seam-welded and galvanised conduit, or protected by electrically continuous metal sheathing or metallic wire armour braid or tape.

14.14.6 Cable penetrations of decks and bulkheads are to be sealed against the passage of gas or vapour.

14.15 Requirements for ships with spaces for storing paint

14.15.1 In order to eliminate potential sources of ignition in paint stores, electrical equipment is to be selected as follows:

(a) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a type acceptable for **zone 1**;

(b) electrical equipment situated within 1 m of inlet and exhaust ventilation openings or within 3 m of exhaust mechanical ventilation outlets is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP55, *see* IEC 60529, *Classification of Degrees of Protection Provided by Enclosures*. *See* 1.11.1 for degrees of protection required for equipment on open deck.

14.15.2 A space having access to a paint store may be regarded as non-hazardous if fulfilling all of the following conditions:

(a) access is by means of a self-closing gastight steel door without any hold-back arrangement;

(b) the paint store is ventilated from a non-hazardous area and;

(c) warning notices are fitted adjacent to the paint store entrance warning of flammable liquids contained in paint store.

NOTE

A watertight door may be considered as being gastight.

14.15.3 The relevant group and temperature class for electrical equipment in hazardous zones are, respectively, IIB and T3.

Section 15
Navigation and manoeuvring systems

15.1 Steering gear

15.1.1 The requirements of 15.1.2 to 15.1.7 are to be read in conjunction with those in Pt 5, Ch 19,5.

15.1.2 Two exclusive circuits, fed from the main source of electrical power and each having adequate capacity to supply all the motors which may be connected to it simultaneously are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors. One of these circuits may pass through the emergency switchboard, *see also* Pt 5, Ch 19,6.

15.1.3 The main and auxiliary steering gear motors are to be capable of being started from a position on the navigating bridge and also arranged to restart automatically when power is restored after a power failure.

15.1.4 The motor of an associated auxiliary electric or electrohydraulic power unit may be connected to one of the circuits supplying the main steering gear.

15.1.5 Only short-circuit protection is to be provided for each main and auxiliary steering gear motor circuit.

15.1.6 In ships of less than 1600 gross tonnage, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements other than described in 15.1.5 for such a motor primarily intended for other services.

15.1.7 Each main and auxiliary steering gear electric control system which is to be operated from the navigating bridge is to be served with electric power by a separate circuit supplied from the associated steering gear power circuit, from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected. Each separate circuit is to be provided with short-circuit protection only.

15.2 Thruster systems for steering

15.2.1 Where azimuth or rotatable thruster units, used as the sole means of steering, are electrically driven the requirements of Pt 5, Ch 20,5.1 are to be complied with.

15.3 Thruster systems for dynamic positioning

15.3.1 For ships having a **DP** notation the requirements of Pt 7, Ch 4 are to be complied with.

15.4 Thruster systems for manoeuvring

15.4.1 Where a thruster unit is fitted solely for the purpose of manoeuvring, and is electrically driven, its starting and operation is not to cause the loss of any essential services.

15.4.2 In order to ensure that the thruster system is not tripped inadvertently whilst manoeuvring the ship, overload protection in the form of an alarm is to be provided for the electric motor and any associated supply converters, in lieu of tripping.

15.4.3 The thruster unit electric motor is not to be disconnected as part of a load management switching operation.

15.5 Transverse thrust units

15.5.1 Where transverse thrust units are remotely controlled, means are to be provided at the remote control station to stop the propulsion unit.

15.5.2 Transverse thrust units are to be provided with indications of direction and magnitude of thrust and propeller pitch at each station from which it is possible to control justify the propeller pitch.

15.6 Navigation lights

15.6.1 Navigation lights are to be connected separately to a distribution board reserved for this purpose only and accessible to the officer of the watch. This distribution board is to be connected directly or through transformers to the emergency source of electrical power in compliance with, for passenger ships, 3.2.7(b) and 3.2.9(a) or, for cargo ships, 3.3.7(c) and 3.3.9(a). An alarm is to be activated in the event of failure of a power supply from the distribution board.

15.6.2 Each navigation light is to be controlled and protected in each insulated pole by a switch and fuse or circuit-breaker mounted on the distribution board.

15.6.3 Provision is to be made on the navigating bridge for the navigation lights to be transferred to an alternative circuit fed from the main source of electrical power.

15.6.4 Each navigation light is to be provided with an automatic indicator giving audible and/or visual indication of failure of the light. If an audible device alone is fitted, it is to be connected to an independent source of supply, e.g., a battery, with means provided to test this supply. If a visual signal is used connected in series with the navigation light, means are to be provided to prevent extinction of the navigation light due to failure of the signal. The requirements of this paragraph do not apply to tugs, trawlers and similar small vessels.

15.6.5 For navigation lights using light emitting diodes (consisting of multiple light sources) means to ensure that the overall luminous intensity of the navigation light is sufficient are to be provided in addition to the alarm to indicate the complete loss of the navigation light illumination required by 15.6.4. For replacement navigation lights, *see* 1.5.5.

15.6.6 To satisfy 15.6.5, an audible and visual alarm is to be activated to notify the Officer of the Watch when the luminous intensity of the light reduces below the level required by the IMO *Convention on the International Regulations for Preventing Collisions at Sea*. Alternative measures to ensure continuing acceptable performance of navigation lights using light emitting diodes may be considered that are in accordance with:

- IMO Res. MSC.253(83), *Performance Standards for Navigation Lights, Navigation Light Controllers and associated Equipment*, and
- EN 14744, *Inland navigation vessels and sea-going vessels – Navigation light*, or a relevant National or International Standard.

Where alternative measures are proposed that require verification by personnel of the luminous intensity of navigation lights using light emitting diodes, details of the inspection implementation in the ship's safety management system and acceptance by the National Administration are to be submitted for consideration.

15.6.7 Navigation light power supply units installed to convert, control and/or monitor the distribution board power supply required by 15.6.1 above for connection to the light source(s) (e.g., for LED type navigation lights) are, in the event of a short-circuit on the unit output, to disconnect or limit the supply to prevent further damage and activate an alarm.

15.6.8 Navigation light power supply units are to be self-checking, detecting failures of the unit itself and activating an alarm. These are to include:

- detection of system lock-ups (program hangs);
- means to detect failure of navigation light switching command input circuits or links; and
- means to detect failure of the navigation light monitoring arrangements required to provide the alarms required by 15.6.4 and 15.6.5, as applicable.

15.6.9 The navigation light power supply failure alarms required by 15.6.1 are not to be displayed as a group alarm. Other navigation light alarms may be grouped for each navigation light where means are provided for personnel to determine the cause of the alarm. Activation of more than one of the navigation light alarms as a result of a single failure is to be prevented.

15.6.10 Any statutory requirements of the country of registration are to be complied with and may be accepted as an alternative to the above.

15.7 Navigational aids

15.7.1 Navigational aids as required by SOLAS are to be fed from the emergency source of electrical power, *see also* 3.2.7(c)(ii) and 3.3.7(d)(ii).

15.7.2 For ships having a notation **NAV 1** navigational aids are to have an alternative supply fed from the main source of electrical power, independent of the emergency switchboard, with automatic changeover facilities.

■ *Section 16* **Electric propulsion**

16.1 General

16.1.1 Where the arrangements permit a propulsion motor to be connected to a generating plant having a continuous rating greater than the motor rating, means are to be provided to limit the continuous input to the motor to a value not exceeding the continuous full load torque for which the motor and shafts are approved.

16.1.2 The ventilation and cooling systems for electrical propulsion equipment are to be provided with monitoring devices arranged to operate an alarm if the temperature of the heated cooling medium exceeds a predetermined safe value.

16.1.3 The embedded temperature detectors required by 9.1.10 are to be arranged to operate an alarm if the temperature exceeds a predetermined safe value.

16.1.4 Propulsion motors, generators and converters are to be provided with means to prevent the accumulation of moisture and condensate when operating at low power levels, or when idle.

16.2 System design and arrangement

16.2.1 In general, for a ship to be assigned an unrestricted service notation, it is to have two independently driven propellers or other propulsion devices, each connected with at least one electric motor, where these form the sole means of propulsion.

16.2.2 For vessels where a propulsion device driven by electric motors is proposed as the sole means of propulsion, at least two effective, independent electric propulsion motors are to be provided and the system is to be designed in accordance with Pt 7, Ch 14. The risk management is to identify components where a failure could cause loss of propulsion power or other essential services and the proposed arrangements for preventing and mitigating the effects of such a failure.

16.3 Power requirements

16.3.1 The propulsion system is to have sufficient power for manoeuvring the ship and for going astern. With the ship travelling at maximum service speed the propulsion equipment is to be capable of stopping and reversing the ship in an agreed time.

16.3.2 The propulsion system is to have adequate torque and power margins for all operating conditions including manoeuvring and rough weather with due regard to propeller and ship characteristics.

16.3.3 The electric power for the propulsion system may be derived from generating sets dedicated to propulsion duty or from a central power generation plant which serves both propulsion and ship service loads.

16.3.4 Where propulsion power is derived from a central, common, power plant the control system is to ensure a safe distribution of power between propulsion and ship services, with tripping of non-essential loads and/or reduction in propulsion power if necessary.

16.3.5 Where a central power generation system is employed the number and rating of generator sets is to be such that with one set out of action the remaining sets are capable of providing all essential and normal ship service loads whilst maintaining an effective level of propulsion power.

16.3.6 Where, in a central power generation system, the electrical power requirements are normally supplied by two or more generating sets operating in parallel, on sudden loss of power from one set, the rating of the remaining set(s) in service is to be sufficient to ensure uninterrupted operation of essential services and an effective level of propulsion power.

16.3.7 Where a central power generation system is employed, means are to be provided to connect available generator sets to meet the power requirement of the electric propulsion system. Arrangements are to be in place to prevent generator sets being automatically disconnected during ship manoeuvres.

16.3.8 Where forced cooling is used on propulsion motors it is to be possible to operate the motor at a defined reduced power level in the event of failure of the forced cooling.

16.3.9 Total harmonic distortion of the a.c. voltage waveform up to 10 per cent on electric propulsion circuits, not directly connected to the main source of electrical power, may be considered where details are submitted which demonstrate that the equipment and systems are capable of operating under such conditions.

16.4 Propulsion control

16.4.1 Propulsion control systems are to be stable throughout their normal operating range and arranged to attenuate any effects of cyclic propeller load fluctuations caused by wave action.

16.4.2 Step-less control of propeller speed, and/or pitch, from zero to full power ahead or astern is to be provided.

16.4.3 The control system is to ensure that there is no dangerous overspeeding of propulsion motors upon loss of load.

16.4.4 Interlocks are to be provided in the control system to ensure that ahead and astern circuits are not energised simultaneously.

16.4.5 Any single fault in either the propulsion machine excitation or power distribution systems is not to result in a total loss of propulsion power.

16.4.6 Control, alarm and safety systems for the propulsion system are to satisfy the requirements of Chapter 1.

16.4.7 Each control station is to be provided with an emergency stop function for the propulsion motors. The emergency stop function is to be independent of the normal control system.

16.4.8 The control system is to limit the propulsion power if the power available from the generator(s) is not sufficient to supply the demand level of propulsion power. In the event of a power limitation, there is to be a visual indication at the control stations.

16.4.9 Means are to be provided to identify the cause of propulsion motor power limitation or automatic reduction (e.g., excessive load torque, cooling failure, high temperature, power availability).

16.4.10 Local controls are to be provided, independent of any remote or automatic system, to permit effective control of the propulsion equipment.

16.4.11 Control systems are not to share hardware or data communication links with control, safety and alarm systems not associated with propulsion control, *see also* Ch 1,2.11.

16.5 Protection of propulsion system

16.5.1 Provision is to be made for protection against severe overloads, and electrical faults likely to result in damage to plant.

16.5.2 Propulsion motors are to be capable of withstanding, without damage, the thermal and mechanical effects of a short-circuit at the terminals.

16.5.3 Electric motors of podded propulsion units, and/or having permanent magnet excitation, are to be provided with a protective device which, in the event of a short-circuit in the motor or in the cables between the motor and its circuit-breaker, will instantaneously open the circuit-breaker and, in motors with electromagnetic excitation, de-excite the motor. Motors with permanent magnet main excitation are to be provided with means to prevent further damage as a result of continued rotation after disconnection (e.g., shaft brake).

16.5.4 Safeguards for protecting propulsion equipment against damage resulting from earth faults are to be as specified by the equipment manufacturer. Where the fault current flowing is liable to cause damage to the electrical equipment there are to be arrangements for interrupting the current automatically.

16.5.5 For the protection of electrical equipment and cables against overvoltages means are to be provided for limiting the induced voltage when field windings, and other inductive circuits are opened. Protective resistors and devices are to be sized to cater for the likely extreme operating conditions.

16.5.6 An alarm is to be initiated when the excitation system of electric generators providing propulsion power is overloaded such that damage due to heating could occur in the generator or its cabling.

16.5.7 Where, on stopping or reversing the propeller, regenerated energy is produced by the propulsion motor this is not to cause a dangerous increase of speed in the prime mover or a dangerous overvoltage condition on the supply system. Where a central power generation system is used then the voltage and frequency fluctuations are not to exceed the limits given in 1.8.

16.5.8 Dynamic braking resistors are to be suitably rated for their expected operation.

16.5.9 Propulsion converters are to be capable of withstanding, without damage, the thermal and mechanical effects of a short-circuit at the terminals or connection to a propulsion motor with a stalled or locked rotor.

16.5.10 Loss of flow of air or liquid cooling of propulsion converters, where used, is to initiate an alarm at an attended control position. Loss of flow of air or liquid cooling is not to result in immediate damage to the propulsion converter, *see* 10.2.4.

16.5.11 Alarms and safeguards for electric propulsion equipment are indicated in Table 2.16.1.

Table 2.16.1 Electric propulsion equipment: Alarms and safeguards

Item	Alarm	Note
Electric propulsion equipment ventilation and cooling medium temperature	High	*See* 16.1.2 and 16.3.8
Electric propulsion transformer winding temperature	High	*See* 10.1.11
Electric propulsion generator excitation	Overload	*See* 16.5.6
Electric propulsion generators and motors winding temperature	High	*See* 16.1.3
Electric propulsion generator and motor bearing temperature	High	*See* 9.1.11
Electric propulsion generator and motor lubricating oil supply pressure	Low	*See* 9.1.12
Electric propulsion generator and motor lubricating oil temperature	High	*See* 9.1.13

16.6 Instruments

16.6.1 The main control station is to be provided with the following instruments:

(a) a.c. systems:
- (i) an ammeter for each generator, propulsion motor and propulsion transformer primary; voltmeter, wattmeter and frequency meter for each generator and ammeter for each excitation circuit; and
- (ii) a temperature indicator for each generator, propulsion transformer and propulsion motor windings and bearings, the indicator is to read stator winding temperature of the rotating machines and cooling system temperature.

(b) d.c. systems:
- (i) a voltmeter and ammeter for each generator and propulsion motor; and
- (ii) an ammeter for each excitation circuit.

16.6.2 Each control station is to be provided with instruments to indicate:

(a) propeller speed;
(b) direction of rotation for a fixed pitch propeller or pitch position for a controllable pitch propeller;
(c) visual indication of power limitation; and
(d) indication of station in control.

■ *Section 17* Fire safety systems

17.1 Fire detection and alarm systems

17.1.1 Fire detection and alarm systems are to comply with Chapter 9 of the *Fire Safety Systems Code* (FSS Code) and 17.1.2 to 17.1.10.

17.1.2 Fire detection and alarm systems are to be provided with at least two power supplies. One supply is to be connected to the main source of electrical power and another supply is to be connected to the emergency source of electrical power required by 3.2 or 3.3, or an accumulator battery capable of supplying power for the same period of time as the emergency source of electrical power. All power supply feeders for fire detection and alarm systems are to be in accordance with 11.6.4.

17.1.3 Automatic changeover facilities in accordance with 5.3.5 are to be located in, or adjacent to, the main fire-control panel. Power supply changeover is to be achieved without adverse effect. Failure of any power supply is to operate an audible and visual alarm. *See also* 1.14 and 1.16.

17.1.4 Where an accumulator battery provides a power supply, on restoration of the main source of electrical power, the rating of the charge unit is to be sufficient to recharge the battery while maintaining the output supply to the fire detection and alarm system.

17.1.5 Power supplies from the main and emergency switchboards are to be supplied by separate feeders that are reserved solely for this purpose. Where the emergency feeder for the electrical equipment used in the operation of the fixed fire detection and alarm system is supplied from the emergency switchboard, it is to be run from this switchboard to the automatic changeover switch without passing through any other switchboard.

17.1.6 A loop circuit of an addressable fire detection system, capable of remotely identifying from either end of the loop each detector and manually operated call point served

by the circuit, may serve spaces on both sides of the ship and on several decks, but is not to be situated in more than one main vertical or horizontal fire zone, nor is a loop circuit which covers an accommodation space, service space and/or control station to include a machinery space of Category A.

17.1.7 A loop circuit of an addressable fire detection system may comprise one or more sections. Where the loop comprises more than one section, the sections are to be separated by devices which will ensure that, if a short-circuit occurs anywhere in the loop, only the affected section will be isolated from the control panel. No section of detectors and manually operated call points is in general to include more than 50 detectors.

17.1.8 Where the fire detection system does not include means of remotely identifying each detector and manually operated call point individually, no section covering more than one deck within accommodation, service spaces and control stations is normally to be permitted except a section which covers an enclosed stairway. The number of enclosed spaces in each section is to be limited to the minimum considered necessary in order to avoid delay in identifying the source of fire. In no case are more than fifty spaces permitted in any section.

17.1.9 A section of fire detectors and manually operated call points is not to be situated in more than one main vertical zone.

17.1.10 The wiring for each section of detectors and manually operated call points in an addressable fire detector system is to be separated as widely as practicable from that of all other sections on the same loop. Where practicable no loop is to pass through a space twice. When this is not practicable, such as in large public spaces, the part of the loop which by necessity passes through the space for a second time is to be installed at the maximum possible distance from other parts of the loop.

17.2 Automatic sprinkler system

17.2.1 Any electrically driven power pump, provided solely for the purpose of continuing automatically the discharge of water from the sprinklers, is to be brought into action automatically by the pressure drop in the system before the standing fresh water charge in the pressure tank is completely exhausted.

17.2.2 For **passenger ships**, electrically driven sea-water pumps for automatic sprinkler systems are to be served by not less than two circuits reserved solely for this purpose, one fed from the main source of electrical power and one from the emergency source of electrical power. Such feeders are to be connected to an automatic changeover switch situated near the sprinkler pump and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.

17.2.3 The automatic alarm and detection system is to be fed by exclusive feeders from two sources of electrical power, one of which is to be an emergency source, with automatic changeover facilities located in, or adjacent to, the main alarm and detection panel.

17.2.4 Feeders for the sea-water pump and the automatic alarm and detection system are to be arranged so as to avoid galleys, machinery spaces and other enclosed spaces of high fire risk, except in so far as it is necessary to reach the appropriate switch boards. The cables are to be of a fire resistant type where they pass through such high risk areas.

17.3 Fixed water-based local application fire-fighting systems

17.3.1 Where fixed water-based local application fire-fighting system pressure sources are reliant on external power they need only be supplied by the main source of electrical power.

17.3.2 The fire detection, control and alarm systems are to be provided with an emergency source of electrical power required by 3.2 or 3.3 and are also to be connected to the main source of electrical power. Separate feeders, reserved solely for this purpose, with automatic changeover facilities located in, or adjacent to, the main control panel are to be provided.

17.3.3 Failure of any power supply is to operate an audible and visual alarm. *See also* 1.14 and 1.15.

17.3.4 Means to activate a system are to be located at easily accessible positions inside and outside the protected space. Arrangements inside the space are to be situated such that they will not be cut off by a fire in the protected areas and are suitable for activation in the event of escape. Where it is proposed to install local activation means outside of the protected space, details are to be submitted for consideration.

17.3.5 For the electrical safety of electrical and electronic equipment in areas protected by fixed water-based local application fire-fighting systems and adjacent areas where water may extend, the requirements of 17.3.6 to 17.3.10 apply.

17.3.6 As far as is practicable, electrical and electronic equipment is not to be located within protected areas or adjacent areas. The system pump, its electrical motor and the sea valve if any, may be in a protected space provided that they are outside areas where water or spray may extend.

17.3.7 High voltage equipment and their enclosures are not to be installed in protected areas or adjacent areas. For high voltage generators enclosures which cannot be fully located outside of adjacent areas due to close proximity, a technical justification, including proposed degree of protection ratings that are normally not to be lower that IP54, may be submitted for consideration that demonstrates the overall safety of the installation in the event of system operation.

17.3.8 In addition to the degree of protection requirements of 1.11.1, electrical and electronic equipment enclosures located within protected areas and within adjacent areas are to provide adequate protection in the event of system operation.

17.3.9 To demonstrate compliance with 17.3.8, evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas is to be submitted in accordance with 1.2.13. The evidence is to demonstrate that additional precautions have been taken, where necessary, in respect of:

(a) satisfying 17.3.6 and 17.3.7;
(b) personnel protection against electric shock;
(c) cooling airflow, where necessary, for equipment required to operate during system operation; and
(d) maintenance requirements for equipment before return to operation following system activation.

Any test evidence submitted is to consider the overall installation, including equipment types, system configuration and nozzles and the potential effects of airflows in the protected space.

17.3.10 The evidence required by 17.3.9 is to demonstrate the safe and effective operation of the overall arrangements in the event of system operation. This evidence is to demonstrate that exposure to system spray and/or water:

- cannot result in loss of essential services (e.g., unintended activation of automatic machinery shut-down);
- cannot result in loss of availability of emergency services;
- will not affect the continued safe and effective operation of electrical and electronic equipment required to operate during the required period of system operation;
- does not present additional electrical or fire hazards; and
- would require only identified readily replaceable components to be repaired or replaced.

The installation of electrical and electronic equipment required to provide essential or emergency services in enclosures with a degree of protection less than IP44 within areas exposed to direct spray is to be acceptable to LR, and evidence of suitability is to be submitted accordingly.

17.3.11 Fixed water-based local application fire-fighting system electrically driven pumps may be shared with:

- equivalent automatic sprinkler systems;
- equivalent main machinery space fire-fighting systems; or
- local fire-fighting systems for deep-fat cooking equipment;

provided that the shared use is accepted by the National Administration as complying with applicable statutory regulations and the arrangements comply with the requirements of 17.3.12 to 17.3.14.

17.3.12 Shared electrically driven sea-water pumps are to be served by not less than two circuits reserved solely for this purpose, one fed from the main source of electrical power and one from the emergency source of electrical power. Such feeders are to be connected to an automatic changeover switch situated near the pumps and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.

17.3.13 Failure of a component in the power and control system is not to result in a reduction of the total available pump capacity below that required by any of the areas which the system is required to protect. For equivalent automatic sprinkler systems, a failure is not to prevent automatic release or reduce sprinkler pump capacity by more than 50 per cent.

17.3.14 Where fire-fighting systems share fire-fighting pumps, failure of one system is not to prevent activation of the pumps by any other system.

17.4 Fire pumps

17.4.1 When the emergency fire pump is electrically driven, the power is to be supplied by a source other than that supplying the main fire pumps. This source is to be located outside the machinery spaces containing the main fire pumps and their source of power and drive units.

17.4.2 The cables to the emergency fire pump are not to pass through the machinery spaces containing the main fire pumps and their source of power and drive units. The cables are to be of a fire-resistant type where they pass through other high fire risk areas.

17.5 Refrigerated liquid carbon dioxide systems

17.5.1 Where there are electrically driven refrigeration units for carbon dioxide fire-extinguishing systems, one unit is to be supplied by the main source of electrical power and the other unit from the emergency source of electrical power.

17.5.2 Each electrically driven carbon dioxide refrigerating unit is to be arranged for automatic operation in the event of loss of the alternative unit.

17.6 Fire safety stops

17.6.1 In order to limit the fire growth potential in every space of the ship, means for controlling the air supply to the spaces and flammable liquids within the spaces are to be provided.

17.6.2 To control air supply, a means of stopping all forced and induced draught fans, and all ventilation fans serving accommodation spaces, service spaces, control stations and machinery spaces from an easily accessible position outside of the space being served is to be provided. The position is not to be readily cut off in the event of a fire in the spaces served by the fans.

17.6.3 In passenger ships carrying more than 36 passengers, a second means of stopping ventilation fans serving accommodation spaces, service spaces and control stations is to be provided at a position as far apart from the position required by 17.6.2 as is practicable. At both positions, the controls are to be grouped so that all fans can be stopped from either of the two positions.

17.6.4 A second means of stopping ventilation fans serving machinery spaces is to be provided at a position as far apart from the position required by 17.6.2 as is practicable. At both positions the controls are to be grouped so that all fans are operable from either of the two positions. The means for stopping machinery space ventilation fans are to be entirely separate from the means for stopping fans serving all other spaces.

17.6.5 In passenger ships, the means of stopping machinery ventilation fans required by 17.6.2 is to be located at the central control station which is to have safe access from the open deck. The central control station is to be provided with ventilation fan OFF status indications together with a means for restarting the ventilation fans.

17.6.6 In passenger ships carrying 36 passengers or more, exhaust ducts from main laundries are to be fitted with additional remote-control arrangements for shutting off the exhaust fans and supply fans from within the space and for operating electrically operated fire dampers fitted at the lower end of the duct.

17.6.7 To control flammable liquids, a means of stopping all fuel oil, lubricating oil, hydraulic oil, cargo oil and thermal oil pumps, oil purifiers from outside the spaces being served is to be provided. The position is not to be cut off in the event of a fire.

17.6.8 Means of cutting off all electrical power to the galley except lighting circuits, in the event of a fire, is to be provided outside the galley exits, at positions which will not readily be rendered inaccessible by such a fire. Consideration may be given to relaxing this requirement for supplies to equipment not used for heating or cooking (e.g., alarm and clock systems) that do not present an electrical shock risk to fire-fighting personnel.

17.6.9 Following activation of any fire safety stops, a manual reset is to be provided in order to restart the associated equipment.

17.6.10 Fire safety stop systems are to be designed on the fail safe principle or alternatively the power supplies to, and the circuits of, the fire safety stop systems are to be continuously monitored and an alarm initiated in the event of a fault. Cables are to be of a fire-resistant type, *see* 11.5.3. *See also* 5.2.1.

17.7 Fire doors

17.7.1 The electrical power required for the control, indication and alarm circuits of fire doors is to be provided by an emergency source of electrical power as required by 3.2. In passenger ships carrying more than 36 passengers an alternative supply fed from the main source of electrical power, with automatic changeover facilities, is to be provided at the central control station. Failure of any power supply is to operate an audible and visual alarm, *see also* 1.14 and 1.16.

17.7.2 The control and indication systems for the fire doors are to be designed on the fail-safe principle with the release system having a manual reset.

17.8 Fire dampers

17.8.1 The electrical power required for the control and indication circuits of fire dampers is to be supplied from the emergency source of electrical power.

17.8.2 The control and indication systems for the fire dampers are to be designed on the fail-safe principle with the release system having a manual reset.

17.8.3 In passenger ships carrying 36 passengers or more, where electrically operated fire dampers are fitted at the lower end of exhaust ducts from main laundries, they are to be capable of automatic and remote operation.

17.9 Fire-extinguishing media release

17.9.1 Where it is required that alarms be provided to warn of the release of a fire-extinguishing medium, and these are electrically operated, they are to be provided with an emergency source of electrical power, as required by 3.2 or 3.3, and also connected to the main source of electrical power, with automatic changeover facilities located in, or adjacent to, the fire-extinguishing media release panel, *see also* 1.14. Failure of any power supply is to operate an audible and visual alarm, *see also* 1.14 and 1.16.

17.9.2 The opening of the fire-extinguishing media control cabinet door, or panel, for any purpose, other than for the release of the fire-extinguishing media, is not to cause the loss of any essential services, *see* 1.6.1.

17.10 Safety centre on passenger ships

17.10.1 Passenger ship safety centres required by SOLAS Ch II/2, Reg. 23 to provide a control station dedicated to assist with the management of emergency situations are to satisfy the requirements of this sub-Section.

17.10.2 The safety centre is to be either a part of the navigation bridge or to be located in a separate adjacent space having direct access to the navigation bridge.

17.10.3 Except where located in the same space, means of communication between the safety centre, the central control station, the navigation bridge, the engine control room, the storage room(s) for fire extinguishing system(s) and fire equipment lockers are to be provided.

17.10.4 The operation, control and monitoring of the following arrangements, where they are required to be installed by the National Administration, is to be additionally available from the safety centre:
- all powered ventilation systems;
- fire doors;
- general emergency alarm system;
- public address system;
- electrically powered escape route lighting or low location lighting for evacuation guidance;
- watertight and semi-watertight doors;
- indicators for bow and inner doors and stern and side shell doors and their closing appliances;

- water ingress detection for bow and inner doors and stern and side shell doors;
- remote surveillance systems for bow and inner doors and stern and side shell doors;
- fire detection and alarm systems;
- fixed water-based local application fire-fighting systems;
- automatic sprinkler systems, or equivalents;
- water-based fixed fire-extinguishing systems for machinery spaces;
- alarm to summon the crew;
- atrium smoke extraction system;
- flooding detection systems; and
- fire pumps and emergency fire pumps.

Operation, control and/or monitoring facilities provided at the safety centre are additional to any dedicated facilities required at other locations by the Rules or the National Administration.

17.10.5 Where arrangements are operated, controlled and/or monitored from the safety centre in accordance with 17.10.4, they are to comply with the relevant requirements of Ch 1,2 in respect of control, alarm and programmable electronic systems.

17.11 Electrically powered air compressors for breathing air cylinders

17.11.1 In passenger ships carrying more than 36 passengers where electrically powered air compressors are installed as part of the means required by SOLAS 1974 as amended, Chapter II-2/C, for recharging breathing apparatus air cylinders for fire-fighters' outfits, the compressors are to be supplied by the main and emergency sources of electrical power. Details of the emergency supply electrical load, supply changeover arrangements and operation under fire conditions are to be submitted for consideration. The arrangements are to be to the satisfaction of the National Administration with which the ship is registered.

■ *Section 18* Crew and passenger emergency safety systems

18.1 Emergency lighting

18.1.1 For the purpose of this Section emergency lighting, transitional emergency lighting and supplementary emergency lighting are hereafter referred to under the generic name 'emergency lighting'.

18.1.2 Emergency lighting provided in compliance with Section 3 is to be arranged so that a fire or other casualty in the spaces containing the emergency source of electrical power, associated transforming equipment and the emergency lighting switchboard does not render the main lighting system inoperative.

18.1.3 The level of illumination provided by the emergency lighting is to be adequate to permit safe evacuation in an emergency, having regard to the possible presence of smoke, *see* 18.4.

18.1.4 The exit(s) from every main compartment occupied by passengers or crew is to be continuously illuminated by an emergency lighting fitting.

18.1.5 Switches are not to be installed in the final sub-circuits to emergency light fittings unless the light fittings are serving normally unmanned spaces (e.g., storage rooms, cold rooms, etc.), or they are normally required to be extinguished for operational reasons (e.g., for night visibility from the navigating bridge). Where switches are fitted they are to be accessible only to ship's crew with provision made to ensure that the emergency lighting is energised when such spaces are manned and/or during emergency conditions.

18.1.6 Where emergency lighting fittings are connected to dimmers, provision is to be made, upon the loss of the main lighting, to automatically restore them to their normal level of illumination.

18.1.7 Fittings are to be specially marked to indicate that they form part of the emergency lighting system.

18.2 General emergency alarm system

18.2.1 An electrically operated bell or klaxon or air-operated whistle with independent air supply or other equivalent warning system installed in addition to the ship's whistle or siren, for sounding the general emergency alarm signal is to comply with the *International Life-Saving Appliances (LSA) Code* and with the requirements of this Section, *see also* 1.14 and 1.16.

18.2.2 The general emergency alarm system is to be provided with an emergency source of electrical power as required by 3.2 or 3.3 and also connected to the main source of electrical power with automatic changeover facilities located in, or adjacent to, the main alarm signal distribution panel. Failure of any power supply is to operate an audible and visual alarm, *see also* 1.14.

18.2.3 The general emergency alarm distribution system is to be so arranged that a fire or casualty in any one main vertical zone, as defined by SOLAS 1974 as amended Reg II-2/A, 3.32, other than the zone in which the public address control station is located, will not interfere with the distribution in any other such zone.

18.2.4 There are to be segregated cable routes to public rooms, alleyways, stairways, control stations and on passenger ships on open decks, so arranged that any single electrical fault, localised fire or casualty will not cause the loss of the facility to sound the general emergency alarm in any public rooms, alleyways, stairways, control stations and on passenger ships on open decks, albeit at a reduced capacity.

18.2.5 Where the special alarm fitted to summon the crew, operated from the navigation bridge, or fire-control station, forms part of the ship's general alarm system, it is to be capable of being sounded independently of the alarm to the passenger spaces.

18.2.6 The sound pressure levels are to be measured during a practical test and documented, *see* 21.2.

18.3 Public address system

18.3.1 Public address systems on passenger ships and public address systems used on cargo ships to sound the general emergency alarm or the fire-alarm, are to comply with the *International Life-Saving Appliances (LSA) Code* and the requirements of this Section.

18.3.2 The public address system is to be provided with an emergency source of electrical power as required by 3.2 or 3.3 and also connected to the main source of electrical power with automatic changeover facilities located adjacent to the public address system. Failure of any power supply is to operate an audible and visual alarm, *see also* 1.14 and 1.16.

18.3.3 The public address system is to have multiple amplifiers having their power supplies so arranged that a single fault will not cause the loss of the facility to broadcast emergency announcements in public rooms, alleyways, stairways and control stations, albeit at a reduced capacity.

18.3.4 The public address distribution system is to be so arranged that a fire or casualty in any one main vertical zone, as defined by SOLAS 1974 as amended Reg II-2/A, 3.32, other than the zone in which the public address control station is located, will not interfere with the distribution in any other such zone.

18.3.5 There are to be at least two cable routes, sufficiently separated throughout their length, to public rooms, alleyways, stairways and control stations so arranged that any single electrical fault, fire or casualty will not cause the loss of the facility to broadcast emergency announcements in any public rooms, alleyways, stairways and control stations, albeit at a reduced capacity.

18.3.6 Amplifiers are to be continuously rated for the maximum power that they are required to deliver into the system for audio and, where alarms are to be sounded through the public address system, for tone signals.

18.3.7 Loudspeakers are to be continuously rated for their proportionate share of amplifier output and protected against short-circuits.

18.3.8 Amplifiers and loudspeakers are to be selected and arranged to prevent feedback and other interference. There are also to be means to automatically override any volume controls, so as to ensure the specified sound pressure levels are met.

18.3.9 Where the public address system is used for sounding the general emergency alarm and the fire-alarm, the following requirements are to be met in addition to those of 18.2:

(a) The emergency system is given automatic priority over any other system input.
(b) More than one device is provided for generating the sound signals for the emergency alarms.

18.3.10 Where more than one alarm is to be sounded through the public address system, they are to have recognisably different characteristics and additionally be arranged, so that any single electrical failure which prevents the sounding of any one alarm will not affect the sounding of the remaining alarms.

18.3.11 The sound pressure levels are to be measured during a practical test using speech and, where applicable, tone signals, and documented, *see* 21.2.

18.4 Escape route or low location lighting (LLL)

18.4.1 The escape route or low location lighting (LLL) required by SOLAS 1974 as amended Pt D, Ch II-2, Reg. 13, 3.2.5.1, where satisfied by electric illumination, is to comply with the requirements of this sub-Section.

18.4.2 The LLL system is to be provided with an emergency source of electrical power as required by 3.2 and also be connected to the main source of electrical power, with automatic changeover facilities located adjacent to the control panel, *see also* 1.16.

18.4.3 The power supply arrangements to the LLL are to be arranged so that a single fault or a fire in any one fire zone or deck does not result in loss of the lighting in any other zone or deck. This requirement may be satisfied by the power supply circuit configuration, use of fire-resistant cables complying with 11.5.3, and/or the provision of suitably located power supply units having integral batteries adequately rated to supply the connected LLL for a minimum period of 60 minutes, *see* 12.3.8.

18.4.4 The performance and installation of lights and lighting assemblies are to comply with ISO 15370: *Ships and marine technology – Low location lighting on passenger ships – Arrangement.*

■ *Section 19*
Ship safety systems

19.1 Watertight doors

19.1.1 The electrical power required for power-operated sliding watertight doors is to be separate from any other power circuit and supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the bulkhead deck. The associated control, indication and alarm circuits are to be supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the bulkhead deck and for passenger ships be capable of being automatically supplied by the transitional source of emergency electrical power required by 3.2.8 in the event of failure of either the main or emergency source of electrical power.

19.1.2 A single failure in the power operating or control system of power-operated sliding watertight doors is not to result in a closed door opening or prevent the hand operation of any door.

19.1.3 Availability of the power supply is to be continuously monitored at a point in the electrical circuit adjacent to the door operating equipment. Loss of any such power supply is to activate an audible and visual alarm at the central operating console at the navigating bridge.

19.1.4 Electrical power, control, indication and alarm circuits are to be protected against fault in such a way that a failure in one door circuit will not cause a failure in any other door circuit. Short-circuits or other faults in the alarm or indicator circuits of a door are not to result in a loss of power operation of the door. Arrangements are to be such that leakage of water into the electrical equipment located below the bulkhead deck will not cause the door to open.

19.1.5 The enclosures of electrical components necessarily situated below the bulkhead deck are to provide suitable protection against the ingress of water with ratings as defined in IEC 60529: *Degrees of protection provided by enclosures (IP Code)* or an acceptable and relevant National Standard, as follows:

(a) Electrical motors, associated circuits and control components, protected to IPX7 Standard.
(b) Door position indicators and associated circuit components protected to IPX8 Standard, where the water pressure testing of the enclosures is to be based on the pressure that may occur at the location of the component during flooding for a period of 36 hours.
(c) Door movement warning signals, protected to IPX6 Standard.

19.1.6 Watertight door electrical controls including their electric cables are to be kept as close as is practicable to the bulkhead in which the doors are fitted and so arranged that the likelihood of them being involved in any damage which the ship may sustain is minimised.

19.1.7 An audible alarm, distinct from any other alarm in the area, is to sound whenever the door is closed remotely by power and sound for at least five seconds but no more than ten seconds before the door begins to move and is to continue sounding until the door is completely closed. The audible alarm is to be supplemented by an intermittent visual signal at the door in passenger areas and areas where the noise level exceeds 85 dB(A).

19.1.8 Sliding watertight doors on **cargo ships** are to be capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure.

19.1.9 On passenger ships, a central operating console is to be fitted on the navigating bridge and is to be provided with a 'master-mode' switch having:

(a) a 'local control' mode for normal use which is to allow any door to be locally opened and locally closed after use without automatic closure, and;
(b) a 'doors closed' mode for emergency use which is to allow any door that is opened to be automatically closed whilst still permitting any doors to be locally opened but with automatic reclosure upon release of the local control mechanism.

19.1.10 On passenger ships, the 'master mode' switch is to be arranged to be normally in the 'local control' mode position; be clearly marked as to its emergency function and be Type Approved in accordance with LR's Procedure for Type Approved Products.

19.1.11 On passenger ships, the central operating console at the navigating bridge is to be provided with a diagram showing the location of each door, with visual indicators to show whether each door is open or closed. A red light is to indicate a door is fully open and a green light, a door fully closed. When the door is closed remotely a red light is to indicate the intermediate position by flashing. The indicating circuit is to be independent of the control circuit for each door.

19.1.12 The arrangements are to be such that it is not possible to open any door remotely from the central operating console.

19.2 Stern and side shell doors and bow and inner doors

19.2.1 The requirements of 19.2.2 to 19.2.14 apply to all stern and side shell doors, bow doors and inner doors, giving access to vehicle decks, and subdivision doors, in accordance with Pt 4, Ch 2,9, on all ships except where otherwise stated in 19.2.11 and 19.2.12.

19.2.2 A notice is to be displayed at the operating panel stating that the door is to be fully closed, secured and locked preferably before, or immediately the ship leaves the berth and that this operation is to be entered in the ship's log.

19.2.3 Control positions are to be provided with a system of warning indicator lights. The system is to provide positive indication that the door is fully closed, secured and locked. The indication arrangements are to be 'fail-safe' such that in the event of a fault the system cannot incorrectly indicate that the doors are fully closed, secured or locked.

19.2.4 The indication system is to be arranged such that it functions independently of any system for door operation, securing and locking.

19.2.5 The electrical power supply for the indication system is to be independent of any electrical power supply for operating, securing and locking the doors.

19.2.6 The indication system is to be fed from two exclusive circuits, one from the main source of electrical power and one from the emergency source of electrical power with automatic changeover facilities located adjacent to the panel. Loss of either active or standby power supply is to initiate an audible and visual alarm on the navigation bridge.

19.2.7 The indicator panel is to be provided with a lamp test function. It is not to be possible to turn off the indication lights at the panel. Dimming facilities may be provided, but the indications are to remain clearly readable under all operating lighting conditions.

19.2.8 Means are to be provided to prevent unauthorised operation of the doors and associated securing and locking devices.

19.2.9 Detection of door position and securing and locking device status is to be by direct sensing of proximity, contact or equivalent, not inferred from actuator positions. Sensors are to be protected against ice formation, mechanical damage and water ingress to be not less than IPX6 Standard as defined in IEC 60529: *Degrees of protection provided by enclosures (IP Code)*, or an acceptable and relevant National Standard.

19.2.10 Where a strongback or equivalent independent secondary means of securing an inwardly opening door is required, these need not be monitored by the indication system providing their correct positioning can be easily observed from the control position.

19.2.11 Doors with a clear opening area of 12 m^2 or greater are to be provided with closing devices operable from a remote control position. Doors which are located partly or totally below the freeboard deck with a clear opening area greater than 6 m^2 are to be provided with an arrangement for remote control from a position above the freeboard deck. This remote control is to provide centralised control for:

(a) The closing and opening of the doors.
(b) Associated securing and locking devices.

19.2.12 Bow doors and inner doors, giving access to vehicle decks, and subdivision doors are to be provided with an arrangement for remote control from a position above the freeboard deck, providing centralised control for:

(a) the closing and opening of the doors; and
(b) associated securing and locking devices.

19.2.13 The location of the remote control panel is to be such that door operation can be easily observed by the operator or by other suitable means such as closed circuit television. Where remote control is required, television surveillance or other such means may satisfy this requirement.

19.2.14 A drainage system is to be arranged in the area between bow door and ramp or, where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible alarm function on the navigation bridge being set off when the water levels in these areas exceed 0,5 m.

19.2.15 The additional requirements of 19.2.16 to 19.2.22 apply to stern and side shell doors in the boundaries of special category spaces or ro-ro cargo spaces through which such spaces may be flooded, and to bow doors and inner doors. For cargo ships, where no part of the door is below the uppermost waterline and the area of the door opening is not greater than 6 m^2, the requirements of 19.2.16 to 19.2.22 need not be applied.

19.2.16 An indicator panel is to be located on the navigating bridge, providing separate visual indications of the position of each door and the status of their associated securing/locking devices.

19.2.17 The indication system is to be provided with a 'harbour/sea voyage' mode selection function, with means of operation located on or adjacent to the navigating bridge indication panel. The selected mode is to be displayed on all indicator panels. An audible alarm is to be initiated on the navigating bridge if the ship leaves the harbour with any door not fully closed or not fully secured. Where practical, the alarm should be initiated immediately the ship leaves the berth. Audible alarms are to be silenced in the 'harbour' mode. Visual indications are to remain operational in either mode.

19.2.18 An audible and visual alarm is to be given on the navigation bridge in the event of any fault within the indication system.

19.2.19 An audible and visual alarm is to be initiated on the navigation bridge and the engine control room, or an equivalent attended position, in the event of leakage through the doors.

19.2.20 Television surveillance arrangements are to be provided to enable the positions of bow doors and inner doors, and a sufficient number of their closing devices, to be monitored from the navigation bridge and the engine control room, or an equivalent attended position. The television surveillance arrangements are also to allow leakage through the bow doors and inner doors to be assessed from the same positions in the event of leakage through the doors. Special consideration is to be given to the lighting and contrasting colour of objects under surveillance.

19.2.21 For passenger ships, television surveillance arrangements are to be provided to allow leakage through stern and side shell doors below the freeboard deck to be assessed from the navigation bridge and the engine control room, or equivalent attended position.

19.2.22 The electrical power supply for surveillance lighting is to be independent of any electrical power supply for operating, securing and locking the doors.

19.3 Subdivision doors on vehicle decks

19.3.1 Where subdivision doors are provided on passenger ship vehicle decks in accordance with Pt 4, Ch 2,9, the control and monitoring arrangements for these doors are to generally comply with 19.2.

19.4 Bilge pumps

19.4.1 Where the bilge pumps for the holds of open-top container ships are electrically driven one pump is to be supplied from the emergency switchboard, the remaining pumps are to be supplied from the main source of electrical power, independent of the emergency switchboard.

■ *Section 20*
Lightning conductors

20.1 General

20.1.1 In order to minimise the risks of damage to the ship and its electrical installation due to lightning, ships having non-metallic masts or topmasts are to be fitted with lightning conductors in accordance with the applicable requirements of IEC 60092-401: *Electrical installations in ships — Part 401: Installation and test of completed installation* or an alternative and relevant National Standard.

■ *Section 21*
Testing and trials

21.1 Testing

21.1.1 Tests in accordance with 21.1.2 to 21.1.4 are to be satisfactorily carried out on all electrical equipment, complete or in sections, at the manufacturer's premises and a test report issued by the manufacturer.

21.1.2 A high voltage at any frequency between 25 and 100 Hz is to be applied between:

(a) all current carrying parts connected together and earth;

(b) all current carrying parts of opposite polarity or phase.

For rotating machines the value of test voltage is to be 1000 V plus 2 x rated voltage with a minimum of 2000 V, and for other electrical equipment, it is to be in accordance with Table 2.21.1. Items of equipment included in the assembly for which a test voltage lower than the above is specified may be disconnected during the test and tested separately at the appropriate lower test voltage. The test is to be commenced at a voltage of about one-third the test voltage and is to be increased to full value as rapidly as is consistent with its value being indicated by the measuring instrument. The full test voltage is then to be maintained for 1 minute, and then reduced to one-third full value before switching off. The assembly is considered to have passed the test if no disruptive discharge occurs.

21.1.3 When it is desired to make additional high voltage tests on equipment which has already passed its tests, the voltage of such additional tests is to be 80 per cent of the test voltage the equipment has already passed.

Table 2.21.1 Test voltage

Rated voltage, U_n U_n V	Test voltage a.c. (r.m.s.), V
$U_n \leq 60$	500
$60 < U_n \leq 1000$	$2 \times U_n + 1000$
$1000 < U_n \leq 2500$	6500
$2500 < U_n \leq 3500$	10000
$3500 < U_n \leq 7200$	20000
$7200 < U_n \leq 12000$	28000
$12000 < U_n \leq 15000$	38000

21.1.4 Immediately after the high voltage test, the insulation resistance is to be measured using a direct current insulation tester, between:

(a) all current-carrying parts connected together and earth;

(b) all current-carrying parts of different polarity or phase.

The minimum values of test voltage and insulation resistance are given in Table 2.21.2.

Table 2.21.2 Test voltage and minimum insulation

Rated voltage U_n V	Minimum voltage of the tests, V	Minimum insulation resistance, MΩ
$U_n \leq 250$	$2 \times U_n$	1
$250 < U_n \leq 1000$	500	1
$1000 < U_n \leq 7200$	1000	$\frac{U_n}{1000} + 1$
$7200 < U_n \leq 15000$	5000	$\frac{U_n}{1000} + 1$

21.1.5 Tests in accordance with the Standard with which the equipment complies may be accepted as an alternative to the above.

21.2 Trials

21.2.1 Before a new installation, or any alteration or addition to an existing installation, is put into service the applicable trials in 21.2.2 to 21.2.7 are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturer's works and are to be to the Surveyor's satisfaction.

21.2.2 The insulation resistance is to be measured of all circuits and electrical equipment, using a direct current insulation tester, between:

(a) all current-carrying parts connected together and earth and, so far as is reasonably practicable;

(b) all current-carrying parts of different polarity or phase;

The minimum values of test voltage and insulation resistance are given in Table 2.21.2. The installation may be subdivided and appliances may be disconnected if initial tests produce results less than these figures.

21.2.3 Tests are to be made to verify the effectiveness of:

(a) earth continuity conductor;

(b) the earthing of non-current-carrying exposed metal parts of electrical equipment and cables not exempted by 1.12.2;

(c) bonding for the control of static electricity.

21.2.4 It is to be demonstrated that the Rules have been complied with in respect of:

(a) satisfactory performance of each generator throughout a run at full rated load;

(b) temperature of joint, connections, circuit-breakers and fuses;

(c) the operation of engine governors, synchronising devices, overspeed trips, reverse-current, reverse-power and over-current trips and other safety devices;

(d) voltage regulation of every generator when full rated load is suddenly thrown off and when starting the largest motor connected to the system;

(e) voltage drop at worst case condition;

(f) harmonic distortion of the voltage waveform, where declared;

(g) satisfactory parallel operation, and kW and KVA load sharing of all generators capable of being operated in parallel at all loads up to normal working load;

(h) all essential and other important equipment are to be operated under service conditions, though not necessarily at full load or simultaneously, for a sufficient length of time to demonstrate that they are satisfactory;

(j) propulsion equipment is to be tested under working conditions and operated in the presence of the Surveyors and to their satisfaction. The equipment is to have sufficient power for going astern to secure proper control of the ship in all normal circumstances. In passenger ships the ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum ahead service speed, is to be demonstrated at the sea trial; and

(k) operation of power management for electric propulsion.

21.2.5 Measurements are to be taken as part of the trials specified in 21.2.4(c), (d), (e) and (f) to verify that the installation will provide a quality of power supply in accordance with the values listed in 1.8.

21.2.6 Satisfactory load management in accordance with 6.9 is to be demonstrated. The demonstration is to include verification that the requirements of 1.8 will be met following disconnection of a generator under all defined operating profiles as agreed with the operators.

21.2.7 It is to be demonstrated by practical tests that the Rules have been complied with in respect of fire, crew and passenger emergency and ship safety systems.

21.2.8 On completion of the general emergency alarm system and the public address system tests, the Surveyor is to be provided with two copies of the test schedule, detailing the measured sound pressure levels. Such schedules are to be signed by the Surveyor and the Builder.

21.3 High voltage cables

21.3.1 Before a new high voltage cable installation, or an addition to an existing installation, is put into service a voltage withstand test is to be satisfactorily carried out on each completed cable and its accessories. The test is to be carried out after the insulation resistance test required by 21.2.2 and may use either an a.c. voltage at power frequency or a d.c. voltage.

21.3.2 When an a.c. voltage withstand test is carried out, the voltage is to be not less than the normal operating voltage of the cable and it is to be maintained for a minimum of 24 hours.

21.3.3 When a d.c. voltage withstand test is carried out, the voltage is to be not less than:

(a) 1,6 (2,5U_o + 2 kV) for cables of rated voltages (U_o) up to and including 3,6 kV, or

(b) 4,2U_o for higher rated voltages

where U_o is the rated power frequency voltage between conductor and earth or metallic screen, for which the cable is designed.

The test voltage is to be maintained for a minimum of 15 minutes. After completion of the test the conductors are to be connected to earth for a sufficient period in order to remove any trapped electric charge. An insulation resistance test in accordance with 21.2.2 is then to be repeated.

21.4 Hazardous areas

21.4.1 All electric equipment located in hazardous areas is to be examined to ensure that it is of a type permitted by the Rules, has been installed in compliance with its certification, and that the integrity of the protection concept has not been impaired.

21.4.2 Alarms and interlocks associated with pressurised equipment and the ventilation of spaces located in hazardous areas are to be tested for correct operation.

Section 22
Spare gear

22.1 General

22.1.1 It is recommended that adequate spares, together with the tools necessary for maintenance, or repair, be carried. The spares are to be determined by the Owner according to the design and intended service. The maintenance of the spares is the responsibility of the Owner.

Sections

■ *Section 1* General requirements

1.1 Application

1.1.1 The requirements of this Chapter apply to the refrigerated cargo installations of refrigerated cargo ships, refrigerated container ships, fish factory ships, fishing vessels, fruit juice carriers, and the reliquefaction/refrigerating plant of liquefied gas carriers and chemical carriers or tankers, where an **RMC** notation is requested.

1.1.2 Ships with refrigerated cargo installations which are approved, installed and tested in accordance with these requirements will be eligible for the applicable class notation specified in Pt 1, Ch 2.

1.1.3 The requirements for the classification of ships for the carriage of liquefied gas are given in Lloyd's Register's (hereinafter referred to as 'LR') *Rules and Regulations for the Construction and Classification of Ships for the Carriage Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases). Where reliquefaction or refrigeration equipment is fitted for cargo temperature and pressure control, the equipment is to comply with the requirements of Sections 2 to 11, as applicable.

1.1.4 The requirements for the refrigeration equipment and systems necessary for provision stores and air conditioning are specified in Pt 7, Ch 15.

1.2 Plans and particulars

1.2.1 The following plans and particulars, as applicable, and any others which may be specially requested for the **refrigerating plant and systems**, are to be submitted in triplicate for approval, before construction is commenced:

(a) Schematic plans, including full particulars of piping and instrumentations, for:
- primary and secondary refrigeration systems;
- air cooler defrosting arrangements;
- gas reliquefaction systems; and
- condenser cooling water systems.

(b) Detailed dimensioned plans and material specifications for:
- reciprocating compressor crankshaft and crankcase, where exposed to refrigerant pressure;
- rotary-type compressor rotors and casing;
- condensers shell and tube and plate type;
- evaporators shell and tube and plate type;
- air coolers;
- arrangement of air cooling pipe grids and construction method;
- liquid receivers;
- oil separators; and
- any other pressure vessels, *see* Pt 5, Ch 11,6.1.

(c) General arrangement of refrigerating machinery compartment in elevation and plan, showing location and arrangement of the plant, ventilation details and location of temperature sensors and vapour detectors.

(d) Details of automatic controls, alarms and safety systems, *see* Ch 1,1.

(e) Details of level indicators.

(f) Where provision is made for the manufacture and/or storage of inert gas in liquid form, details of the storage vessel insulation arrangements and the reliquefaction equipment and piping system are to be submitted.

(g) Capacity calculations for pressure relief valves and/or bursting discs, and discharge pipe pressure drop calculations, *see* 4.15.5 to 4.15.21.

(h) Programme of tests to be conducted on completion of the installation, *see* Section 11.

1.2.2 The following plans and particulars, as applicable, and any others which may be specially requested for **refrigerated cargo spaces**, are to be submitted in triplicate for approval, before work is commenced:

(a) Specification of proposed insulation envelope system, including physical, thermal and fire properties.

(b) General arrangement of insulated refrigerated spaces in elevation and plan.
- The plans are to be to a scale adequate for the measurement of the external surfaces and the deck and bulkhead edges.
- Dimensions and spacing of frames, beams and stiffeners, and details of other steel work intruding into the insulation and within the spaces, are to be shown.
- Oil fuel and liquid cargo tanks adjacent to or below the refrigerated spaces are to be shown, and whether heating arrangements are provided for such tanks are to be indicated.
- Ventilating and air-conditioning trunks, and ducts passing through refrigerated spaces are to be shown.

- The plans are to include a diagram showing the position of the spaces in relation to other parts of the ship if this is not otherwise apparent.

(c) Plans showing:
- the thicknesses and methods of attachment of the insulation and linings on all surfaces including girders, hatch coamings and pillars; and
- details of prefabricated panels and their fixings, vapour barriers, insulated doors and hatch access, bilge and manhole plugs and their frames.

(d) Methods of attachment of air cooling grids (if fitted) are to be indicated.
(e) Size and position of refrigerated space pressure equalising devices, where fitted, *see* 9.2.12 and 9.2.13.
(f) Arrangements of the drainage system, and sounding and air pipes that pass through the refrigerated spaces.
(g) Arrangements of air ducts and distribution systems within the refrigerated spaces (including method of cooling spaces within hatch coamings), and air cooler spaces showing location of the coolers and their fans and drive motors.
(h) Details of temperature indicating, and recording and sensing equipment, and arrangement of sensors within the refrigerated spaces.

1.2.3 Single copies of the following plans and particulars are to be submitted:
- LR Data Sheet for refrigerated cargo installations (LR Form 3905).
- Specification of proposed refrigerating system and auxiliary equipment, including the refrigerating capacities of the compressors, condensers, evaporators and air coolers.
- Heat load calculations at all design operating conditions justifying the refrigerating capacity which is to be installed.

1.3 Materials

1.3.1 Steel plating used in ship construction is to be of an appropriate grade corresponding to the proposed temperature notation, *see* Pt 3, Ch 2,2.2.

1.3.2 Materials used in the construction of the refrigerating equipment and associated systems are to be generally manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.3.3 Where it is proposed to use materials other than those specified in Rules for Materials, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement with LR.

1.3.4 All materials used in refrigerating equipment and systems are to be suitable for use with the selected refrigerants. This includes joints, sealing materials and lubricants. For example, the following materials and refrigerants are not to be combined:
- Copper with ammonia.
- Magnesium with fluorinated hydrocarbons.
- Zinc with ammonia or fluorinated hydrocarbons.

1.3.5 For ammonia systems, the condensers/evaporators are to be manufactured in titanium or a suitable grade of stainless steel.

1.4 Equipment to be constructed under survey

1.4.1 All major items of equipment are to be surveyed at the manufacturer's works. The workmanship is to be to the Surveyor's satisfaction and the Surveyor is to be satisfied that the components are suitable for the intended purpose and duty. Examples of such units are:
- Crankshafts, crankcases, rotor shafts and casings for all compressors.
- Condensers.
- Evaporators (secondary refrigerant coolers).
- Air coolers.
- Pressure vessels (e.g., liquid receivers, surge drums, suction separators, intercoolers, oil separators).
- Cooling water pumps for condensers.
- Valves and other components intended for installation in pressure piping systems having a maximum working pressure greater than 7 bar.
- Thermal insulating panels (factory made).

1.5 Type approved equipment

1.5.1 Where it is proposed to use components (e.g., compressors, condensers, oil separators) which have valid LR Type Approval or General Approval Certificates, the types and model numbers of the components are to be stated. Plans of components that have been so approved need not be re-submitted.

1.6 Notation and temperature conditions

1.6.1 The class notation assigned will state the minimum temperature or a temperature range approved by the Committee for the installation with the maximum sea temperature stated, e.g., '✠Lloyd's RMC to maintain temperature(s) of minus 29°C to plus 14°C with sea temperature plus 32°C maximum'.

1.6.2 For refrigerated installations aboard container ships with approved refrigerating plant and arrangements to supply refrigerated air through ducting to insulated containers, the class notation assigned will additionally specify the maximum number and characteristics of the containers for which the plant is approved, e.g., 'to supply refrigerated air at temperatures of minus 25°C to plus 14°C to 800 certified insulated containers with an average thermal transmittance per container of 27 W/K with sea temperature plus 32°C maximum'.

1.6.3 For reliquefaction or refrigerating plants aboard liquefied gas carriers, the notation assigned will state the minimum cargo temperature for which the installation is approved, unless otherwise qualified, *see* LR III.3 of the Rules for Ships for Liquefied Gases.

1.6.4 On application from an Owner, consideration will be given by the Committee to an alternative temperature notation being assigned to that appearing in the *Register Book*.

1.7 Novel arrangements and design

1.7.1 Where the proposed construction of the refrigerating plant or refrigerated spaces or chambers is novel in design or involves the use of unusual material, special tests may be required, and a suitable class notation may be assigned when the Committee considers this necessary.

1.8 Heat balance tests

1.8.1 A heat balance test will be required as prescribed in Section 11 on a classed installation, or one being considered for reclassification, when extensive repairs or alterations have been carried out, or when the Surveyors consider that an amended temperature condition should be assigned.

1.9 Controlled atmosphere (CA) systems

1.9.1 Where it is intended to install a CA system on a vessel intended for classification, the requirements of Pt 7, Ch 1 are to be complied with.

1.9.2 Where a **CA** notation is requested by an Owner, it is a prerequisite that the refrigeration installation be assigned an **RMC** notation.

1.10 Spare gear and refrigerant charge

1.10.1 It is recommended that adequate spares, together with the tools necessary for maintenance, or repair, be carried. The spares are to be determined by the Owner according to the design and intended service. The maintenance of the spares is the responsibility of the Owner.

1.10.2 For systems complying with 2.5.6 sufficient carbon dioxide is to be carried on board to allow the refrigeration system to be fully recharged. In addition, adequate reserve supplies of refrigerant are to be carried for maintenance purposes. The replacement refrigerant is to be stored in containers complying with 3.3.5.

■ *Section 2* Design criteria

2.1 General

2.1.1 The proposed refrigerating plant, insulation and refrigerants are to be suitable for achieving the designed notation temperature. The refrigerating machinery and all components are to operate satisfactorily under the conditions listed in Table 1.3.1 in Pt 5, Ch 1.

2.1.2 The properties of steel materials used in refrigerated holds are to be suitable for the proposed notation temperature.

2.2 Refrigerants and classes of pipes

2.2.1 These Rules are applicable to the primary refrigerants in Table 3.2.1.

2.2.2 Attention is to be given to any statutory requirements, regarding the use of refrigerants, of the National Authority of the country in which the ship is to be registered.

2.2.3 Within the parameters of pressures, temperatures, toxic nature and flammability, the class of pipe to be used with various refrigerants is shown in Table 3.2.1.

2.2.4 Design conditions as applicable to the classes of pipes are defined in Pt 5, Ch 12,1.5.

2.2.5 The materials of Class I and Class II piping systems are to be manufactured at a works approved by LR and tested in accordance with the appropriate requirements of Rules for Materials. Particular attention is drawn to Ch 6,4 of the Rules for Materials, where testing requirements for pipes used for low temperature service are given.

2.2.6 The materials of Class III piping system are to be manufactured and tested in accordance with the requirements of acceptable National Specifications. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of materials.

2.2.7 Particulars of refrigerating systems using refrigerants other than those listed will be given special consideration.

2.3 Refrigeration units

2.3.1 A refrigerating unit is considered to comprise a compressor, its driving motor and one condenser. Where a secondary refrigerant, such as brine, is employed, the unit is also to include an evaporator (secondary refrigerant cooler) and a brine pump.

2.3.2 Two or more compressors driven by a single motor, or having only one condenser or evaporator (secondary refrigerant cooler) are to be regarded as one unit.

Table 3.2.1 Primary refrigerants and their class of pipe

Refrigerant	Type	Composition	Class I	Class of Pipe Class II	Class III
R-717 (Ammonia)	NH_3	–	✓	–	–
R-22	HCFC	–	–	✓	–
R-290 (Propane)	HC	–	–	✓	–
R-600a (Isobutane)	HC	–	–	✓	–
R-134a	HFC	–	–	–	✓
R-407C	Blend	R-32, R-125, R-134a	–	✓	–
R-410A	Blend	R-32, R-125	–	✓	–
R-507A	Blend	R-125, R-143a	–	✓	–
R-404A	Blend	R-134a, R-125, R-143a	–	✓	–
R-744 (Carbon Dioxide)	CO_2	–		*See* 2.5.6	

NOTES
1. HCFC – Hydrochlorofluorocarbon.
2. HFC – Hydrofluorocarbons.
3. HC – Hydrocarbon.
4. In view of increasing world-wide restrictive legislation and phasing out of the refrigerant R-22, it is recommended that this refrigerant should not be used in any new installation.
5. Although ozone depleting and global warming potentials are not included in these Rules for Classification, these effects are important and need to be considered when selecting the refrigerant for a particular application.

2.3.3 The refrigerating units of a classed cargo installation are to be completely independent of any refrigerating machinery associated with air-conditioning plant, or any domestic refrigerated installation, or any process plant, unless full details of any proposal have been submitted and approved.

2.4 Refrigeration capacity

2.4.1 The refrigeration capacity provided is to be sufficient to maintain the temperatures specified in the class notation when operating 24 hours per day with one unit on standby. The plant is to be able to cool down a complete cargo to its carrying temperature within the time specified by the manufacturer. The standby unit may be considered as an operating unit during the cooling down period of a non-precooled cargo. In order to compensate for deterioration of machinery and insulation over the life of the installation, the equipment is to be designed to have at least five per cent excess capacity over that required for maximum design output.

2.4.2 The proposals of both machinery and insulating contractors will be evaluated by LR in determining the theoretical capabilities of the equipment to maintain the duty temperatures. LR will advise the contractors after appraisal of the specification and plans if it is considered that additional refrigeration or insulating effect is required, but the temperature assigned on completion of the capacity heat balance test will be determined from the actual results of the test.

2.4.3 Where the units are not connected in common to all refrigerated chambers, the equipment serving each group of chambers is to comply with 2.4.1.

2.4.4 In the case of installations having a large number of small units arranged to serve individual chambers or groups of chambers, the question of standby capacity will be specially considered.

2.4.5 Where only two refrigerating units are fitted, the working parts are to be interchangeable.

2.4.6 Where a refrigerating plant is provided for sub-cooling the liquid refrigerant of other units, but is not arranged for cooling the cargo chambers independently, it will not be regarded as a unit.

2.5 Design pressures

2.5.1 The design pressure of the system is to be regarded as equal to its maximum working pressure.

2.5.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No relief valve is to be set to a pressure higher than the maximum working pressure.

2.5.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure system.

2.5.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be 1,11 x P_b, where P_b is an allowance for the compressor high pressure cut-out. P_b is to be at least equal to 1,11 x P_a, where P_a is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure at 46°C.

2.5.5 Design pressures (bar g) applicable to refrigerants are to be not less than the values given in Table 3.2.2 when condensers are sea-water cooled. The design pressure for other refrigerants and condensing arrangements is to be agreed with LR.

Table 3.2.2 Pressure limits

Refrigerant	Pressure (bar g)	
	High	Low
R-717	21,2	17,2
R-22	20,6	16,7
R-290	18,1	14,7
R-600a	6,4	5,2
R-134a	13,4	10,9
R-407C	23,5	19,0
R-410A	33,14	29,9
R-507A	25,3	20,5
R-404A	24,8	20,1
R-744	*See* 2.5.6	

2.5.6 Due to the low critical temperature of carbon dioxide it is inappropriate to determine the design pressure in accordance with 2.5.3. The proposed design pressure for a carbon dioxide system is to be stated, taking account of the maximum working pressure and the maximum pressure at rest conditions. Where the maximum pressure at rest condition is maintained by the fitting of a supplementary refrigeration unit, condensing the vapour in a holding vessel, supporting calculation is to be provided to show that this can be undertaken with a local ambient temperature of 45°C. The holding vessel is to be thermally insulated to prevent the operation of the relief devices within a 24 hour period after stopping the supplementary refrigeration unit at an ambient temperature of 45°C and an initial pressure equal to the starting pressure of the refrigeration unit.

2.5.7 Where a carbon dioxide system is designed for hot gas defrosting, due regard is to be given to the possibility of a higher pressure being imposed on the low pressure system. The design pressure for this section of the system shall be 10 per cent above the maximum pressure experienced during defrosting.

2.6 Insulation

2.6.1 Properties of materials used for thermal insulation are to be verified against known standards for the following parameters, as applicable, to ensure that they are adequate for the intended service. The following test results are to be made available to LR for approval:

- Closed cell content.
- Density.
- Mechanical properties.
- Thermal expansion.
- Abrasion.
- Cohesion.
- Thermal conductivity.
- Resistance to fire and flame spread.
- Ageing.
- Bonding (adhesive and cohesive strength).

2.6.2 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted for approval.

2.6.3 Where applicable, having regard to their location and environmental conditions, insulation materials are to be:

- suitably resistant to fire;
- suitably resistant to the spreading of flame;
- adequately protected against penetration of water vapour; and
- adequately protected against mechanical damage.

■ *Section 3* Refrigerating machinery and refrigerant storage compartments

3.1 General

3.1.1 Refrigerating machinery is to be located in a well ventilated compartment. In general, the arrangements are to be such that all components of the refrigerating machinery can be readily opened up for inspection or replacement. Space is to be provided for the withdrawal and renewal of the tubes in 'shell-and-tube' type evaporators (brine coolers) and condensers. Proposals for alternative arrangements are to be submitted for consideration. *See* 3.2 for refrigerating machinery using ammonia.

3.1.2 Refrigerating machinery using toxic and/or flammable refrigerants is to be located outside the main machinery space in a separate gastight compartment.

3.1.3 Where the refrigerating machinery is located in a separate gastight compartment, outside the main machinery space, this compartment is to be equipped with effective mechanical ventilation to provide 30 air changes per hour based upon the total volume of the space. The mechanical ventilation is to have two main controls, one of which is to be operable from a place outside the compartment.

3.1.4 Refrigerating machinery using non-toxic and non-flammable refrigerants will not, in general, be required to be located in a separate compartment outside the main machinery space.

3.1.5 Openings for pipes, electrical cables and other fittings in the bulkheads and deck are to be fitted with gastight seals.

3.1.6 Ammonia piping is not to pass through accommodation spaces.

3.2 Arrangements for compartments housing machinery using ammonia

3.2.1 Where ammonia refrigerant is used, the refrigerating machinery shall be installed in a dedicated gastight compartment. *See also* 3.2.9.

3.2.2 The compartment containing ammonia refrigerating machinery and any access ways are to be provided with independent mechanical ventilation capable of:

- removing the heat generated by the equipment installed in the compartment;
- maintaining the atmosphere in the compartment at acceptable vapour threshold levels under normal operating conditions; and
- disposing of ammonia vapour safely and quickly in the event of a major leakage.

3.2.3 The ventilation system is to be of the negative pressure type where abnormal stoppages of the extraction fans activate an audible and visual alarm.

3.2.4 Compartments containing ammonia refrigerating machinery, including process vessels, are to be provided with:

- a negative ventilation system, independent of ventilation systems serving other spaces, having a capacity of not less than 30 air changes per hour based upon the total volume of the space. Other suitable arrangements which ensure an equivalent effectiveness may be considered;
- fresh air inlets, located at a low level in the machinery compartment and arranged so as to provide a supply of fresh air and to minimise the possibility of re-cycling the exhaust air from the outlet;
- exhaust outlets, located at a high level and arranged so as to promote good air distribution throughout the compartment;
- a fixed ammonia detector system with alarms inside and outside the compartment;
- water screens above all access doors, operable manually from outside the compartment in all ambient conditions;
- an independent bilge system;
- where the charge is greater than 50 kg, emergency body shower and eye wash facilities shall be installed locally outside the compartment. The water for the shower is to be thermostatically controlled so as to avoid low temperature shock.

3.2.5 Compartments are to have at least two access doors, opening outwards, one of which is to be an emergency exit giving direct access to the open deck. The doors are to be fitted with an easily operated opening mechanism to facilitate rapid escape in an emergency. In the case of small compartments where more than one door would be impractical, the emergency exit only is to be provided.

3.2.6 At least two sets of self-contained breathing apparatus and protective clothing are to be provided, readily available in the vicinity of the compartment but external to the area of risk. *See* 8.1.4.

3.2.7 The location of the exhaust duct, from the compartment or area, is to be free from obstruction and be such as not to cause danger. Where practicable, they are to be 10 m, in the horizontal direction from other ventilation intakes and openings to accommodation and other enclosed areas, and at least 2 m above the surrounding deck.

3.2.8 Ventilation fans are not to produce a source of vapour ignition in either the ventilated compartment/area or ventilation system. Ventilation fans and fan ducts, in way of fans only, are to be of non-sparking construction.

3.2.9 In the case of ammonia plants on fishing ships under 55 m overall length, or ammonia plants with a charge of ammonia not greater than 25 kg, the refrigerating machinery may be located in the main machinery space provided it complies with the following requirements:

- The entrance to the machinery space is properly illuminated and marked and has warning signs permanently posted.
- The area where the ammonia machinery is installed is served by a hood with a negative ventilation system, so as not to permit any leakage of ammonia dissipating into other areas.
- A water spray system is provided for the area.
- Coamings, of not less than 150 mm in height, are installed around the ammonia machinery area.
- A fixed ammonia detector system with alarms inside and outside the main machinery space is provided.
- Means are provided for stopping the ammonia compressor prime movers from a position outside the machinery space.
- At least two sets of self-contained breathing apparatus and protective clothing are to be provided readily available in the vicinity of the compartment but external to the area of risk. *See* 8.1.4.
- Air intakes of other machinery are located away from the ammonia machinery area as far as is practicable.

3.3 Gas storage compartments

3.3.1 Portable steel cylinders containing reserve supplies of refrigerant are to be stored in a well ventilated compartment reserved solely for this purpose.

3.3.2 The compartment is to be provided with a mechanical ventilation system providing 10 air changes per hour and is to have at least one door opening outwards giving direct access to open deck.

3.3.3 Bulk storage tanks holding more than 150 kg of replacement carbon dioxide are to be located in a separate compartment. The compartment is to be provided with a mechanical ventilation system having a minimum capacity of 6 air changes per hour. The ventilation system exhaust ducting is to remove air from the base of the compartment. The compartment is to be fitted with a gas tight access door opening outward.

3.3.4 The compartment is to be provided with a refrigerant vapour detection system.

3.3.5 The compartment is to be provided with suitable water drainage arrangements not connected with the main machinery spaces.

3.3.6 Steel storage cylinders are to be of an approved type, supplied by the refrigerant manufacturer and are to be filled to a level suitable for an ambient temperature of plus 46°C.

3.3.7 The compartment is to be provided with racks to facilitate secure stowage of the cylinders.

3.4 Compartments housing carbon dioxide containing equipment

3.4.1 Self closing gas tight access doors are to be provided between each compartment and the dedicated escape routes. *See* 5.1.5.

3.4.2 In compartments which are normally occupied and where the volume of ventilation required by 3.1.3 is not desirable, such as production areas on fishing vessels, a negative pressure ventilation system, capable of 10 air changes per hour, is required to be fitted. This ventilation system is to be automatically activated when, in the event of a leak the concentration of carbon dioxide reaches a predetermined level but in no case higher than the threshold limit value of 5,000 ppm.

■ *Section 4* Refrigeration plant, pipes, valves and fittings

4.1 General requirements for refrigerating compressors

4.1.1 New compressor types or developments of existing types are to be subjected to an agreed programme of type testing to complement the design appraisal and review of documentation.

4.1.2 Where it is proposed to treat the bearing surfaces either by local hardening or by chromium plating, then these processes are to be confined to the bearing area and not extended to the fillets. Particulars of the process are to be submitted.

4.1.3 Where ball or roller bearings are incorporated, they are to have a minimum life expectancy of 25 000 running hours, for the application in question.

4.1.4 A check valve is to be fitted to each compressor discharge.

4.1.5 Where off-loading devices are incorporated, arrangements are to be provided which indicate the extent of the off-loading being effected.

4.1.6 A pressure relief valve and/or safety disc is to be fitted between each compressor and its gas delivery stop valve in accordance with 4.15.5 and 4.15.6.

4.1.7 Stop valves are to be provided on compressor suctions and discharges.

4.1.8 Suction strainers and lubricating oil filters are to be provided and so arranged that they are easily accessible for cleaning or renewal of the filter elements, without substantial loss of refrigerant or lubricating oil.

4.1.9 The correct direction of rotation is to be permanently indicated.

4.1.10 Where any hermetic or semi-hermetic compressor has the electric motor cooled by the circulating refrigerant, the following arrangements are to be provided:

(a) Refrigeration circuits are to contain no more than one hermetic or semi-hermetic compressor.
(b) Every compressor motor is to be fitted with a thermal cut-out device to protect the motor against overheating.
(c) In each refrigeration circuit containing a hermetic or semi-hermetic compressor, suitable arrangements shall be provided to remove debris and contaminants resulting from a motor failure. *See* 4.16.1.
(d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of Pt 5, Ch 11 and Ch 17 as applicable. Plans are to be submitted for consideration as required by Pt 5, Ch 11,1.6.

4.2 Reciprocating compressors

4.2.1 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:

(a) Carbon and carbon-manganese steel castings – 400 to 550 N/mm^2.
(b) Carbon and carbon-manganese steel forgings (normalised and tempered) – 400 to 600 N/mm^2.
(c) Carbon and carbon-manganese steel forgings (quenched and tempered) – not exceeding 700 N/mm^2.
(d) Alloy steel castings – not exceeding 700 N/mm^2.
(e) Alloy steel forgings – not exceeding 1000 N/mm^2.
(f) Spheroidal or nodular graphite iron castings – 370 to 800 N/mm^2.

(g) Grey iron castings – not less than 300 N/mm^2.

4.2.2 Where it is proposed to use materials outside the ranges specified in 4.2.1, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

4.2.3 Materials for components of reciprocating compressors such as crankshafts, pistons, piston rods, crank cases, etc., are to be produced at a works approved by LR and in general to be tested in accordance with the Rules for Materials.

4.2.4 A fully documented fatigue strength analysis is to be submitted indicating a factor of safety of 1,5 at the design loads based on a suitable fatigue strength criteria. Alternatively, the requirements of 4.2.5 to 4.2.9 may be used.

4.2.5 The diameter, d, of a compressor crankshaft using one of the refrigerants detailed in 2.5, is to be not less than that determined by the following formula, when all cranks are located between two main bearings:

$$d = V_c \left(\frac{D^2 \, p \, Z}{78{,}5} \left(\frac{S}{16} + \frac{ab}{a+b} \right) \right)^{1/3} \text{ mm}$$

where

a = distance between inner edge of one main bearing and the centreline of the crankpin nearest the centre of the span, in mm

b = distance from the centreline of the same crankpin to the inner edge of the adjacent main bearing, in mm

$a + b$ = span between inner edges of main bearings, in mm

d_p = proposed minimum diameter of crankshaft, in mm

p = design pressure, in bar g, as defined in 2.5

D = diameter of cylinder, in mm

S = length of stroke, in mm

V_c = 1,0 for shafts having one cylinder per crank, or
= 1,05 for 90°
= 1,18 for 60°
= 1,25 for 45°
} between adjacent cylinders on the same crankpin
for the shaft and cylinder arrangements as detailed in Table 3.4.1

$Z = \dfrac{560}{\sigma_u + 160}$ for steel

$Z = \dfrac{700}{\sigma_u + 260 - 0{,}059 d_p}$ for spheroidal or nodular graphite cast iron

$Z = \dfrac{700}{\sigma_u + 260 - 0{,}069 d_p}$ for grey cast iron

σ_u = specified minimum tensile strength of crankshaft material, in N/mm^2.

4.2.6 Where the shaft is supported additionally by a centre bearing, the diameter is to be evaluated from the half shaft between the inner edges of the centre and outer main bearings. The diameter so found for the half shaft is to be increased by six per cent for the full length shaft diameter.

Table 3.4.1 Angle between cylinders

Number of crankpins	Number of cylinders per crank	Angle between cylinders, in degrees		
1 or 2	2	45	60	90
3	2	45	60	—
4	2	45	60	—
1	3	45	60	90
2	3	45	60	—
3	3	45	—	—
1	4	45	60	—
2	4	45	—	—

4.2.7 The dimensions of crankwebs are to be such that Bt^2 is to be not less than given by the following formulae:

0,4d^3, for the web adjacent to the bearing

0,75d^3, for intermediate webs where a single intermediate web is common to two adjacent crankthrows

where

B = breadth of web, in mm

d = minimum diameter of crankshaft as required by 4.2.5, in mm

t = axial thickness of web which is to be not less than 0,45d for the web adjacent to the bearing, or 0,60d for intermediate webs, in mm.

4.2.8 Fillets at the junction of crankwebs with crankpins or journals are to be machined to a radius not less than 0,05d. Smaller fillets, but of a radius not less than 0,025d, may be used provided the diameter of the crankpin or journal is not less than cd,

where

$c = 1{,}1 - 2\dfrac{r}{d}$ but to be taken as not less than 1,0

d = minimum diameter of crankshaft as required by 4.2.5, in mm

r = fillet radius, in mm.

4.2.9 Fillets and oil holes are to be rounded to an even contour and smooth finish.

4.2.10 An oil level sight glass is to be fitted to the crankcase.

4.2.11 Compressors with cylinder bores in excess of 50 mm diameter are to be provided with arrangements to relieve high cylinder pressures such as would result from 'hydraulic lock' (i.e., liquid refrigerant in the cylinders). Alternatively the provision of positive means to prevent liquid refrigerant reaching the compressor may be accepted.

4.2.12 The crankcases of trunk piston compressors are to be designed to withstand a pressure equal to the maximum working pressure of the system. The crankcases of compressors of the crosshead type which are substantially isolated from the refrigerant circuit may be designed for lower pressures but are to be provided with relief valves adjusted to lift at a pressure not exceeding the design pressure, and discharging to a safe place.

4.2.13 A crankcase heater, arranged to be energised when the compressor is stopped, is to be provided.

4.3 Screw compressors

4.3.1 For screw-type compressors, the materials of the rotors and casings are to be produced, and the manufacture is to be carried out, at a works approved by LR, and in general, they are to be tested in accordance with the Rules for general machinery forgings.

4.3.2 The rotor casing is to be designed for the maximum pressure to which it may be subjected, *see* 2.5.

4.3.3 Where gearing is fitted to increase the rotor speed and also to locate the rotors, the gearing is to comply with Pt 5, Ch 5. The manufacturer's maximum allowable tolerances for clearances and backlash between mating rotors are to be stated.

4.4 Pressure vessels and heat exchangers

4.4.1 The term 'pressure vessel' will normally apply to receivers and heat exchangers, and does not include any of the following:

- Compressors.
- Liquid refrigerant pumps.
- Pipes and their fittings.

The use of plate heat exchangers will be specially considered on submission of plans, and special tests may be required.

4.4.2 Fusion welded steel pressure vessels exposed to the pressure of the refrigerants are to be constructed in accordance with the requirements of Pt 5, Ch 11 and Ch 17. Plans are to be submitted for consideration if required by Pt 5, Ch 11,1.6.

4.4.3 Where ammonia is the refrigerant, the pressure vessels are to be constructed to at least Class 2/1 requirements.

4.4.4 Pressure vessels for the containment of primary refrigerants for use in conventional refrigeration circuits where the pressure/saturation temperature relationship applies are not required to be low temperature impact tested unless the design temperature is lower than minus 40°C.

4.4.5 Pressure vessels are to be thermally insulated to an extent which will minimise condensation of moisture from the surrounding atmosphere. The insulation is to be provided with an efficient vapour barrier and adequately protected from mechanical damage. Prior to applying the insulation, the steel surfaces are to be suitably protected against corrosion.

4.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated is to be protected with overpressure relief devices, *see* 4.15.

4.5 Condensers, oil coolers and evaporators

4.5.1 In order to minimise the risk of corrosion, where the refrigerant is ammonia, the material interface between the primary refrigerant and cooling water or secondary refrigerant is to be of a suitable grade of stainless steel. Carbon-manganese steel with a suitable inhibitor would also be acceptable.

4.5.2 Space is to be provided for the withdrawal and replacement of condenser and evaporator tubes, *see* 3.1.1.

4.5.3 Where ammonia is used as the refrigerant, the refrigerating plant is to comply with the following additional requirements:

(a) Automatic air purgers are to be provided, with their discharges being led through water before venting to atmosphere.
(b) The cooling water returns from sea-water cooled condensers are not to be led into the main machinery spaces.
(c) Fresh water condenser cooling systems are to be provided with pH meters to activate audible and visual alarms in the event of an ammonia leak.

4.6 Liquid receivers

4.6.1 Primary refrigerating systems are to be provided with liquid receivers with sufficient capacity to hold the complete refrigerant charge to prevent emission of the refrigerant to the atmosphere during servicing or repairs.

4.6.2 Alternatively, in systems using a secondary refrigerant, with a number of units, smaller receivers may be used provided the system includes a common storage receiver with sufficient capacity to hold at least the primary refrigerant charge from two units. The common receiver is to be provided with the necessary crossover connections to facilitate transfer of refrigerant to and from each unit in the system.

4.7 Oil separators

4.7.1 Oil separators are to be provided at compressor discharges and are to be fitted with a control arrangement to enable the separated oil to be returned to the compressor crankcase. Wire gauze used in separators is to be sufficiently robust and well supported.

4.8 Air coolers and cooling grids

4.8.1 Refrigerated spaces may be cooled by air coolers or cooling grids on the ceiling, bulkheads and sides. In order to minimise the dehydration of the cargo and the frosting of the air coolers or cooling grids, the installation is to be designed to maintain the required notation temperatures with a minimum of difference between the refrigerant and space temperatures.

4.8.2 Individual spaces are to have a minimum of two independent air coolers, each comprising one or more fans and one or more refrigerant circuits in a single casing and with isolating valves. Alternatively, multiple circuits each with their own fan(s), in a single cooler casing may each be regarded as a separate cooler, provided stop valves are fitted so that each circuit may be isolated.

4.8.3 For refrigerated spaces having a net volume of 300 m^3 or less, a single cooler with one circuit will be accepted.

4.8.4 The refrigeration capacity of the air cooler arrangement is to be such that the notation temperature conditions can be maintained with any one independent cooler or circuit out of action. The capacities of the fans are also to be such that they can maintain the required air flow rates (*see also* 9.4) and uniform air temperature throughout the refrigerated spaces, when part or fully loaded with cargo, with any one cooler or fan out of action.

4.8.5 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.

4.8.6 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. Provision is to be made for the prevention of freezing of the condensate.

4.8.7 Air coolers are to be located such that when the refrigerated spaces are loaded with cargo, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.

4.8.8 The cooling grids in each refrigerated space are to be arranged in not less than two sections, and each section is to be fitted with valves so that it can be shut off. The notation temperature conditions are to be capable of being maintained with any one section isolated. For spaces having a net volume of 300 m^3 or less, a single section will be acceptable.

4.8.9 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

4.9 Refrigerant pumps

4.9.1 Pumped primary and/or secondary refrigerant systems are to have a minimum of two pumps. Each pump is to be capable of operating on all cargo chambers and maintaining full duty with any one pump out of operation.

4.9.2 Primary and, where appropriate, secondary refrigerant pumps are to be provided with pressure relief valves, *see* 4.15.13.

4.10 Condenser cooling water pumps

4.10.1 At least two separate condenser cooling water pumps are to be installed. One of the pumps may be considered as a standby pump and may be used for other purposes, provided that it is of adequate capacity and its use on other services does not interfere with the supply of cooling water to the condensers.

4.10.2 Not less than two sea inlets are to be provided supplying sea-water to the pumps for condenser cooling. It is recommended that one of the sea inlets be provided on the port side and the other on the starboard side. The sea inlets are to be fitted in accordance with Pt 5, Ch 13,2.6.

4.10.3 The cooling water pumps and sea inlets are to be suitably valved and cross-connected with each condenser.

4.10.4 Suitable spring-loaded safety valves are to be provided in each cooling water circuit, *see* 4.15.13.

4.11 Piping systems

4.11.1 All piping, valves and fittings are to be suitable for the maximum pressure to which the system can be subjected and are to comply with the requirements of Pt 5, Ch 12.

4.11.2 Pipework for ammonia (R-717) is to comply with Class I requirements.

4.11.3 In addition to visual examination of pipe welds, non-destructive examination of pipe welds is to be carried out in accordance with the requirements of Chapter 13 of the Rules for Materials to the satisfaction of the Surveyors.

4.11.4 All steel pipework on the low temperature part of the system is to be protected against external corrosion. Protective coatings are to be removed from pipe surfaces to a distance of not less than 50 mm either side of the joint weld preparations prior to welding. On completion of welding and testing a protective coating is to be applied.

4.11.5 Where brine is the secondary refrigerant, piping and tanks should not be galvanised on the brine side. If any parts of the brine system have been galvanised, the brine cooling and return tanks are to be provided with a ventilating pipe or pipes led to the atmosphere in a location where no damage will arise from the gas discharged. The ventilation pipes are to be fitted with wire gauze diaphragms which can be readily renewed.

4.11.6 Copper piping is to be manufactured in accordance with Pt 5, Ch 12,3 except in the case of small air coolers having finned pipes of sizes not greater than 19 mm outside diameter, and which have been fabricated under workshop conditions. The finned pipes may have a minimum wall thickness of 0,5 mm when used with R-22 and R-134a refrigerants.

4.11.7 Where the use of plastics pipe is proposed in a secondary refrigerant system (e.g., brine), it is to be in accordance with Pt 5, Ch 12,5.

4.11.8 Pipelines are to have ample provision for expansion and contraction in service conditions. In general, expansion bends are to be used for this purpose. However, the use of metallic expansion bellows will be accepted provided test data is produced showing satisfactory strength and fatigue properties under the appropriate conditions.

4.11.9 All pipelines are to be fully supported and secured so as to prevent vibration. Flexible hoses may be used, where necessary, to prevent transmission of vibration provided the documentation in 4.11.8 is provided. Flexible hoses are to be of a type which has been approved by LR, *see* Pt 5, Ch 12,6.

4.11.10 Pipework, which may contain low temperature refrigerant, except within secondary refrigerant cooler rooms, is to be thermally insulated to an extent which will minimise condensation of moisture. Insulation in pre-formed sections is recommended. If *in situ* foamed insulation is employed, pre-production testing on site is to be carried out to the satisfaction of the Surveyor, using a 'mock-up' representative of the system to be employed.

4.11.11 All pipe insulation is to be provided with an efficient vapour barrier, care being taken to ensure that it is not interrupted in way of supports, valves, etc. Also adequate protection of insulation surfaces from mechanical damage is to be provided.

4.11.12 Where refrigerating piping is embedded in the cargo chamber insulation, the locations of the pipe joints are to be marked on the outside of the insulation lining.

4.12 Joints

4.12.1 Butt welded pipe joints are to be employed as far as practicable. Socket welded pipe joints are acceptable up to 25 mm diameter. Flanged or other joints are to be kept to a minimum and, in general, are to be restricted to connections with items of machinery or components which may have to be removed for maintenance purposes. Connections to valves are normally to be welded unless they are of a type, or in a position, which precludes *in situ* maintenance.

4.12.2 Pipe connections to fittings (e.g., gauge lines, level controls) which are likely to be subjected to heavy corrosion, are to be of heavy gauge construction, or be made from suitable corrosion resistant materials.

4.13 Liquid level indicators

4.13.1 Where liquid level indicators of the 'see-through' variety are used they are to be of the flat plate type incorporating glass (or equivalent material) of heat resistant grade.

4.13.2 All level indicators are to be provided with automatic shut-off devices and isolating valves. Plate-type sight glasses which form an integral part of the component in which they are mounted (e.g., compressor crankcases, pressure vessels) are exempt from this requirement.

4.13.3 All level indicators are to be suitable for the system maximum working pressure and tested accordingly.

4.14 Automatic expansion valves

4.14.1 Refrigerating systems with automatic expansion valves are also to be provided with efficient hand expansion valves and the arrangement is to be such that the automatic expansion valves can be by-passed and isolated.

4.14.2 As an alternative, duplicate automatic expansion valves may be fitted, each valve to be capable of the required duty and operable with the other out of action.

4.15 Overpressure protection devices

4.15.1 Refrigeration systems are to be provided with relief devices, but it is important to avoid circumstances which would bring about an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that pressure due to fire conditions will be safely relieved.

4.15.2 Pressure relief devices are to be mounted in such a way that it is not possible to isolate them from the part of the system which they are protecting except that, where duplicated, a changeover valve may be fitted which will allow either device to be isolated for maintenance purposes without it being possible to shut off the other device at the same time.

4.15.3 Relief discharge is to be led to a safe place above deck away from personnel accesses and air intakes. Discharge piping should be designed to preclude ingress of water, dirt or debris which may cause the equipment to malfunction.

4.15.4 For ammonia systems, discharge from relief valves is to be led through water before venting to the atmosphere. Vapour detectors are to be provided in the discharge pipes to activate audible and visual alarms in the event of a leakage of ammonia.

4.15.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The flow capacity of the valve or disc is to exceed the full load compressor capacity on the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

4.15.6 Compressors protected by bursting discs are to be provided with automatic shut-down in the event of high discharge temperatures.

4.15.7 Each compressor is to be provided with automatic shut-down in the event of high discharge pressure. For refrigeration systems where the maximum working pressure is less than or equal to 40 bar g the automatic shut-down is to operate at a pressure in excess of normal operating pressure but no greater than 0,9 of the maximum working pressure. For refrigeration systems where the maximum working pressure is greater than 40 bar g the automatic shut-down is to operate at a pressure in excess of normal operating pressure but no greater than 0,95 of the maximum working pressure.

4.15.8 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of stop or automatic control or check valves is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device.

4.15.9 Pressure vessels which are interconnected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any vessel.

4.15.10 Omission of one of the specified relief devices and the changeover device, as required by 4.15.8, will be allowed where:

- vessels are of less than 300 litres internal gross volume; or
- vessels discharge into the low pressure side by means of a relief valve; or
- vessels operating using only cargo gas and, which can be independently isolated and gas freed during normal cargo operations provided that a shelf spare is carried.

4.15.11 Sections of systems and components which could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.

4.15.12 Refrigerant pumps are to be provided with pressure relief valves on the discharge side, which may relieve to the suction side, or to another suitable location.

4.15.13 Suitable spring-loaded safety valves are to be provided on the cooling liquid side of condensers and the brine side of evaporators where the pressure from any pump or expansion of the liquid in the circuit could exceed the design pressure of the system or any component forming part of the cooling system.

4.15.14 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system, as defined in 2.5.

4.15.15 When satisfactorily adjusted, relief valves are to be protected against tampering or interference by a wire with a lead seal or similar arrangement.

4.15.16 Valves which are arranged to discharge to the low pressure side of the system are to be substantially independent of back pressure and are to be of a type which has been approved by LR.

4.15.17 The minimum required discharge capacity related to air of the pressure relief device for each pressure vessel is to be determined as follows:

$$C = D\,L\,f$$

where

C = minimum required discharge capacity related to air of each relief device, in kg/s
D = outside diameter of the vessel, in metres
L = length of the vessel, in metres
f = factor which is dependent on the refrigerant:

R-717 (Ammonia)	0,041
R-22, R-134a, R-407C	0,131
R290 (Propane), R-600a (Isobutane)	0,082
R-410A, R-404A, R-507A	0,203
R-744 (Carbon dioxide) (when used on the low side of a cascade system)	0,082.

4.15.18 The rated discharge capacity of the pressure relief valves expressed in kg/s of air may also be determined in accordance with an appropriate recognised National or International Standard such as *ISO 5149 Mechanical Refrigeration Systems used for Cooling and Heating – Safety Requirements.*

4.15.19 The rated discharge capacity of a bursting disc discharging to atmosphere under critical flow conditions is to be determined by the following formula:

$$d = 85{,}75\sqrt{\frac{C}{P}}\ \text{mm}$$

where

d = minimum diameter of free aperture of bursting disc, in mm
C = minimum required air equivalent discharge capacity, in kg/s, *see* 4.15.17
P = 1,1 x maximum working pressure, *see* 2.5.

4.15.20 The bore of the discharge pipe shall be at least the same bore as the relieving device outlet. The size of a common discharge line serving two or more pressure relieving devices which may discharge simultaneously shall be based on the sum of their outlet areas. Where discharge lines are long or where the outlets of two or more pressure relieving devices are connected into a common line, the discharge piping shall be sized such that the back pressure at full relief rate does not exceed 10 per cent of the relief valve set pressure.

4.15.21 Due account is to be taken of the reaction force on a relief valve or on discharge piping during discharge and adequate support provided.

4.15.22 As carbon dioxide can form a solid powder at atmospheric pressure, there is a possibility that relief devices will choke if vented directly to atmosphere. The method used to guard against the formation of powder is to be submitted for consideration.

4.15.23 In carbon dioxide systems, overpressure protection is to be fitted to pipelines or components which can be isolated in a liquid full condition. Pressure relief devices are to be arranged such as to vent vapour at all times.

4.15.24 In cascade systems where carbon dioxide is used in combination with ammonia, the effects of carbon dioxide leaking into the ammonia side are to be considered. It may be desirable to design the ammonia system to either withstand the design pressure on the carbon dioxide side or have relief arrangements to safely deal with the additional vapour produced if a leak occurs.

4.16 Filters, driers and moisture indicators

4.16.1 Suitable filters are to be provided in the refrigerant gas lines to compressors and in the liquid lines to refrigerant flow controls. Wire gauze used in filters is to be sufficiently robust and well-supported. A filter may be combined with the oil separator required by 4.7.1. Stop valves are to be provided to allow for servicing of filters. After first commissioning of the system, the filters should be examined to confirm that elements remain intact and not collapsed.

4.16.2 Refrigerant filters, driers and moisture indicators are to be fitted in halocarbon refrigerant systems, and the arrangement is to be such that filters and driers can be by-passed, isolated and opened up without interrupting plant operations.

4.17 Purging devices

4.17.1 Where the operating pressure of the low pressure system may be below atmospheric, a purging device is to be provided, the discharge from which is to be led to a safe place above deck.

4.18 Piping in way of refrigerated spaces

4.18.1 All sounding pipes, whether for compartments or tanks, which pass through refrigerated spaces or the insulation thereof, in which the temperatures contemplated are 0°C or below, are to be not less than 65 mm bore. The pipework is to be in accordance with the requirements of Pt 5, Ch 12 and Pt 5, Ch 13,2.9.

4.18.2 Sounding pipes to oil compartments are not to terminate within refrigerated spaces or in their air cooler spaces, nor are these pipes to terminate in enclosed spaces from which access is provided to refrigerated spaces or their air cooler spaces.

4.18.3 All pipes, including scupper pipes, air pipes and sounding pipes that pass through refrigerated spaces are to be insulated.

4.18.4 Where the pipes referred to in 4.18.3 pass through chambers intended for temperatures of 0°C or below, they are also to be insulated from the steel structure, except in positions where the temperature of the structure is mainly controlled by the external temperature and will normally be above freezing point. Pipes passing through a deck plate within the ship side insulation, where the deck is fully insulated below and has an insulation ribband on top, are to be attached to the deck plating. In the case of pipes adjacent to the shell plating, metallic contact between the pipes and the shell plating or frames is to be avoided so far as practicable.

4.18.5 The air refreshing pipes to and from refrigerated spaces need not, however, be insulated from the steelwork.

4.19 Drainage from refrigerated spaces

4.19.1 Provision is to be made for the continuous drainage of the inside of all refrigerated spaces and cooler trays. The pipework is to be in accordance with the requirements of Pt 5, Ch 12 and Pt 5, Ch 13,3.2.

4.19.2 All drain pipes from the refrigerated spaces and cooler trays are to be fitted with liquid sealed traps, which are to be of adequate depth and readily accessible for cleaning and refilling with brine. The pipes from lower spaces situated on the tank tops are also to be fitted with bilge non-return valves.

4.19.3 Where drains from separate refrigerated spaces join a common main, the branch pipes are each to be provided with a liquid sealed trap.

4.19.4 Sluices, scuppers or drain pipes which would permit drainage from compartments outside the refrigerated spaces into the bilges of the latter are not to be fitted.

4.19.5 Screwed plugs or other means for blanking off scuppers, draining chambers and cooler trays are not to be fitted. If, however, it is specially desired to provide means for temporarily closing these scuppers, they may be fitted with shut-off valves.

4.20 Corrosion protection of metal fixtures

4.20.1 All steel bolts, nuts, hangers, brackets and fixtures which support or secure cooling appliances, piping insulation, meat rails, linings and prefabricated insulated panels, etc., are to be suitably protected against corrosion.

4.21 Pressure testing at manufacturers' works

4.21.1 Components intended for use with a primary refrigerant are to be subject to strength and leak pressure tests as detailed in Table 3.4.2.

Table 3.4.2 Test pressure

Component	Test pressure, bar g	
	Strength test	Leakage test
1. Pressure vessels	*See* Pt 5, Ch 11	1,0p
2. Compressor cylinders/ crankcase/casing	1,5p	1,0p
3. Valves and fittings	2,0p	1,0p
4. Pressure piping, fabricated headers, air coolers, etc.	1,5p	1,0p

NOTE
p is the design pressure as defined in 2.5.

4.21.2 Component strength pressure tests are to be hydraulic or where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.

4.21.3 Component leakage pressure tests are to be carried out only after completion of satisfactory strength pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.

4.21.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure, but in no case less than 3,5 bar g.

4.22 Pressure test after installation on board ship

4.22.1 For primary refrigerant piping welded in place, strength pressure tests of the welds are to be carried out at a test pressure of 1,5*p*. This will normally take the form of a pneumatic test since hydraulic testing media such as water are not acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.

4.22.2 Pneumatic pressure tests are to be carried out using a suitable inert gas. All pneumatic tests are potentially dangerous and due precautions are to be observed.

4.22.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by 4.22.2 may be omitted provided non-destructive tests by ultrasonic or radiographic methods are carried out with satisfactory results on the entire circumference of all butt welds not tested in accordance with 4.11.3. Where ultrasonic tests have been carried out, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have a prejudicial effect on the service performance of the piping.

4.22.4 After completion of the test required by 4.22.1, 4.22.2 or 4.22.3, a leak pressure test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the Surveyor.

4.22.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure, but in no case less than 3,5 bar g.

■ *Section 5* Refrigerant detection systems

5.1 General

5.1.1 A fixed refrigerant detection system is to be provided in the refrigerating machinery compartment or space, the discharge pipes from pressure relief valves, ventilation outlet ducts, and the cargo chambers, where appropriate.

5.1.2 The alarm system is to comply with the requirements of Chapter 1 and, as a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and a high-level concentration corresponding to the refrigerant's safe occupational level.

5.1.3 Detection equipment is to be so designed that it may be readily tested and calibrated, and failure of the equipment is to initiate an alarm.

5.1.4 The location of the detectors is to be determined relative to the layouts of the individual compartments and machinery spaces and are to be indicated on the plan submission.

5.1.5 For carbon dioxide systems, spaces such as machinery rooms, storage compartments, production areas on fishing vessels and valve stations, where leakage may occur, are to be fitted with detectors. Welded pipelines passing through passageways or access ducts are not considered possible leakage areas.

5.1.6 Audible and visual alarms are to be activated, located both inside and outside the affected space. The alarms are to be readily identifiable and be visible and audible in all locations within the space housing the refrigeration equipment.

5.2 Ammonia vapour detection and alarm equipment

5.2.1 A fixed detector system for ammonia is to comply with the requirements contained in 5.1.2.

5.2.2 The location of the detectors is to be determined relative to the layouts of the individual spaces and are to be indicated on the plan submission required by 1.2.

5.2.3 Ammonia vapour detectors are to be provided in the refrigeration machinery compartment, associated access ways, the exhaust ducts, the ammonia store room and the discharge pipes from pressure relief valves.

5.2.4 Sufficient detectors are to be provided to monitor the total areas of the above spaces.

5.2.5 For vapour detection in relief valve discharge pipes, *see* 4.15.4.

5.2.6 Details of the refrigerant detector set points and operational philosophy are to be submitted for consideration.

■ *Section 6* Electrical installation

6.1 General

6.1.1 Where the refrigerating machinery is to be electrically driven, the requirements of Ch 2,2 are to be complied with, as applicable.

6.1.2 The generating capacity available for the refrigerated installation is to be sufficient to supply power to the installation during cooling down of a complete cargo to, and maintenance of, the notation temperature conditions in all refrigerated spaces at the Rule maximum ambient and seawater temperatures.

6.1.3 Electrical equipment is not to be installed in spaces in which ammonia refrigerant is used or stored unless it is essential for operational purposes. Where electrical equipment is installed in such spaces the requirements of 6.2 are to be complied with.

6.2 Electrical equipment for use in explosive gas atmospheres

6.2.1 Lighting fittings are to be of a certified safe-type and be arranged on at least two independent final branch circuits. Switches and protective devices are to interrupt all lines or phases and are to be located outside the space.

6.2.2 Where electric motors driving ventilation fans are located within the spaces, within ventilation ducts, or within three metres of ventilation openings, they are to be of a certified safe-type.

6.2.3 Monitoring control and alarm systems which are required to operate under conditions of ammonia leakage are to be of a certified safe-type.

6.2.4 Electrical equipment which is not of a certified safe-type is to de-energise automatically if the ammonia concentration within the space exceeds 1,0 per cent by volume.

■ *Section 7* Instrumentation, control, alarm, safety and monitoring systems

7.1 Instrumentation

7.1.1 All compressors are to be provided with the following instrumentation and automatic shut-downs:

- Indication of suction pressure (saturated temperature), including intermediate stage, when applicable.
- Indication of discharge pressure (saturated temperature), including intermediate stage, when applicable.
- Indication of lubricating oil pressure.
- Indication of cumulative running hours (screw compressors).
- Automatic shut-down in the event of low lubricating oil pressure.
- Automatic shut-down in the event of high discharge pressure, *see also* 4.15.7.
- Automatic shut-down in the event of low suction pressure.

7.1.2 The automatic safety equipment is to be designed to fail safe and the arrangements are to be such that the compressors can be operated manually with the equipment out of action, in accordance with the relevant requirements of Chapter 1.

7.1.3 For installations greater than 25 kW the following instrumentation, additional to that required by 7.1.1, is to be provided:

- Indication of lubricating oil temperature.
- Indication of cooling water outlet temperature.
- Indication of cumulative running hours (reciprocating compressors).
- Indication of suction and discharge temperatures.

7.2 Control, alarm and safety systems

7.2.1 Where the refrigerating system is fitted with automatic or remote controls, so that under normal operating conditions no manual intervention by the operators is required, it is to be provided with the alarms required by 7.2.2 and 7.2.3 in accordance with the relevant requirements of Chapter 1.

7.2.2 Alarms are to be initiated in the event of the following compressor fault conditions:

- High discharge pressure.
- Low suction pressure.
- Low oil pressure.
- High discharge temperature.
- High oil temperature.
- Motor shut-down.

7.2.3 Alarms are also to be initiated in the event of the following fault conditions:

- Failure of condenser cooling water pumps.
- High condenser cooling water outlet temperature.
- Failure of air cooler fans.
- High and low refrigerated air delivery temperatures.
- High secondary refrigerant temperatures.
- Failure of secondary refrigerant pump.
- Failure of air refreshing fans.
- Low level in secondary refrigerant header tank.

7.3 Temperature monitoring and recording

7.3.1 Temperature sensors are to be of a type which has been approved by LR. The number of sensors and their locations are to be such as to give a true measurement of the temperatures within the refrigerated spaces and of the cooler delivery and return air temperatures.

7.3.2 At least one automatic recorder is to be provided for the remote monitoring and continuous recording of air temperatures within the refrigerated spaces, and delivery and return air temperatures of individual air coolers. Where only one recorder is installed, at least one sensor in each refrigerated space or in its air distribution system is to be connected to a separate remote temperature indicating instrument.

7.3.3 Where the equipment controlling the temperature of the air delivered from the air coolers is equipped with a temperature indicator, this indicator will be given consideration as a standby instrument.

7.3.4 In the case of freezer fishing vessels, where the catch is frozen on board and stored in a refrigerated space, thermometer(s) hung within each space(s) will be accepted as the standby temperature indicator, provided the space is accessible at all times.

7.3.5 Automatic temperature recorders and temperature indicators are to be of a type which has been approved by LR and, where appropriate, are to be in accordance with the requirements of Chapter 1. Approval will be granted on the basis of compliance with 7.3.6 and 7.3.7, together with satisfactory environmental testing in accordance with the requirements of LR's Type Approval System. This is to include low temperature testing at the class notation minimum temperatures for any components which may be installed in environments subject to temperatures below ambient.

7.3.6 All temperature instrumentation is to be accurate to within ±0,15°C of the true temperature in the range minus 3°C to plus 15°C , and to ±0,3°C in other parts of the range and is to register to 0,1 of a degree Celsius.

7.3.7 Where the installation is intended for the carriage of frozen cargo only, the readings need only be accurate to within ±0,5°C of the true temperature, throughout the range.

7.3.8 A spirit-in-glass thermometer is to be carried on board for checking purposes, which is to be calibrated to a recognised National Standard.

7.3.9 Thermometer tubes with their flanges and covers are to be insulated from the deck plating, and on weather decks they are to be so arranged that water will not run down the tubes when temperatures are being taken.

7.3.10 The inside diameter of thermometer tubes is to be not less than 50 mm, and the tubes are not to be in contact with cold decks.

7.3.11 Where thermometer tubes pass through compartments other than those which they serve, they are to be efficiently insulated.

■ *Section 8*
Personnel safety equipment and systems

8.1 Personnel safety equipment

8.1.1 Access doors and hatches to the refrigerated spaces and air cooler spaces are to be provided with an external locking arrangement.

8.1.2 Access ways to the refrigerated space are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.

8.1.3 Access ways and air cooler spaces are to be provided with an independent lighting system in accordance with the requirements of Ch 2,5.7.2 and Ch 2,5.7.4, with the means of locking the switches in the 'on' position.

8.1.4 Where ammonia is used in refrigerating systems, the following items of safety equipment are to be provided as a minimum, and positioned in accessible protected storage (e.g., locked glass fronted cabinets) located outside the machinery compartment:

- Two sets of ammonia protective clothing (including helmet, boots and gloves).
- Two portable battery powered hand lamps (to be of certified safe-type).
- Two sets of self-contained breathing apparatus (compressed air).
- Two full face mask respirators.
- Two fire-resistant life-lines.
- Two firemen's axes.
- Two heavy duty adjustable spanners.
- Two wheel wrenches.
- Irrigation facilities or eye wash bottles containing an eye wash solution, distilled water or non-carbonated mineral water.
- Hand or foot-operated douches providing a copious supply of clean water, located outside the compartment's doors. *See* 3.2.4.

8.2 Personnel warning systems

8.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.

8.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the Surveyors must indicate their well-being by accepting the warning.

8.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.

8.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.

8.2.5 In the event that the crew member(s) fail(s) to respond and accept the warning within an agreed specified time, the system is to immediately initiate an alarm on the bridge and in the engineers' accommodation. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.

8.2.6 The system is to comply with the relevant requirements of Chapter 1.

Section 9
Refrigerated cargo spaces

9.1 Airtightness of refrigerated spaces

9.1.1 The envelopes of individual refrigerated spaces, enclosing each temperature zone, are to be sufficiently airtight to prevent infiltration of water vapour and cross-contaminating odours. Each envelope is to be hose-tested for tightness before the insulation is installed. Alternative proposals to test with gas or air under pressure will be considered.

9.1.2 Hatch closing appliances, access doors, side loading doors, bilge and manhole plugs forming part of an insulated envelope are to be made airtight and, where exposed to ambient conditions, are to be provided with a double seal.

9.1.3 Ventilators, ducts or pipes passing through refrigerated spaces to other compartments are to be made airtight and efficiently insulated. Particular attention is to be given to insulation linings forming surfaces of air ducts. Ventilators to refrigerated spaces, if fitted, are to be provided with airtight closing appliances.

9.1.4 Refrigeration pipes passing through bulkheads or decks of refrigerated chambers or spaces are not to be in direct contact with the steelwork. The temperature of the ship's steelwork close to low temperature refrigeration piping must not be lower than that acceptable for the steel grade, *see also* Pt 3, Ch 2,2.2. The airtightness of the bulkheads and decks is to be maintained and, where the pipes pass through watertight decks and bulkheads, the fittings and packing of the glands are to be both fire resisting and watertight.

9.2 Insulation systems

9.2.1 Steelwork and fittings are to be clean and dry, and suitably coated to prevent corrosion, before insulation is applied.

9.2.2 *In situ* insulation and insulating panels are to be of a type that has been approved by LR and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the *Procedure for LR Type Approval System* will be supplied on application. Prefabricated panels, with an organic foam core and metal or similar cladding both sides, are also to be manufactured under survey at a works approved by LR. Organic foam materials are to be certified as self-extinguishing. All materials are to be free from odour likely to cause taint.

9.2.3 The thickness of insulation over all surfaces and the manner in which it is supported are to be in accordance with the approved specification and plan.

9.2.4 The insulation is to be efficiently packed and, where it is of slab form, the joints are to be butted closely together and staggered. Where it is intended to use a foamed *in situ* type of insulation, full details of the process are to be submitted for approval before the work commences and pre-production testing on site is to be carried out to the satisfaction of the Surveyor, using a 'mock-up' representative of the system to be employed. Prefabricated panels are to be of a design such that, when erected, continuity of the insulation envelope is maintained without any gaps. Gaps between panels or insulation slabs are to be filled with insulating material to the satisfaction of the Surveyor.

9.2.5 The inner surfaces of insulation envelopes are to be clad with a suitable lining, such as marine grade aluminium or plywood, or equivalent material which is:
- impermeable;
- able to withstand wear and tear and the flexing of the ship's structure without fracture at the notation temperatures;
- non-corrosive, non-rotting; and
- free from odour likely to cause taint.

Where prefabricated panels are employed the outer surfaces are also to be clad with a suitable lining.

9.2.6 Insulation linings are to be constructed and fitted so that they are airtight and provide an effective vapour barrier. The means of joining prefabricated panels are to have sufficient mechanical strength to maintain a vapour barrier on the inner and outer faces. All joints, including corner, deck, deckhead and tank top intersections are to be sealed with a suitable flexible, water vapour resistant sealant or gasket. Special care is necessary where air ducts are embedded in the insulation, and where refrigeration pipes, air refreshing ducts, fan supports, fixtures, etc., protrude through the linings.

9.2.7 Hatch covers and plugs, access doors, manhole plugs, bilge limbers and plugs forming part of the insulated envelope are to be constructed of, or covered with, a suitable lining material.

9.2.8 Insulation linings and air screens, together with supports, are to be strong enough to withstand the loads imposed by either refrigerated or general cargo.

9.2.9 Successive coatings impervious to oil are to be applied before insulating the exposed plating of tank tops and bulkheads protecting tanks containing oil. The total thickness of the required coating will depend on the construction of the tank, the composition of the coating used and the method of application.

9.2.10 If the cargo to be loaded on the tank top insulation could cause damage to the lining, then additional protection is to be provided in way of the hatch and 0,6 m beyond. The protection may be of either a permanent or temporary nature.

9.2.11 Where the insulation is to support fork lift trucks, the strength of the lining and its supports is to be demonstrated. A sample of the insulation, approximately 4 m x 4 m, is to be prepared and tested by a fully loaded fork lift truck with a gross weight of 6,5 tons on one axle with a wheel pitch of 1450 mm, having single wheeled pneumatic tyres. The truck is to be driven and manoeuvred over the sample to the satisfaction of the Surveyors.

9.2.12 Prefabricated panel systems are to be fitted with suitable pressure equalising devices to prevent damage which may be caused by under or over pressure resulting from the defrosting of coolers, rapid changes in pressure on the inner and outer faces of the panels or rapid cooling of the chamber.

9.2.13 The pressure equalising devices are to be so designed as to allow the passage of air in either direction, but remain effectively closed until the pressure differential reaches a value of 10 mm water column. Heating is to be provided to protect the mechanism from freezing.

9.3 Access plugs and panels

9.3.1 Insulated plugs are to be provided in the insulation where required for easy access to the bilges, bilge suction strum boxes, cooler and chamber drains and tank manhole lids. Removable panels are to be provided for access to tank air and sounding pipes and drains.

9.3.2 Tank top insulation in way of manholes and bilge hats is to be provided with a liquid-tight steel coaming to prevent seepage into the insulation.

9.3.3 Manholes are not permitted in the bulkheads of fuel oil tanks which form part of the cargo space envelope.

9.4 Air circulation and distribution

9.4.1 When frozen cargo is carried, provision is to be made for the adequate circulation of air between the frozen cargo and all the insulation lining surfaces.

9.4.2 When cooled cargo is carried, of a type which may generate heat or emit gas, provision is to be made for the adequate circulation of air through all the stow.

9.4.3 There is to be adequate air flow between cargo and cooling grids, where fitted.

9.4.4 The air distribution arrangements are to be such that the required circulation rate and uniform distribution can be achieved when the space is part or fully loaded with cargo. The arrangement is also to be capable of maintaining uniform air temperature throughout the space with any one fan, or air cooler, or cooling grid circuit out of action, *see* 4.8.

9.5 Air refreshing arrangements

9.5.1 Where spaces are intended for the carriage of refrigerated cargoes requiring controlled ventilation, means are to be provided for air refreshening. The positions of the air inlets are to be carefully selected to minimise the possibility of contaminated air entering the spaces. Chambers or spaces are to be provided with separate inlet and discharge vents. Each vent is to have a positive airtight valve capable of closing onto a seat. It is recommended that a distance of at least 3 m is maintained between inlet and exhaust vents.

9.6 Heating arrangements for fruit cargoes

9.6.1 Where the class notation includes the symbol ‡ for the carriage of fruit cargoes, facilities for heating the refrigerated spaces are to be provided to maintain the carrying temperatures when the temperatures outside the spaces are lower.

■ *Section 10*
Container ships fitted with refrigerating plant to supply cooled air to insulated containers in holds

10.1 General

10.1.1 Classed installations designed to supply refrigerated air to insulated ‘porthole’ containers in holds aboard container ships are to comply with the requirements of Sections 1 to 9 and 11, so far as they are applicable, and the special requirements of this Section.

10.1.2 The classed refrigerating installation is to include the refrigerating machinery, air coolers, supply and return air ducting, and the flexible couplings between containers and the duct system. Where the arrangements are such that cell air conditioning is essential to the carriage of the containers, the air conditioning equipment and (if fitted) the insulation of the hold, deckheads, sides and tank tops are to be included in the classification.

10.2 Additional information and plans

10.2.1 In addition to those requirements detailed in Section 1 which are also applicable to refrigerated container ships, the following information is to be submitted before the work commences:

- Details of air coolers.
- Details of the design of ducting proposed, including joints, connections, insulation, vapour sealing and linings.
- Details of cell air conditioning arrangements and components.
- Details of couplings between ducting and containers, including operating arrangements.

10.3 Air coolers

10.3.1 Air ducts supplying more than ten standard 20 ft containers or five standard 40 ft containers are to have a single air cooler with multiple circuits or two independent coolers. The individual circuits or coolers are to be provided with stop valves so that each circuit or cooler may be readily isolated.

10.3.2 The refrigeration capacity of the air cooler arrangement is to be such that the temperature conditions can be maintained with any one circuit or independent cooler out of action.

10.3.3 For air ducts supplying ten standard 20 ft containers or five standard 40 ft containers or less, a single cooler with one circuit will be acceptable.

10.4 Air duct systems

10.4.1 The air ducts, together with all branches and couplings, supplying refrigerated air to insulated containers in holds, are to be made airtight. For design purposes, however, an air leakage rate of 0,5 per cent of total volume flow at the design pressure for each duct is to be taken.

10.4.2 Where air ducting is insulated on the internal surfaces, provision is to be made to prevent retention of odour which may taint subsequent cargo.

10.4.3 Couplings are to be of a type that has been approved by LR. Prototypes are to be tested under all operating conditions, witnessed by the Surveyors, to demonstrate that they extend, retract and separate satisfactorily from a ‘container end wall’ at the minimum temperature condition. When operated by means of air pressure they are to be supplied with air sufficiently dry to avoid ice formation. The air supply lines are to be strength pressure tested to 1,5 x design pressure.

10.5 Duct air leakage and distribution tests

10.5.1 Air leakage tests on at least 10 per cent of ducting, selected at random, are to be carried out to the satisfaction of the Surveyors before the insulation is applied. The Surveyors may require further testing to demonstrate airtightness of ducting. The air leakage from each duct will depend on several factors and, while complete airtightness should be the objective, the air leakage rate for design purposes is not to exceed 0,5 per cent of total volume flow at the design pressure of 250 Pa.

10.5.2 In the case of prefabricated ducts, the prototype is to be subjected to air distribution, heat leakage and air leakage tests. Each production duct is to be tested for air leakage and is not to exceed the prototype test results by more than five per cent. Additionally, one duct in 50 or part thereof is to be tested for heat leakage and the results are not to exceed the prototype test results by more than 10 per cent.

10.5.3 In all cases when prefabricated sections are assembled on board, the tests as detailed in 10.5.2, are to be carried out aboard the ship.

10.5.4 On application from the Owner, the air leakage tests on air ducts installed aboard the ship, as detailed in 10.5.1 to 10.5.3, may be omitted provided that:

- the installation is designed with at least 20 per cent surplus refrigerating capacity, or
- assignment of a temperature notation for the installation be deferred until verified by a thermal balance test to the Surveyor’s satisfaction.

10.5.5 All ducts are to be tested for air distribution to the containers, at the manufacturer’s works, by measuring the flow of air from the supply couplings while the fan is operated at full speed against the designed pressure. The air flow at each coupling is to meet the specified figure within ±5 per cent.

10.5.6 Systems comprising rigid prefabricated ducts complete with coolers and fans are to be tested for air distribution at the place of manufacture. The remaining tests are to be carried out aboard the ship.

10.6 Cell air-conditioning arrangements

10.6.1 The cell air-conditioning equipment and ducting, and/or insulation of the holds, deckheads, sides and tank tops, is to be such as to maintain a uniform temperature throughout the cell and to ensure the ship’s steelwork is maintained above the minimum temperature acceptable for the steel grade, *see also* Pt 3, Ch 2,2.2.

■ *Section 11* Acceptance trials

11.1 Tests after completion

11.1.1 On completion of construction, the acceptance tests prescribed in 11.3.1 are to be carried out to verify the correct functioning of the installation and its ability to maintain the lowest notation temperature conditions required for the assignment of the intended class notation. The proposed test schedules, which should include methods of testing and test facilities provided, are to be submitted for approval before these acceptance tests are started.

11.2 Thermographic survey

11.2.1 The insulated envelope of refrigerated cargo ships and, where applicable, fish factory ships, fishing vessels, fruit juice carriers and container ships is to be scanned using a thermal imaging camera. The main purpose of carrying out the infra-red scan is to verify the efficiency of the insulation system.

11.2.2 During the course of, or prior to, the acceptance trials all inner insulated surfaces, including tank tops, bulkheads, 'tween decks, insulated hatches, coamings and weather decks are to be subject to an infra-red scan.

11.2.3 Where internal obstructions preclude an internal scan, it is to be carried out externally.

11.2.4 The scan is to be conducted with the 'tween deck and main holds in total darkness and with air coolers/cooling grids isolated and all heat sources disconnected. The temperature difference, cargo hold to ambient air or sea-water temperature, is to be 15 K or more.

11.2.5 Any deficiencies or abnormalities revealed are to be investigated and repaired to the extent considered necessary by the Surveyor.

11.3 Acceptance tests

11.3.1 The acceptance tests (*see also* 11.3.2 and 11.3.3) are to comprise the following:

(a) Verification of control, alarm, safety and refrigerant detection systems.
(b) Test simulating failure of selected components such as compressors, fans and pumps, to verify correct functioning of alarm and systems in service.
(c) Verification of accuracy, calibration and functioning of temperature control, monitoring and recording instrumentation.
(d) Verification of air cooler fan outputs running at maximum speed, and air circulation rates and distribution arrangements in individual refrigerated spaces or chambers. The latter is to be undertaken firstly with all coolers in operation and secondly with any one cooler or fan out of action.
(e) Verification of air refreshing and heating arrangements.
(f) Verification of personnel safety devices and warning systems in refrigerated spaces.
(g) Refrigeration and thermal balance tests to demonstrate the capability of the combined refrigerating plant and insulation envelope to maintain the lowest notation temperature to be assigned.
(h) Refrigeration tests for refrigerated container ships carrying 'porthole' type insulated containers. If the prescribed thermal balance tests cannot be carried out due to the number of insulated containers available in the shipyard being inadequate, then, alternatively, the following separate tests will be accepted:
    (i) Compressor capacity test.
    (ii) Duct heat leakage test on at least 20 per cent of the insulated ducting selected at random.
    (iii) Cell heat leakage test.
(j) Thermographic scan to be carried out as required by 11.2.

11.3.2 Where a number of identical installations are constructed for the same Owner and by the same shipyard, the refrigeration and thermal balance tests required in 11.3.1(g), need only be carried out on two of the series, provided the results are satisfactory.

11.3.3 Where the cells of 'porthole' type insulated containers are not insulated, a heat leakage test will be required on the first ship of the series only.

11.4 Sea trials

11.4.1 Where the class notation includes the symbol ‡ for the carriage of fruit, or the symbol ‡ is to be assigned to a fishing vessel the following records are to be kept during the first loaded voyage:

(a) **Refrigerated cargo or container ships:**
Refrigerating machinery logs and temperature records for the refrigerated cargo spaces or containers, demonstrating the installation's capability to cool down the full cargo of fruit and maintain the notation temperature conditions.
(b) **Fishing vessels:**
Refrigerating machinery and freezing equipment logs and temperature records for the refrigerated cargo spaces, demonstrating the installation's capability to freeze the catch and maintain the notation temperature conditions.

11.5 Reporting of tests

11.5.1 On completion of the tests prescribed in 11.1, two copies of the test schedule for the refrigerated cargo installation, giving details of all recorded data and thermal heat balance results, signed by the Surveyor and Builder are to be provided. One copy is to be placed on board the ship and the other submitted to LR.

11.5.2 At the end of the first loaded voyage a copy of the logs and temperature records requested in 11.4.1(a) and (b), as applicable, signed by the ship's Chief Engineer, are to be submitted to LR.

Section

Section 1 **General**

1.1 Application

1.1.1 Cargo ships of 500 gross tons or more, all passenger ships and gas and chemical tankers on international voyages, where provision is made within International Conventions are to be provided with the fire safety measures required by the *International Convention for the Safety of Life at Sea*, 1974, as amended (SOLAS 74). Fishing vessels of 45 m freeboard length and over are to be provided with the fire safety measures required by the Torremolinos Protocol of 1993 relating to the *Torremolinos International Convention for the Safety of Fishing Vessels*, 1977 (Torremolinos Protocol).

1.1.2 Cargo ships of 500 gross tons or more, all passenger ships, and gas and chemical tankers, employed on national voyages are to comply with the fire safety measures prescribed and approved by the Government of the Flag State.

1.1.3 It is the responsibility of the Government of the Flag State to give effect to the fire protection, detection and extinction requirements of 1.1.1 and 1.1.2. However, Lloyd's Register (hereinafter referred to as 'LR') will undertake to do this in cases where:

(a) contracting Governments have authorised LR to apply the requirements of SOLAS 74 or the Torremolinos Protocol and issue the appropriate certification on their behalf; or

(b) the Government of the Flag State is not a signatory to SOLAS 74 or the Torremolinos Protocol; or

(c) the ship or fishing vessel is to be classed for restricted or special service in national waters for which the Government of the Flag State has no national requirements. In such cases, LR will apply the fire safety measures required by SOLAS 74 or the Torremolinos Protocol, as appropriate.

However, due consideration will be given to arrangements deemed to provide an equivalent level of fire safety, taking due cognisance of the circumstances of the restricted or special service.

1.1.4 Section 2 of this Chapter, which is within the spirit of the International Convention and Protocol requirements for ships of Convention size, is applicable to cargo ships of less than 500 gross tons (where not covered by International Conventions), fishing vessels of 12 m registered length and over but less than 45 m freeboard length, and ships not fitted with propelling machinery.

1.1.5 Consideration will be given to the acceptance of fire safety measures prescribed and approved by the Government of the Flag State in lieu of 1.1.4.

1.1.6 Special consideration, consistent with the fire hazard involved, will be given to construction or arrangement features not covered by this Chapter.

1.1.7 Cargo ships of less than 500 gross tons intended for the carriage of dangerous goods are to comply with SOLAS 1974 as amended II-2/G.19.

Section 2 **Fire detection, protection and extinction**

2.1 General provisions

2.1.1 The provisions of these requirements, are intended to apply to new and, as far as reasonable and practicable, or as found necessary by the relevant Administration, to existing cargo ships of less than 500 gt.

2.1.2 It should be remembered that the *International Codes for the Construction and Equipment of Ships carrying Dangerous Chemicals in Bulk and Liquefied Gases in Bulk* are applicable to such ships regardless of size including those of less than 500 gt.

2.2 Definitions

2.2.1 The terms, used in these requirements are as defined in SOLAS 1974 (as amended).

2.2.2 The term Gross Tonnage (gt) is as defined in IMO Resolutions A.493 (XII), calculated in accordance with the 1969 Tonnage Convention and the interim scheme applicable to ships with keels laid up to 18 July 1994 in accordance with IMO Resolution A.494 (XII).

2.2.3 **Service area definitions**

(a) 'Unrestricted service' means a ship engaged on international voyages.

(b) 'Restricted service' is broken down into two broad categories: (a) ships operating coastal or specified operating areas (b) ships operating within protected or extended protected waters.

  (i) **Specified coastal service**. Service along a coast, the geographical limits of which are to be defined and for a distance out to sea generally not exceeding 20 nautical miles, unless some other distance is specified for 'coastal service' by the Administration with which the ship is registered, or by the Administration of the coast off which it is operating. A typical example might be 'Indonesian coastal service'.

  Specified operating or service areas may be service between two or more ports or other geographical features, or service within a defined geographical area such as 'Red Sea Service', 'Piraeus to Thessaloniki and Islands within the Aegean Sea'.

(ii) **Protected water service**. Service in sheltered water adjacent to sand banks, reefs, breakwaters to other coastal features, and in sheltered water between islands.
Extended protected water service. Service in protected waters and also short distances (generally less than 15 nautical miles) beyond protected waters in 'reasonable weather'.

2.3 Surveys and maintenance

2.3.1 The hull, machinery and all equipment required for safety aspects of every ship should be constructed and installed so as to be capable of being regularly maintained to ensure that they are at all times, in all respects, satisfactory for the ship's intended service.

2.3.2 A competent authority should arrange for appropriate surveys of the required equipment relating to fire safety aspects during construction and, at regular intervals after completion, generally as prescribed within Chapter I of SOLAS 1974 (as amended). Such surveys should be carried out by the Society classing the ship or the Flag State.

2.3.3 The condition of the structural fire protection and fire safety related equipment shall be maintained to conform with the provisions of the requirements to ensure that the ship, in these respects, will remain fit to proceed to sea without danger to the ship or persons on board. The hull structure and machinery do not form part of these requirements but should be similarly surveyed and maintained.

2.4 Requirements

2.4.1 Table 4.2.1 details the various minimum fire protection, detection and extinction arrangements that are required depending on the vessel's intended service area.

Table 4.2.1 General fire detection, protection and extinction requirements

Fire-fighting	Unrestricted	Restricted	Protected
1. FIRE PUMPS			
Ships greater than 150 gt			
Independently driven power pumps	1	1	1
Power pumps	1	1	—
Hand pumps	—	—	1
Ships less than 150 gt			
Independently driven power pumps	—	—	—
Power pumps	1	1	1
Hand pumps	1	1	—
2. FIRE HYDRANTS			
Sufficient number and so located that at least one powerful water jet can reach any normally accessible part of ship	X	X	X
3. FIRE HOSES (Length >15 m)			
With couplings and nozzles	≥ 3	≥ 3	≥ 2
4. FIRE NOZZLES			
Dual purpose (spray/jet) with 12 mm jet and integral shut-off	X	X	X
Jet may be reduced to 10 mm and shut-off omitted for hand pump hoses			
5. PORTABLE FIRE-EXTINGUISHERS			
Accommodation and service spaces	≥ 3	≥ 3	≥ 2
Boiler rooms, etc.	≥ 2	≥ 2	≥ 2
Machinery spaces (one extinguisher per 375 kW of internal combustion engine power)	≥ 2 ≤ 6	≥ 2 ≤ 6	≥ 2 ≤ 6
Cargo pump-rooms (capacity 9 l. fluid or equivalent)	≥ 2	≥ 2	≥ 2
6. NON-PORTABLE FIRE-EXTINGUISHERS IN MACHINERY SPACES			
Ships greater than 150 gt	1	1	—
Ships greater than 350 gt (capacity 45 l. fluid or equivalent)	—	—	1
7. FIXED FIRE-EXTINGUISHING SYSTEMS SHIPS GREATER THAN 350 gt			
Category A machinery spaces	X	X	—
Cargo pump-rooms	X	X	—
8. CARGO TANK PROTECTION			
Mobile foam appliances	X	X	X
9. FIREMAN'S OUTFIT			
Ships greater than 150 gt complete outfit	≥ 2	≥ 2	≥ 2
Ships less than 150 gt complete outfit	≥ 1	≥ 1	—
Fireman's axe	—	—	1
10. MEANS OF ESCAPE			
Accommodation and service spaces	2	2	2
Machinery spaces	≥ 1	≥ 1	≥ 1
Cargo pump-rooms	1	1	1
11. STRUCTURAL FIRE PROTECTION WHEEL HOUSE AND MACHINERY SPACES			
Separation from adjacent spaces of negligible fire risk	A-0	A-0	A-0
Separation from other adjacent spaces	A-60	A-30	A-0
Escape routes	B-0	B-0	B-0

■ *Section 1* General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to refrigerated cargo ships where a Controlled Atmosphere **(CA)** notation is requested.

1.1.2 The requirements are additional to the classification requirements for refrigerated cargo installations contained in Pt 6, Ch 3.

1.1.3 Ships provided with CA systems which are approved, installed and tested in accordance with the following requirements will be eligible for the applicable class notation specified in Pt 1, Ch 2,2.6.2.

1.1.4 An example of a typical class notation on a refrigeration installation classed with Lloyd's Register (hereinafter referred to as 'LR'), fitted with a CA system built under Special Survey, would be:

✠ **Lloyd's RMC** to maintain a temperature –29°C to +14°C with sea temperature 35°C maximum.

✠ **CA (1–12% O_2, 0–25% CO_2) RH**

1.2 Novel arrangements and design

1.2.1 Where the proposed construction of the CA system, or CA zones, is novel in design, or involves the use of unusual materials or equivalent arrangements to those specified in the following sections, special tests may be required, and a suitable descriptive note may be assigned.

1.3 Definitions

1.3.1 **CA zone** means one or more cargo chambers enclosed in an air-tight envelope.

1.3.2 **Gas** means a suitable gaseous mixture to retard the metabolic process of fresh products.

1.3.3 **Gas system** means a system which controls the levels of oxygen and/or carbon dioxide.

1.3.4 **Adjacent space** means an enclosed space adjoining a CA zone separated by watertight bulkheads or decks penetrated by pipes, cables, ducts, doors, 'tween deck, etc.

■ *Section 2* Plans and documentation

2.1 Plans of CA zones and adjacent spaces

2.1.1 The following plans and particulars of the CA zones and adjacent spaces are to be submitted in triplicate for approval before construction is commenced:

(a) Capacity plan.
(b) Location and installation of CA equipment.
(c) Arrangement of CA zones in elevation and plan view.
(d) Access arrangement.
(e) Arrangement and use of spaces adjacent to CA zones.
(f) Details of securing weather deck and 'tween deck hatch lids.
(g) Details of securing gratings in way of hatch lids.
(h) Details of weather deck and access hatch seals.
(j) Door seals, scuppers, pipes, cables and ducts penetrating the decks, bulkheads, etc., together with proposed design conditions in the CA zones.
(k) Specified leakage rate and proposals for its measurement.
(l) Location of sampling points for CA gas and/or sensors in the CA zones and adjacent spaces.
(m) Details of the gas supply piping system.
(n) Details of gas freeing arrangements, including fans, valves, ducts and any interlocks.
(o) Details of pressure/vacuum valves for protecting devices in CA zones, location of outlets from P/V valves and capacity calculations.
(p) Details of security locks provided on entry to the hatch and manhole covers, and doors leading to CA zones and adjacent spaces.
(q) Arrangements of ventilation systems for the gas generator compartment and other adjacent spaces adjoining CA zones.

2.2 Gas supply system

2.2.1 The following plans and particulars of the gas supply system, etc., are to be submitted in triplicate for approval, before construction is commenced:
(a) Schematic arrangements of the proposed gas supply systems and, where applicable, details of compressors, pressure vessels, membranes, storage tanks, gas cylinders, control and relief valves and safety arrangements, including pressure set points of alarm and safety devices.
(b) Capacities of gas supply systems at different oxygen and carbon dioxide levels, if applicable.

2.3 Humidifiers

2.3.1 Where applicable, the following plans and particulars of the humidification system, etc., are to be submitted in triplicate for approval, before construction is commenced:
(a) Specification and capacity of the system.
(b) Principles of operation and control of relative humidities under different operating conditions.
(c) Details of proposed equipment, nozzles, pads, heaters, pumps, steam generator, compressors, water tanks, etc.
(d) Layouts of the equipment and the positioning of sensors and controls.

2.4 Control equipment

2.4.1 The following plans and details of the control, alarm and safety systems for CA zones, gas supply compartment and other adjacent spaces, are to be submitted in triplicate before construction is commenced:
(a) Line diagrams of all control circuits.
(b) List of monitored, control and alarm points.
(c) Details of computer systems, if fitted.
(d) Location of control panels and consoles.
(e) Controls of all valves and dampers fitted to CA zones.
(f) Details of oxygen and carbon dioxide analysers and arrangements for calibration.
(g) Relative humidity (RH) sensors and details of calibration.
(h) Details of alarm system, including location of central control panel and audible and visual warning devices.

2.5 Electrical

2.5.1 In addition to the applicable requirements of Pt 6, Ch 2,1.2, the following information and plans specific to the installed CA system are to be submitted in triplicate for approval, before construction is commenced:
(a) Main power supply arrangement to the CA system.
(b) Single-line diagram of the CA system which is to include rating of electrical machines, insulation type, size and current loading of cables and make, type and rating of protective devices.
(c) A schedule of normal operating loads of CA system, estimated for the different operating conditions expected.

2.6 Testing

2.6.1 Details of the testing programme are to be submitted, including instrumentation to be used with range and calibration.

■ *Section 3* CA zones and adjacent spaces

3.1 Air-tightness of CA zones

3.1.1 The CA zones are to be made air-tight in accordance with the requirements in 9.3. Particular attention is to be paid to sealing of hatches, plugs and access doors in each CA zone. Double seals are to be fitted to each opening.

3.1.2 Openings for pipes, ducts, cables, sensors, sampling lines and other fittings passing through the decks and bulkheads are to be suitably sealed and made air-tight.

3.1.3 The liquid sealed traps from bilges and drains from the cooler trays are to be deep enough to withstand, when filled with liquid which will not evaporate or freeze, the design pressure in each CA zone when taking account of the ship's motion.

3.1.4 Air refreshing inlets and outlets are to be provided with isolating arrangements.

3.2 CA zone protection

3.2.1 Means are to be provided to protect CA zones against the effect of overpressure or vacuum.

3.2.2 At least two P/V valves are to be fitted in each CA zone. They are to be set for the design conditions of the CA zone.

3.2.3 Consideration will be given to the use of a single valve in combination with other suitable means of overpressure or vacuum protection.

3.2.4 The proposed P/V valves for each zone are to be of adequate size to release any excess pressure and to relieve the vacuum at maximum cooling rate.

3.2.5 P/V valve discharges are to be located at least 2 m above deck and 10 m away from any ventilation inlets. Discharge piping is to be arranged to preclude ingress of water, dirt or debris which may cause the equipment to malfunction.

3.2.6 Pressure sensors are to be installed in locations necessary to monitor pressure of all CA zones. Pressure sensors are to be installed away from fans, air inlets and outlets.

3.3 Gas freeing of CA zones

3.3.1 The arrangements for gas freeing of CA zones are to be capable of purging all parts of the zone to ensure a safe atmosphere.

3.3.2 Cargo air cooling fans and the air refreshing arrangements may be used for gas freeing operations.

3.3.3 Gas freeing outlets are to be led to a safe place in the atmosphere 2 m above the deck, away from accommodation spaces and intakes of the fans for accommodation.

3.4 Ventilation of adjacent spaces

3.4.1 Deckhouses and other adjacent spaces which require to be entered regularly are to be fitted with a positive pressure type mechanical ventilation system with a capacity of at least 10 air changes per hour capable of being controlled from outside these spaces.

3.4.2 Adjacent spaces not normally entered are to be provided with a mechanical ventilation system which can be permanent or portable to gas free the space prior to entry.

3.4.3 Ventilation inlets are to be arranged so as to minimise recycling any gas and are to be at least 10 m in the horizontal direction away from the ventilation outlets.

■ *Section 4* Gas systems

4.1 General

4.1.1 Means are to be provided to achieve and maintain the required oxygen and/or carbon dioxide levels in the CA zones. This may be accomplished by the use of stored gas, portable or fixed gas generating equipment or other equivalent arrangements. The arrangements are to be such that a single failure will not cause a complete loss of gas supply to the CA zones.

4.1.2 The gas system is to have sufficient capacity to make good any gas loss from the CA zones and to maintain a positive pressure in all CA zones.

4.1.3 The gas system is also to be able to:

(a) Deliver gas at 125 per cent of the specified flow rate with two compressors operating.

(b) Maintain the specified gas levels in all CA zones when operating 24 hours per day with one unit on stand-by.

4.1.4 Air intakes are to be located to ensure that contaminated air is not drawn into the compressors.

4.1.5 Where it is intended to supply gas by means of stored gas bottles, the arrangements are to be such that depleted bottles may be readily and safely disconnected and charged bottles readily connected.

4.2 Location

4.2.1 Fixed gas generating equipment, gas bottles or portable gas generators are to be located in a compartment reserved solely for their use. Such compartments are to be separated by a gastight bulkhead and/or deck from accommodation, service and control station spaces. Access to such compartments is to be only from the open deck.

4.2.2 Gas piping systems are not to be led through accommodation, service and machinery spaces or control stations.

4.3 Gas supply

4.3.1 The gas systems are to be designed so that the pressure which they can exert on any CA zone will not exceed the design pressure of the zone.

4.3.2 During initial operation, arrangements are to be made to vent the gas outlets from each generator to the atmosphere. All vents from gas generators are to be led to a safe location on the open deck.

4.3.3 Where gas generators use positive displacement compressors, a pressure relief device is to be provided to prevent excess pressure being developed on the discharge side of the compressor.

4.3.4 Suitable arrangements are to be provided to enable the supply main to be connected to an external supply.

4.3.5 Where it is intended that gas systems are to be operated unattended, the required CA zone environment is to be automatically controlled.

4.3.6 Means of controlling inadvertent release of nitrogen into CA zones, such as locked valves, are to be provided.

4.4 Gas supply compartment ventilation and alarm

4.4.1 The gas supply compartment is to be fitted with a mechanical extraction ventilation system providing a rate of at least 20 air changes per hour based on the total empty volume of the compartment.

4.4.2 Ventilation ducts from the gas generator/supply compartment are not to be led through accommodation, service and machinery spaces or control stations.

4.4.3 The air outlet duct is to be led to a safe place on the open deck.

4.4.4 The gas supply compartment is to be provided with a low oxygen alarm system.

Section 5 Relative humidity (RH)

5.1 Humidification

5.1.1 Where a humidification system is fitted, the following requirements are to be complied with:

(a) The supply of fresh water for humidification is to be such as to minimise the risk of corrosion and contamination of the cargo.

(b) To prevent damage or blockage in the humidification system caused by water freezing, the air, steam or water pipelines in the cargo chambers are to be installed to facilitate ease of drainage and are to be provided with suitable heating arrangements.

Section 6 Electrical installation

6.1 General

6.1.1 In addition to the requirements of Pt 6, Ch 2, the following requirements are to be complied with:

(a) The electrical power for the CA plant is to be provided from a separate feeder circuit from the main switchboard.

(b) Under sea-going conditions, the number and rating of service generators are to be sufficient to supply the cargo refrigeration machinery and CA equipment in addition to the ship's essential services, when any one generating set is out of action.

Section 7 Control instrumentation and alarms

7.1 General

7.1.1 An alarm system for monitoring the atmosphere in CA zones is to be installed which may be integral with the machinery space alarm system as required by Pt 6, Ch 1,2.3.

7.1.2 Where alarms are displayed as group alarms in the main machinery space alarm system, provision is to be made to identify individual alarms at the refrigerated cargo control station.

7.1.3 The pressure in each CA zone is to be monitored and an alarm initiated when the pressure is too high or too low.

7.1.4 Where the **RH** notation is to be assigned, humidity sensors are to be installed in each of the CA zones and are to initiate an alarm when the relative humidity (RH) falls below or exceeds the predetermined set values.

7.1.5 Gas sensors or analysers are to be provided to monitor gas content in CA zones, *see* 7.3 and 7.4.

7.1.6 Gas analysers and sensors are to be calibrated automatically once in every 24 hours. An alarm is to be initiated if accuracy is outside tolerance limits.

7.1.7 Direct readout of the gas quality within any CA zone is to be available to the operating staff on demand.

7.1.8 At least one automatic recorder is to be provided for the remote monitoring and recording of O_2 and CO_2 levels in each CA zone.

7.1.9 Alarms are to be initiated in the event of O_2 or CO_2 levels in each CA zone falling below or exceeding the predetermined set values.

7.2 Gas systems

7.2.1 Where air compressors are to be used for gas production, alarms are to be initiated for the following conditions:

- High lubricating oil temperature.
- High differential pressure across the filters.
- Electric supply failure.

The compressors are to shutdown automatically in the event of:

- High discharge air temperature.
- High discharge air pressure.
- Low lubricating oil pressure.
- High pressure in CA zone.

7.2.2 Instrumentation is to be fitted for indicating continuously:

(a) Gas pressure.
(b) Gas temperature.
(c) Gas content.
(d) Gas flow.

7.3 Gas analysers and sampling

7.3.1 Where analysers are fitted, at least two analysers for oxygen and carbon dioxide having a tolerance of ±0,1 per cent by volume are to be provided to determine the content of the circulated gas within the CA zones.

7.3.2 Two separate sampling points are to be located in each CA zone and one sampling point in each of the adjacent spaces. The arrangements are to be such as to prevent water condensing and freezing in the sampling lines under normal operating conditions. Filters are to be provided at the inlet to sampling point lines.

7.3.3 Arrangements of the gas sampling points are to be such as to facilitate representative sampling of the gas in the space.

7.3.4 Where gas is extracted from the CA zones via a sampling tube to analysers outside the space, the sample gas is to be discharged safely to the open deck.

7.3.5 Provision is to be made for gas sampling by means of portable equipment as required by 9.6.3.

7.3.6 The sampling frequency is to be at least once per hour.

7.4 Gas sensors

7.4.1 Where sensors are fitted, at least two sensors for each of O_2 and CO_2, having a tolerance of ±0,1 per cent are to be installed in each CA zone to monitor gas levels.

7.4.2 Gas sensors may be used for indication and alarm.

■ *Section 8* Safety requirements

8.1 Personnel safety

8.1.1 CA zones are to be clearly labelled with 'Caution' and 'Danger' signs to alert personnel.

8.1.2 Entry hatch and manhole covers, doors leading to the CA zones and adjacent spaces are to be fitted with acceptable security-type locks and alarms activated when covers and doors are opened. The alarms are to be placed in a manned location.

8.1.3 All doors and access hatches to CA zones which may be under pressure are to open outwards and are to be fitted with secondary catches to prevent injury or damage during opening.

8.1.4 At least two portable oxygen sensors are to be provided to sample the oxygen level in all CA zones and adjacent spaces.

8.1.5 A means of communication is to be provided between CA zones and an attended location on deck.

8.1.6 Medical first aid equipment, including at least one set of oxygen resuscitation equipment, is to be provided on board.

■ *Section 9* Inspection and testing on completion

9.1 General

9.1.1 CA system trials are to be witnessed on board by the LR Surveyor, before the system is put into service and before a certificate is issued. These trials are in addition to any tests which may have been carried out at the manufacturer's works.

9.1.2 An Operating and Safety Manual for the guidance of the ship's staff is to be provided, covering the following topics:

(a) Principal information on the use of CA.
(b) Complete description of the CA installation on board.
(c) Hazards of low oxygen atmospheres and consequential effects on human life.
(d) Countermeasures when exposed to low oxygen atmospheres.
(e) Instructions for operation, maintenance and calibration of all gas detectors.
(f) Instructions for use of portable oxygen analysers with alarm for personal protection.
(g) Prohibition of entry to spaces under CA.
(h) Loading instructions prior to injection of gas.
(j) Procedure for checking security of CA zones, doors and access hatches prior to injection of gas.
(k) Gas freeing procedure for all CA zones.
(l) Procedure for checking atmosphere of CA zones before entry.

9.2 Gas supply and sampling systems

9.2.1 The gas supply main and branches are to be pressure and leak tested. The test pressures are to be 1,5 and 1,0 times the design pressure respectively.

9.2.2 All gas sampling lines are to be leak tested using a vacuum or overpressure method.

9.3 Air-tightness of CA zones

9.3.1 Air-tightness of each CA zone is to be tested and the results entered on the certificate. The measured leakage rate of each zone is to be compared with the specified value.

9.3.2 Either a constant pressure method or a pressure decay method is to be used to determine the degree of air-tightness.

9.3.3 If the constant pressure method is used, the test is to be carried out at the design pressure of the CA zones.

9.3.4 If the pressure decay method is used, the time for the pressure to drop from 350 Pa to 150 Pa is to be measured and the leakage is to be calculated using the following formula:

$$A.L. = \frac{7{,}095 \times V}{t}$$

where

$A.L.$ = air leakage, in m^3/h
V = volume of zone, in m^3
t = time, in seconds
7,095 = constant for 200 Pa pressure decay.

During this test, adjacent zones are to be kept at atmospheric pressure.

9.4 Gas system performance

9.4.1 Capability of the gas system to supply the gas at the specified flow rate and condition is to be verified by tests.

9.4.2 If the notation conditions cannot be verified during testing, assignment of the notation is to be deferred until log book entries confirm the achievement of the specified conditions in every CA zone during a loaded passage.

9.5 Gas freeing

9.5.1 The gas freeing arrangements are to be tested to demonstrate that they are effective.

9.6 Safety, alarms and instrumentation

9.6.1 The control, alarm and safety systems are to be tested to demonstrate overall satisfactory performance of the control engineering installation. Testing is also to take account of the electrical power supply arrangements, *see also* Pt 6, Ch 1,2.3.

9.6.2 Locking arrangements of all CA zones and adjacent spaces where gas may accumulate, provision of warning notices at all entrances to such spaces, communication arrangements and operation of alarms, controls, etc., are to be examined.

9.6.3 The provision of portable gas detectors and personnel oxygen monitors are to be verified by the LR Surveyor. Suitable calibrated instruments for measuring the levels of O_2, CO_2 and humidity, gas pressure and gas flow to the CA zones, are to be provided for testing. Their accuracy is to be verified.

Section

■ *Section 1* Introduction

1.1 Scope

1.1.1 This Chapter is intended for the classification of self-propelled or non-self-propelled ships with specialised structures which have plant installed on board for the processing of chemicals, liquefied gases and related products, where permitted by the Flag Administration, and which fall into one of the following environmental categories:

1A Ships which have plants operable while navigating at sea.
1B Ships which have plants operable at sea, but only while the ship is attached to an offshore mooring facility.
2 Ships which can navigate at sea, but whose plants are intended to be operated only while the ships are in harbour or similarly protected waters.
3 Specialised ships, including pontoons, barges and similar structures which are designed as sea transportation vehicles to carry non-operative process plants, but which are specially constructed to be fully supported by the sea bed when the plants are operative.

1.1.2 Each category in 1.1.1 may include provision for the storage of the products used in the process or processes concerned.

1.2 General

1.2.1 The Rules are framed on the understanding that ships will not be operated in environmental conditions more severe than those agreed for the design basis and approval, without the prior agreement of Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 Except as indicated in this Chapter, the hull, propulsion machinery, auxiliary machinery, equipment for essential services of the ship, electrical installations and control engineering systems are to comply with the relevant Sections of Parts 3, 4, 5 and 6, the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals) and the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases), where applicable. Hulls made of reinforced or prestressed concrete will be specially considered.

1.2.3 The additional hull structural requirements for Category 3 ships to enable them to be satisfactorily grounded on prepared foundations will be specially considered. Full details of the intended foundations and the local conditions at the site are to be submitted for use in assessing the hull structural capability, etc.

1.2.4 Where the process plant is intended to operate in close proximity to bulk storage of feedstocks and/or products, further consideration may be necessary in addition to that contained in this Chapter, particularly with regard to the provision of effective separation, methods of storage, loading and discharging arrangements.

1.2.5 For ships of all categories in 1.1.1 except Category 1A, provision is to be made for purging, gas freeing, inerting or otherwise rendering safe the plant and process storage facilities before the ship proceeds to sea or changes location. The provisions to be adopted, if any, when a ship of Category 1A enters harbour will be specially considered.

1.2.6 In addition to the requirements for periodical surveys, a general examination of the ship, machinery and process plant is to be carried out by LR's Surveyors before and after a ship, of any category other than 1A, changes location. Every precaution is to be taken to ensure safety during such examination.

1.2.7 Requirements additional to those of this Chapter may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the process plant is intended to operate.

1.3 Classification of ship

1.3.1 A ship built in accordance with the requirements of this Chapter, or in accordance with requirements equivalent thereto, will be assigned an appropriate class in the *Register Book*, as indicated in Section 2, and will continue to be classed so long as it is found, upon examination at the prescribed surveys, to be maintained in a safe and efficient condition, *see also* 1.4.6.

1.3.2 For each category described in 1.1.1, classification covers the hull, containment systems for stored products, propulsion machinery, auxiliary machinery used for essential services, and equipment necessary to maintain a suitable environment within which the plant may safely operate.

1.3.3 In general, classification will not be extended to the process plant itself, and the classification requirements do not relate to the specialised machinery, equipment and associated piping, etc., which is solely concerned with the production operations, except where the design and/or arrangements of such equipment and piping may affect the safety of the vessel.

1.3.4 When the reliquefaction plant is installed, and the plant and equipment are in accordance with the requirements of the Rules for Ships for Liquefied Gases, consideration will be given to classing the plant in accordance with Pt 1, Ch 2,2.6.

1.4 Certification of process plant

1.4.1 Process plant will be required to be certified by LR, and a note to the effect that this has been carried out will be appended to the class notation in the *Register Book*.

1.4.2 The certificate will include a brief description of the process plant, indicating the chemical(s) processed and the end products.

1.4.3 The certificate of the plant will cease to be valid if a significant alteration is made to the plant or the arrangements on board without the written approval of LR. This provision does not exclude the direct replacement of any item by a substitute part which has been approved and tested by LR.

1.4.4 The process plant will be required to be surveyed by LR's Surveyors at intervals to be prescribed by the Committee, dependent on the process involved.

1.4.5 The class notation for the ship will, in general, state that the process plant is not classed but certificated by LR and periodically surveyed by LR's Surveyors.

1.4.6 The maintenance of the class of the ship while the plant is in operation will be dependent upon a valid certificate and the plant being found, upon examination at the prescribed surveys, to be maintained in a safe and efficient condition.

1.4.7 The plant certificate is not to be taken as a recommendation for, or an approval of, the process or processes.

■ *Section 2*
Class notations

2.1 Ship notations

2.1.1 Ships of Category 1A, which have chemical process plants designed to operate while the ship is navigating at sea, will be eligible to be classed '100A1 Chemical Process Factory', *see also* 1.4.5.

2.1.2 Ships of Category 1B, which have chemical plants designed for operation at sea while the ship is specially moored, anchored or otherwise linked to the shore, sea bed or other stationary vessel or structure, will be eligible to be classed '100A1(T) moored (oil, ammonia, etc.) processing (tanker, barge, etc.) for service at . . .', *see also* 1.4.5.

2.1.3 Ships of Category 2, which have chemical plants installed and designed for operation while the ship is in harbour, will be eligible to be classed '100A(T) chemical process plant installed – for operation only when moored in harbour', *see also* 1.4.5.

2.1.4 Specialised ships of Category 3 which have chemical plants designed to operate only while the ship is fully supported on the sea bed, will be eligible to be classed 'A chemical process plant pontoon/platform – to be operated only when grounded on prepared foundations at...', *see also* 1.4.5.

2.2 Additional notations

2.2.1 A special chemical cargoes notation may be assigned to ships where raw materials or products are stored or retained on board in bulk.

2.2.2 The Committee may append details of process, product storage, safety or other particulars to the notation as it considers necessary.

2.2.3 Ships of Category 1B or 2 which have process plants installed solely for the purposes of the physical liquefaction of impure feedstock gases at low temperatures and the storage of the purified liquefied gases (where the chemical treatment of the impurities is an incidental process) will be assigned additional notations to those stated in 2.1.2 or 2.1.3, such as 'for liquefaction and storage of methane, etc., in independent tanks Type B, etc. – maximum pressure – minimum temperature'.

2.3 Special mooring and linking arrangements

2.3.1 Where the process plant is operable only when the ship is specially moored, anchored or otherwise linked to the shore, sea bed or other stationary vessel, and the equipment and/or other linking arrangements and components have been approved by the Committee as suitable and sufficient for the intended service, an equipment character, T, will be assigned in addition, or as an alternative, to the equipment character, 1, as appropriate.

2.3.2 For the purpose of the Rules, the word 'linked' is to be taken to include spuds, retractable legs, floating or submerged pipelines connecting directly to the ship, ship to shore electrical connections, etc., which restrain the ship in its operating position, or which require such restraint to be applied and the failure of which could hazard the ship.

■ *Section 3* Plans and particulars

3.1 General

3.1.1 Before the work is commenced, plans in triplicate, together with the relevant information as detailed in this Section, are to be submitted for consideration. Any subsequent modifications are subject to approval before being put into operation.

3.1.2 Any alterations to basic design, construction, materials, manufacturing procedure, equipment, fittings or arrangements of the process are to be re-submitted for approval.

3.1.3 For Category 1 ships, the plant is to be capable of sustaining an emergency condition at full operating temperatures and pressures with the hull statically listed to an angle of $22^{1}/_{2}$° and statically trimmed to an angle of 10° beyond the maximum normal operating trim. These angles may be modified by the Committee in particular cases as it considers necessary. The stress calculations for the plant and the supporting structure are to take account of this condition. Wind loads need not be considered to be acting during this emergency condition.

3.1.4 For Category 2 ships, the plant is to be capable of sustaining an emergency condition at full operating temperatures and pressures with the hull statically listed to an angle of 15° and statically trimmed to an angle of 5° beyond the maximum normal operating trim. These angles may be modified by the Committee in particular cases as it considers necessary. The stress calculations for the plant and the supporting structure are to take account of this condition. Wind loads need not be considered to be acting during this emergency condition.

3.2 Hull construction

3.2.1 For all categories of ship, the plans and information detailed in 3.2.2 to 3.2.6 are to be submitted, in addition to those required by Pt 3, Ch 1,5, Chapter IV of the Rules for Ships for Liquid Chemicals or Chapter IV of the Rules for Ships for Liquefied Gases, as applicable.

3.2.2 Plans showing the general arrangement of the ship are to be submitted, giving the location of the following:

- Hatches and other openings to enclosed plant spaces and adjacent cofferdams.
- Doors, hatches, ventilation and other openings to crew accommodation, stations essential for operation at sea, control stations, store rooms and workshops.
- Coated tanks or tanks constructed of special material.
- Additional structure associated with the plant above the deck.
- Proposed grouping of areas within the plant for segregation purposes.

3.2.3 Plans for mooring, anchoring and linking, as applicable, together with relevant wind and sea data are to be submitted for information.

3.2.4 Plans outlining the containment arrangements in the event of an accident, together with all relevant information, are to be submitted.

3.2.5 Particulars of the marine environment and safety arrangements associated with the process plant are to be submitted, including:

- Arrangements for preventing the ingress of water into the ship or structure where the process plant and equipment protrude through the weather deck.
- Proposed emergency flooding procedures and their control.

3.2.6 Particulars of the proposed storage arrangements of hazardous and/or toxic substances, feedstocks and products in bulk, on the ship or structure, are to be submitted.

3.3 Process plant

3.3.1 A description of the expected method of operation of the process plant and a diagram showing the process flow are to be submitted.

3.3.2 General arrangement plans of the process plant showing the hazardous and safe zones and spaces are to be submitted, indicating the following:

- Spaces where toxic gases or vapours may accumulate.
- Spaces where flammable gases or vapours may accumulate.
- Areas maintained at an over-pressure to prevent the ingress of such gases or vapours.

3.3.3 Details of the flammability, toxicity, corrosivity and reactivity of the substances entering, being processed and leaving, or stored in, each compartment, together with details of any exothermic and hazardous reactions particularly with regard to sea-water and other materials normally found in the marine environment, are to be submitted.

3.3.4 Plans of the layout of the process plant indicating the hatches and other openings to enclosed plant spaces and cofferdams are to be submitted.

3.3.5 Details and arrangements of the blow-down systems, including quantities of materials and the capacity and working pressure of the containers installed for the reception of the materials to be blown down, are to be submitted.

3.3.6 Proposals for de-watering blow-down tanks in which hot oils and/or chemicals are discharged are to be submitted.

3.3.7 Proposals for the purging, gas freeing, inerting or otherwise rendering safe of the process plant and storage facilities are to be submitted.

3.3.8 Particulars of the arrangements for protecting the process plant systems and vessels against temperature, over-pressure and vacuum are to be submitted.

3.3.9 Proposals for the disposal of hazardous or toxic gases and liquid effluents during normal plant operation, including any proposed flare systems, are to be submitted.

3.3.10 Particulars of the proposals for isolating the ship or structure from the shore installation and/or lightering ships or vessels, where applicable, and from the supply of fuel to boilers, etc., in the process plant and the return flow of chemicals or process effluent, are to be submitted, including:

- Feedstock supply and product discharge, with details of the arrangements showing the location of shut-off valves and of the control and indicating stations.
- The process plant parameters and analysis of transient conditions under which emergency shutdown will be initiated and the time estimated to obtain a safe environment.
- The proposed emergency procedures for controlled shutdown of the process plant, i.e. depressurising, inerting, etc., and the arrangements for the continued operation of the essential services necessary to allow for such controlled shutdown under the emergency conditions of 3.1.3 or 3.1.4, as applicable.

3.3.11 Plans for the ventilation of process plant compartments are to be submitted, together with the following information:

- Location of hazardous and safe zones and spaces.
- Location of all possible sources of ignition.
- Location of air inlets and outlets.
- Number of complete air changes per hour.
- Estimated maximum and minimum ambient temperatures for the regions in which the plant is to operate.
- Expected heat loss of the process plant to the compartment environment.

3.3.12 Particulars of any dust or gas explosion hazard in the enclosed compartments of the process plant are to be submitted.

3.3.13 Proposals for the decontamination of the process plant compartments are to be submitted.

3.3.14 Proposals for the detection of vapour or gas and of oxygen deficiency in the process plant compartments are to be submitted.

3.4 Mechanical equipment associated with the process plant

3.4.1 A list of mechanical equipment associated with the process plant, with the exception of any boilers and other pressure vessels, to be installed in the ship or structure is to be submitted.

3.4.2 Details of safety and relief devices and their discharge arrangements are to be submitted.

3.4.3 When required, in order to facilitate inspection, plans showing the materials of construction, working pressures and temperatures, maximum power and revolutions per minute, as applicable, are to be submitted before the work is commenced.

3.4.4 Calculations of the torsional vibration characteristics of the shafting systems, where applicable, are to be submitted in accordance with the requirements of Pt 5, Ch 8.

3.5 Boilers and other pressure vessels associated with the process plant

3.5.1 Plans of the boilers and other pressure vessels, including the proposals for the support of the vessels, are to be submitted.

3.5.2 Details of the safety and relief devices and their discharge arrangements are to be submitted.

3.5.3 Stress calculations are to be submitted, taking into account the ship linear and angular accelerations, roll and pitch amplitudes, ship flexure and wind loads appropriate to any condition which may normally arise at sea. Where applicable, calculations for the emergency condition in 3.1.3 or 3.1.4 are to be submitted. Due consideration is to be given to the effects of thermal expansion and contraction on the support points of the vessels.

3.5.4 Outline plans of all types of fired equipment, ventilation arrangements with projected casing temperatures, uptake arrangements, gas and/or oil fuel burning arrangements and controls are to be submitted.

3.6 Pumping and piping systems associated with the process plant

3.6.1 Plans of the process plant piping systems, showing the materials of construction, scantlings, support and expansion arrangements, together with the calculations, are to be submitted for consideration.

3.6.2 The following diagrammatic plans for systems associated with the process plant are to be submitted, in addition to those required by Pt 5, Ch 13 and Ch 15 or Chapter V of the Rules for Ships for Liquefied Gases, as applicable:

- The Shipbuilder's plan of the general pumping arrangements, including air and sounding pipes and any cross flooding pipes and fittings.
- Pumping arrangements at the fore and aft ends, drainage of cofferdams and process spaces.
- Bilge, ballast and oil fuel pumping arrangements in the process plant machinery space, including the capacities of the pumps on bilge service.
- Arrangement of oil fuel pipes and fittings at settling and service tanks.
- Arrangement of gas and/or oil fuel piping in connection with gas and/or oil burning arrangements.
- Oil fuel overflow systems, where fitted.
- Arrangement of boiler feed system.
- Arrangement of compressed air systems for the process plant.
- Arrangements of lubricating oil and cooling water systems, oil fuel settling, service and other oil tanks not forming part of the ship's structure.

3.6.3 Plans showing the arrangement and dimensions of main steam pipes, with details of flanges, bolts and weld attachments and particulars of the materials of the pipes, flanges, bolts and welding consumables, are to be submitted for consideration.

3.6.4 Details of the safety and relief devices and their discharge arrangements are to be submitted.

3.7 Electrical equipment for the process plant

3.7.1 Details of the electrical system(s) are to be submitted, including the following:

- A statement quoting the standard or Code of Practice in accordance with which the installation has been designed.
- A statement quoting the standard of design and/or manufacture of electrical equipment, e.g., BS, NEMA, VDE, etc.,
- A schedule of the normal operational loads on the system, estimated for the different operating conditions expected.
- Expected range of ambient temperature.

3.7.2 The following line diagram plans and particulars are to be submitted:

- General arrangement plan of the process plant showing the location of the major items of electrical equipment.
- Line diagram of the installation(s) indicating the rating of the various items of rotating machinery, converters, transformers and protective devices, together with the types and sizes of cables and the makes and types of protective devices.
- Arrangement plans and circuit diagrams of the switchboards.
- Calculations of short-circuit currents at the main switchboards, sub-switchboards and the secondary side of transformers.
- General arrangement plan of the process plant showing the location of electrical equipment in hazardous zones, together with the Code of Practice on which they are based.
- A schedule of safe-type electrical equipment located in hazardous zones, giving details of the type of equipment employed, the certifying authority and the certificate number.

3.7.3 Written confirmation and Works' Test Certificates that all items of electrical equipment comply with the relevant standard or Code of Practice are to be supplied.

3.8 Control equipment for the process plant

3.8.1 Details of the control system(s) are to be submitted, together with the following line diagrams and particulars:

- Line diagrams of any control system(s) fitted.
- General arrangement plan of the process plant showing the locations of items of control equipment and the locations of hazardous zones.
- Schedule of the parameters which are monitored and controlled, including alarms and shutdown devices.

3.9 Fire protection, detection and extinction

3.9.1 Plans of fire protection, detection and extinction arrangements, together with details of the fire and explosion hazards involved, are to be submitted.

■ *Section 4* Materials

4.1 General

4.1.1 The materials used in the construction are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) and of Chapter 6 of the Rules for Ships for Liquefied Gases, as applicable. Materials for which provision is not made in those requirements may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

4.1.2 Materials of construction are to be suitable for the intended service, having regard to the substances, process and temperatures involved. For materials unsuitable for use with certain chemicals, and for the protection of materials, *see* Chapter 6 of the Rules for Ships for Liquid Chemicals.

4.1.3 Details of the materials proposed for all types of construction are to be submitted for approval.

■ *Section 5*
Process plant characteristics

5.1 Design

5.1.1 The design and arrangements are to comply with the requirements of this Chapter and with relevant statutory regulations of the National Authority of the country in which the ship or structure is registered and/or in which it is to operate.

5.1.2 The process plant is to be designed for normal operation in accordance with recognised and agreed codes suitably modified to take into account the ship-borne environment in all its aspects. Except for emergency conditions, as detailed in 3.1.3 or 3.1.4, the total stress in any component of the plant is not to exceed the code value at the temperature concerned, unless expressly agreed otherwise by LR, whether the plant is operative or non-operative, when subjected to any possible combination of the following loads:

(a) Static and dynamic loads due to wave-induced ship motions.
(b) Loads resulting from hull flexural effects at the plant support points.
(c) Direct wind loads.
(d) Normal process weights and pressures.
(e) Thermal loads.

5.1.3 For the emergency conditions in 3.1.3 or 3.1.4, the stress levels are to be agreed with LR.

5.2 Separation from ship machinery

5.2.1 Where, during operation, process plant spaces contain or are likely to contain hazardous and/or toxic substances, they are to be kept separate and distinct from the main propulsion and auxiliary machinery and essential ship services, and also the power generating machinery for the process plant.

5.2.2 Notwithstanding the requirements of 5.2.1, this does not exclude the use of the ship's main, auxiliary and/or essential services, for process plant operation in suitable cases. Where, for reason of hazard, essential ship services have to be duplicated within the process plant space, they are to comply with the requirements of Section 9 and Parts 5 and 6, as applicable.

■ *Section 6*
Hull construction

6.1 General

6.1.1 The hull structure is to comply with the relevant requirements of Parts 3 and 4, except as stated otherwise in this Section. The containment of liquefied gas products is to comply with Chapter 4 of the Rules for Ships for Liquefied Gases.

6.1.2 All chemical product and effluent tank structures and their location relative to the ship's hull are to comply with the Rules for Ships for Liquefied Gases, or with the Rules for Ships for Liquid Chemicals, as applicable. Where necessary, the probable temperature variations during operations and the thermal stress considerations are to be stated.

6.1.3 Materials for the hull structures subjected to low temperature are to comply with Pt 3, Ch 2,2.2 relating to refrigerated spaces and adjacent structures, or with Chapter 6 of the Rules for Ships for Liquefied Gases, as applicable.

6.1.4 Subdivision and damage stability are not covered by these Rules. However, attention must be given to any relevant statutory regulations of the National Authority of the country in which the ship is to be registered or in which the plant is to be operated.

6.2 Location of accommodation, service and control spaces

6.2.1 All accommodation and other compartments not directly essential to the operation of the plant are to be arranged well clear of plant spaces, and feedstock and product tanks.

6.2.2 Service and control stations essential to the operation of the plant must be made 'gas-safe' in accordance with internationally accepted codes and standards, and should, wherever possible, be so located that access thereto is from a defined safe space. If such location is not possible, the station is to be specially ventilated.

6.3 Integrity of gastightness between compartments

6.3.1 Where integrity of gastightness is required between compartments containing the plant, this is to be maintained in way of pipe tunnels or duct keels where these traverse such compartments.

6.4 Cofferdams

6.4.1 Cofferdams are to be sited as required by the Rules for Ships for Liquefied Gases, or by the Rules for Ships for Liquid Chemicals, as applicable, segregating any spaces in which raw materials or products are stored or retained in bulk.

6.4.2 Cofferdams are to be arranged around independent tanks containing chemical products or effluents where these are separate from the ship structure, but permanently connected thereto. Such cofferdams are to be mechanically ventilated using portable or permanent systems as required by Chapter 12 of the Rules for Ships for Liquid Chemicals, and are to be of sufficient size to allow effective inspection of all the tank and ship structure in way.

6.5 Access and openings to spaces

6.5.1 Access openings, windows, side scuttles and ventilation openings to accommodation, service and control stations essential for the operation of the ship, and similar safe spaces are to be located and arranged, as required by the Rules for Ships for Liquefied Gases, or by the Rules for Ships for Liquid Chemicals, as applicable.

6.5.2 Arrangements are to be made to provide easy access to, or escape from, plant working spaces. In general, ladders are not to be arranged vertically, and intermediate platforms are to be fitted at vertical intervals of about 6 m. Ladders and platforms are to have guard rails and permanent provision made for attaching hoists for use in emergencies. The arrangements for the emergency hoists are to allow a clear, unobstructed lift to the outside deck.

6.5.3 Two separate means of access from the open deck are generally to be provided to the cofferdams required by 6.4.1.

6.6 Longitudinal strength

6.6.1 Longitudinal strength calculations are to be made in accordance with Pt 3, Ch 4 for the following conditions, and the Loading Manual required by Pt 3, Ch 4,8 is to include this information:

(a) **Sea-going conditions**:
These conditions are to take account of the weights and disposition of all ballast, plant items including any working fluids, other substances, spare gear, etc., and any special support bracing where thermal effects are considered, which will be on board during any sea-going condition of the plant appropriate to the category of ship.

(b) **Harbour condition**:
This condition is to take account of the weights and disposition of all ballast and plant items, including all working and other substances (in all intended stowage dispositions) and spare gear which will be on board during operation of the plant in harbour.

6.7 Plant support structure

6.7.1 Decks and other structure supporting the plant are, in general, to comply with the requirements of Part 3. Such structure can, however, be considered on the basis of an agreed uniformly distributed loading in association with local loads at plant support points, provided that adequate transverse strength of the ship is maintained.

6.7.2 Where the nature and dispositions of heavy plant items are such that forces on the ship and support structure due to ship motions are significant (whether underway with or without working fluids, or moored with working fluids), calculations of the loading and the structural response are to be submitted. In this respect, the guidance formulae for accelerations as given in the Rules for Ships for Liquefied Gases can be used where appropriate. Details of the mass distribution and support points of the plant items are to be submitted in all cases.

6.7.3 Where model tests or reliable direct calculation procedures are used to estimate wave-induced responses and which may indicate accelerations and motion amplitudes differing from those arising from the application of the Rules, such values will be taken into account in the approval of support structure.

6.7.4 If the vessel is intended for limited service at sea (e.g. a 'once only' voyage from port of build to service location), a reduction in the Rule accelerations and motion amplitudes may be permitted. In order to apply such a reduction, details of the intended service limitation should be submitted.

6.8 Loading due to wave-induced motions

6.8.1 In cases where the mass distribution of large columnar plant items is such that the centre of action of the dynamic force differs significantly from the centre of gravity of the item, due account of this is to be taken in the calculation of the forces and moments at the support positions.

6.9 Additional loads

6.9.1 The structure supporting the plant is also to be capable of withstanding forces arising from the following:

(a) Wind loads (in all conditions of service and all categories of ships).
(b) The angle of static heel arising from the emergency condition referred to in 3.1.3 or 3.1.4, as applicable.
(c) For a Category 1A ship, a collision force acting on the tank corresponding to one-half of the weight of the item with or without working fluids, as appropriate, to the approved sea-going conditions from forward and one-quarter of the weight of the item from aft.
(d) For all other categories of ship, a collision force from any horizontal direction of one-fifth of the weight of the item.

6.9.2 Wind loading, which is to be applied to the plant items and supporting structure protruding above the weather deck, should be considered to act simultaneously with wave-induced loading. Loadings 6.9.1(b), (c) and (d) need not be combined with wind loads or wave-induced loads.

6.10 Allowable stresses in support structure

6.10.1 The following stress levels are applicable in conjunction with the loading on the support structure:

(a) Support members above or below the weather deck which are not subject to main hull girder loading:
direct stress:
$\sigma_a + \sigma_b = 0,6\sigma_y$
shear stress:
$\tau = 0,6\tau_y$ or $0,35\sigma_y$ whichever is the smaller combined stress:
$\sigma_c = 0,75\sigma_y = \sqrt{(\sigma_a + \sigma_b)^2 + 3\tau^2}$

where

$\sigma_a + \sigma_b$ = the algebraic sum of the axial and bending stresses at the point under consideration
σ_y = specified minimum tensile yield stress or 0,2 per cent proof stress at room temperature
τ_y = shear yield stress.

(b) Support members directly connected to hull structure and subject to transference of loading therefrom:
- the maximum allowable direct, shear and combined stresses as defined in (a), but with member local loading increased by a factor of 1,30, or
- when the stresses in such structure are determined using methods which satisfactorily take into account any ship deflection and load transference in way of supports, no load factor need be applied.

(c) Primary members forming an integral ship structural and plant support system:
- in general, the allowable stresses in such a system will be especially considered on the basis of the degree of refinement employed in the load prediction, structural response and stress analysis methods. Structural response calculations should include the interaction effects of the hull and plant item.

6.10.2 In general, all seatings, platform decks, girders and pillars supporting plant items are to be arranged to align with the main hull structure, which is to be suitably reinforced, where necessary, to carry the appropriate loads. Attention should be paid to the capability of the support structure to withstand buckling.

6.11 Integrity of weather deck

6.11.1 The integrity of the weather deck is to be maintained. Where items of plant equipment penetrate the weather deck and are intended to constitute the structural barrier to prevent the ingress of water to spaces below the freeboard deck, their structural strength is to be equivalent to the Rule requirements for this purpose. Otherwise, such items are to be enclosed in superstructures or deckhouses fully complying with the Rules. Full details are to be submitted for approval.

6.12 Equipment

6.12.1 Anchors and chain cables for ships navigating at sea are to comply with the requirements of Pt 3, Ch 13,7. Special consideration will be given to the equipment required for ships of Categories 1B and 2.

6.13 Gangways and freeing arrangements

6.13.1 Gangways are to be sufficient to provide proper access to all areas necessary for ship safety while the ship is operational and while it is at sea, and are to be to the Surveyor's satisfaction.

6.13.2 Freeing ports are to be fitted in accordance with the requirements of Pt 3, Ch 8,5.3.

■ *Section 7*
Mechanical equipment for the process plant

7.1 General

7.1.1 The requirements of this Section are applicable to all types of mechanical equipment associated with the process plant, with the exception of boilers and other pressure vessels.

7.1.2 The mechanical plant and equipment are to be designed and constructed in accordance with the relevant Sections of Part 5 and Pt 6, Ch 3, as applicable, and/or with agreed codes and specifications, suitably modified where necessary to suit shipboard conditions. The design is to be capable of accommodating the forces and moments stated in 6.7, 6.8 and 6.9, as applicable, generated at the support points.

7.2 Safety precautions

7.2.1 Oil engines, air compressors and associated air starting piping, concerned with supplying services not essential to the safety of the vessel or structure, are to comply with the requirements of Pt 5, Ch 2, where applicable.

7.2.2 Air intakes for internal combustion engines are to be led from a safe space. Where internal combustion engines, other than gas turbines, are used in association with plant processing flammable substances, the air intakes are to be fitted with an automatic device to prevent overspeeding in the event of accidental ingestion of flammable gases and/or vapours.

7.2.3 Exhaust pipes from internal combustion engines are to be led well clear of hazardous areas and, where such engines are used in association with plant processing flammable substances, are to be fitted with efficient spark arresters.

7.2.4 In general, air compressors are not to be installed in hazardous areas. Where this is not practicable, alternative arrangements may be accepted, provided that the air inlets are trunked or ducted from a safe space and that such trunking/ducting is fitted with gas detectors arranged to give audible and visible alarms and to shutdown the compressor in the event of flammable and/or toxic gas or vapour entering the air inlets.

7.2.5 The gas detectors are to be capable of continuously sampling the air supply and are to be so arranged as to prevent cross-communication between hazardous and safe spaces, such as control rooms, etc.

7.3 Inspection and installation

7.3.1 The scope of the inspection to be carried out at the manufacturers' works by the Surveyors is to be agreed before the work is commenced.

7.3.2 The mechanical plant and equipment are to be installed to the Surveyor's satisfaction. Proposals to site internal combustion engines in hazardous areas will be the subject of special consideration.

■ *Section 8* Boilers and other pressure vessels for the process plant

8.1 General

8.1.1 The requirements of this Section are applicable to fired and unfired pressure vessels associated with the process plant.

8.1.2 The pressure vessels are to be made in accordance with the requirements of the relevant Sections of Pt 5, Ch 10 or Ch 11, as applicable, or with agreed codes and specifications normally used for similar plant in land installations suitably modified and/or adapted for the marine environment. The design is to be capable of accommodating the forces and moments stated in 6.7, 6.8 and 6.9, as applicable, generated at the support points.

8.1.3 Stress calculations are to take account of the emergency conditions in 3.1.3 or 3.1.4, as applicable, in addition to the normal operational loadings. Due consideration is to be given to the effects of thermal expansion and contraction on the support points of the vessels.

8.2 Construction and installation

8.2.1 The pressure vessels are to be constructed, installed and tested to the Surveyor's satisfaction.

8.2.2 Suitable access is to be provided to the vessels for inspection, including checks on the operation of mountings, fittings, controls and pressure relief devices.

8.3 Safety devices

8.3.1 Where necessary, a test rig is to be supplied to enable the pressure setting of the safety and relief devices to be checked.

8.3.2 Where required, an additional pressure relieving device, with sufficient capacity (a) to prevent pressure vessels becoming liquid-full during fire engulfment and/or (b) to discharge vapours generated under fire exposure, is to be fitted in accordance with the relevant Rules for Ships for Liquefied Gases.

8.3.3 The arrangement of safety and relief discharges is to be such that there is no possibility of hazardous reaction between the substances involved.

8.3.4 Where provision is made for the isolation of safety relief devices from vessels and/or systems for maintenance purposes, not less than two such safety devices are to be fitted.

8.3.5 The isolating or blocking valves are to be so arranged that at least one safety relief device will remain in communication with the vessel or system under all conditions.

■ *Section 9* Pumping and piping systems for the process plant

9.1 General

9.1.1 Arrangements are to be made in the process plant spaces, in order that substances which are flammable, toxic or are likely to present a hazard due to reaction when mixed are kept separate.

9.2 Process plant piping systems

9.2.1 Process plant piping systems are to be designed and constructed in accordance with agreed codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted where necessary to suit the marine environment.

9.2.2 Sections of piping which may contain hazardous liquids or gases and which can be isolated are to be suitably protected, *see* 8.3.2.

9.3 Lubricating oil and oil fuel piping

9.3.1 Lubricating oil and oil fuel pipes, fittings, associated equipment, oil fuel burning arrangements and their materials of construction are to comply with the requirements of Pt 5, Ch 14, where applicable.

9.4 Gas fuel supply systems

9.4.1 The gas fuel supply systems are to comply with the requirements of the relevant Sections of the Rules for Ships for Liquefied Gases, where applicable.

9.4.2 Provision to shut off the gas is to be made in the gas firing supply lines immediately before the lines enter the compartment in which the equipment is installed. The shut-off arrangements are to be of the double block and vent type, and are to be operable at the equipment or the equipment control position and at a position in a safe area remote from the equipment.

9.5 Air and sounding pipes

9.5.1 Details of air and sounding pipes to tanks containing chemical products are to be submitted for approval.

9.6 Bilge and effluent arrangements

9.6.1 The arrangements for the storage on board ship, and the disposal of bilge and effluent from the process plant spaces, are to be submitted for consideration, and due recognition is to be given to the requirements of the appropriate National Authority.

9.6.2 Bilge and effluent pumping and piping systems in the process plant spaces are to be constructed of material suitable for the substances processed or produced or any combination of the substances which might result from accidental admixture.

9.6.3 Arrangements are to be provided for the control of the bilge and effluent pumping and piping system installed in the process plant spaces from within these spaces and also from a position outside the spaces.

9.6.4 The bilge and effluent pumping and piping systems handling hazardous materials should, wherever possible, be installed in the space associated with the particular hazard. Spaces containing pumps and piping systems that take their suction from a hazardous space may also be considered as hazardous spaces where a pipeline is not of an all-welded construction without flanges, valve glands and bolted connections, etc., and the pumps are not totally enclosed.

9.6.5 Where, during operation, process plant spaces contain or are likely to contain hazardous and/or toxic substances, they are to be kept separate and distinct from the ship's main bilge pumping and piping system. This does not, however, preclude the use of the ship's main bilge system when the process plant is shutdown, gas freed or otherwise made safe.

9.6.6 Pumping and piping systems for the ship services and process plant are to be constructed and installed to the Surveyor's satisfaction.

■ *Section 10* Firing arrangements of steam boilers, fired pressure vessels, heaters, reformers, etc.

10.1 General

10.1.1 The requirements of this Section are applicable to all types of fired equipment associated with the process plant. The equipment is to be constructed, installed and tested to the Surveyor's satisfaction.

10.2 Design and construction

10.2.1 Details of the design and construction of the fuel gas burning equipment for steam boilers, oil and gas heater furnaces, reformers, etc., are to be in accordance with the Rules for Ships for Liquefied Gases, or with agreed codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted for the marine environment. Ignition of the burners is to be by means of permanently installed igniters, or properly located and interlocked pilot burners and main burners arranged for sequential ignition.

10.2.2 Gas or gas/air mixtures having relative densities compared with that of air at the same temperature greater than one are not to be used as fuels for fired pressure vessels situated below deck. Proposals to burn such mixtures above deck will be specially considered in each case.

10.2.3 Proposals for the furnace purging arrangements prior to ignition of the burners are to be submitted. Such arrangements are to ensure that any accidental leakage of product liquid or gas into the furnace, from a liquid or gas heating element, or from the accidental ingestion of flammable gases and/or vapours, does not result in hazardous conditions.

10.2.4 Compartments containing fired pressure vessels, heaters, reformers, etc., for heating or processing hazardous substances are to be so arranged that the compartment in which the fired equipment is installed is maintained at a higher pressure than the combustion chamber of the equipment. For this purpose, induced draught fans or a closed stokehold system of forced draught may be employed. Alternatively, the fired equipment may be enclosed in a pressurised air casing.

10.2.5 The fired equipment is to be suitably lagged. The clearance spaces between the fired equipment and any tanks containing oil are to be not less than 760 mm. The compartments in which the fired equipment is installed are to be provided with an efficient ventilating system.

10.2.6 Smoke box and header box doors of fired equipment are to be well-fitting and shielded, and the uptake joints made gastight. Where it is proposed to install dampers in the uptake gas passages of fired equipment, the details are to be submitted. Dampers are to be provided with a suitable device whereby they may be securely locked in the fully open position.

10.2.7 Each item of fired equipment is to have a separate uptake to the top of the stack casing. Where it is proposed to install process fired equipment with separately fixed furnaces converging into a convection section common to two or more furnaces and/or a secondary radiant section at the confluence of the fired furnace uptake to the convection section, the proposed arrangements, together with the details of the furnace purging and combustion controls, are to be submitted.

Section 11
Electrical equipment for the process plant

11.1 Design of installation

11.1.1 Installations are to be designed in accordance with Pt 6, Ch 2, or with a recognised National or International Standard or Code of Practice.

11.1.2 Attention must be given to any relevant statutory regulations of the National Authority of the country in which the ship is to be registered or in which the process plant is to be operated.

11.2 Equipment suitability for environment

11.2.1 Electrical equipment is to be constructed so that it is suitable for use in the environmental conditions envisaged, e.g. in areas of high ambient temperature, derating may be necessary.

11.3 Hazardous zones

11.3.1 Where flammable gases and vapours are involved, the defining of hazardous zones is to be in accordance with a National or International Standard or Code of Practice.

11.4 Certified safe-type equipment

11.4.1 Where safe-type equipment is permitted in hazardous zones, e.g.:

- Intrinsically-safe (symbol i),
- Flameproof (symbol d),
- Increased safety (symbol e),
- Pressurised enclosure (symbol p),

such equipment is to be certified for the gases and vapours involved. The construction and type testing are to be in accordance with IEC 60079: *Electrical Apparatus for Explosive Gas Atmospheres*, or an equivalent National Standard.

11.5 Survey and testing

11.5.1 All electrical equipment is to be installed and tested to the Surveyor's satisfaction.

Section 12
Control engineering for the process plant

12.1 Design of installation

12.1.1 Normal good engineering practice and standards are to be employed in any control system(s) fitted.

12.1.2 Due to the wide variety of types of process plant, it is not possible to lay down precise details of control scheme(s), since any control scheme is affected by the nature of, and the operating procedures of, the process plant. A description of the expected method of operation of the process plant is to be submitted.

12.2 Equipment

12.2.1 Control equipment is to be compatible with the materials involved in the plant process.

12.2.2 Where flammable gases or vapours are involved, control equipment located in hazardous zones is to be of certified safe-type.

12.3 Survey and testing

12.3.1 Control system(s) are to be installed and tested to the Surveyor's satisfaction.

Section 13
Plant blowdown systems

13.1 General

13.1.1 Where a liquid blowdown system is provided in the process plant, the design and installation are to make adequate provision for the effects of back pressure in the system and vapour flash off when the pressures of liquids in the blowdown system are reduced.

13.1.2 Substances which will react with each other are to be provided with separate systems.

Section 14
Plant flare gas systems

14.1 General

14.1.1 Details of any flare gas stack system and proposals for installation on board the ships, including safety arrangements, are to be submitted for consideration.

14.1.2 The protection zone around the nozzle of the flare gas stack is dependent upon the limiting radiation intensity under all conditions and, also, whether suitable radiation screens are provided. The flare gas stack is to be located so that the nozzle is situated not less than the radius of the protection zone or 50 m, whichever is the greater, from equipment and manned stations, etc.

14.1.3 The arrangements are to ensure that combustion of the flare gas is complete and safe at all times.

■ *Section 15* Supply and discharge arrangements for feedstock and product

15.1 General

15.1.1 Arrangements are to be made to isolate the ship from the supply of feedstock for processing, the supply of oil fuel or gas to boilers, heaters, etc., and the return flow of product, chemicals or process effluent, blow-down or flare gas, etc.

15.1.2 The arrangements are to provide for valves installed at the shore connection, where applicable, and on board ship which are to be operable from shut-off control and indicating stations on the ship, on the shore, and at the valves.

15.2 Emergency procedures

15.2.1 Detailed instructions of the emergency shutdown and evacuation procedure are to be posted in a prominent position at the ship and shore control stations, where applicable.

■ *Section 16* Ventilation of the process plant and other spaces associated with the process plant operation

16.1 General

16.1.1 An efficient means of ventilation is to be provided for all enclosed compartments associated with the operation of the process plant.

16.1.2 The capacity of the ventilation systems is to comply with the requirements of Pt 5, Ch 15,1.7 or the Rules for Ships for Liquefied Gases, or Chapter 12 of the Rules for Ships for Liquid Chemicals, where applicable, or to an acceptable Code of Practice suitably modified and/or adapted where necessary to suit the marine environment. It is to be related to the hazard and/or environmental consideration of manned spaces during normal operation, and take into account additional requirements which may be necessary during start-up procedures.

16.2 Design and construction

16.2.1 Hazardous compartments where flammable and/or toxic substances are being processed or produced are to be arranged for underpressure ventilation, except as stated in 10.2.4.

16.2.2 Safe compartments, including control rooms, are to be arranged for overpressure ventilation.

16.2.3 The number and capacity of fans are to be such that the minimum ventilation capacity required in each compartment is maintained at all times, with one unit out of service. If internal combustion engines are proposed, their fuel supply is to be kept separate from any other system. Electric motors are to be supplied by two alternative circuits, each of which is capable of supplying all the motors which are normally connected to that circuit and which are operated simultaneously.

16.2.4 The mechanical ventilation system is to be capable of being controlled from a position outside the compartment being ventilated.

16.2.5 Reduction of ventilation capacity below the required level should be indicated in the compartment and also in the control room by an audible and visible alarm.

16.2.6 The parts of the rotating body and of the casing of each fan situated in a hazardous space are to be made of recognised spark-proof materials. If non-metallic materials are used, they are to have anti-static properties.

16.2.7 Ventilation trunking or ducting is to be suitably coated or painted, or made from material suitable for the substances processed or produced, or any combination of the substances which might result from accidental admixture.

16.3 Air inlets and discharges

16.3.1 The air inlets for the ventilation systems are to be located in a designated safe area.

16.3.2 The air inlets and discharges of the ventilation system are to be so situated that recirculation of the vented vapours does not occur.

16.3.3 The discharges from ventilation systems which may contain vapours that present a hazard due to reaction with each other are to be effectively segregated.

16.3.4 The discharges from ventilation systems which may contain hazardous vapours are to be located not less than 10 m from the nearest air intake or opening to accommodation, service and control station spaces or other safe spaces, and from all possible sources of ignition.

16.3.5 Air intakes and openings into the accommodation spaces and all service and control station spaces are to be fitted with closing devices. For toxic gases, these devices are to be operable from inside the space.

16.3.6 Where it is impracticable to locate a plant service or control station so that any access thereto is from a safe space, the service or control station is to be maintained at an overpressure of not less than 5 mm water gauge above the surrounding spaces. Details of the arrangements to ensure that this pressure differential is maintained are to be submitted.

16.3.7 Airlocks for intercompartmental access doors and emergency escape trunks are to have separate ventilation systems so arranged that an overpressure of 5 mm water gauge is maintained above the adjacent compartments. Details of the arrangements to ensure that this pressure differential is maintained are to be submitted.

16.4 Installation and inspection

16.4.1 The ventilation systems are to be installed to the Surveyor's satisfaction.

16.4.2 The Surveyors are to be satisfied that the ventilation system is capable of maintaining a safe environment during process plant operation. This may require monitoring over an extended period to prove its effectiveness.

■ *Section 17* Gas detection

17.1 General

17.1.1 An efficient gas detection system, suitable for the gases and/or vapours being processed or produced, and for the measurement of oxygen levels in the process plant compartments, is to be provided. Gas detector systems are also to comply with the requirements of Section 17 or of Chapter 13 of the Rules for Ships for Liquefied Gases, where applicable.

17.2 Design and construction

17.2.1 The equipment is to consist of a permanently fixed installation and at least two sets of portable equipment suitable for the process or products involved.

17.2.2 The position and number of fixed sampling points should be determined with due regard to the density of the gases and/or vapours of the substances processed or produced, and the dilution resulting from compartment ventilation. In each case, a sufficient number of sampling points are to be provided to give efficient selective sequential sampling to maintain a safe environment.

17.2.3 Unmanned or closed compartments, such as cofferdams, etc., associated with plant processing or producing flammable or toxic substances, are to have permanently installed sampling points suitable for use with portable detection equipment to be used before entry of the spaces by personnel and thereafter continuously while occupied by them.

17.2.4 Arrangements of the sampling point pipe runs are to be such that there is no possibility of hazardous gases and/or vapours entering a safe space. Common sampling lines to the detection equipment are not to be fitted.

17.2.5 The permanently installed gas detection system is to give audible and visible alarm, both in the control station and within the compartment, during hazardous conditions.

17.2.6 Except where continuous sampling is required (i.e. as in 7.2.5), the gas detection equipment should be capable of sampling and analysing from each sampling point at agreed intervals, which are in no case to exceed 30 minutes.

17.2.7 The gas detection equipment is to be designed so that it may be readily and regularly tested and calibrated. Suitable equipment and span gas is to be provided for this purpose. In addition, regular checking procedures with portable equipment are to be provided, particularly for closed or unmanned spaces during process plant operation.

17.2.8 Where equipment for detecting the specific flammable, toxic or asphyxiate substances which may be present in process plant spaces cannot be provided, full details are to be submitted, including personnel protection requirements and arrangements for decontaminating such spaces if necessary.

17.3 Installation

17.3.1 The gas detection system is to be installed to the Surveyor's satisfaction.

■ *Section 18* Fire protection, detection and extinction

18.1 General

18.1.1 The requirements of SOLAS Chapter II-2 and the Rules for Ships for Liquefied Gases are to be complied with, so far as they are applicable. Additional protection, consistent with the fire hazard involved, may be required for process plant control stations, and accommodation spaces. For the position of accommodation spaces relative to the process plant, *see* 6.2.

18.1.2 Where the design of the process plant is such that it may be operated only while the vessel or floating structure is specially moored, anchored or otherwise linked close to the shore, consideration will be given to a shore-based fire-fighting facility, taking account of the particular hazards involved.

18.2 Design arrangements

18.2.1 Arrangements are to be made in enclosed process plant spaces to prevent contact of dangerously interreactive substances and of flammable materials with sources of ignition. In general, compartments containing process plant are not to exceed 40 m in length, and the boundary bulkheads are to be 'A' Class divisions.

18.2.2 Where, during operation, process plant spaces or adjacent hazardous zones contain or are likely to contain flammable and/or explosive mixtures, special consideration is to be given to the exclusion of all possible sources of ignition.

18.2.3 All heated surfaces, e.g. exhaust pipes, boiler uptakes and steam pipes, are to be effectively lagged or cooled, so that the maximum temperature, °C, of the surfaces is, in general, not to exceed 70 per cent of the auto-ignition temperature, °C, of any substances which may be present in the compartment. In no case is the difference in these temperatures to be less than 50°C.

18.2.4 Compartments where a fire hazard exists and which are not continuously manned are to be provided with an approved fire detection system which shall give visible and audible warning of the location of the fire in the control station and, for plant operating at sea (Category 1A), at the navigating bridge control position.

18.2.5 The fire main is to be so arranged, and hoses and nozzles provided, that any part of the compartments or structure associated with the process plant can be reached with two powerful jets of water, one of which shall be produced by a single length of hose. The hoses are to be provided with dual-purpose nozzles capable of producing a jet or a spray. Special consideration will be given to an exemption from this requirement in respect of compartments where the use of water would in itself constitute a hazard.

18.2.6 Each compartment where the fire hazard so demands is to be provided with an approved fixed fire-extinguishing system capable of extinguishing fires involving the materials present. Operation of such a system at its required output is not to prevent the simultaneous use of the required jets of water from the fire main. Where carbon dioxide systems and Halon systems are fitted, due consideration should be given to the danger of static electricity.

18.2.7 An adequate number of portable fire extinguishers are to be provided in each compartment where a fire hazard exists. The number of such extinguishers will be decided in relation to the nature of the hazard and the layout of the compartment, but shall not be less than two, one of which is to be positioned near the entrance. The extinguishing medium is to be considered in relation to the nature of the hazard involved.

18.2.8 Means are to be provided for stopping all fans and, where practicable, closing all openings which might admit air to the compartment. Such means should be capable of being operated from a position outside the compartment and not likely to be rendered inaccessible by a fire in the compartment.

18.2.9 Means are to be provided for stopping the supply of combustible materials to the compartment in the event of fire.

18.2.10 The provision of additional fireman's outfits, each complying with the requirements of SOLAS Reg. II-2/A, 17, and the necessity for protective clothing, will be specially considered in relation to the layout of the process plant and the hazards involved.

Section 1
General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships intended for fire-fighting operations and are additional to those applicable in other Parts.

1.1.2 A ship provided with fire protection and fire-fighting equipment in accordance with these Rules will be eligible for an appropriate class notation which will be recorded in the *Register Book*.

1.1.3 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the fire-fighting ship is intended to operate.

1.2 Classification and class notations

1.2.1 The class notations which may be assigned are:
- '**Fire-fighting ship 1** (total monitor discharge capacity in brackets)',
- '**Fire-fighting ship 2** (total monitor discharge capacity in brackets)',
- '**Fire-fighting ship 3** (total monitor discharge capacity in brackets)',
- '**Fire-fighting ship 1** (total monitor discharge capacity in brackets) **with water spray**',
- '**Fire-fighting ship 2** (total monitor discharge capacity in brackets) **with water spray**',
- '**Fire-fighting ship 3** (total monitor discharge capacity in brackets) **with water spray**'.

1.2.2 The notation **Fire-fighting ship 1**, **Fire-fighting ship 2** or **Fire-fighting ship 3** signifies that a ship complies with these Rules and is provided with the appropriate fire-fighting equipment described in Table 3.1.1, with the total discharge capacity of monitors in m^3/h shown in brackets.

1.2.3 The addition of the words '**with water spray**' to the notations referred to in 1.2.1 signifies that a ship is provided with a water spray system, which will provide an effective cooling spray of water over the vertical surfaces of the ship to enable it to approach a burning installation for fire-fighting purposes. The requirements for such a system are set out in 4.2.

Table 3.1.1 Fire-fighting equipment

Equipment	Fire-fighting ship 1	2	3
Minimum total pump capacity, m^3/h	2400	7200	10 000
Minimum number of water monitors	2	3	4
Minimum discharge rate per monitor, m^3/h	1200	1800	1800
Minimum height of trajectory of jets of monitors above sea level, metres	45	70	70
Minimum range of monitor jets, m	120	150	150
Minimum fuel capacity for monitors, hours	24	96	96
Number of hose connections each side of ship	4	8	8
Number of fireman's outfits	4	8	8

1.3 Surveys

1.3.1 The arrangements and equipment referred to in this Chapter are to be examined and tested under working conditions on completion of the installation and, subsequently, annually.

1.4 Submission of plans

1.4.1 The following plans and information are to be submitted:
- A general arrangement showing the disposition of all fire-fighting equipment required by this Chapter.
- Details of major items of fire-fighting equipment, such as pumps and monitors, including their capacity, range and trajectory of delivery.
- A general arrangement plan showing the disposition of fire divisions and their class.
- Detailed plans of the fire divisions and, where applicable, copies of the certificates of approval for the insulating materials proposed.
- A plan of the construction of the fire doors.
- Plans showing the layout and capacity of the water spray system. Where alternative arrangements to those specified in 4.2 are proposed, evidence is to be submitted to satisfactorily demonstrate that an equivalent level of protection from radiated heat is provided, including details of the environmental conditions in which the ship is intended to operate, *see* 4.2.1.
- A plan of the seating arrangements for the water monitors.
- Particulars of the means of keeping the ship in position during fire-fighting operations.
- A plan showing the fire pumps, the fire water main, the hydrants, hoses and hose nozzles and the monitors, together with particulars of their delivery capability.
- Details of the fireman's outfits provided.
- Plans of any other fire-fighting systems provided.

1.5 Definitions

1.5.1 'A-60 standard' means a fire-resisting construction of steel or other equivalent material, which is suitably stiffened and so constructed as to be capable of preventing the passage of smoke and flame for the complete period of the one-hour standard fire test. It is to be insulated with approved non-combustible materials, so that the average temperature on the unexposed side will not rise by more than 139°C above the original temperature, nor will the temperature at any one point, including any joint, rise more than 180°C above the original temperature within 60 minutes.

1.5.2 'Steel or other equivalent material'. In this context, 'equivalent material' means any material which, by itself or due to insulation provided, has structural and integrity properties equivalent to steel at the end of the applicable standard fire test exposure period (e.g. aluminium with appropriate insulation).

1.5.3 'The standard fire test' is one in which specimens of the relevant bulkheads or decks, having a surface area of approximately 4,65 m^2 and a height of 2,44 m, resembling as closely as possible the intended construction and including, where appropriate, at least one joint, are exposed in a test furnace to heat on a time-temperature relationship, approximately as follows:

- At the end of the first 5 minutes, 538°C.
- At the end of the first 10 minutes, 704°C.
- At the end of the first 30 minutes, 843°C.
- At the end of the first 60 minutes, 927°C.

1.5.4 A 'non-combustible material' means a material which neither burns nor gives off flammable vapours in sufficient quantity for self-ignition when heated to approximately 750°C. Any other material is a 'combustible material'.

■ *Section 2* Construction

2.1 Hull

2.1.1 The structure of the ship is to be strengthened as necessary to withstand the forces imposed by the fire-extinguishing systems when operating at their maximum capacity.

2.2 Sea suctions

2.2.1 The sea suctions of the fire pumps are to be arranged as low as practicable in the ship's structure to avoid icing or the ingress of oil from the surface of the sea.

2.2.2 All sea inlet valves are to be provided with a low pressure steam or compressed air connection for clearing purposes.

2.3 Stability

2.3.1 Each ship is to comply with the draught and stability requirements of the National Authority and is to have on board sufficient stability data to enable the ship to be properly loaded and handled. This data is to take full account of the effect of the monitors when they are operating at their maximum output in all possible directions of use.

2.4 Manoeuvrability

2.4.1 Arrangements are to be provided to enable the ship to maintain position, so that the monitors may be effectively deployed.

2.5 Bunkering

2.5.1 The Owner should ensure that any fuel which may be required while the ship is operating on station can be safely received on board.

■ *Section 3* Fire-extinguishing

3.1 Water monitors

3.1.1 The minimum number of monitors, their discharge rate, their range and their height of trajectory above sea level are to comply with the requirements of Table 3.1.1.

3.1.2 The monitors are to be so arranged that the required direction, range and height of trajectory can be achieved separately, with the required number of monitors operating simultaneously.

3.1.3 The monitors are to be capable of adequate adjustment in the vertical and horizontal direction and are to be so positioned that the jets will be unimpeded within the required range of operation.

3.1.4 Means are to be provided for preventing the monitor jets from impinging on the ship's structure and equipment when in external fire-fighting mode. Combined systems for high pressure external fire-fighting and deck foam fire-fighting may be permitted provided consideration is given to monitor position and to the safety of operating pressures when used in deck foam mode and during changeover between modes. Changeover between modes is to be by a simple operator action. The combined system is to be capable of simple and rapid operation in either mode.

3.1.5 The monitors are to be capable of being activated and manoeuvred by remote control from a protected position providing a good view of the monitors and the operating area of the water jets.

3.1.6 The monitors are to be of robust construction and their seating arrangements are to be of adequate strength for all modes of operation, particular attention being paid to shock loading when all the monitors are activated simultaneously.

3.1.7 For the class notations **Fire-fighting ship 2** and **Fire-fighting ship 3,** an arrangement with one less monitor than required in Table 3.1.1 may be considered as an equivalent solution. In such cases the total pump capacity is to be as required in Table 3.1.1. The minimum range of monitor jets and minimum height of trajectory of jets of monitors above sea level are to be 180 m and 110 m, respectively.

3.2 Pumps

3.2.1 The pumps and their piping system which are intended for serving the monitors are not to be available for services other than fire-extinguishing and water spraying. They are to be provided with independent sea inlets.

3.2.2 Where the pumps are used for fixed water spray systems, the piping is to be independent of that supplying the monitors. The water spray systems are to be adequately protected against overpressure.

3.2.3 The minimum total pump capacities required are shown in Table 3.1.1.

3.2.4 For assignment of the notations **Fire-fighting ship 2** or **Fire-fighting ship 3**, there are to be at least two pumps serving the monitors and they should be of approximately equal capacity. For assignment of the notation **Fire-fighting ship 1**, one pump only need be provided.

3.3 Hose stations

3.3.1 Hose stations are to be provided on each side of the ship in accordance with Table 3.1.1.

3.3.2 Each hose station is to be provided with a hydrant, a hose and a nozzle capable of producing a jet or a spray and simultaneously a jet and a spray. The hoses are to be 15 m in length and not less than 38 mm nor more than 65 mm in diameter. Where hose stations are connected to the monitor supply lines, provision is to be made to reduce the water pressure at the hydrants to an amount at which each fire hose nozzle can be safely handled by one man. The water pressure shall be sufficient to produce a water jet throw of at least 12 m.

3.4 Fireman's outfits

3.4.1 The number of fireman's outfits provided, in addition to those provided in accordance with Pt 6, Ch 4,12 or SOLAS Reg. II-2/A, 17 as applicable, is to be in accordance with Table 3.1.1. They are to be stored in a safe position which is readily accessible from the open deck.

3.4.2 The composition of a fireman's outfit is to be as follows:

- Protective clothing of material to protect the skin from heat radiating from the fire and from burns and scalding by steam. The outer surface is to be water-resistant.
- Boots and gloves of rubber or other electrically non-conducting material.
- A rigid helmet providing effective protection against impact.
- An electric safety lamp (hand lantern) of an approved type with a minimum operating period of three hours.
- An axe having an insulated handle.
- A self-contained breathing apparatus, which is to be capable of functioning for a period of at least 30 minutes and having a capacity of at least 1200 litres of free air. Spare, fully charged air bottles are to be provided at the rate of at least one set per required apparatus.
- For each breathing apparatus, a fireproof lifeline of sufficient length and strength is to be provided capable of being attached by means of a snaphook to the harness of the apparatus or to a separate belt, in order to prevent the breathing apparatus becoming detached when the life-line is operated.

3.5 Recharging of equipment

3.5.1 A suitable air compressor for recharging the bottles used in the breathing apparatus of the fireman's outfits is to be provided. It is to be capable of recharging the bottles of the breathing apparatus required to be carried, in accordance with Table 3.1.1, in a time not exceeding 30 minutes.

■ *Section 4* Fire protection

4.1 General

4.1.1 In ships which are not provided with a water spray system as described in 4.2 all windows and port lights are to be provided with efficient deadlights or external steel shutters, except in the wheelhouse.

4.2 Water spray systems

4.2.1 Ships which are intended to operate in close proximity to a large fire will require protection from the heat radiated from the fire. Such protection may be afforded by a system which provides a water spray over the surface of the ship, or by a combination of insulation and a water spray system. Alternative arrangements providing an equivalent level of protection may be accepted where it can be demonstrated that such arrangements are effective for the environmental conditions in which the ship is intended to operate.

4.2.2 The water spray system is to be a fixed system which is capable of delivering a spray of water over all the exposed external vertical surfaces of the hull in the lightest sea-going condition, including the superstructures and deck-houses and over the monitor position. The water spray system will also be required to cover the areas of deck which form the crowns of machinery spaces and other spaces containing combustible materials.

4.2.3 The system is to have a capacity of 10 litres/min per m^2 of the protected area of uninsulated steel and 5 litres/min per m^2 of the protected area which is insulated internally to A-60 standard.

4.2.4 The system may be divided into sections, so that it will be possible to enable the closing down of those sections covering surfaces which are not exposed to radiant heat.

4.2.5 The nozzles are to be arranged to give an even distribution of water spray over the protected area.

4.2.6 The pumping capacity is to be sufficient to supply simultaneously at the required pressure the sections which serve the maximum area which may be exposed to radiant heat from a fire. If the main fire pumps are used for this purpose, they are to be capable of operating this system and the monitors and hose stations simultaneously at the required pressures, *see also* 3.2.2.

4.2.7 Deck scuppers and freeing ports are to be of sufficient area to ensure efficient drainage of water from decks and horizontal surfaces in all conditions when the water spray system is in operation.

■ *Section 5* **Lighting**

5.1 General

5.1.1 Two searchlights should be provided for illuminating the burning structure and facilitate the effective deployment of the water monitors at night.

5.1.2 The searchlights are to be capable of providing at a range of 250 m in clear atmospheric conditions a level of illumination of 50 lux within an area of not less than 11 m diameter. They are to be capable of being adjusted in the horizontal and vertical directions.

■ *Section 1* General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships with installed dynamic positioning systems and are additional to those applicable in other Parts of these Rules.

1.1.2 A ship provided with a dynamic positioning system in accordance with these Rules will be eligible for an appropriate class notation which will be recorded in the *Register Book*.

1.1.3 Requirements, additional to these Rules, may be imposed by the National Administration with whom the ship is registered and/or by the administration within whose territorial jurisdiction it is intended to operate. Where national legislative requirements exist, compliance with such regulations shall also be necessary.

1.1.4 For the purpose of these Rules, dynamic positioning means the provision of a hydrodynamic system with automatic and/or manual control capable of maintaining the heading and position of the ship during operation within specified limits and environmental conditions.

1.1.5 For the purpose of these Rules, the area of operation is the specified allowable position deviation from a set point, *see* 1.3.2.

1.1.6 Special consideration will be given where the dynamic positioning system is used primarily for purposes other than position keeping, e.g. track following. A descriptive note may be entered in column 6 of the *Register Book* to this effect.

1.2 Classification notations

1.2.1 Ships complying with the requirements of this Chapter will be eligible for one of the following class notations, as defined in Pt 1, Ch 2:

DP(CM) *See* Section 2.
DP(AM) *See* Section 3.
DP(AA) *See* Section 4.
DP(AAA) *See* Section 5.

1.2.2 The notations given in 1.2.1 may be supplemented with a Performance Capability Rating (PCR). This rating indicates the calculated percentage of time that a ship is capable of maintaining heading and position under a standard set of environmental conditions (North Sea), *see* Section 6.

1.2.3 Additional descriptive notes may be entered in column 6 of the *Register Book* indicating the type of position reference system, control system, etc.

1.2.4 Where a **DP** notation is not requested, dynamic positioning systems are to be installed in accordance with the requirements of Section 2 as far as is practicable.

1.3 Information and plans required to be submitted

1.3.1 The information and plans specified in 1.3.2 to 1.3.7 are to be submitted in triplicate. The Operation Manuals specified in 1.3.9 are to be submitted in a single set.

1.3.2 Details of the limits of the area of operation and heading deviations, together with proposals for redundancy and segregation provided in the machinery, electrical installations and control systems, are to be submitted. These proposals are to take account of the possible loss of performance capability should a component fail or in the event of fire or flooding, *see also* 1.3.6 and Sections 4 and 5.

1.3.3 Where a common power source is utilised for thrusters, details of the total maximum load required for dynamic positioning are to be submitted.

1.3.4 Plans of the following, together with particulars of ratings in accordance with the relevant Parts of the Rules, are to be submitted for:
(a) Prime movers, gearing, shafting, propellers and thrusters.
(b) Machinery piping systems.
(c) Electrical installations.
(d) Pressure vessels for use with dynamic positioning system.

1.3.5 Plans of control, alarm and safety systems, including the following, are to be submitted:
(a) Functional block diagrams of the control system(s).
(b) Functional block diagrams of the position reference systems and the environmental sensors.
(c) Details of the electrical supply to the control system(s), the position reference system(s) and the environmental sensors.
(d) Details of the monitoring functions of the controllers, sensors and reference systems, together with a description of the monitoring functions.
(e) List of equipment with identification of the manufacturer, type and model.

(f) Details of the control stations, e.g. control panels and consoles, including the location of the control stations.
(g) Test schedules (for both works testing and sea trials) that are to include the methods of testing and the test facilities provided.

1.3.6 For assignment of a **DP(AA)** or **DP(AAA)** notation, a Failure Mode and Effects Analysis (FMEA) is to be submitted, demonstrating that adequate segregation and redundancy of the machinery, the electrical installation and the control systems have been achieved in order to maintain position in the event of equipment failure (*see* Section 4); or fire or flooding, *see* Section 5. The FMEA is to take a formal and structured approach and is to be performed in accordance with an acceptable and relevant national or international standard, e.g. IEC 60812.

1.3.7 Where the **DP** notation is to be supplemented with a Performance Capability Rating (PCR) (*see* 1.2.2), the following information is to be submitted for assignment of a PCR:
(a) Lines plan.
(b) General arrangement.
(c) Details of thruster arrangement.
(d) Thruster powers and thrusts.

1.3.8 Details of the intended modes of operation are to be submitted. As a minimum, these are to include:
(a) a description of all the intended operating modes;
(b) details of the system configuration required for each mode of operation. When applicable, this is to include the configuration needed to meet the FMEA requirements of 1.3.6; and
(c) the procedures which are to be followed in each operating mode during normal and abnormal conditions.

1.3.9 A set of the operation and maintenance manuals is to be placed and retained on board the ship.

■ *Section 2* Class notation DP(CM)

2.1 General

2.1.1 For assignment of **DP(CM)** notation, the requirements of 2.1.2 and 2.2 to 2.5 are to be complied with.

2.1.2 Control engineering systems, electrical and piping installations and machinery items are to be designed, constructed, installed and tested in accordance with the relevant requirements of Parts 5 and 6.

2.2 Thrusters

2.2.1 Thruster installations are to be designed, constructed, installed and tested in accordance with the requirements of Pt 5, Ch 20, as applicable.

2.2.2 Thruster installations are to be designed to minimise potential interference with other thrusters, sensors, hull or other surfaces, which could be encountered in the service for which the ship is intended.

2.2.3 Thruster intakes are to be located at sufficient depth to reduce the possibility of ingesting floating debris and vortex formation.

2.2.4 The response and repeatability of thrusters to changes in propeller pitch or propeller speed/direction of rotation are to be suitable for maintaining the area of operation and heading within specified limits.

2.3 Electrical systems

2.3.1 This Section applies to the electrical generation and distribution system associated with the Dynamic Positioning System, whether this generating system is dedicated to the DP system or forms a central generating arrangement for all loads on the ship.

2.3.2 The electrical installation is to be designed, constructed and installed, in accordance with the requirements of Pt 6, Ch 2, together with the requirements of 2.3.3 to 2.3.12.

2.3.3 Where thrusters are electrically driven, the relevant requirements, including surveys, of Pt 6, Ch 2,16 are to be complied with.

2.3.4 Essential services are those defined in Pt 6, Ch 2,1.6, as applicable, together with thruster auxiliaries, computers, generator and thruster control equipment, reference systems, environmental sensors and electrically driven thrusters.

2.3.5 The number and rating of generator sets, transformers and converter equipment are to be sufficient to ensure the operation of essential services, even when one generating set, transformer or converter equipment is out of action.

2.3.6 For electrically driven thruster systems, the generator rating is to be determined by the maximum dynamic positioning load, together with the maximum ancillary load.

2.3.7 There are to be arrangements to prevent overloading of the running generator(s). The tripping of non-essential loads and the temporary reduction in the load demands of electrically driven thrusters may form part of these arrangements.

2.3.8 An alarm is to be initiated when the total electrical load exceeds a preset percentage of the running generator(s) capacity. This alarm is to be adjustable between 50 and 100 per cent of the running capacity and is to be set with regard to the number of generators in service and the effect of the loss of any one generator.

2.3.9 On loss of power due to the failure of the operating generator(s), there is to be provision for the automatic starting and connection to the switchboard of a standby set and the automatic sequential restarting of essential services. Consideration may be given to cases where arrangements for automatic re-starting of thrusters would not be practicable. Details are to be submitted in such cases to show that manual means for the immediate re-starting of thrusters would be available at the control station from where the dynamic positioning system would be operated.

2.3.10 Any loads that require an uninterrupted electrical power supply are to be provided with uninterruptible power systems (UPS) having a capacity for a minimum of 30 minutes' operation following loss of the main supply. A UPS is to be provided for each control computer system.

2.3.11 An indication of the absorbed power and the available on-line generating capacity is to be provided at the main dynamic positioning control station.

2.3.12 Essential services are to be served by individual circuits. Essential services that are duplicated are:

(a) to be supplied from independent sections of their switchboard or section board;
(b) to have their circuits separated throughout their length as widely as is practicable; and
(c) not to depend upon common feeders, transformers, converters, protective devices, control circuits or control gear assemblies to operate.

2.4 Control stations

2.4.1 Control stations from which the dynamic positioning system may be operated are to be designed in accordance with sound ergonomic principles, and are to be provided with sufficient instrumentation to provide effective control and indicate that the systems are functioning correctly. Colour schemes and screen layouts are to be selected such that necessary information is readily available and clearly displayed. *See also* Pt 6, Ch 1,2.10 for general ergonomic requirements.

2.4.2 Control station(s) are to be located such that the operator has a good view of the ship's exterior limits and surrounding area.

2.4.3 Indication of the following is to be provided at each station from which it is possible to control the dynamic positioning system:

(a) The heading and location of the ship relative to the desired reference point or course.
(b) Vectorial thrust output, individual and total.
(c) Operational status of position reference systems and environmental sensors.
(d) Environmental conditions, e.g. wind speed and direction.
(e) Availability status of standby thrusters.

2.4.4 At least one position reference system, heading reference sensor and wind sensor are to be provided to ensure that the specified area of operation and heading can be effectively maintained.

2.4.5 Position reference systems are to incorporate measurement techniques suitable for the service conditions for which the ship is intended.

2.4.6 Where necessary for the correct functioning of a position reference system, a vertical reference sensor is to be provided to correct for the pitch and roll of the ship. There are to be at least as many vertical reference units as there are associated position reference systems.

2.4.7 Alarms, in accordance with the requirements of Pt 6, Ch 1,2.3, are to be provided for the following fault conditions as applicable:

(a) When the ship deviates from the area of operation.
(b) When the heading exceeds the allowable deviation.
(c) Position reference system fault (for each reference system).
(d) Heading reference sensor fault.
(e) Vertical reference sensor fault.
(f) Wind sensor fault.
(g) Taut wire excursion limit.
(h) Automatic changeover to a standby position reference system or environmental sensor.

A permanent record of the occurrences of alarms and warnings, and of status changes is to be provided.

2.5 Control system

2.5.1 A centralised remote manual control system is to be provided such that changes in the vectorial thrust output may be readily effected by a single operator action.

2.5.2 Suitable processing and comparative techniques are to be provided to validate the control system inputs from position and other sensors. Abnormal signal errors revealed by the validity checks are to operate alarms.

2.5.3 The control system for dynamic positioning operation is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.

2.5.4 Automatic controls are to be provided to maintain the heading of the ship within specified limits.

2.5.5 The allowable deviation from the desired heading is to be adjustable, but should not exceed the specified limits, *see* 1.1.4. Arrangements are to be provided to fix and identify the set point for the desired heading.

2.5.6 Alarms, in accordance with the requirements of Pt 6, Ch 1,2.3, are to be provided for the following fault conditions:

(a) Control computer system fault.
(b) Automatic changeover to a standby control computer system, as applicable, *see* 4.1.8.

■ *Section 3* **Class notation DP(AM)**

3.1 Requirements

3.1.1 For assignment of **DP(AM)** notation, the applicable requirements of Section 2, together with 3.1.2 to 3.1.6, are to be complied with.

3.1.2 An automatic and a manual control system are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative. Arrangements for manual control are to satisfy the requirements of Section 2 when the automatic system is inoperative.

3.1.3 At least two position reference systems suitable for the intended service conditions and incorporating different measurement techniques, are to be provided and arranged, so that a failure in one system will not render the other system inoperative. Special consideration will be given where the use of different techniques would not be practicable during DP operations.

3.1.4 At least two heading reference sensors and two wind sensors are to be provided and arranged, so that a failure of one sensor will not render the other sensor(s) inoperative.

3.1.5 In the event of a single failure of a position reference, heading reference, or wind sensor, the control systems are to continue operating on signals from the remaining sensors without manual intervention.

3.1.6 The area of operation is to be adjustable, but is not to exceed the specified limits based on a percentage of water depth, or as applicable, a defined absolute or relative surface movement. Arrangements are to be provided to fix and identify the set point for the area of operation.

■ *Section 4* **Class notation DP(AA)**

4.1 Requirements

4.1.1 For assignment of **DP(AA)** notation, the applicable requirements of Sections 2 and 3, together with 4.1.2 to 4.1.10 are to be complied with.

4.1.2 Power, control and thruster systems and other systems necessary for, or which could affect, the correct functioning of the DP system are to be provided and configured such that a fault in any active component or system will not result in a loss of position. This is to be verified by means of a FMEA, *see* 1.3.6. Such components may include, but are not restricted to, the following:

- Prime movers (e.g. auxiliary engines).
- Generators and their excitation equipment.
- Gearing.
- Pumps.
- Fans.
- Switchgear and control gear, including their assemblies.
- Thrusters.
- Valves (where power actuated).

Systems which are not part of the DP system but which, in the event of a fault, could affect the correct functioning of the DP system (for example, fire suppression systems, engine ventilation systems, shutdown systems, etc.) are to be included in the FMEA.

4.1.3 Cables, pipes and other components essential for correct functioning of the DP system are to be located and protected, where necessary, such that the risk of fire or mechanical damage is minimised.

4.1.4 The electrical generation and distribution arrangements are to be isolatable such that at least the minimum number of any duplicated, or otherwise replicated, items required to provide essential services would remain operational in the event of a single fault. Evidence to verify compliance with this requirement is to be submitted for consideration when required; for example, where it is intended to operate with the independent sections required by 2.3.12 connected together.

4.1.5 Where the independent switchboards or section boards required by 2.3.12 are to be connected together, this is to be via two multipole circuit-breakers connected in series. Where alternative arrangements are proposed, these may be accompanied by a technical justification showing compliance with 4.1.4.

4.1.6 For electrically driven thruster systems:

(a) a reduction in position keeping capability may be accepted, but this is not to result in a loss of position in the environmental conditions in which the DP system is intended to operate; and
(b) provision is to be made for the automatic starting, synchronising and load sharing of a non-running generator before the load reaches the alarm level required by 2.3.8.

4.1.7 Two automatic control systems are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative.

4.1.8 Control systems are to be arranged such that, in the event of failure of the working control system, the standby system takes control automatically without manual intervention and without any adverse effect of the ship's station keeping performance.

4.1.9 At least three position reference systems incorporating at least two different measurement techniques are to be provided and arranged so that a failure in one system will not render the other systems inoperative.

4.1.10 At least three heading reference sensors are to be provided and arranged so that a failure of one sensor will not render the other sensors inoperative.

4.1.11 The DP system is to incorporate a computer based consequence analysis to determine whether the position of the vessel would remain within the limits set by the operator in the event of a worst case fault. An audible and visual alarm is to be initiated where the consequence analysis determines that the limits would be exceeded. Where applicable to the timescale for safely terminating operations, the consequence analysis is to allow for manual input of predicted environmental conditions.

Section 5
Class notation DP(AAA)

5.1 Requirements

5.1.1 For assignment of **DP(AAA)** notation, the applicable requirements of Sections 2, 3 and 4, together with 5.1.2 to 5.1.12 are to be complied with.

5.1.2 The DP system is to be arranged such that failure of any component or system necessary for the continuing correct functioning of the DP system, or the loss of any one compartment as a result of fire or flooding, will not result in a loss of position. This is to be verified by means of a FMEA. *See* 1.3.6.

5.1.3 Thruster units are to be installed in separate machinery compartments, separated by a watertight A–60 class division.

5.1.4 Generating sets, switchboards and associated equipment are to be located in at least two compartments separated by an A–60 class division, so that at least half of the equipment will be available following a fire or similar fault in one of the compartments. If the equipment is located below the operational waterline, the division is also to be watertight. There is to be provision to connect the switchboard sections together by means of circuit-breakers.

5.1.5 Duplicated cables and pipes for services essential for the correct functioning of the DP system are not to be routed through the same compartments. If this is not practicable, then they are to be carried in A–60 protected ducts. The termination arrangements are also to take due account of the degree of protection. Alternative arrangements will be considered.

5.1.6 Where duplicated cables and pipes for services essential for the correct functioning of the DP system are installed in adjacent compartments, A-60 rated fire protection is to be provided between the spaces. Details of alternative arrangements which demonstrate essential equipment located in an adjacent space will continue to operate satisfactorily and essential services will continue to be available in the event of a fire in the adjacent space may be submitted for consideration.

5.1.7 An additional/emergency automatic control unit is to be provided at an emergency control station, in a compartment separate from that for the main control station, and is to be arranged to operate independently from the working and standby control units required by 4.1.8.

5.1.8 Arrangements are to be provided such that, in the event of a failure of the working and standby control units, a smooth transfer of control to the emergency control unit may be effected from the emergency control station by manual means.

5.1.9 Arrangements are to be provided at the emergency control station so that changes in the resultant vectorial thrust output may be readily effected by a single operator action.

5.1.10 The control/indication unit of one of the position reference systems required by 4.1.9 is to be located at the emergency control station. A repeater control/indication unit from this system is to be located at the main control station.

5.1.11 One of the heading reference sensors required by 4.1.10 is to be located at the emergency control station.

5.1.12 One wind sensor is to directly supply the additional/emergency control unit.

5.1.13 The additional/emergency control unit is to be supplied from its own independent UPS, *see* 2.3.10.

Section 6
Performance Capability Rating (PCR)

6.1 Requirements

6.1.1 Where the **DP** notation is to be supplemented with a Performance Capability Rating (PCR) (*see* 1.2.2), the calculation will be carried out using the information specified in 1.3.7.

6.1.2 Two rating numerals are calculated:
(a) The first numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with all thrusters operating.
(b) The second numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with the most effective thruster being inoperative.

A typical rating might be (95), (70).

6.1.3 In calculating the PCR, the following parameters are considered:
(a) Thruster force vectors.
(b) Thruster/thruster, thruster/hull and thruster/current interactions.
(c) Sea current loads on the ship.
(d) Wind force on the ship.
(e) Wave drift force on the ship.

6.1.4 Where the ship has been subject to alteration or addition, which may affect the performance characteristics of the DP system, the PCR is to be recalculated.

Section 7
Testing

7.1 General

7.1.1 Control units are to be surveyed at the manufacturer's works and are to be tested in accordance with the approved test schedule to the Surveyor's satisfaction, *see* 1.3.5(g).

7.1.2 Before a new installation (or any existing installation, which has been subject to alteration or addition which may affect the performance characteristics of the system) is put into service, sea trials are to be carried out to the approved schedule and to the Surveyor's satisfaction, *see* 1.3.5(g).

7.1.3 The suitability of the dynamic positioning system is to be demonstrated during sea trials, observing the following:

(a) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power, verifying the findings of the FMEA where required.

(b) Response of the system under a set of predetermined manoeuvres for changing:
   - (i) Location of area of operation.
   - (ii) Heading of the ship.

(c) Continuous operation of the system over a period of four to six hours.

7.1.4 Two copies of the dynamic positioning system sea trial test schedules, as required by 1.3.5(g), each signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed and retained on board the ship and the other submitted to LR.

7.1.5 Records and data regarding the performance capability of the dynamic positioning system are to be maintained on board the ship and are to be made available at the time of the Annual Survey, *see* Pt 1, Ch 3,2.2.23.

■ *Section 1* General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships equipped to handle, store and transport oil recovered from a spill in emergency situations.

1.1.2 For ships of less than 500 gross tons, also fishing vessels of 12 m length and over, but less than 45 m length, and ships not fitted with propelling machinery, the arrangements for fire protection and extinction are to comply with Section 6. Consideration will be given to the acceptance of the fire safety measures for oil recovery ships prescribed and approved by the Government of the Flag State.

1.1.3 For ships of 500 gross tons and over, also fishing vessels of 45 m length and over, it is the responsibility of the Government of the Flag State to give effect to the fire safety measures, *see* Pt 6, Ch 4,1.1. Where the Government of the Flag State has no National Requirements for oil recovery ships, Lloyd's Register (hereinafter referred to as 'LR') will apply the fire safety measures required by Section 6 for classification purposes.

1.1.4 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.2 Classification and class notations

1.2.1 A ship complying with the requirements of this Chapter will be eligible for the notation **Oil Recovery**.

1.2.2 A ship dedicated solely to oil recovery duties will be given the class notation **Oil Recovery Ship**. The scantlings will be specially considered on the basis of the requirements of Pt 4, Ch 9.

1.3 Surveys

1.3.1 The arrangements and equipment referred to in this Chapter are to be examined and tested on completion of the installation and, subsequently, annually.

1.4 Plans and supporting documentation

1.4.1 In addition to the supporting documentation required for classification as specified in other Parts of the Rules, details relevant to oil recovery operations are to be submitted.

1.4.2 Plans covering the following items are to be submitted for approval:

- Structural support in way of equipment.
- Structural arrangement of recovered oil tanks including access.
- Piping system arrangements for recovered oil including venting.
- Power supply, electrical protection and cabling for oil recovery equipment.
- Hazardous areas and spaces.
- Electrical equipment located in hazardous areas and spaces.
- Structural fire protection and extinguishing equipment.

1.4.3 The following supporting documents are to be submitted:

- General arrangement of recovery equipment, including portable items, handling facilities, access, ventilation details, arrangement of other openings to hazardous spaces and adjacent compartments, machinery exhaust outlet positions.
- Gas detection equipment specification.
- Operating Manual.

1.4.4 The following supporting calculations are to be submitted:

- Deck equipment support structure loadings.
- Schedule of loads on the electrical system for oil recovery operations.

■ *Section 2* Oil recovery

2.1 General

2.1.1 The ship is to be capable of performing the following functions at a safe distance from the source of oil spill:

(a) Removal of the oil from the surface of the sea.

(b) Handling, storage and transportation of the recovered oil.

2.2 Equipment and deck arrangement

2.2.1 The arrangements for collection, handling and transfer of recovered oil are to be such that the probability of oil spill on deck and overflow is minimised and the operation is to be performed as far away from the accommodation spaces as practicable.

2.2.2 In way of working areas, hand rails and gratings or other non-slip surfaces are to be provided.

2.2.3 Means are to be provided to keep deck spills away from the accommodation and service areas. This may be accomplished by provision of a permanent continuous coaming not less than 150 mm high.

2.2.4 At least two portable instruments are to be available on board for gas detection.

2.2.5 For engines used in oil recovery operations, *see* 4.4.

2.2.6 Masts and derricks, etc., are to comply with the appropriate Sections of Chapters 2 and 3 of LR's *Code for Lifting Appliances in a Marine Environment*.

■ *Section 3* Ship structure

3.1 Structural arrangement

3.1.1 The position of bulkheads is to comply with the requirements of Pt 3, Ch 3,4.

3.1.2 Any tanks not utilised during oil recovery operations are to be arranged so that recovered oil cannot be transferred to them inadvertently.

3.1.3 In tanks intended for recovered oil, internal obstructions are to be avoided as far as practicable to prevent the entrapment of foreign objects usually present in recovered oil. Adequate drainage openings are to be provided to ensure free flow of residues to assist in cleaning and gas freeing on completion of recovery operations.

3.1.4 Tanks used for the storage of recovered oil are to be located outside the accommodation and machinery spaces.

3.1.5 Except where permitted by 3.1.6 and 3.1.7, tanks intended for the storage of recovered oil are to be separated from accommodation and machinery spaces by cofferdams. Cofferdams are to be at least one frame spacing in length (600 mm minimum) and are to cover the whole area of the boundary under consideration.

3.1.6 A pump room, oil fuel bunker, water ballast tank or other closed space where oil recovery handling equipment is stored will be accepted in lieu of a cofferdam.

3.1.7 In the case of a ship not primarily intended for oil recovery operations, where cofferdams are impractical to arrange, tanks arranged adjacent to machinery spaces may be accepted for storage of recovered oil. Acceptance will be conditional upon the tank boundary bulkheads being readily accessible for inspection. The bulkheads are to be carried continuously through joining structure to the top of the tank, where full penetration welding is to be carried out. Such tanks will require to be pressure tested at every Periodical Survey, *see* Table 1.9.1, Ch 1, as applicable to oil tankers. Special consideration will be given to arrangements incorporating double bottom tanks in these locations.

3.1.8 All openings to tanks for recovered oil are to be located on the open deck. This includes sounding pipes, vent pipes, and hatches for the deployment of portable pumps and hoses. Suitable access hatches, not less than 600 mm x 600 mm, are to be arranged to facilitate tank cleaning and gas freeing. Dual access hatches, as widely separated as practicable, are to be provided for tanks of a cellular internal structure.

3.1.9 Where there is a risk of significant sloshing induced loads, additional strength calculations may be required, *see* Pt 3, Ch 3,5.4.

3.1.10 Where recovered oil temperatures are to be increased significantly above 65°C during transit voyages, attention is drawn to Pt 4, Ch 9,12 regarding thermal stress considerations.

3.2 Scantlings

3.2.1 The scantlings and arrangements are, in general, to be as required by Pt 4, Ch 1. If the ship is to perform the duties of a supply ship the requirements of Pt 4, Ch 4 are also to be complied with, as applicable.

■ *Section 4* Machinery arrangements

4.1 Piping arrangements

4.1.1 Piping arrangements for the recovered oil system are to be located outside machinery spaces and are to have no connections to such spaces.

4.1.2 When the ship is in oil recovery mode, means are to be provided to isolate the oil recovery system from any other system to which it may be connected.

4.1.3 Ventilation outlets from the recovered oil tanks are to have a minimum height of 2,4 m above deck and be fitted with flame screens. Temporary pipe sections may be used for this purpose. Outlets are to be located not less than 5 m measured horizontally from the nearest air intakes and openings to accommodation and enclosed spaces containing a source of ignition and from deck machinery and equipment which may constitute an ignition hazard.

4.1.4 Each recovered oil tank is to be fitted with suitable means of ascertaining the liquid level in the tank. Sounding pipes or other approved devices are acceptable for this purpose.

4.2 Pump room for recovered oil

4.2.1 Pump rooms are to be fitted with a permanent ventilation system of the mechanical extraction type.

4.2.2 The ventilation system is to be capable of being operated from outside the compartment being ventilated and a notice is to be fixed near the entrance stating that no person is to enter the space until the ventilation system has been in operation for a specified period, sufficient to achieve at least five air changes based on the gross volume of the space.

4.2.3 The ventilation system is to be capable of at least six air changes per hour, based on the gross volume of the space.

4.2.4 Protection screens of not more than 13 mm square mesh are to be fitted outside openings of ventilation ducts, and ventilation intakes are to be so arranged as to minimise the possibility of recycling hazardous vapours from any ventilation discharge opening. Vent exhausts are to be arranged to discharge to a safe place on the open deck and comply with the requirements of 4.2.5.

NOTE

If the pump room is designed to recover chemicals listed in Chapter 17 of the *International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk, (IBC Code)* the vent exhausts are to be arranged to discharge upwards.

4.2.5 The vent exhausts from pump rooms are to discharge at least 3 m above deck, and from the nearest air intakes or openings to accommodation and enclosed working spaces, and from possible sources of ignition.

4.2.6 Ventilation fans to be constructed in accordance with Pt 5, Ch 15,1.8.

4.2.7 Pump rooms are to have no direct communication with machinery spaces.

4.2.8 Bilge drainage of the pump room is to be effected by pumps or bilge ejector suctions. For ships of less than 500 gross tons, the pump room bilge may be drained by a hand pump having a 50 mm bore suction.

4.3 Ventilation of machinery spaces

4.3.1 Where machinery spaces adjacent to recovered oil tanks are permitted by 3.1.7, the ventilation arrangements are to comply with 5.4.1(a) and (b).

4.4 Exhaust systems

4.4.1 The exhaust lines of diesel engines, boilers and equipment containing sources of ignition and the vents of diesel engine crank cases are to be led to a position outside any hazardous area as defined in 5.3. In addition, suitable spark arrestors are to be fitted.

4.5 Miscellaneous

4.5.1 Low sea suctions are to be provided to supply water for the machinery and all fire pumps.

4.5.2 Means are to be provided to enable heating coils in recovered oil tanks and adjacent tanks to be blanked off during recovery operations.

4.5.3 The heating medium supply and return lines are not to penetrate the recovered oil tank plating, other than at the top of the tank to reduce the possibility of the recovered oil entering the heating system in the event of a failure of the heating pipework within the tank.

4.5.4 If required to facilitate discharge operations, steam returns are to be led to an observation tank which is to be in a well-ventilated and well-lighted part of the machinery space remote from the boilers.

■ *Section 5* Electrical equipment

5.1 General

5.1.1 The electrical installation is to comply with the relevant requirements of Pt 6, Ch 2, with the specific exceptions of 14.1, 14.2, 14.5, 14.7, 14.8 and 14.10, which are replaced by 5.3 to 5.6 of this Chapter.

5.2 Systems of supply and distribution

5.2.1 Only the systems of generation and distribution, listed under Pt 6, Ch 2,5.1.2, are acceptable.

5.3 Hazardous zones and spaces

5.3.1 The following zones or spaces are regarded as hazardous during and on completion of oil recovery operations, until proven gas-safe:

(a) The interiors of tanks intended for the storage of recovered oil.

(b) The interiors of piping systems intended for the handling of recovered oil.

(c) Spaces separated by a single bulkhead, deck or other tank boundary, from the interior of a tank intended for recovered oil, or having a bulkhead immediately above or below and in line with a bulkhead of a tank intended for recovered oil, unless protected by a diagonal plate in accordance with Pt 4, Ch 9,1.2.7 or the arrangements comply with the requirements of 3.1.7.
(d) Spaces housing piping systems or other equipment containing or contaminated with recovered oil and having flanged joints or glands or other openings from which leakage of fluid may occur under normal operating conditions.
(e) Zones on open deck within a 3 m radius of the ventilation outlets, or inspection hatches permitted to be opened under normal operating conditions, of tanks intended for recovered oil.
(f) Zones on open deck within a 1,5 m radius of any sampling or sounding point of a tank intended for recovered oil.
(g) Zones on open deck within a 1,5 m radius of any flanged joints, glands or other parts of any equipment containing or contaminated with recovered oil from which leakage may occur under normal operating conditions.
(h) Zones on open deck within the confines of, and extending 1,5 m beyond, any bund or barrier intended to contain a spillage of recovered oil, up to a height of 1,5 m.
(j) Zones on open deck within a 1,5 m radius of any opening into a space described by (c) or (d).
(k) Zones on open deck over all tanks intended for recovered oil, where the tops of the tanks are exposed to the weather, to the full width of the ship plus 3 m fore and aft of the forwardmost and aftmost tank bulkhead, up to a height of 0,45 m above the deck or to the height of any bulwarks.
(l) Zones on open deck extending 1,5 m beyond those defined by 5.3.1(e) to (j).
(m) Any enclosed or semi-enclosed space having a direct opening into a hazardous zone or space identified above, unless the space is protected by pressurisation in accordance with 5.5.1 or 5.5.2, or the opening is a ventilation outlet arranged in compliance with 5.4.2.

5.4 Ventilation

5.4.1 The extent of any hazardous zone within an enclosed or semi-enclosed space may be limited to that defined for an equivalent situation on open deck, provided that the ventilation arrangements fulfil all the following conditions:
(a) Mechanical ventilation is provided, with the air intake and outlet located outside any hazardous area defined by 5.3.1, ensuring at least 12 air changes per hour, and leaving no region of stagnant air.
(b) Ventilation air flow is continuously monitored and so arranged that, in the event of failure of ventilation, an alarm is given at an attended station.

5.4.2 An enclosed or semi-enclosed space having a ventilation outlet situated in a hazardous zone, as defined under 5.3.1(k) or (l), may be regarded as non-hazardous if fulfilling all the following conditions:
(a) The space has mechanical ventilation with the air intake located outside any hazardous area defined by 5.3.1.
(b) The ventilation outlet is equipped with a self-closing flap or other suitable means of closure operating automatically on loss of ventilation airflow.
(c) The space contains no equipment of a type described in 5.3.1(d), or vent from or opening into any hazardous space or zone defined by 5.3.1, other than the ventilation outlet under consideration.
(d) The space is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil.

5.5 Pressurisation

5.5.1 A space having access to a hazardous space or zone, as defined under 5.3.1(c) to (j), may be regarded as non-hazardous if it fulfils all of the following conditions:
(a) Access is by means of an air-lock, having gastight doors, the inner of which, as a minimum, is self-closing without any hold-back arrangement.
(b) It is maintained at an overpressure of at least 50 Pa relative to the external hazardous area by ventilation from a non-hazardous area.
(c) The relative air pressure within the space is continuously monitored and so arranged that, in the event of loss of overpressure, an alarm is given at an attended station.
(d) It contains no piping system or equipment of a type described in 5.3.1(d), and no vent from or opening into any hazardous space or zone defined by 5.3.1, other than the access under consideration.
(e) It is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil.

5.5.2 A space having access to a hazardous zone, as defined under 5.3.1(k) or (l), may be regarded as non-hazardous if it fulfils all of the following conditions:
(a) Access is by means of a gastight self-closing door without any hold back arrangement.
(b) It is maintained at an overpressure in accordance with 5.5.1(b).
(c) The air pressure within the space is monitored in accordance with 5.5.1(c).
(d) It contains no piping system or equipment of a type described in 5.3.1(d), and no vent from or opening into any hazardous space or zone defined by 5.3.1, other than the access under consideration.
(e) It is separated from the interior of any tank intended for recovered oil in accordance with 5.5.1(e).

5.5.3 A space having access to a hazardous space or zone, as defined under 5.3.1(c) to (j), and fulfilling the conditions given under 5.5.2(a) to (e) may be regarded, for the purposes of selection of electrical equipment, as equivalent to an open-deck hazardous area, such as defined under 5.3.1(k).

5.6 Selection of electrical equipment for installation in hazardous areas

5.6.1 The installation of electrical equipment in hazardous areas is to be minimised as far as is consistent with operational necessity and the provision of lighting, monitoring, alarm or control facilities enhancing the overall safety of the ship.

5.6.2 When electrical equipment is to be installed in hazardous areas, unless permitted otherwise by 5.6.3 or 5.6.4, it is to be of a 'safe type', as listed below, certified or approved by a competent authority for Group IIA, temperature class T3. The construction and type testing is to be in accordance with IEC 60079: *Electrical Equipment for Explosive Gas Atmospheres*, or an acceptable and relevant National Standard.

- Intrinsically safe Ex 'i'
- Increased safety Ex 'e'
- Flameproof Ex 'd'
- Pressurised enclosure Ex 'p'
- Powder filled Ex 'q'
- Encapsulated Ex 'm'

5.6.3 Consideration may additionally be given to the use of equipment of the following types:

(a) Equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2.
(b) Simple non-energy-storing apparatus having negligible surface temperature rise in normal operation, such as limit switches, strain gauges, etc., incorporated in intrinsically-safe circuits.
(c) Submersible pumps, having at least two independent methods of shutting down automatically in the event of low liquid level.
(d) Radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15. Additionally, in the case of transmitter aerials, it is to be shown, by detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m, respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment.
(e) Electrical apparatus having a special type of protection (Ex's'), certified or approved by a competent authority.
(f) Electrical apparatus having the type of protection Ex'n' (or Ex'N'), that, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere, and in which a fault capable of causing ignition is not likely to occur.

5.6.4 Equipment not meeting the requirements of 5.6.5 to 5.6.14 may be installed in hazardous zones or spaces, or locations rendered non-hazardous by ventilation or pressurisation, if not required to be energised during oil recovery operations, and not essential for the safety of the ship or crew. Such equipment is to be controlled by multi-pole switches or circuit breakers situated outside any hazardous area. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

5.6.5 In tanks and piping systems defined by 5.3.1(a) and (b), only the following electrical equipment will be permitted:

(a) Intrinsically-safe apparatus of category 'ia'.
(b) Simple apparatus, as defined under 5.6.3(b), incorporated in an intrinsically-safe circuit of category 'ia'.
(c) Submersible pumps, as defined under 5.6.3(c).
(d) Ex's' apparatus, certified for use in Zone 0, as defined by IEC 60079-10.
(e) Cable required for the operation of the equipment installed.

5.6.6 In spaces adjacent to tanks, as defined by 5.3.1(c), with no mechanical ventilation, only the following electrical equipment will be permitted:

(a) That described in 5.6.5(a), (b), (d) and (e).
(b) Ex'd' lighting fittings.
(c) Ex'p' lighting fittings of either the air-driven type, or pressurised from an external source of protective gas and arranged to be de-energised automatically on loss of pressurisation.
(d) Gas detector heads having sinter-type flametrap protection, included within an intrinsically-safe circuit, all of which is to be certified as a system.
(e) Ex'd' alarm sounders, without internal sparking contacts.
(f) Cables for impressed current cathodic protection systems (for external hull protection only) installed in heavy gauge steel pipes with gastight joints up to the upper deck; the arrangements are to comply with Pt 3, Ch 2,3.5.3.
(g) Through runs of cables, installed in heavy gauge steel pipes with gastight joints.

The electrical equipment described in (b), (c) and (e) will be permitted only where personnel are required to have access to the space during oil recovery operations.

5.6.7 In spaces adjacent to tanks, as defined by 5.3.1(c) having mechanical ventilation, and in spaces and zones containing piping systems, equipment, etc., or close to vents, flanges, etc., and other zones as defined by 5.3.1(d) to (j), only the following electrical equipment will be permitted:

(a) That described in 5.6.6.
(b) Intrinsically-safe apparatus of category 'ib'.
(c) Simple apparatus, as defined under 5.6.3(b), incorporated in an intrinsically-safe circuit of category 'ib'.
(d) Other apparatus certified as Ex'e', Ex'd', Ex'q', Ex'm' or Ex's'.
(e) Pressurised equipment, certified Ex'p', or as described in 5.6.3(a), arranged to be de-energised automatically on loss of pressurisation.
(f) Through runs of cable in spaces and zones described in 5.3.1(d) to (j) only.

5.6.8 In zones defined by 5.3.1(k) and (l), only the following electrical equipment will be permitted:

(a) That described in 5.6.7.
(b) Pressurised equipment, certified Ex'p', or as described in 5.6.3(b), arranged to give an audible and visual alarm at a manned station in the event of loss of pressurisation.
(c) Equipment as described in 5.6.3(d) and (f).

5.6.9 Electrical installations in enclosed or semi-enclosed spaces, as described in 5.3.1(m), are to comply with the requirements for the space or zone into which the opening leads, unless ventilated in accordance with 5.4.1 or 5.4.2.

5.6.10 Electrical installations in enclosed or semi-enclosed spaces, ventilated as described in 5.4.1, are to comply with the requirements for hazardous zones, as described in5.3.1(e) to (l), within the radii or distances from adjacent sources of hazard or sources within the space specified by these paragraphs. Equipment within a radius of 3 m from any ventilation outlet of such a space is to be of a type described in 5.6.8. Equipment not of a type described in 5.6.7 is to be provided with a means of disconnection capable of being controlled from an attended station in the event of ventilation failure. Where the means of disconnection is located within the space, then it is to be of a 'safe type'.

5.6.11 Electrical installations in machinery spaces adjacent to recovered oil tanks, where permitted by 3.1.7, are to comply with the requirements of 5.6.10, and the additional requirement that equipment within 0,45 m of the tank bulkhead or the bottom of the space is to be of a type described in 5.6.8.

5.6.12 In pressurised spaces defined by 5.5.1, electrical equipment not of a type described in 5.6.8 is to be automatically disconnected in the event of loss of overpressure. Other equipment is to be provided with a means of disconnection capable of being controlled from an attended station in the event of loss of overpressure. Where the means of disconnection is located within the space, it is to be of a 'safe type'. Emergency lighting, pressure monitoring equipment and any alarm sounders or lights are to be of types described in 5.6.6.

5.6.13 In pressurised spaces defined by 5.5.2, any equipment not of a type described in 5.6.8 is to be provided with a means of disconnection capable of being controlled from an attended station in the event of loss of overpressure.

5.6.14 In pressurised spaces defined by 5.5.3, only electrical equipment as described in 5.6.8 may be permitted. Any equipment that is not of a type described in 5.6.7 is to be provided with a means of disconnection capable of being controlled from an attended station in the event of loss of overpressure. Emergency lighting, pressure monitoring equipment and any alarm sounders or lights are to be of types described in 5.6.6.

■ *Section 6* Fire protection and extinction

6.1 Structural fire protection

6.1.1 Exterior boundaries of superstructures and deckhouses enclosing accommodation and service spaces, including any overhanging decks which support such accommodation and service spaces, are to be insulated to 'A-60' standard for all parts which face deck areas where there are arrangements for collection, handling and transfer of recovered oil and for a distance 3 m aft or forward thereof.

6.1.2 Windows and side scuttles in the exterior boundaries, referred to in 6.1.1, are to be provided with permanently installed inside covers of steel. Aluminium alloy components are not to be used in the construction of the windows and side scuttles.

6.1.3 As an alternative to compliance with 6.1.1 and 6.1.2, a fixed water spraying system may be accepted. The system is to be capable of delivering water at a rate of 10 litres/m^2/min. on all boundaries, windows and side scuttles, that would otherwise be required to comply with 6.1.1 and 6.1.2.

6.2 Fire-extinguishing arrangements

6.2.1 Deck areas, where there are arrangements for the collection, handling and transfer of recovered oil, are to be provided with the following fire-extinguishing equipment:

(a) Two dry powder fire-extinguishers, each at least 50 kg capacity.
(b) At least one portable low expansion foam applicator.

6.2.2 The fire-extinguishers are to be located near the working deck identified in 6.2.1 and are to be fitted with discharge hoses.

6.2.3 The foam installation is to be capable of applying foam to any part of the working deck. The capacity of any applicator is to be not less than 400 litres/min. of foam solution and the applicator throw in still air conditions is to be not less than 15 m. Sufficient foam concentrate is to be provided for at least 0,4 litres/m^2 of the working deck area with a minimum quantity of 200 litres.

6.3 Fireman's outfits

6.3.1 At least two fireman's outfits, additional to those required by Pt 6, Ch 4,12 or SOLAS Reg II-2/A, 17.3 as applicable, are to be provided.

■ *Section 7*
Operating Manual

7.1 General

7.1.1 Information regarding the safe use of the ship with respect to the oil recovery and subsequent operations is to be prepared.

7.1.2 The Operating Manual is, in general, to contain information regarding procedures for:

(a) establishing and maintaining a safe atmosphere in any space(s) liable to become hazardous during oil recovery and subsequent operations;
(b) isolation, where necessary, of electrical equipment in zones or spaces considered hazardous during oil recovery and subsequent operations, and in spaces described in 7.1.2(a) prior to carrying out, or on failure of, the measures required to establish and maintain a safe atmosphere;
(c) fire-fighting;
(d) gas measurements;
(e) recovery and storage of oil;
(f) ballasting;
(g) transfer of recovered oil;
(h) tank cleaning;
(j) gas freeing; and
(k) contacts in the event of an emergency.

■ *Section 1* General

1.1 Application

1.1.1 The requirements of this Chapter apply to tankers equipped with bow/stern loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals, such as loading platforms, loading buoys, FPSOs and FSUs, and are additional to those applicable in other Parts of the Rules. These requirements also apply to submerged turret loading systems where applicable.

1.1.2 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.1.3 The materials used are to be suitable for the intended service conditions.

1.2 Class notations

1.2.1 Ships complying with the requirements of this Chapter will be eligible to have one of the following special features notations included in the class notation:
(a) Ships fitted with a bow loading system, **BLS**.
(b) Ships fitted with a stern loading system, **SLS**.
(c) Ships fitted with submerged turret loading systems, **TLS**.

1.3 Surveys

1.3.1 The survey of these items is to be arranged to coincide with hull and machinery surveys, *see* Pt 1, Ch 3.

1.4 Submission of plans and documentation

1.4.1 In addition to the plans and information required by other relevant Sections of the Rules, the plans and information detailed below are to be submitted:

(a) **Bow/stern loading**:
Detail drawing(s) showing:
- Cargo loading equipment.
- Manifold position and pipeline connections.
- Mooring equipment layout, including design loads and supporting structure.
- Fire safety arrangements.
- Control station(s).

(b) **Systems and arrangements**:
General arrangement. Plans showing the general arrangement of all areas where the piping systems are located, together with ventilation arrangements and details of openings for any enclosed spaces at the fore and/or aft part of the ship.
Diagrammatic arrangement. Plans indicating all piping systems arrangements associated with loading systems between cargo tank area and manifold. The plans are to include details of means of isolation, manifold arrangement, means of draining, inerting, cleaning and gas freeing of the cargo piping. Also details of manifold drip tray arrangements with means of drainage, together with any stripping line arrangements, are to be submitted. If the ship is to be installed with a vapour emission control system, plans showing details of piping arrangements are also to be submitted.
Piping system specification. Piping design information which includes the materials specifications, design pressure, maximum allowable transfer rate, corrosion allowance, and design ambient weather conditions. Also the design forces and moments for which the presentation manifold, together with the terminal flange and associated supporting arrangements, have been designed are to be submitted.
Operating Manuals. Operating Manuals are to be submitted for approval and provided on board. The Manuals are to include the following information:
- Particulars of piping arrangements and control systems.
- Operating criteria.
- Procedures for connecting/disconnecting the cargo hose, isolation arrangements, inerting, cleaning, gas freeing of the pipe line and drainage of the drip tray.
- Procedures to be followed during cargo handling operations. These are to include guidance on procedures to be followed in the event of sudden closure of the terminal valve.
- Detailed communication sequence concerning pre-mooring, mooring, pre-loading, loading and tanker departure phases.

Where the ship is fitted with dynamic positioning and/or a positional mooring system(s), the information required by Ch 4,1.3.7 and Ch 8,1.5.6 is also to be submitted as applicable.

(c) **Submerged turret loading**:
Detail drawing(s) showing:
- Arrangement of turret room, including receiving structure, locking mechanism and traction winch equipment with associated supporting structure and design loadings.
- Turret hatch and operating equipment, including hydraulic power pack and control systems, and cargo loading equipment.
- Turret room fire safety arrangements.

- Turret room electrical installations.
- Piping arrangements for all systems associated with the turret loading.

Section 2 Arrangements

2.1 Mooring arrangements

2.1.1 The ship is to be provided with sufficient mooring arrangements, which may be combined with the ship's manoeuvring system, to ensure adequate alignment and security during bow, stern or submerged turret loading operations.

2.1.2 The mooring/positioning system is to be arranged to prevent mooring forces being transmitted to the loading line connector.

2.1.3 Suitable single point mooring arrangements are indicated in Pt 3, Ch 13,9.

2.1.4 Particular attention is to be given to operational requirements and conditions in the design and mounting of securing devices and fittings. Seatings for equipment are to be designed to avoid the formation of pockets or recesses which may lead to excessive corrosion in service.

2.2 Materials for mooring fittings

2.2.1 Where mooring fittings are used as part of a positional mooring system, they are to comply with the requirements of Chapter 8.

2.3 Strength of mooring fittings

2.3.1 The strength of the mooring arrangements associated with the bow/stern loading system is to be considered on the basis of Pt 3, Ch 13,9, and Chapter 8 as applicable.

2.4 Enclosed spaces adjacent to manifold connection

2.4.1 In addition to the arrangements required by Section 4, the following are to be complied with:

(a) Spaces where an explosive gas atmosphere may be present are to be suitably ventilated prior to entry.
(b) Spaces required to be entered during normal operations are to be provided with permanent ventilation arrangements capable of being operated from outside the compartment.

2.4.2 The ventilation arrangements are to provide a minimum of eight air changes per hour, *see* Pt 6, Ch 2,14.

Section 3 Positioning, monitoring and control arrangements

3.1 General

3.1.1 The requirements of this Section are additional to those given in Pt 6, Ch 1, and Chapter 4 and Chapter 8.

3.1.2 If the ship is fitted with a dynamic positioning system, it is at least to comply with the DP(AM) requirements, *see* Chapter 4.

3.2 Control station

3.2.1 A control station for offshore loading may be arranged within the bow area or on the navigation bridge. All operations concerning positioning of the ship and monitoring of mooring and loading parameters are to be capable of being performed from this station.

3.3 Instrumentation

3.3.1 Bow/stern mooring instrumentation is to monitor:

(a) Mooring line traction.
(b) Chain stopper.
(c) Data logger system for recording of mooring and load parameters.

3.3.2 The mooring system is to be provided with a tension meter capable of continuously indicating the tension during the bow loading operation. Consideration may be given to waiving this requirement for ships fitted with a dynamic positioning system.

3.3.3 Bow/stern/submerged turret loading instrumentation is to be provided as follows:

(a) Indicator for loading connector coupling position.
(b) Cargo valve position indicators.
(c) Cargo tank level indicators and high level alarm.
(d) A system for automatic transfer of signals from the control and safety system, to enable personnel on the offshore terminal to effect control of cargo transfer pump(s) and closing of valve(s) on the terminal.

3.4 Emergency disconnect arrangements for pipeline and mooring

3.4.1 In addition to any automatic disconnection systems, a manually operated backup emergency disconnection system is to be provided. This system is to make possible individual operation of the chain stopper and coupling by-pass locks located in the bow control station.

3.4.2 Where an emergency quick-release system is fitted for the mooring system, an equivalent arrangement is to be provided to release the cargo loading hose outboard of the ship.

3.5 Communication

3.5.1 Main and emergency means of communication are to be provided between the bow control station and the offshore loading terminal. The communication equipment is to be intrinsically-safe.

3.5.2 Continuous communication is to be maintained between the control station and the offshore terminal at all times.

■ *Section 4*
Fire protection, detection and extinction

4.1 General

4.1.1 The fire protection and extinction arrangements are to comply with the requirements of the *International Convention for the Safety of Life at Sea, 1974*, as amended, or as required by the National Authority.

4.1.2 When Lloyd's Register (hereinafter referred to as 'LR') is authorised to act on behalf of the National Authority in giving effect to the fire safety measures on non-convention tankers or the application of SOLAS for convention ships, LR will also apply the *Guidelines for bow and stern loading and unloading arrangements on oil tankers* as given in IMO MSC/Circ.474, dated 19 June 1987.

4.1.3 Tankers of less than 500 gross tons will be specially considered.

■ *Section 5*
Piping systems

5.1 Materials

5.1.1 All materials used in the piping systems are to be suitable for use with the intended cargoes and ambient weather conditions, and are to comply with the relevant requirements of Pt 5, Ch 12 and the applicable requirements of the *Rules for the Manufacture, Testing and Certification of Materials*.

5.2 Piping system design

5.2.1 All piping, valves and fittings are to be suitable for the design operating and environmental conditions.

5.2.2 The piping is to comply with the requirements for manufacture, testing and certification of Class II piping systems.

5.2.3 The pipelines and associated piping systems and equipment forward and/or aft of the cargo area are to have only full penetration butt welded joints, except at the loading station where valve connections may be flanged. The pipes are not to pass through enclosed spaces and are to be, as far as possible, self-draining.

5.2.4 Means of mechanical isolation are to be provided in the cargo area, where any pipes used for cargo handling are branched off from the cargo system. Such isolation is to be as near as possible to the boundary of the aftmost, in the case of stern loading, or forwardmost, in the case of bow loading, cargo tank bulkhead and within the cargo area.

5.2.5 A manually operated shut-off terminal valve is to be provided at the manifold. In addition, a blank flange, or equivalent arrangement, is to be provided at the bow and/or stern pipe line end connection.

5.2.6 The terminal pipe, valves and other fittings to which the cargo hose is directly connected are to be of steel or other approved ductile material. They are to be of robust construction, adequately supported and suitable for the stated design conditions. Attention is drawn to the *Recommendations for Oil Tanker Manifolds and Associated Equipment*, published by OCIMF.

5.2.7 Means of emptying, cleaning, inerting and gas-freeing the pipe lines used for cargo handling are to be provided. The venting arrangements are to be located in the cargo deck area. Isolation similar to that described in 5.2.4 is also to be provided.

5.2.8 A drip tray of adequate size, together with means of drainage, are to be provided at the manifold. Suitable spray shields are to be fitted in way of the terminal manifolds where leakage may occur at valves and pipe joints.

5.2.9 Zones on open deck within 3 m of loading manifolds or pipe joints, and within 3 m of the spillage drip tray, are to be regarded as hazardous with regard to machinery or other equipment which could constitute a possible source of ignition, *see also* Pt 6, Ch 2,14.5 and 14.10.

5.2.10 Air vent pipes to the tanks and enclosed spaces, and mechanical ventilation outlets are to be located as far as possible, but in no case less than 3 m, from the terminal manifold or the nearest barrier of the spillage drip tray, whichever is closer.

5.3 Piping system testing and non-destructive examination

5.3.1 Testing and non-destructive examination of the piping system is to comply with the relevant requirements for Class II piping.

Section 6
Trials and testing

6.1 General

6.1.1 The arrangements and equipment referred to in this Chapter are to be examined and tested on completion of the installation, including calibration of coupling equipment.

6.1.2 Examination and testing is to include witnessing of the initial hook-up trials and the implementation of operational procedures for the range of actions covered by the Operating Manual.

■ *Section 1* General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships using coal as a primary source of heat for the generation of steam for main and essential auxiliary services.

1.1.2 The relevant requirements of the Rules and those of the National Authority with whom the ship is registered, together with any special requirements of the Administration within whose territorial jurisdiction the ship is intended to operate, are to be complied with. Attention is drawn to the statutory requirements concerning intact and damaged stability of the ship.

1.1.3 For the purpose of these requirements, it is assumed that no manual handling of coal for the transportation from bunkers to boiler, or for actual firing of the boiler, will be employed. The emphasis has been placed on the presumption that the boiler firing will be by some form of moving grate. Special consideration will be given to other forms of firing, such as pulverised fuel, slurries of coal-oil-water mixtures or fluidised bed firing, if submitted.

1.1.4 For single main boiler installation, *see* Pt 5, Ch 3,5.3.

1.2 Submission of plans

1.2.1 The plans and information required by 1.2.2 to 1.2.4 are to be submitted in triplicate for consideration.

1.2.2 General arrangement plans and specification of the storing, handling and burning equipment and ash handling plant.

1.2.3 Structural plans showing details and arrangements in way of coal bunkers, and support arrangements for coal handling and ash disposal plants.

1.2.4 A general arrangement plan showing details of construction, fire protection and extinction for coal bunkers and coal handling systems, supplemented as necessary, by detailed plans and calculations for fire-extinguishing, explosion suppression, temperature monitoring and carbon monoxide detection systems.

1.3 Surveys

1.3.1 Coal bunkering, coal handling, burning and ash disposal plants are to be built, installed, and tested under operating conditions to the Surveyors' satisfaction and subsequently at each Boiler Survey. Fire-extinguishing, explosion suppression, temperature monitoring and carbon monoxide detection systems are to be installed and tested to the Surveyors' satisfaction and subsequently examined annually as required by Pt 1, Ch 3,2.2.

1.4 Additional bilge drainage

1.4.1 It should be noted that, under the provision of SOLAS 1974, additional bilge drainage is required for passenger ships burning coal, as detailed in 1.4.2 and 1.4.3.

1.4.2 In passenger ships there shall be provided in the boiler room, in addition to the other suctions required by the Rules, a flexible suction hose of suitable diameter and sufficient length capable of being connected to the suction side of an independent power pump.

1.4.3 In passenger ships where there is no watertight bulkhead between the engine and the boiler spaces, a direct discharge overboard or, alternatively, a by-pass shall be fitted from any circulating pump discharge used for emergency bilge pumping duties.

■ *Section 2* Coal storage, handling, ash collection and disposal arrangements

2.1 Coal storage

2.1.1 The arrangements for coal bunkers, including hatchways, ventilation, monitoring and their design characteristics regarding intact and damaged stability are to comply with the requirements detailed in Sections 4 and 7, as applicable.

2.1.2 Coal is to be stored in not less than two bunkers. Vessels on restricted routes having a voyage time less than the capacity of the daily service hoppers, or where the boiler has the alternative means of firing, or where alternative means of propulsion are fitted, may be provided with only one bunker.

2.1.3 The clearance spaces between the boilers, other heated surfaces and the coal bunkers are to be adequate for the free circulation of air necessary to avoid transmission of heat to the coal.

2.1.4 A daily service storage hopper is to be provided for each coal-fired boiler.

2.1.5 Coal bunkers and daily service storage hoppers are to be designed to avoid dead spots and areas where coal can accumulate and impede the normal flow or can provide the conditions to promote spontaneous combustion.

2.1.6 Bunker and daily service storage hopper outlet gravity-fed discharges are to be provided with shut-off devices. Stopping the transfer device will be acceptable in lieu where a bunker delivers to transfer arrangements and stopping the transfer device effectively prevents flow from the bunker, *see* 2.2.4.

2.1.7 Shut-off devices on the coal bunker and daily service storage hopper outlets are to be capable of being operated locally and also from an accessible position outside the compartment in which they are situated.

2.1.8 The arrangements for loading coal into bunkers or during transfer into daily service storage hoppers should, in general, avoid the tendency of the coal to segregate. For this purpose, multiple loading points should be used if necessary.

2.2 Coal handling

2.2.1 Each daily service storage hopper is to be provided with a separate system for transferring coal from the bunker(s). In the case of a single boiler installation, more than one transfer system from the bunker(s) to the daily service storage hopper are to be provided, unless alternative means of firing the boiler is available.

2.2.2 Adequate access facilities are to be provided in the coal feeder systems to permit maintenance and removal of blockages.

2.2.3 Where coal screens or crushers are necessary for the efficient operation of the coal burning equipment, they are to be provided in each boiler coal feed arrangement.

2.2.4 The coal handling plant is to be capable of being stopped locally and from an accessible position outside the compartment in which it is situated, *see* 2.1.6.

2.2.5 The use of milling systems for the production of pulverised fuel will be specially considered.

2.3 Ash collection and disposal arrangements

2.3.1 Each coal fired boiler is to be provided with a bottom ash and fly ash collecting and disposal arrangement.

2.3.2 Where both bottom ash and fly ash collecting and disposal arrangements are operated by either pneumatic or water systems, then these may be made common.

2.3.3 Two independent means of supplying the operating medium for ash collection and disposal systems are to be provided.

2.3.4 Heated ash storage and transfer systems are to be efficiently lagged to minimise risk of fire and to prevent damage by heat.

2.3.5 Where wet ash water transfer systems are used, consideration is to be given to the effects of corrosion and erosion on the collection, transfer and storage equipment.

2.3.6 Ash transfer systems employing water separation arrangements are to be such that water will drain naturally back to the de-watering bins or into a collection tank. Such drainage facilities should not, in general, be led directly to bilge wells.

2.3.7 Where a dry ash collection system is proposed, the arrangement of conveyors, pipes and chutes should avoid condensation due to excessive cooling to prevent solidification of the ash.

2.3.8 Adequate ash storage capacity, with access facilities to permit maintenance and removal of blockages, is to be provided for systems using boilers which have no alternative means of firing. Certain National Authorities or local Administrations prohibit the direct discharge of ash overboard.

■ *Section 3* Coal burning equipment

3.1 Operating conditions

3.1.1 The design and arrangements for coal burning equipment are to be such that it can be manually controlled from a suitable position local to the boiler fronts.

3.1.2 Burning arrangements for solid fuel firing:

(a) The arrangements should permit a sufficient level of control of coal feed to the grates or bed to avoid uneven firing conditions likely to cause damage to the grate or bed, due to excessive heat or coal build-up, under all operating conditions.

(b) In addition to the adequate supplies of air for efficient combustion, sufficient capacity and means of control of the combustion air supply below the grates or beds are to be provided to ensure cooling of the grate or bed under all conditions of coal or alternative means of firing.

(c) When the coal bed is not fully incandescent, i.e. during low steaming conditions when coal-fired beds are banked or reduced in output, sufficient purging sequences to sweep the furnace volumes are to be provided before any alternative means of firing is attempted.

3.1.3 Where it is proposed to provide means of firing the boiler simultaneously on coal and oil, details of the arrangements for furnace purging and ignition of oil burners are to be submitted and will be the subject of special consideration.

3.2 Forced and induced draught air fans

3.2.1 In boilers fitted with forced and induced draught fans, suitable bias is to be maintained to avoid gas leakage into the boiler room.

3.2.2 In the event of induced draught fan failure, the forced draught fan should be arranged to stop automatically. Alternative arrangements which will permit the forced draught fan to be controlled to reduce the supply of air may be considered.

3.3 Fuel characteristics and specification

3.3.1 In general, the coal burning equipment is to be designed to utilise the various grades of coal likely to be encountered.

3.4 Alternative means of firing

3.4.1 Where it is proposed to use an alternative means of firing, such as oil or coal/oil slurry mixtures, the arrangements are to be in accordance with the requirements for oil burning, *see* Pt 5, Ch 14.

3.4.2 Particular attention is drawn to the requirements concerning arrangements for securely locking up-take dampers in the fully open position when burning oil fuel.

3.4.3 Where it is proposed to use oil fuel burners for lighting up coal fires, details are to be submitted of the pre-purging sequences of the boiler before lighting-up burners are introduced into the furnace.

3.4.4 Where it is proposed to employ lighting-up burners using diesel oil or similar marine distillate fuels, they are to be provided with their own combustion air supply.

3.4.5 Where it is proposed to use steam purging or steam atomising oil burners with coal-fired boilers, particular attention is to be given to furnace purging arrangements. Details of the purging sequences are to be submitted.

3.4.6 The arrangements for purging the oil burners are to be such that the minimum practicable volume of oil will be introduced into the boiler furnace.

■ *Section 4* Ship structure

4.1 General

4.1.1 The requirements of this Section are additional to those given in other parts of these Rules and in separate Rules for specific ship types.

4.1.2 Other than as permitted in 4.3.2, separation between coal bunkers and adjacent spaces is to be gastight. In oil or chemical tankers, coal bunkers are to be separated from cargo tanks by means of cofferdams.

4.1.3 Boiler room access doors are to comply with Pt 3, Ch 11,6.4, as applicable.

4.1.4 Coaling ports on the side shell are to comply with parts of Pt 3, Ch 11,8 as applicable.

4.1.5 No side scuttles are to be fitted in spaces appropriated exclusively for the carriage of coal.

4.1.6 All openings from coal bunkers are to be located clear of the defined hazardous area for the particular ship type.

4.2 Coal bunker hatchways

4.2.1 Coal bunker hatchways are to be provided with gasketed steel covers and coamings, complying with Pt 3, Ch 11, as applicable.

4.2.2 Coal bunker hatchways are to be located clear of the defined hazardous area for the particular ship type.

4.3 Coal bunker bulkheads

4.3.1 The scantlings of main coal bunker boundary bulkheads which are counted towards the number of bulkheads required by Pt 3, Ch 3,4, or which form the boundary of deep tanks, are to satisfy the requirements of Pt 4, Ch 1,9. Other boundaries are to satisfy the requirements of Pt 4, Ch 1,9, but the load head may be taken to the top of the bunker. The scantlings of cofferdam bulkheads not forming the boundaries of a cargo tank in oil or chemical tankers are to satisfy the requirements of Pt 4, Ch 9,7. In all cases when flooding is envisaged as a means of fire-extinction, the moduli of stiffening members on bunker bulkhead boundaries are to be increased by 25 per cent.

4.3.2 Where the coal bunker is situated immediately forward of the engine room, the aft coal bunker bulkhead may be non-watertight. The scantlings for this bulkhead are to be as required for watertight bulkheads (Pt 4, Ch 1,9) but the load head may be taken to the top of the tank. With this arrangement, the forward end of the coal bunker may, if appropriate, be regarded as the engine room forward bulkhead.

4.3.3 The thickness of the plating in way of the bulkhead knuckles in the region of the hoppers and the plating of the hopper apexes is to be increased by 1,5 mm over that derived from 4.3.1 and 4.3.2. However, the minimum thickness of the lowest strake in the coal hopper is to be not less than 9 mm. Where solid stainless steel is employed, the plate thickness may be reduced by 10 per cent or 1 mm, whichever is the lesser.

4.3.4 Non-watertight coal bunker bulkhead scantlings are to be as required by Table 1.4.8 in Pt 4, Ch 1, but the thickness of the lowest strake is to be not less than 9 mm.

4.3.5 The scantlings of the boundaries of compartments intended for the storage of ash in liquid or slurry form will be specially considered.

4.3.6 Watertight doors may be fitted in watertight bulkheads between permanent and reserve bunkers, and may be of the sliding, hinged or equivalent type. They are to be accessible at all times, *see also* Pt 3, Ch 11,9.

4.3.7 Arrangements are to be made by means of screens or otherwise to prevent the coal from interfering with the closing of watertight doors.

4.4 Longitudinal strength

4.4.1 For the purpose of longitudinal strength, the requirements for the relevant ship types are to be applied.

4.4.2 The calculation of still-water shear forces and bending moments are to cover both departure and arrival conditions, and any special mid-voyage conditions caused by variation in coal bunkering and ballast distribution. Details of typical coal stowage rates are to be submitted, as well as trim and stability data for these conditions.

4.4.3 Where local reduction of double bottom depth is proposed to accommodate coal handling equipment, the strength of the double bottom and scarfing arrangements will require special consideration. Adequate scarfing of longitudinal material in way of double bottom and hopper tanks should be arranged.

4.5 Ventilation

4.5.1 Ventilators serving coal bunkers or boiler rooms are to comply with Pt 3, Ch 12,2 as applicable. In addition, the atmosphere in the bunkers is to be sampled by means of fixed or portable monitors as follows:

(a) prior to entering the space – for oxygen deficiency,
(b) prior to opening the hatchways – for accumulation of flammable gases.

4.5.2 Ventilator exits from main coal bunkers and coal processing spaces are to discharge clear of the defined hazardous area for the particular ship type and not less than 3 m from the nearest intake or opening to accommodation and enclosed working spaces, and from possible source of ignition.

■ *Section 5*
Electrical equipment

5.1 General

5.1.1 All electrical equipment should be situated in positions where it is not exposed to concentration of coal dust. Where this is not practicable, the enclosure of the equipment should be designed and installed such that:

(a) Dust cannot enter the interior of the enclosure. An ingress protection rating of at least I.P. 55 in accordance with IEC 60529, if not of a safe-type, is considered to be acceptable.
(b) Dust will not collect on the surface of the enclosure to such an extent that proper cooling is prevented, thus causing a dangerous rise in temperature.
(c) The maximum surface temperature of the enclosure is not capable of igniting the dust, and should be limited to 165°C for equipment not subjected to overloading and 120°C for equipment such as motors, that may be overloaded.

5.2 Arrangements in coal bunkers

5.2.1 Electrical equipment located within the coal bunkers is to be of a safe-type certified for Group II A atmospheres and temperatures Class T1 in accordance with IEC 60079, *Electrical Apparatus for Explosive Atmospheres*, or an equivalent National Standard.

5.2.2 The switches and protective devices for such equipment are to interrupt all lines or phases and are to be located outside the coal bunker spaces. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

■ *Section 6*
Control engineering systems

6.1 General

6.1.1 The requirements of Pt 6, Ch 1 are applicable. The additional requirements for boilers which are coal grate-fired and under normal operation are remotely controlled or are automatic in operation, are given in Table 7.6.1.

6.1.2 In general, ships complying with the relevant requirements of Pt 6, Ch 1,4 or Ch 1,5 will be eligible for the notations **UMS** (unattended machinery space) or **CCS** (centralised control station) respectively.

Table 7.6.1 Coal burning: Alarms and safeguards

Item	Alarm	Note
Drum water level	Low	Combustion air; coal spreaders and/or any alternative fuel supply to be shut-off automatically
Daily service hopper level	High/Low	—
Coal feed plant	Failure	—
Primary combustion air system	Failure	Coal spreaders to be stopped automatically
Secondary combustion air system	Failure	—
Coal supply controller (if separate from spreader)	Failure	Per controller
Spreader drive	Failure/ Overload	Per drive. *See also* primary combustion air system failure
Grate drive	Failure/ Overload	Per drive
Localised overheating of the grate	Excessive	—
Induced draught fan	Failure	Coal spreaders to be stopped automatically, *see also* 3.2.2
Ash disposal system	Failure	—

NOTE
Interlocks are to be provided to prevent the burning of oil fuel, unless dampers in the gas passages of uptakes have been securely locked in the fully-open position, *see also* 3.4.2.

■ *Section 7*
Fire protection and extinction

7.1 Fire protection

7.1.1 In general, the coal bunkers are to be separated from adjacent spaces by 'AO' divisions, but where such spaces are intended to contain highly flammable substances, such as the cargo tanks of an oil tanker, they are to be separated from the coal bunkers by a cofferdam or equivalent space.

7.1.2 The spaces above the coal in the coal bunkers and coal processing spaces are to be adequately ventilated to prevent the accumulation of flammable gases. The ventilators are to be provided with means of closure which are readily accessible at all times. Where mechanical ventilation is provided, means are to be provided for stopping the fans from a position which will be readily accessible at all times.

7.2 Fire-extinction

7.2.1 A fixed fire-extinguishing system should be provided in the coal bunkers. This system should discharge CO_2, but alternative arrangements such as water flooding will be considered, *see also* 4.3.

7.2.2 Where, due to operating conditions, it is considered likely that coal dust in significant quantities will be present in the coal crushing and conveying system, an explosion suppression system is to be provided in the coal crushing and conveying system. Activation of the explosion suppression system is to operate an audible and visual alarm.

7.2.3 A fixed fire-extinguishing system should be provided in the ready-use coal hopper and this should be extended to the boiler room, if there is any danger of the spread of fire to that space. The system should depend on $C0_2$, but alternative extinguishing media will be considered. Where it can be shown that the residence time, of the coal in the hopper, is of sufficiently short duration that a fire in the hopper is unlikely to be sustained, consideration will be given to dispensing with this requirement.

Section

Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to Lloyd's Register (hereinafter referred to as 'LR') classed ships with positional mooring systems or thruster-assisted positional mooring systems and are additional to those applicable in other Parts of the Rules. The Rules are not intended to apply to vessels which have station-keeping capabilities, but which are not required to remain on station in adverse weather conditions. This normally precludes the Rules being applicable to small ships.

1.1.2 Compliance with this Chapter is not mandatory, but ships provided with a positional mooring system or thruster-assisted positional mooring system which do comply will be eligible for an appropriate class notation which will be recorded in the *Register Book* at the specific request of an Owner.

1.1.3 The mooring system will be considered for classification with LR on the basis of operating constraints and procedures specified by the Owner and recorded in the Operations Manual.

1.1.4 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the administration within whose territorial jurisdiction it is intended to operate.

1.2 Classification notations

1.2.1 Ships provided with a positional mooring system which complies with the requirements of this Chapter will be eligible to have included in the class notation one of the following special features notations:

(a) For ships fitted with a positional mooring system:
PM (Positional mooring system), or
PMC (Positional mooring system for mooring in close proximity to other ships or installations. This notation will apply in particular to any ship operating in conjunction with a fixed installation, e.g. crane barge, accommodation unit, maintenance vessel, etc.)

(b) For ships fitted with a thruster-assisted positional mooring system:
PM T1 [or T2 or T3]
or
PMC T1 [or T2 or T3]
The numeral in the circled supplementary notation, T1, etc., defines the thruster allowance which may be permitted in the design of the positional mooring system, and is determined by the capacity/redundancy of the thrust/machinery installation, *see* Table 8.3.2.

1.2.2 Additional descriptive notes may be given and entered in column 6 of the *Register Book* indicating the type of positional mooring system, reference system, control system, limiting environmental criteria, etc.

1.3 Surveys

1.3.1 The positional mooring and thruster-assisted positional mooring systems and their associated equipment are to be examined and tested during construction and under working conditions on completion of the installation. The Periodical Survey of these items is to be arranged to coincide with Hull and Machinery Surveys as required by other Parts of these Rules.

1.4 Definitions

1.4.1 Positional mooring is a method of station keeping by means of multiple anchor lines laid out in catenary array. Each positional mooring system is to consist of the following:
(a) Anchors or anchor piles.
(b) Anchor lines.
(c) Anchor line fittings (shackles, connecting links, wire rope terminations, quick release devices, etc.).
(d) Fairleads.
(e) Winches or windlasses.
(f) Chain or wire rope stoppers.
Where applicable, the structural or mechanical connection of these items to the ship is also considered to be part of the positional mooring system.

1.4.2 'Thruster-assisted Mooring' is the use of thrusters and main propulsion, if so designed, to supplement the ship's anchoring system.

1.5 Plans and data submission

1.5.1 The information and plans specified in 1.5.2 to 1.5.5 are to be submitted in triplicate. One copy of the Operations Manual referred to in 1.5.6 is to be forwarded for information.

1.5.2 Plans and data dealing with positional mooring arrangements and the associated equipment are to be submitted, including the following:

(a) Mooring arrangements with details of mooring patterns, anchor lines and fittings, etc.
(b) Mooring equipment with details of anchors, fairleads and cable stoppers.
(c) Winches or windlasses with details of gearing shafting, brake systems, ratchet and pawl, drum/cable lifter and frame.

1.5.3 For thruster-assisted positional mooring systems, plans of the following, together with particulars of ratings, in accordance with the relevant Parts of these Rules are to be submitted for the following:

(a) Prime movers, gearing, shafting, propellers and thrust units, *see also* Pt 5, Ch 8.
(b) Machinery piping systems.
(c) Electrical installations.

In addition, details of proposals for the redundancy provided in machinery, electrical installations and control systems are to be submitted. These proposals are to take account of the possible loss of performance capability should a component fail. Where a common power source is utilised for thrusters, details of the total maximum load required for thruster-assist are to be submitted.

1.5.4 Plans of control, alarm and safety systems, including the following, are to be submitted:

(a) Functional block diagrams of the control system(s).
(b) Functional block diagrams of the position reference systems and the environmental sensors.
(c) Details of the electrical supply to the control system(s), the position reference system(s) and the environmental sensors.
(d) Details of the monitoring functions of the controllers, sensors and reference system, together with a description of the monitoring functions.
(e) List of equipment with identification of the manufacturer, type and model.
(f) Details of the overall alarm system linking the centralised control station, subsidiary control stations, relevant machinery spaces and operating areas.
(g) Details of the control stations, e.g. control panels and consoles, including the location of the control stations.
(h) Test schedules which are to include the methods of testing and the test facilities provided.

1.5.5 The following supporting plans, data, calculations or documents are to be submitted:

(a) General arrangement showing plan views, side elevations and sections of the ship.
(b) Design criteria showing operating and survival environment, water depth range and required station keeping limits.
(c) Environmental forces on ship showing wind, current and wave drift. These forces are to be verified by direct calculation, model test reports, or full-scale data, etc.
(d) Ship motions showing first order wave motions, surge, sway and yaw. Tank test data or equivalent to be provided.
(e) Mooring analysis, including computer printout where relevant.
(f) Strength calculations for anchors, fairleads, winches/windlasses, cable stoppers and special fittings.
(g) Thruster arrangements for thruster-assist systems, including powers, thrusts and interactions between thrusters, thruster and hull, thruster and current.

1.5.6 An Operations Manual for the system is to be placed on board the ship. This Manual is to contain all necessary information and instructions regarding positional mooring and, where relevant, thruster-assisted positional mooring. It would normally also contain descriptions of the following:

- Mooring systems.
- Laying the mooring system.
- Anchor pre-loading.
- Pre-tensioning anchor lines.
- Tension adjustment.
- Winch performance.
- Winch operation.
- Procedure in event of failure or emergency.
- Procedure for operating thrusters.
- Fault-finding procedures for thruster-assist system.

■ *Section 2*
Environmental criteria – Forces and motions

2.1 Limiting environmental criteria

2.1.1 Limiting criteria in the form of maximum operating and survival environmental conditions are to be specified by the Owner or Designer.

2.1.2 The limiting criteria are to be defined in terms of wind and current speeds, wave heights and periods, and water depth range.

2.1.3 As water depth will have a large influence on a ship's mooring capability, the limiting environmental criteria may be varied according to water depth.

2.1.4 **Maximum operating conditions** will be those in which the ship is able to carry out its primary operational activities, while anchor line tensions remain within designated operating limits. *See* 3.2 for required factors of safety in operating conditions.

2.1.5 **Survival conditions** are to be based on an average recurrence period of not less than 50 years. The mooring system is to be such that maximum line tensions will be limited in these conditions to designated survival levels. *See* 3.2 for required factors of safety.

2.2 Design environmental criteria

2.2.1 **Wind**. The design wind speed for wind force determination can normally be taken as the one-hour mean value referenced to 10 m above sea level. Account is to be taken of the variation of wind speed with height above sea level. The wind velocity gradient can be calculated from the following:

$$V_H = V_{10}\left(\frac{H}{10}\right)^{0,125}$$

where

V_H = wind velocity at H height above sea level

V_{10} = 1 hour mean wind speed referenced to 10 m above sea level.

2.2.2 **Current**. The design current speed is to be taken as the sum of wind-induced and tidal current velocities. For calculation purposes, tidal current velocity can be assumed constant over water depth, and wind-induced current velocity can be taken to reduce linearly from its maximum value at the surface to zero at 50 m below sea level.

2.2.3 **Wave**. The significant wave height and period range is to be defined for each relevant design case.

2.3 Environmental forces

2.3.1 In determining environmental forces, it is to be assumed that the defined limiting environment of wind, waves and current will act concurrently. For fixed azimuth mooring systems, these forces are considered to act in the same direction.

2.3.2 Environmental loading on the ship (and the corresponding catenary system motions analysis to determine anchor loads and line tensions, etc.) will require to be investigated for a sufficient number of directions to establish the critical cases.

2.3.3 It is generally to be assumed that the maximum specified environmental conditions can come from any direction relative to the ship's heading. However, in cases where a ship is to be restricted to specific defined locations, consideration will be given to the acceptance of an environmental rosette (allowing the ship to be headed in the most favourable direction with respect to mooring loads).

2.3.4 Where quasi-static methods of analysis are adopted (*see* 3.1.2), at least the wind, current, and mean wave drift forces acting on the ship in the various relevant design conditions are to be calculated or determined. In addition, any significant yawing moments induced by these effects are to be taken into account when carrying out the mooring system motions analysis.

2.3.5 Environmental forces and moments can be determined by suitable methods of direct calculation or by model testing. In either case, account must be taken of all significant load generating structural elements or equipment. In the case of wind force and moment determination, all deck structures, fittings, cranes, towers, superstructures, etc., are to be considered, and for current force, account is to be taken of thrusters, nozzles, propellers, etc.

2.3.6 First order wave motions – the oscillatory motions of the ship – are to be determined. Surge and sway are the most relevant motions in terms of quasi-static mooring analysis, *see* 3.1.2 and Fig. 8.3.1.

2.3.7 The first order wave motions of the ship are to be determined from appropriate wave spectra, either by use of tank testing or by suitable direct calculation methods.

2.3.8 Account is to be taken of the effects of shallow water on the ship's first order wave motions.

■ *Section 3* Mooring system – Design and analysis

3.1 General

3.1.1 The positional mooring system is to be designed to meet the specified limiting environmental criteria (*see* 2.1), and any associated operational constraints (restricted offset of ship, etc.) as contained in the Operations Manual.

3.1.2 This Section in general, and the anchor line factors of safety in particular, relate principally to the quasi-static approach to mooring analysis. This method of analysis takes wind, current and wave drift forces to be steady effects which will displace the moored ship from its original equilibrium position to a new mean position where the mooring system will have developed sufficient restoring force to 'balance' the steady applied force. Wave-induced oscillatory vessel motions take place about this new mean position. In quasi-static analysis, maximum anchor line tensions are taken to occur at the extremity of vessel offset, *see also* Fig. 8.3.1.

3.1.3 Consideration will be given to the adoption of alternative methods of design for the mooring system, including the use of part-dynamic or full-dynamic analysis techniques. In such cases, factors of safety, etc., will be specially considered.

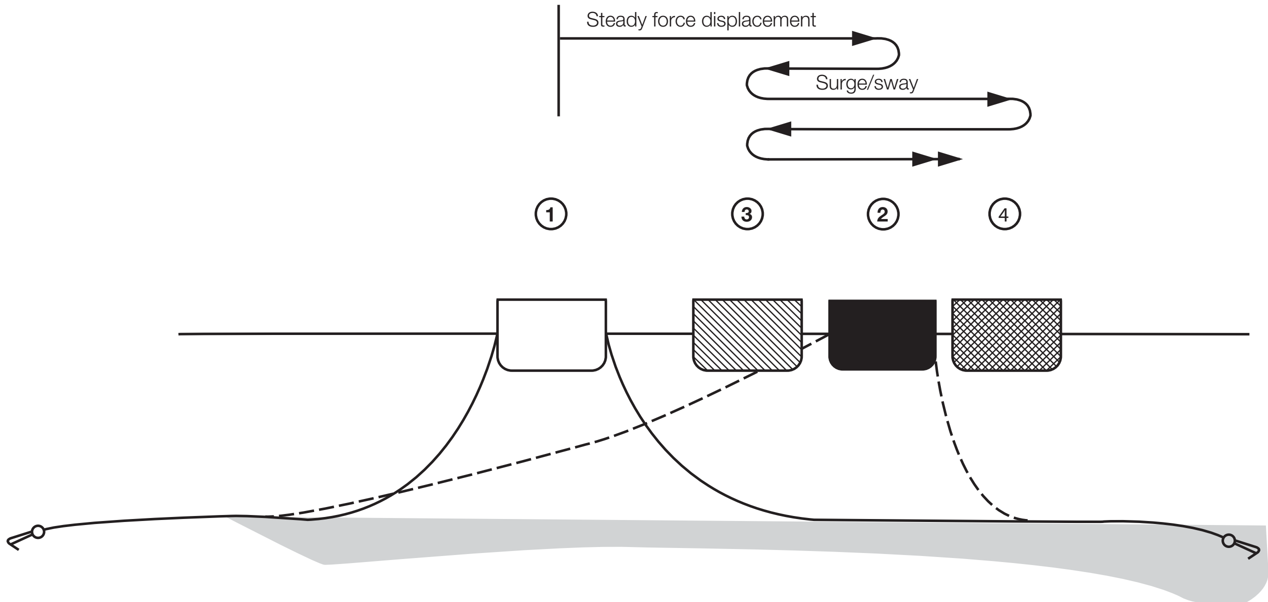
3.1.4 For ships which intend to utilise thruster assistance, as an aid to position-keeping or as a means of reducing anchor line tensions, the extent of thruster allowance which is permitted in calculations is given in Table 8.3.2.

3.1.5 Anchor line length is to be sufficient to avoid uplift forces occurring at the anchors in the worst damaged survival condition.

3.1.6 Account is to be taken in the mooring analysis of the elastic stretch of anchor lines.

3.2 Design cases and factors of safety

3.2.1 The design cases which require to be considered, and the associated minimum anchor line factors of safety are given in Table 8.3.1.



Position 1: Zero environmental force on ship. Anchor lines under pre-tension only.

Position 2: New mean position taken up by ship under the action of steady forces – wind, current and wave drift.

Positions 3 & 4: The inner and outer limits of vessel motion at wave frequency. Maximum quasi-static anchor line tension occurs at position 4.

NOTE

Mooring lines and anchor lines omitted in position 3 and position 4 for clarity.

Fig. 8.3.1 Quasi-static analysis

Table 8.3.1 Minimum anchor line factors of safety

Design case	Description	Factor of safety – Class notation: **PM**, **PM** T1 etc.	Factor of safety – Class notation: **PMC**, **PMC** T1 etc.
1	Operating – Intact The ship in an operating mode with its mooring system intact, subject to specified operating constraints (limiting environment and permissible offset of the ship).	2,7	3,0
2	Survival – Intact The ship in survival mode with mooring system intact, subject to maximum (survival) environmental conditions.	1,8	2,0
3	Operating – Damaged As Case 1, but with loss of restraint of any one anchor line, *see also* Note 3.	1,8	2,0
4	Survival – Damaged As Case 2, but with loss of restraint of any one anchor line.	1,25	2,0/1,4 (*See* Note 5)

NOTES
1. In the context of this Chapter, Cases 1 and 2 ('Intact' Cases) refer to the mooring system with all anchor lines intact. Cases 3 and 4 ('Damaged' Cases) refer to the mooring system with the loss of any one anchor line.
2. $\text{Anchor line factor of safety} = \dfrac{\text{Minimum rated break strength}}{\text{Maximum line tension}}$
3. The factors of safety given in Table 8.3.1 are to be based on maximum line tensions resulting from steady force offset of the ship, plus maximum first order wave motion. In Design Cases 3 and 4, the factors relate to the ship in its post-damage settled position, following the loss of restraint from an anchor line, (i.e. neglecting transient effects, but *see* Note 4).
4. In addition to the 'static' considerations in Design Cases 3 and 4 (*see* Note 3), account is also to be taken of transient vessel motions following anchor or line failure. The motion path taken by the vessel in moving to a new static equilibrium position is to be determined for each line breakage case to ensure that:
   (a) The ship maintains adequate clearance from any adjacent installation (applicable where **PMC** or **PMC** T1 etc. notation is to be assigned). A minimum dimensional clearance of 10 m will normally be required.
   (b) The ship remains within its required operational excursion limits.
   (c) Successive line failures will not occur. In calculating factors of safety, the maximum anchor line tensions in this case are to be those resulting from the extreme point of transient motion, with the ship subject to steady force and significant wave motion.
5. The factor of safety of 2,0 applies to critical lines maintaining separation between the moored ship and an adjacent installation.

Table 8.3.2 Thruster allowance

Case	Thruster allowance: T1	Thruster allowance: T2	Thruster allowance: T3
Operating (Intact)	None	70% of all thrusters, less one	All thrusters, less one
Survival (Intact)	70% of all thrusters	All thrusters	All thrusters
Operating (Damaged)	None	70% of all thrusters, less one	All thrusters, less one
Survival (Damaged)	70% of all thrusters	All thrusters	All thrusters

NOTES
1. The conditions for assignment of supplementary notations T1, T2 and T3 are defined in Section 8.
2. Where all thrusters are permitted, the net effect of all thrusters can be included in calculations.
3. Where all thrusters except one are permitted, the net effect of all thrusters, less the single most effective one, can be included in calculations.

■ *Section 4* Mooring equipment

4.1 Anchors

4.1.1 Anchors for positional mooring are to be sufficient in number and holding power, and are to have adequate structural strength, for the intended service. It is the Owners'/ Operators' responsibility to ensure adequate anchor holding power for each location or holding ground.

4.1.2 The anchors are to be of an approved type. Supporting calculations to verify the structural strength of the anchor under proof test loading are to be submitted.

4.1.3 The anchors are to be manufactured in accordance with the requirements of Chapter 10 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

4.1.4 The anchors are to be proof tested in the manner laid down in Chapter 10 of the Rules for Materials. The level of proof test loading for positional mooring anchors is to be the greater of the following:
(a) 50 per cent of the minimum rated break strength of the intended anchor line; or
(b) the value given in Table 10.1.1 in Chapter 10 of the Rules for Materials.

4.2 Fairleads

4.2.1 Fairleads are to be designed to permit free movement of the anchor line in all mooring configurations. Fig. 8.4.1 shows the minimum operating range of the fairlead to be considered in conjunction with the design load.

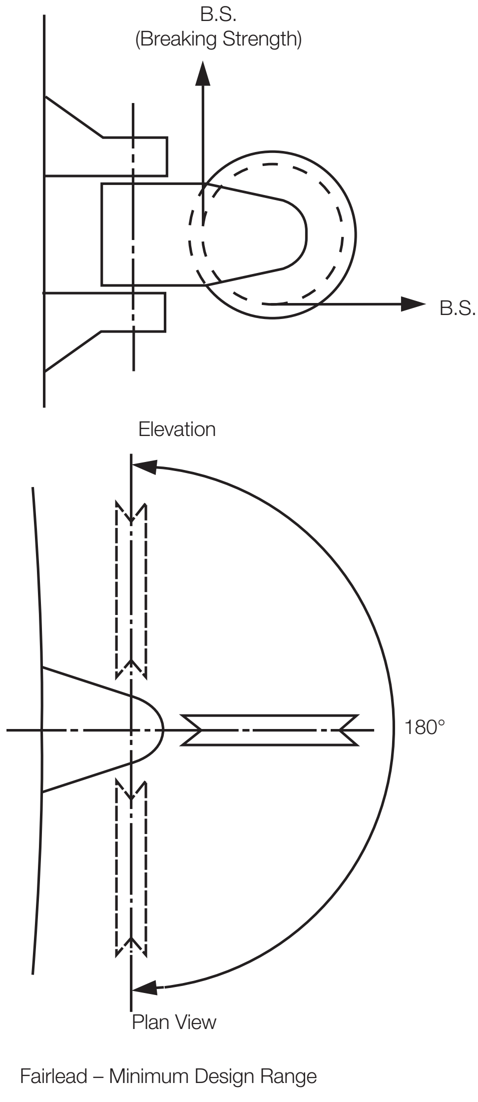


Fig. 8.4.1
Minimum operating range and design loading of fairlead

4.2.2 Fairleads and their supporting structures are to be designed for a load equivalent to the rated minimum break strength of the anchor line.

4.2.3 Maximum allowable stresses for the design criteria given in 4.2.1 and 4.2.2 are to be based on the following factors of safety:

Shear	1,89	Factors relate to tensile yield stress
Tension, compression or bending	1,25	
Combined	1,11	

$$\left(\text{combined stress} = \sqrt{\sigma_X^2 + \sigma_Y^2 - \sigma_X\sigma_Y + 3\tau^2}\right)$$

Where σ_X and σ_Y are the combined axial and bending stresses in the X and Y directions respectively and τ is the combined shear stress due to torsion and/or bending in the X-Y plane.

4.2.4 Materials and steel grades are generally to comply with the requirements given in 5.2 for Type P components.

4.2.5 Chain cable fairleads are to have a minimum of five pockets.

4.2.6 Wire rope fairleads are generally to have a minimum diameter of 20 times the wire rope diameter.

4.3 Stoppers

4.3.1 Stoppers may require to be provided depending on the winch arrangements, *see* Section 5.

4.3.2 Where stoppers are fitted, they are to comply with Section 5 in respect to mechanical and strength aspects, and Section 6 for release arrangements.

4.4 Anchor lines

4.4.1 Anchor lines are generally to be of stud link chain cable, steel wire rope or a combination of both. Special consideration will be given to proposals for the use of alternative materials.

4.4.2 Stud link chain cable is to be either of unified grade (U2 or U3) meeting the requirements of Chapter 10 of the Rules for Materials, or an approved special grade.

4.4.3 Wire rope for anchor lines is to have a suitable construction for its purpose (6 x 37 construction with independent wire rope core is generally acceptable).

4.4.4 Steel wire ropes are generally to comply with Ch 10,5 of the Rules for Materials, or with an equivalent recognised National or International Standard.

4.4.5 Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.

■ *Section 5*
Anchor winches and windlasses

5.1 General

5.1.1 Machinery items are to be constructed, installed and tested in accordance with the relevant requirements of Part 5. For electrical and control equipment, *see* Section 6.

5.2 Materials

5.2.1 Materials are generally to comply with the requirements of Pt 5, Ch 1,2.2.

5.2.2 Components have been categorised in this Section as Type P (Primary) and Type S (Secondary) for material selection purposes:

(a) **Type P**: Components where failure would result in the loss of a primary function of the winch or windlass, e.g.:
Winch drum.
Windlass cable lifter.
Reduction gears.
Shafts.
Brakes.
Pawl stoppers.
Bedplates.

NOTE
Consideration will be given to designating any of the above components as Type S (*see* below), provided adequate redundancy of operation exists.

(b) **Type S**: Secondary, stressed items, not categorised as Type P, and where failure would not result in the loss of a primary winch function.

5.2.3 Steel materials for Type P or Type S components are generally to comply with the following Chapters and Sections of the Rules for Materials:

(a) Plates and bars: Chapter 3, Sections 1 and 2, 3 or 6, as appropriate.
(b) Castings: Chapter 4, Sections 1 and 7.
(c) Forgings: Chapter 5, Sections 1 and 8.

Consideration will be given to the acceptance of suitable equivalent National Standards.

5.2.4 Material grades are to be selected to provide the necessary notch toughness. *See* Table 8.5.1 for suitable Grades.

5.2.5 The requirements of 5.2.3 and 5.2.4 apply where the minimum design air temperature is within the range 0°C to minus 15°C. Requirements for design temperatures outside this range will be subject to special consideration.

Table 8.5.1 Material grades

Component type	Thickness (mm)	Grade					
		Plate		Castings		Forgings	
		AW (*see* Note 1)	PWHT (*see* Note 2)	AW	PWHT	AW	PWHT
P	$t \leq 25$	D, DH32, DH36	AH, B	C-Mn	C-Mn	LT20	LT0
	$25 < t \leq 50$	E, EH32, EH36	DH32, DH36	C-Mn	C-Mn	LT40	LT20
	$50 < t \leq 60$	E, EH32, EH36	E, EH32, EH36* *(*See* Note 5)	C-Mn	C-Mn	LT40	LT40 (*See* Note 5)
	$60 < t \leq 80$	LT60 (*See* Note 3)	E, EH32, EH36	$2\frac{1}{4}$ Ni (*See* Note 3)	C-Mn	LT60 (*See* Note 3)	LT40
	$80 \leq t \leq 100$	LT60	LT60 (*See* Note 3)	$2\frac{1}{4}$ Ni	$2\frac{1}{4}$ Ni (*See* Note 3)	LT60	LT60 (*See* Note 3)
	$100 < t \leq 130$	(*See* Note 4)	LT60	$3\frac{1}{2}$ Ni	$2\frac{1}{4}$ Ni	(*See* Note 4)	LT60
	$130 < t \leq 160$	$1\frac{1}{2}$ Ni	(*See* Note 4)	(*See* Note 7)	(*See* Note 7)	$1\frac{1}{2}$ Ni	(*See* Note 4)
S	$t \leq 60$	DH32, EH36	Not normally applied (*See* Note 6)				
	$60 < t \leq 80$	E, EH32, EH36* *(*See* Note 5)					
	$80 < t \leq 100$	E, EH32, EH36					
	$100 < t \leq 130$	LT60 (*See* Note 3)					
	$130 < t \leq 160$	LT60					

NOTES
1. AW. Without post-weld heat treatment.
2. PWHT. With post-weld heat treatment or not welded.
3. Impact test temperature may be raised to –50°C.
4. Use either $\frac{1}{2}$ Ni or $1\frac{1}{2}$ Ni with impact test at –70°C.
5. Impact test temperature may be raised to –30°C.
6. If PWHT is used, grades will be specially considered.
7. To be specially considered.

5.2.6 For components such as gears, shafts and boltings made from rolled or forged bar materials not subject to welding, the material composition and heat treatment, etc. may be submitted for approval as an alternative to the requirements of Table 8.5.1.

5.2.7 Non-ductile materials are not to be used for torque transmitting items or for those elements subject to tensile/bending stresses.

5.2.8 Spheroid graphite iron castings are to comply with Ch 7,3 of the Rules for Materials, Grades 370/17 or 400/12, or to an equivalent National Standard.

5.2.9 The use of grey iron castings will be subject to special consideration. Where approved, they are to comply with the requirements of Ch 7,2 of the Rules for Materials. This material is not to be used for gear components.

5.2.10 Brake lining materials are to be compatible with operating environmental conditions.

5.3 Brakes

5.3.1 Each anchor winch or windlass is required to have one primary braking system and one secondary braking system. The two systems are to operate independently.

5.3.2 The braking action of the motor unit may be used for secondary braking purposes where the design is suitable.

5.3.3 A residual braking force of at least 50 per cent of the maximum braking force required by 5.5.1 is to be immediately available and automatically applied in the event of a power failure.

5.4 Stoppers

5.4.1 If the winch motor is to be used as a secondary brake, then a stopper is to be provided to take the anchor line load during maintenance of the primary brake.

5.4.2 The stopper may be one of two different types – a pawl stopper fitted at the cable lifter/drum shaft, or a stopper acting directly on the anchor line.

5.4.3 Where the stopper acts directly on the cable, its design is to be such that the cable will not be damaged by the stopper at a load equivalent to the rated breaking strength of the cable.

5.4.4 *See also* 6.2.1 and 6.2.2 for stopper control station requirements, and 6.4.5 for emergency release of stoppers.

5.5 Winch/Windlass performance

5.5.1 The primary brake is required to hold a static load equal to the minimum break strength of the anchor line (at the intended outer working layer of wire rope on storage drum winches). The static load capacity of the primary brake can be reduced to 80 per cent of that value when a stopper capable of holding 100 per cent of the breaking strength of the line is fitted.

5.5.2 The secondary brake is required to hold a static load equal to 50 per cent of the minimum breaking strength of the anchor line.

5.5.3 The anchor winch or windlass is to have adequate dynamic braking capability. The two brake systems in joint operation are to be capable of fully controlling, without overheating, the anchor lines during:

(a) all anchor handling operations;

(b) adjustment of anchor line tensions. (This is particularly relevant where the mooring system has been designed and sized, on the basis of active adjustment of anchor lines in extreme conditions, to minimise line tensions).

5.5.4 *See also* 6.2 for control of winches, windlasses, stoppers and pawls, and 6.4 for brake fail safe requirements and standby power for operation of brakes and release of stoppers in the event of a failure of normal power supply.

5.5.5 The pulling force of the winches or windlasses is to be sufficient to carry out anchor pre-loading on location, to the necessary level. A minimum low-speed pull equal to 40 per cent of the anchor line breaking strength is recommended.

5.6 Strength

5.6.1 Design load cases for the winch or windlass assembly and the stopper when fitted are given in Table 8.5.2. The associated maximum allowable stresses are to be based on the factors of safety given in Table 8.5.3.

Table 8.5.2 Design load cases

Load case	Condition	Anchor line load percentage of break strength
1	Winch braked	100% (*See* Note)
2	Stopper engaged	100%
3	Winch pulling	40% or specified duty pull if greater

NOTE
Where stopper is fitted, anchor line load in Case 1 can be taken as brake slipping load, but is not to be less than 80 per cent break strength.

Table 8.5.3 Safety factors for design load cases

Stress	Load case	
	1 & 2	3
	Factor of safety	
Shear	1,89	2,5
Tension, compression, bending	1,25	1,67
Combined	1,11	1,43

NOTES
1. Factors of safety relate to tensile yield stress.
2. Combined stress = $\sqrt{\sigma_X^2 + \sigma_Y^2 - \sigma_X\sigma_Y + 3\tau^2}$

   Where σ_X and σ_Y are the combined axial and bending stresses in the X and Y directions respectively and τ is the combined shear stress due to torsion and/or bending in the X-Y plane.

5.7 Testing

5.7.1 Works tests are to be carried out in the presence of the Surveyor, on at least one of the winch or windlass units out of the total outfit for the vessel. The tests to be carried out are given in Table 8.5.4. Alternatively, where a prototype winch has been suitably tested, consideration will be given to the acceptance of these results.

Table 8.5.4 Works test

Test	Test load
Static brake – Primary	100% Anchor line break strength (or 80% where stopper fitted. *See* 5.5.1)
Static brake – Secondary	50% Anchor line break strength
Stopper (where fitted)	100% Anchor line break strength
Motor stall test	Specified stall load

5.7.2 The residual braking capability (*see* 5.5.4) is to be verified.

5.7.3 Each winch or windlass is to be tested on board the vessel, in the presence of the Surveyor, to demonstrate that all main aspects, including dynamic brakes, function satisfactorily. The proposed test programme is to be submitted.

5.8 Type approval

5.8.1 Winches or windlasses may be type approved in accordance with LR's Type Approval Scheme. Where this type approval is obtained, the requirements of 5.7.1 may not be applicable.

■ *Section 6*
Electrical and control equipment

6.1 General

6.1.1 The electrical installation is to be designed, constructed and installed in accordance with the relevant requirements of Pt 6, Ch 2.

6.1.2 Control, alarm and safety systems are to be designed, constructed and installed, in accordance with the relevant requirements of Pt 6, Ch 1, together with the requirements of 6.2 to 6.4.

6.2 Control stations

6.2.1 The operation of winches, windlasses and associated brakes, chainstoppers and pawls is to be controlled locally from weather-protected control stations which provide good visibility of the equipment and associated anchor handling operations.

6.2.2 A central control station, which may be located on the bridge or a separate manned control room, is to be provided from which brakes, chainstoppers and pawls can be remotely released.

6.2.3 For each anchor winch, the respective local control station is to be provided with a means of indicating the following:
(a) Line tension.
(b) Length of line paid out.
(c) Line speed.

6.2.4 The indication required by 6.2.3(a) and (b) is to be repeated to the central control station and, in addition, a means of indicating the following is to be provided at this position:
(a) Mooring patterns and anchor line catenaries.
(b) Status of winch operation.
(c) Position and heading, *see also* 6.4.6.
(d) Gangway angle and extension, when applicable.
(e) Riser angle, when applicable.
(f) Wind speed and direction, *see also* 6.4.9.

6.2.5 Means of voice communication are to be provided between the central control station, each local control station and anchor handling vessels, when applicable.

6.3 Alarms

6.3.1 Alarms are to be provided at the local and central control stations for the following fault conditions:
(a) Excessive line tension.
(b) Loss of line tension.
(c) Excessive gangway angle and extension, when applicable.
(d) Excessive riser angle, when applicable.

6.3.2 Alarms are to be provided adjacent to the winches and windlasses to warn personnel prior to and during any remote operation.

6.3.3 Alarms are to be provided at the central control station for the following fault conditions:

(a) When the ship deviates from its predetermined area of operation.

(b) When the ship deviates from its predetermined heading limits.

These alarms are to be adjustable, but should not exceed specified limits. Arrangements are to be provided to fix and identify their set points.

6.4 Controls

6.4.1 Adequate controls are to be provided at the local control station for satisfactory operation of the winch(es).

6.4.2 The braking system is to be arranged so that the brakes, when applied, are not released in the event of a failure of the normal power supply.

6.4.3 Standby power is to be provided to enable winch brakes to be released within 15 seconds in an emergency. The release arrangements are to be operable locally at each winch and from the central control position, and are to be such that the entire anchor line can be lowered in a controlled manner.

6.4.4 The standby power is to be such that, during lowering of the anchor line, it is possible to apply the brakes once and then release them again in a controlled manner.

6.4.5 Standby power is to be provided, so that any anchor line stoppers or pawl mechanisms may be released from either the local or central control stations up to a line tension equal to the minimum rated break strength of the anchor line. These mechanisms are to be capable of release at the maximum angles of heel and trim under the damage stability and flooding conditions for which the ship is designed.

6.4.6 At least one position reference system and one gyrocompass or equivalent is to be provided, when applicable, to ensure the specified area of operation and heading deviation can be effectively monitored.

6.4.7 Position reference systems are to incorporate suitable position measurement techniques which may be by means of acoustic devices, radio, radar, taut wire, riser angle, gangway extension and angle or other acceptable means depending on the service conditions for which the ship is intended.

6.4.8 A vertical reference sensor is to be provided, if applicable, to measure the pitch and roll of the ship.

6.4.9 Means are to be provided to ascertain the wind speed and direction acting on the ship.

■ *Section 7*
Thruster-assisted positional mooring

7.1 General

7.1.1 When the positional mooring system is supplemented by thrusters, the requirements of Pt 7, Ch 4, are to be generally complied with in respect of the machinery, electrical and control engineering arrangements. In applying these requirements, the arrangements for the notations **DP(CM)**, **DP(AM)** and **DP(AA)** may be regarded as equivalent to those for supplementary notations T1, T2 and T3 respectively, unless otherwise stated in this Chapter.

7.2 Control systems

7.2.1 Suitable processing and comparative techniques are to be provided at the central control station to validate the control system inputs, thereby ensuring optimum performance of the thruster-assisted mooring system.

7.2.2 Abnormal signal errors revealed by the validity checks required by 7.2.1 are to initiate alarms.

7.2.3 The control system is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.

7.2.4 An alarm is to be provided for a control computer system fault.

7.2.5 Sufficient instrumentation is to be fitted at the central control station to ensure effective control and indicate that the system is functioning correctly, *see also* 6.2.

7.2.6 The deviation from the desired heading and/or position is to be adjustable, but should not exceed the specified limits. Arrangements are to be provided to fix and identify the set points for the desired heading and/or position.

■ *Section 8*
Thruster-assisted mooring – Classification notation requirements

8.1 Notation T1

8.1.1 For assignment of notation T1, the applicable requirements of Sections 6 and 7, together with 8.1.2, are to be complied with.

8.1.2 Centralised automated manual control of the thrusters is to be provided to supplement the position mooring system. The manual control system is to provide output signals to the thrusters, via the manual controller, to change the speed, pitch and azimuth angle, as applicable, thereby optimising line tension, as indicated at the central control station, *see* 6.2.4.

8.2 Notation (T2)

8.2.1 For assignment of notation (T2), the applicable requirements of Sections 6 and 7, together with 8.2.2 to 8.2.5, are to be complied with.

8.2.2 Automatic and manual control systems are to be provided to supplement the positional mooring systems and arranged to operate independently, so that failure in one system will not render the other system inoperative. *See also* 8.1.2 for manual control.

8.2.3 The automatic control system is to utilise automatic input(s) from the position reference system, the environmental sensors and line tensions, and automatically provide output signals to the thrusters to change the speed, pitch and azimuth angle, as applicable, thereby optimising line tension.

8.2.4 In the event of line failure or failure of the most effective thruster, the ship is to be capable of maintaining its predetermined area of operation and desired heading in the environmental conditions for which the ship is designed and/or classed.

8.2.5 Control, alarm and safety systems are to incorporate a computer-based consequence analysis, which may be continuous or at predetermined intervals, and is to analyse the consequence of predetermined failures to verify that the anchor line tensions and position/heading deviations remain within acceptable limits. In the event of a possible hazardous condition, arising as a result of the consequence analysis, an alarm is to be initiated at the central control station.

8.3 Notation (T3)

8.3.1 For assignment of notation (T3), the applicable requirements of Sections 6 and 7, together with 8.2.3 to 8.2.5 and 8.3.2 to 8.3.5, are to be complied with.

8.3.2 Two automatic control systems are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative.

8.3.3 In the event of failure of the working system, the standby automatic control system is to be arranged to changeover automatically without manual intervention and without any adverse effect on the ship's station keeping capability. The automatic changeover is to initiate an alarm.

8.3.4 At least two position reference systems, as defined by 6.4.7, are to be provided.

8.3.5 At least two of each of the environmental sensors, as required by 6.4.8 and 6.4.9, are to be provided.

■ *Section 9* **Trials**

9.1 General

9.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, trials are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are to be based on the approved test schedules list as required by 1.5.4(h).

9.1.2 The suitability of the positional mooring and/or thruster-assisted positional mooring system is to be demonstrated during sea trials, observing the following:

(a) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power.
(b) Response of the system under a set of predetermined manoeuvres for changing:
  (i) Location of area of operation.
  (ii) Heading of the ship.
(c) Automatic thruster control and line tension optimisation.
(d) Monitoring and consequence analyses.
(e) Simulation of line breakage and damping.
(f) Continuous operation of the thruster-assisted positional mooring system over a period of four to six hours.

9.1.3 Two copies of the test schedules, as required by 1.5.4(h), signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed on board the ship and the other submitted to LR.

Section

Section 1 General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to ships where an optional class notation for optimising environment on the bridge for navigational tasks, including periodic operation of the ship under the supervision of a single watch-keeper on the bridge and/or integrated bridge systems, is requested, and are additional to those applicable in other Parts of the Rules.

1.1.2 The requirements of this Chapter are based on the understanding that the *International Regulations for Preventing Collisions at Sea* and all other relevant Regulations relating to Radio Communications and Safety of Navigation required by Chapters IV and V respectively of SOLAS are complied with.

1.1.3 Requirements additional to those in this Chapter may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction it is intended to operate.

1.1.4 The requirements of this Chapter are framed on the understanding that contingency plans for emergencies are specified and the conditions under which one man watch is permitted are clearly defined in an operations manual which is acceptable to the Administration with which the ship is registered.

1.1.5 In general, ships complying with the requirements of Sections 1 to 4 of this Chapter will be eligible for the notation **NAV1**.

1.1.6 Section 5 of this Chapter states additional requirements which apply where the navigational functions are integrated. In general, ships complying with the requirements of Section 5 will be eligible for the notation **IBS**, *see* Pt 1, Ch 2,2.4. In addition to the assessment of the navigational function integration, the assignment of the notation **IBS** requires that the layout of the bridge and the equipment located on the bridge is to the satisfaction of Lloyd's Register (hereinafter referred to as LR), *see* 5.2.1.

1.2 Information and plans required to be submitted

1.2.1 The following information and plans are to be submitted in triplicate:

- For programmable electronic systems, the plans required by Pt 6, Ch 1,1.2.6.
- Details of the intended area of operation of the ship.
- List of navigational equipment detailing manufacturer, and model and National Authority approval (where applicable).
- Functional block diagrams and descriptions of the navigational equipment, internal communications systems and watch safety system indicating their relationship to each other.
- Details of the electrical power supplies to the navigational equipment, internal communications systems, watch safety system, and clear view arrangements.
- A general arrangement of the ship showing the fields of vision from the bridge.
- A general arrangement of the bridge and wheelhouse showing the positions of consoles, panels, handrails, seating, windows and clear view arrangements.
- A profile view of the wheelhouse detailing the inclination of windows, heights of upper and lower edges of windows, and dimensions of consoles.
- Detailed arrangements of consoles and panels showing the layout of equipment.
- Test schedules which should include methods of testing and test facilities provided.
- A schedule of the electrical and electronic equipment referred to in 2.2.10 giving details of:
  - equipment description;
  - manufacturer;
  - type and/or model; and
  - evidence of electromagnetic compatibility.

1.3 Definitions

1.3.1 The following definitions are applicable to these Rules:

(a) **Workstation:**
A position at which one or several tasks, constituting a particular activity, is carried out.

(b) **Navigation workstation:**
A workstation at which the navigator may carry out all tasks relevant for deciding, executing and maintaining course and speed in relation to waters and traffic. The instrumentation and controls at the navigation workstation should allow the navigator to:
  - analyse the traffic situation;
  - monitor position, course, track, speed, time, propeller revolutions and pitch, rudder angle, depth of water, rate of turn, and wind speed and direction;
  - alter course and speed;
  - effect internal and external communications;
  - give and receive sound signals;
  - control navigational lights;
  - monitor and acknowledge navigational alarms and warnings;
  - confirm his well-being and watch-keeping awareness; and
  - record navigational data.

(c) **Main steering position:**
That part of the navigation workstation where those controls and instrumentation relevant to controlling the ship's course are located.

(d) **Conning position:**
A place on the bridge which is used by navigators when commanding, manoeuvring and controlling a ship.

(e) **Voyage planning workstation:**
A workstation at which the navigator may carry out the following tasks without affecting the actual navigation of the vessel:
- examine and update charts and other relevant documentation;
- plan a voyage as a series of waypoints, courses, speeds and turns;
- calculate an estimated time of arrival at various points on the voyage; and
- determine and plot the ship's position.

■ *Section 2* Physical conditions

2.1 Bridge and wheelhouse arrangement

2.1.1 The bridge configuration, arrangement of consoles and equipment location are to be such as to enable the officer of the watch to perform navigational tasks and other functions allocated to the bridge, as well as maintain an effective lookout. The following tasks are to be supported:
- navigation and manoeuvring;
- monitoring;
- manual steering;
- docking;
- planning;
- safety;
- communications; and
- conning.

2.1.2 Equipment and associated displays and indicators are to be sited at clearly defined workstations.

2.1.3 Consoles, including the chart table, are to be positioned, so that the instrumentation they contain is mounted in such a manner as to face a person looking forward. As far as practicable, operating surfaces are to be normal to the operator's line of sight.

2.1.4 From other workstations within the wheelhouse it is to be possible to monitor the navigation workstation and to maintain an effective lookout.

2.1.5 The main access to the bridge is to be by means of an internal stairway. Secondary external access is also to be provided.

2.1.6 Clear passage of at least 700 mm width is to be available to allow movement around the bridge with a minimum of inconvenience. Particular attention is to be paid to the following routes which are to be as direct as possible:

(a) From bridge wing to bridge wing, a clear passage of at least 1200 mm in width.
(b) Between the internal entrance to the bridge and the route in (a) a clear passage of at least 700 mm in width is to be provided.
(c) Between adjacent workstations, a clear passage of at least 700 mm is to be provided.
(d) Between the bridge front bulkhead or any consoles and installations placed against the front bulkhead, to any consoles or installations placed away from the bridge front, a clear passage of at least 800 mm is to be provided.

Space necessary for operating at a workstation is to be considered as part of the workstation and is not to be part of the passageway.

2.1.7 The clear height between the wheelhouse deck surface covering and the underside of the deckhead is to be at least 2250 mm. The lower edge of deckhead mounted equipment is to be at least 2100 mm in open areas, passageways and at standing workstations.

2.1.8 Toilet facilities are to be provided on the bridge or adjacent to the bridge on the bridge deck.

2.2 Environment

2.2.1 The bridge is to be free of physical hazards to personnel. There are to be no sharp edges or protuberances and wheelhouse, bridge wing and upper bridge decks are to be free of trip hazards and have non-slip surfaces whether wet or dry.

2.2.2 Sufficient hand-rails or equivalent are to be fitted inside the wheelhouse and around workstations to enable personnel to move or stand safely in bad weather. Protection of stairway openings is to be given special consideration.

2.2.3 Provision for seating is to be made in the wheelhouse. Means for securing the seating are to be provided having regard to storm conditions.

2.2.4 Glare and reflections from surfaces are to be minimised. In this respect, walls, ceilings, consoles, chart tables and other major fittings are to be provided with a suitable low reflective finish. Arrangements are to be provided to prevent the obscuration of information presented on visual display units and instruments which are fitted with transparent covers.

2.2.5 Entrance doors to the wheelhouse are to be securable from the inside, and operable with one hand. Bridge wing doors are not to be self-closing, and are to be provided with means to hold them open. For ships required to comply with the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*, the sealing mechanism of each door is to be such that a rapid and efficient gas and vapour tightening can be ensured.

2.2.6 An adequate air conditioning or mechanical ventilation system, together with sufficient heating according to climatic conditions, is to be provided in order to maintain the temperature of the wheelhouse within the range of 14°C to 30°C and the humidity within the range 20 per cent to 60 per cent. The discharge of hot or cold air is not to be directed towards bridge personnel. Control of this system is to be provided in the wheelhouse.

2.2.7 The noise level on the bridge is not to interfere with verbal communication, mask audible alarm signals, or be uncomfortable to bridge personnel. In this respect, the ambient noise level in the wheelhouse in good weather is not to exceed 65 dB(A).

2.2.8 A sound reception system or alternative means is to allow external sound signals to be heard and their direction determined within the wheelhouse.

2.2.9 Permanently installed electrical and electronic equipment is to be installed so that electromagnetic interference does not affect the proper function of the navigational systems and equipment. Installation of the equipment in accordance with the guidelines and recommendations included in IEC 60533: *Electrical and electronic installations in ships – Electromagnetic compatibility*, or an acceptable equivalent Standard, would generally be considered to meet the requirement.

2.2.10 Permanently installed electrical and electronic equipment, on the bridge and in the vicinity of the bridge, that is not subject to the approval required by 3.1.13, is to have undergone electromagnetic compatibility testing that demonstrates the equipment satisfies the conducted and radiated emission requirements of:

- IEC 60533: *Electrical and electronic installations in ships – Electromagnetic compatibility; or*
- IEC 60945: *Maritime navigation and radio communication equipment and systems – General requirements – Methods of testing and required test results.*

Testing in accordance with other appropriate standards is subject to consideration and details are to be submitted.

2.2.11 To demonstrate compliance with 2.2.10, a schedule of applicable equipment is to be compiled, *see* 1.2.1. Where it is proposed to add to or modify the equipment referred to in 2.2.10 the schedule is to be maintained accordingly, *see also* 6.1.1. A copy of the schedule documentation is to be placed on board the vessel and a copy is to be made available to the LR Surveyor on request.

2.2.12 Passive electromagnetic equipment, considered not liable to cause or be susceptible to electromagnetic disturbances, may be provided with an exemption statement in place of evidence of electromagnetic compatibility for the purposes of 2.2.11. Examples of passive electromagnetic equipment include cables, purely resistive loads and batteries.

2.3 Lighting

2.3.1 The level of lighting is to enable bridge personnel to perform all bridge tasks, including maintenance and chart and office work, by day and night. Controls, indicators, instruments, keyboards, etc., on the bridge are to be capable of being seen in the dark, either by means of internal lighting within the equipment or the wheelhouse lighting system. A satisfactory level of flexibility within the lighting system is to be available to enable the bridge personnel to adjust the lighting in brightness and direction as required in different areas of the bridge and by the needs of individual instruments and controls.

2.3.2 All illumination and lighting of instruments, keyboards and controls are to be adjustable down to zero, except the lighting of alarm and warning indicators and the controls of dimmers which are to remain readable.

2.3.3 Two separate circuits are to be provided for wheelhouse lighting, such that failure of any one of the circuits does not leave the space in darkness, *see* Pt 6, Ch 2,5.7.

2.3.4 Emergency lighting is to be provided for the wheelhouse, stairways and exits, *see* Pt 6, Ch 2,3.

2.3.5 Lighting used in areas and at items of equipment requiring illumination, whilst the ship is navigating, is to be such that night vision is not impaired, e.g. red lighting. Such lighting is to be arranged, so that it cannot be mistaken for a navigation light by another ship, and to prevent glare and stray image reflections.

2.3.6 In order to avoid possible confusion in colour discrimination, red lighting is not to be fitted over chart tables.

2.3.7 To avoid unnecessary light sources in the front area of the bridge, only instruments necessary for the safe navigation and manoeuvring of the ship are to be located in this area.

2.3.8 Means are to be provided to prevent the sudden flooding of light onto the bridge from alleyways, accommodation areas and the chart table area.

2.3.9 Deck and superstructure lights which may impair safe navigation are to be controlled from the bridge.

2.3.10 Each navigation light is to be provided with an audible and visual alarm to indicate failure of the light, *see* Pt 6, Ch 2,15.6.

2.3.11 Means are to be provided to test alarm and other indicator lamps.

2.4 Windows

2.4.1 All wheelhouse windows are to be constructed of shatterproof toughened glass having a strength commensurate with the degree of exposure of the bridge to storm conditions and complying with a recognised National or International Standard, e.g. ISO 21005, *Ships and marine technology – Thermally toughened safety-glass panes for windows and side scuttles.*

2.4.2 Windows are to be as wide as possible and divisions between them are to be kept to a minimum. No division is to be positioned immediately forward of any work-station or on the ship's centreline.

2.4.3 To reduce reflections from internal lighting, etc., the bridge windows are to be inclined from the vertical plane top out, at an angle of not less than 10° and not more than 25°. Alternative arrangements will be specially considered.

2.4.4 The height of the lower edge of the front windows is to allow a forward view over the bow for a person at the navigation workstation and is not to obstruct any of the required fields of vision, *see* 2.5. In this respect, the height of the lower edge of the front windows above the deck is to be kept as low as possible and, as far as practicable, is not to be more than 1000 mm above the deck surface.

2.4.5 The upper edge of the front windows is to allow a forward view of the horizon for a person with an eyeheight of 1800 mm at the conning position when the ship is pitching in heavy seas and, as far as practicable, is not to be less than 2000 mm above the deck surface.

2.4.6 Clear views through the windows in front of the conning position, navigation workstation, and, where applica-ble, bridge wings are to be provided at all times regardless of weather conditions. At least two windows are to provide such a view.

2.4.7 To ensure a clear view in bright sunshine, sun-screens with minimum colour distortion are to be provided. Such screens are to be readily removable and not permanently installed. Polarised and tinted windows are not to be fitted.

2.4.8 Heavy duty wipers, preferably provided with an interval function and a fresh water wash, are to be fitted.

2.4.9 Efficient cleaning, de-icing and de-misting systems are to be fitted.

2.4.10 Suitable safe external access arrangements fitted under the bridge windows are to be provided to enable cleaning in the event of failure of the above systems.

2.5 Fields of vision

2.5.1 It is to be possible to observe all objects necessary for navigation, including other traffic and navigation marks, in any direction from inside the wheelhouse. In this respect, there is to be a field of view around the ship of 360° obtained by an observer moving within the confines of the wheelhouse.

2.5.2 The view of the sea surface from the conning position and the navigation workstation is not to be obscured by more than two ship lengths, or 500 m, whichever is less, forward of the bow to 10° on either side, irrespective of the ship's draught, trim and deck cargo, *see* Fig. 9.2.1.

2.5.3 Blind sectors caused by cargo, cargo gear and other obstructions outside of the wheelhouse forward of the beam obstructing the view of the sea surface as seen from the conning position and the navigation workstation are not to exceed 10° each. The total arc of blind sectors is not to exceed 20° and the clear sector between blind sectors shall be at least 5°. However, in the view described in the preceding paragraph, each individual blind sector is not to exceed 5°.

2.5.4 The horizontal field of vision from the conning position and the navigation workstation is to extend over an arc from more than 22,5° abaft the beam on one side, through forward, to more than 22,5° abaft the beam on the other side, *see* Fig. 9.2.2.

2.5.5 From the main steering position, the field of vision is to extend over an arc from dead ahead to at least 60° on each side, *see* Fig. 9.2.3.

2.5.6 From each bridge wing, the field of vision is to extend over an arc from at least 45° on the opposite bow through dead ahead and then aft to 180° from dead ahead, *see* Fig. 9.2.4.

2.5.7 There is to be a line of sight from the port wing to the starboard wing through the wheelhouse.

2.5.8 The ship's side is to be visible from the bridge wing.

2.5.9 From workstations for functions other than navigation, the field of vision is to enable an effective lookout to be maintained and, in this respect, is to extend at least over an arc from 90° on the port bow, through forward, to 22,5° abaft the beam on the starboard side, *see* Fig. 9.2.5.

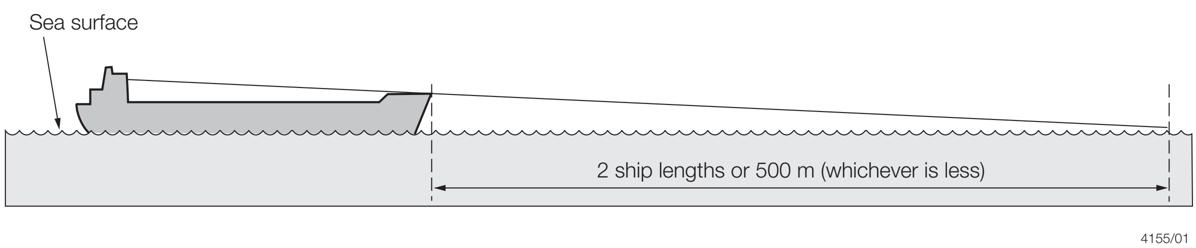

Fig. 9.2.1 View of sea surface from conning position and navigation workstation

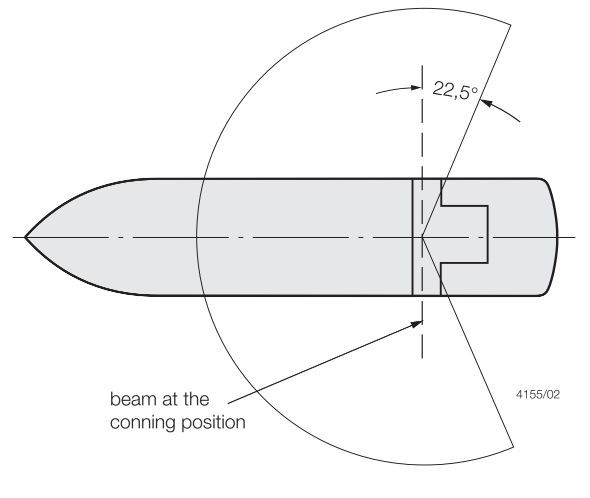

Fig. 9.2.2
Horizontal field of view from conning position and navigation workstation

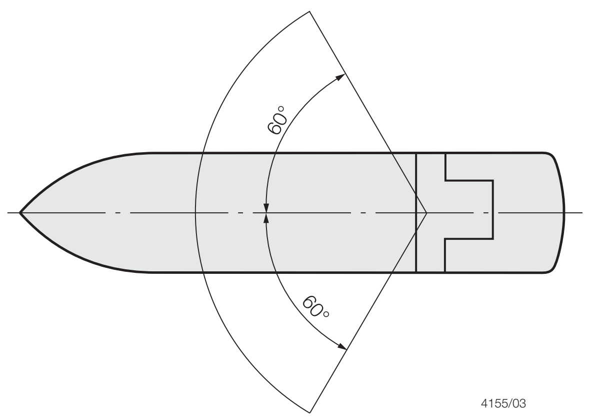

Fig. 9.2.3 Field of view from main steering position

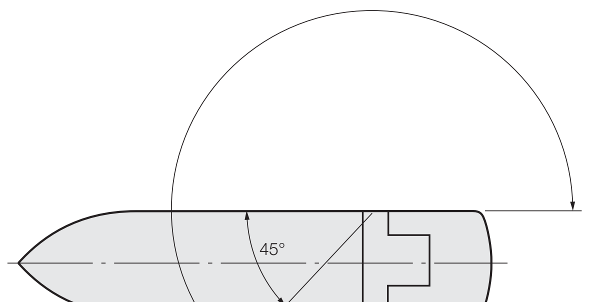

Fig. 9.2.4 Field of view from starboard bridge wing

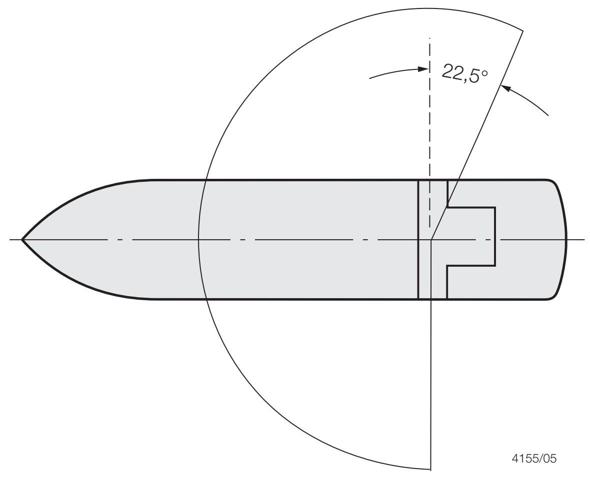

Fig. 9.2.5
Field of view from workstation other than for navigation

2.5.10 The height of consoles is not to interfere with the fields of vision defined above and is not to exceed 1350 mm.

■ *Section 3* Workstations

3.1 Navigation workstation

3.1.1 A workstation for navigation is to be arranged to enable efficient operation by one person under normal operating conditions. The workstation area is to be sufficient to allow at least two operators to use the equipment simultaneously. The arrangement of instruments and controls is to allow the use of all instruments and controls necessary for navigating and manoeuvring in any normal working position.

3.1.2 An adequate conning position is to be provided close to the forward centre window. If the view in the centreline is obstructed by large masts, cranes, etc., two additional conning positions giving a clear view ahead are to be provided, one on the port side and one on the starboard side of the centreline, no more than 5 m apart. In addition to the conning position, a second position with a view of the area immediately in front of the bridge superstructure is to be provided close to a forward window or, alternatively, the conning position is to be wide enough to accommodate two persons.

3.1.3 The main steering position is to be located on the ship's centreline, unless the view ahead is obstructed by large masts, cranes, etc. In this case, the steering position is to be located a distance to starboard of the centreline sufficient to obtain a clear view ahead and special steering references for use by day and night are to be provided, e.g. sighting marks forward.

3.1.4 The following facilities are to be provided at the navigation workstation:

- Radar and radar plotting facilities, *see* 3.1.5.
- Position-fixing system displays, *see* 3.1.6.
- Echo sounder display.
- Speed and distance indications, *see* 3.1.11 and 3.1.12.
- Gyrocompass displays, *see* 3.1.7.
- Magnetic compass display.
- Wind speed and direction indication.
- Steering controls and indication, *see* Pt 5, Ch 19,5.
- Rate of turn indication.
- Course/track controls and indications, *see* 3.1.8 to 3.1.10.
- Main propulsion and thruster controls and indication, *see* Pt 6, Ch 1,2.6 and Pt 5, Ch 7,5.3.
- Watch safety system acknowledge.
- Watch safety system manual initiation.
- Internal communications system.
- VHF radiotelephone.
- Time indication.
- Window clear view controls.
- Navigation lights controls.
- Whistle control.
- Morse light keys.
- Wheelhouse/equipment lighting controls.
- Automatic ship identification system (AIS) information.
- Sound reception system where fitted, *see* 2.2.8.
- Means to cease the distribution of long-range identification and tracking information, where required by SOLAS Ch V, Reg.19-1,7.

3.1.5 Two functionally independent radars or alternative means are to be provided to determine and display the range and bearing of radar transponders and other surface craft, obstructions, buoys, shorelines and navigational marks. One of the radars is to operate in the X-band (9 GHz) and the other is to operate in the S-band (3 GHz).

3.1.6 At least two different automatic position-fixing systems giving a continuous display of latitude and longitude are to be provided in the interests of redundancy and diversity. One of these is to be GPS or equivalent. The other is to be a system providing similar global coverage such as GLONASS, where available. When a second GPS receiver is installed to satisfy this requirement, at least one of the receivers is to be provided with differential correction functionality (DGPS) and the receivers are to be arranged to operate independently as far as is practicable.

3.1.7 A gyrocompass or alternative means for determining, displaying and transmitting the ship's heading by shipborne, non-magnetic means, is to be provided and is to be clearly readable by the helmsman at the main steering position. The heading information is to be used directly by the radars, radar plotting aids and automatic identification system, *see* 3.1.5 and 3.1.13. The gyrocompass is to be provided with a gyrocompass heading repeater located at the emergency steering position in the steering gear compartment and a gyrocompass bearing repeater allowing bearings to be taken over 360°.

3.1.8 An autopilot, track control system or alternative means of automatically maintaining the ship's heading or a straight track is to be provided. At any time, it is to be possible to immediately restore manual control.

3.1.9 Heading monitoring is to be provided to monitor the actual heading information by independent heading sources. An off-course warning is to be given if the actual heading of the ship deviates from the set track course beyond a pre-set value. The pre-set off-course warning limit is to be large enough to prevent unnecessary alarms.

3.1.10 Where automatic track following is provided, sufficient warning is to be given of the approach of a waypoint, so that, in the event of no acknowledgement from the officer of the watch, there is adequate time for the backup navigator to reach the bridge and accept the change of course.

3.1.11 A speed log or alternative means of indicating the ship's speed and distance through water is to be provided. The speed through water measurement is to be used directly by the ARPA as an aid to collision avoidance.

3.1.12 A speed log or alternative means of indicating the ship's speed and distance over ground is to be provided, which is to be separate from the device required by 3.1.11. Speed over ground is to be indicated in both the fore-aft and athwartships directions.

3.1.13 Navigational systems and equipment are to be of a type approved by the national administration and in conformity with appropriate performance standards not inferior to those adopted by IMO from time to time. Documentary evidence to this effect is to be submitted. *See* SOLAS 1974 as amended, Ch V, Reg. 18.

3.1.14 Where alternative means of fulfilling the navigational requirements are permitted, the means are to be approved by the national administration and in conformity with appropriate performance standards.

3.2 Voyage planning workstation

3.2.1 A voyage planning workstation is to be provided at which the following facilities are available:

- Chart display and information facilities.
- Position-fixing systems.
- Time indication.

3.2.2 Time indication at the voyage planning workstation is to be derived from the same system as used at the navigation workstation.

3.2.3 An Electronic Chart Display and Information System (ECDIS) is to be provided. Chart tables for paper charts, where provided, are to be large enough to accommodate all chart sizes normally used internationally for maritime traffic and are to have facilities for illuminating the chart, *see also* 2.3.8.

Section 4
Systems

4.1 Alarm and warning systems

4.1.1 Alarms associated with navigation equipment are to be both audible and visual and are to be centralized for efficient identification. Repeater displays may be fitted on the bridge wings and at other appropriate positions on the bridge where necessary.

4.1.2 The following alarms are to be provided:

- Closest point of approach.
- Shallow depth.
- Waypoint approaching (where automatic track following is provided).
- Off-course.
- Off-track (where automatic track following is provided).
- Steering alarms, *see* Table 19.5.1 in Pt 5, Ch 19 or Table 20.4.1 in Pt 5, Ch 20, as applicable.
- Navigation light failure alarms, *see* Pt 6, Ch 2, 15.6, including 15.6.8 for grouping.
- Gyrocompass failure.
- Watch safety system failure.
- Failure of any power supply to the distribution panels referred to in 4.4.1.

4.1.3 Audible signals are to be designed not to startle operators. Suitable types are shown in Table 9.4.1.

Table 9.4.1 Suitable audible signals

Type	Typical characteristics	Considerations
Buzzer	Low intensity and frequencies	Good alerting in quiet environment without startling
Bell	Moderate intensity and frequencies	Penetrates low frequency noise well, abrupt onset has a high alert value
Chime	Moderate intensity and frequencies	Good in quiet environment, non-startling
Tone	Moderate intensity and limited frequency range	Convenient for intercom transmission, high alert value if intermittent

4.1.4 In the event that any alarm initiated by navigation equipment on the navigating bridge has not been acknowledged on the bridge within a period of 30 seconds, a visual and audible alarm is to be initiated immediately to warn the appointed back-up navigator and/or the Master.

4.1.5 In the event that the alarm required by 4.1.4 is not acknowledged, the system is to initiate an alarm at the locations of further crew members capable of taking corrective actions following a time delay sufficient to allow the Master or back-up navigator to reach the bridge. The time interval is to be adjustable between 90 seconds up to a maximum of 3 minutes. In ships, other than passenger ships, the alarm to warn the further crew members may be initiated at the same time as the alarm to warn the Master and back-up navigator.

4.1.6 The functionality specified in 4.1.4 and 4.1.5 may be incorporated in the watch safety system required by 4.2, or in another fixed system.

4.2 Watch safety system

4.2.1 A watch safety system satisfying the requirements of the IMO Resolution MSC.128(75), *Performance standards for a bridge navigational watch alarm system* (BNWAS), and approved by the national administration is to be provided to monitor the well-being and awareness of the watchkeeper.

4.2.2 If, depending upon the shipboard work organisation, the backup navigator may attend locations not connected to the alarm transfer system, a wireless portable device is to be provided enabling both the transfer of alarms and two-way speech communication with the bridge. An audible warning from the portable device is to be provided in the event of loss of the wireless link with the bridge. Alternative arrangements will be considered.

4.2.3 Acknowledgement of any alarm is to automatically reset the time interval between warnings. Manual adjustment of controls may also be used for this purpose. Manual adjustment of controls and navigation equipment (*see also* 5.3.14) is to automatically reset the watch safety interval timer. Reset arrangements based on the detection of movement in the bridge are not considered to satisfy this requirement or to confirm well-being and watch-keeping awareness.

4.3 Communications

4.3.1 A telephone system is to be provided to enable two-way speech communication between the wheelhouse and at least the following locations:

- machinery control station space, *see* Pt 6, Ch 1,2.6.7;
- emergency steering position in the steering gear compartment;
- Master's and Navigating Officers' cabins, offices, mess and public rooms.

4.3.2 The bridge is to have priority over the system.

4.3.3 A list of extension numbers is to be clearly displayed adjacent to each telephone.

4.4 Power supplies

4.4.1 Local distribution panels are to be provided for all items of electrically operated navigational equipment, the telephone system, the watch safety system and the clear view systems. These panels are to be supplied by two exclusive circuits, one fed from the main source of electrical power and one fed from an emergency source of electrical power. Each item of equipment is to be individually connected to its distribution panel. The power supplies to the distribution panels are to be arranged with automatic changeover facilities between the two sources, *see also* Pt 6, Ch 2,15.7. Failure of any power supply to the distribution panels is to initiate an audible and visual alarm. This alarm should be included in the ship's alarm system, as required by Pt 6, Ch 1,4.2, where applicable.

4.4.2 The watch safety system and the telephone system are to remain operational during blackout conditions.

4.4.3 Following a loss of power which has lasted for 45 seconds or less, all navigation functions are to be readily re-instated. In this respect, all navigational equipment is to recover within five minutes, with minimum operator intervention, by virtue of the emergency source and, where necessary, an uninterruptible power source.

■ *Section 5* Integrated Bridge Navigation System – IBS notation

5.1 General

5.1.1 Where it is proposed that the bridge navigation functions are so arranged as to form an integrated bridge system, the requirements of 5.2 to 5.6 are to be complied with.

5.2 General requirements

5.2.1 For assignment of the notation **IBS**, in addition to satisfying the other requirements of this Section:

(a) the layout of the bridge and the equipment located on the bridge is to satisfy the requirements of a relevant international or national ergonomic or human-centred design Standard or an acceptable equivalent; or

(b) the notation **NAV1** is also to be assigned and the layout of the bridge and the equipment on the bridge are to satisfy the requirements Sections 1 to 4; or

(c) where the bridge is not intended to operate a periodic one man watch, the layout of the bridge and the equipment on the bridge are to satisfy the requirements of Sections 1 to 4, with the exception that the requirements of 4.3 may be relaxed.

5.2.2 Where 5.2.1(a) is applicable, the submissions required by 1.2.1 are to include evidence demonstrating satisfaction of the requirements of an identified relevant Standard.

5.2.3 To satisfy 5.2.2, the evidence submitted is to:

(a) be submitted to LR for assessment, including identification of testing necessary to verify compliance in the submitted test schedules; or

(b) include relevant statutory documentation demonstrating compliance with the relevant identified standard to the satisfaction of the National Administration. Such documentation is to be submitted prior to the assignment of the **IBS** notation. This may necessitate co-ordination of classification and statutory Surveys, particularly for new construction, before the **IBS** notation may be assigned.

5.2.4 Where 5.2.1(c) is applicable, the submissions required by 1.2.1 are to include plans and information for the consideration of LR which demonstrate that the applicable requirements of Sections 1 to 4 have been satisfied.

5.2.5 The design features for computer hardware, local area networks and software required by Pt 6, Ch 1,2.10, 2.11, 2.13 and 2.14 respectively are to be complied with. Alarms and warnings associated with hardware and data communication are to be incorporated in the centralised alarm system required by 4.1.

5.2.6 Failure of a part of the integrated bridge navigation system is not to affect other parts except for those that directly depend upon the information from the defective part. Following such a failure, it is to be possible to operate each other part of the system separately.

5.3 Equipment

5.3.1 Two independent gyrocompasses are to be available to provide heading information to the system. The heading signal from each gyrocompass is to be continuously available for display and for providing input to all relevant items of navigational equipment.

5.3.2 Only one gyrocompass is to be used by the integrated bridge system at any time for main display and control purposes. The navigating officer is to be able to switch between compasses at any time. The non-selected compass is to be used automatically as the independent heading source for the off-course warning required by 3.1.9.

5.3.3 It is to be possible to compare readings from each gyrocompass via the navigation workstation displays.

5.3.4 Automatic comparison between the gyrocompasses is to be provided and an alarm given if the difference between heading signals exceeds a pre-set value.

5.3.5 The capability to receive and utilise differential GPS corrections (or an equivalent) is to be included in the integrated bridge system.

5.3.6 As a minimum, the following information is to be displayed at the navigation workstation via visual display units:

- Steering mode.
- Gyro heading.
- Course to steer.
- Rate of turn.
- Rate of turn order.
- Speed and distance (from log and from GPS).
- Speed order.
- Waypoint bearing, distance and ETA.
- Water depth and alarm setpoint.
- Position fix from each available system.
- Main propulsion and thruster indication, *see* Pt 6, Ch 1,2.6 and Pt 5, Ch 7,5.3.
- Steering indication, *see* Pt 5, Ch 19,5.
- Wind speed and direction.
- Time, *see* 3.2.2.

5.3.7 Additional information such as machinery monitoring, fire detection, cargo control, etc., may also be provided via additional pages on the visual display units.

5.3.8 The centralised alarm system and the watch safety system required by 4.1 and 4.2 respectively are to be incorporated as functions of the integrated bridge system and are to be presented to the navigating officer via the conning display. The presentation and display of alarms and warnings is not to mask, obscure or degrade essential information displayed to aid navigational functions and maintain awareness of the navigational information, *see also* 5.5.

5.3.9 A route planning capability is to be provided by the integrated bridge system. This is to allow a voyage to be pre-planned as a series of waypoints and turn radii. It is to be possible to edit a voyage plan at any time without affecting route control and monitoring.

5.3.10 An automatic track following capability is to be provided in conjunction with the pre-planned route. The position fix used by the system is to be based at least upon GPS or equivalent, and is to be cross-checked by dead-reckoning, based upon speed over ground provided by the ship's log. In areas where differential corrections are available, it is to be possible to utilise these in the track following system.

5.3.11 In the event of failure of the track following capability, the current heading or rate of turn is to be maintained until manually altered by the navigating officer. The quality of position fix input to the system is to be monitored, *see also* 3.1.10 and 4.1.2.

5.3.12 The integrated bridge system is to incorporate a display, which combines simultaneously the ECDIS high resolution colour representation of a nautical chart with a continuously updated record of own ship's position, pre-planned track, and radar targets in the vicinity. The entire tactical situation is to be displayed for the navigating officer in such a way that any risk from approaching, overtaking or crossing vessels may be assessed. Factors affecting the vessel's freedom to manoeuvre, such as water depths, channel boundaries, separation zones and other traffic are to be shown on the display.

5.3.13 The following alarms are to be provided and included in the centralised alarm system specified by 4.1.1:

- Off-track.
- Waypoint approaching, *see* 3.1.10.
- Position fix inaccurate/lost.
- Loss of heading input.
- Loss of log input.
- Equipment or sub-system failure.
- Gyro mis-match.

5.3.14 Manual adjustment of any of the facilities of the integrated bridge system is to reset automatically the watch safety interval timer.

5.4 Operator interface

5.4.1 Integrated display and control functions are to adopt a consistent man-machine interface philosophy and strategy. Particular consideration is to be paid to symbols, colours, controls, and information priorities.

5.4.2 The size, colour and density of text and graphic information displayed on a visual display unit is to be such that it may be read easily from the normal operator position under all operational lighting conditions.

5.4.3 Means are to be provided for the manual adjustment of the brightness of each visual display unit.

5.4.4 All information is to be presented on a background of high contrast, emitting as little light as possible by night.

5.4.5 Paged displays are to be presented in a way which allows the operator to find quickly the information needed. An overview page is to be easily available to remind the operator of the paging system.

5.4.6 Pages are to have a standardised format. Particular types of information and functional areas should be presented in a consistent manner, e.g. in the same position on different pages.

5.4.7 Each page is to have a unique identifying label on the screen.

5.4.8 Keyboards are to be divided logically into areas enabling rapid access to a desired function. Alphanumeric, paging and specific system keys are to be grouped separately and grouping is to be identical at all operator interfaces.

5.4.9 Soft keys may be used for display control and operation of systems non-critical to the safe operation of the vessel, otherwise dedicated controls are to be used.

5.4.10 Functions requested by the operator are to be acknowledged and confirmed by the system on completion.

5.4.11 Interfaces are to incorporate the capability for operators readily to decline or override automatic ship control functions critical to safe operation. *See* Pt 6, Ch 1,1.2.2 regarding submission of information on safety functions and overrides.

5.4.12 Default values, where applicable, are to be indicated by the system when requesting operator input.

5.4.13 If an input error is detected by the system, it is to allow the operator to correct the error immediately.

5.4.14 The system is to require confirmation from the operator for critical actions, e.g. they should not rely on single keystrokes.

5.4.15 Input error messages are to guide the correct responses, e.g.:

use Invalid entry: re-enter set point between 0 and 10

not Invalid entry.

5.4.16 All functions of the integrated bridge system are to remain available in the event of a single failure of an operator interface. This is to be achieved through redundancy in the integrated bridge system interfaces.

5.5 Alarm management

5.5.1 All alarms provided on the bridge are to be included in the centralised alarm system required by 4.1.1.

5.5.2 In general, the alarm system is to be in accordance with Pt 6, Ch 1,2.3, *A.1021(26) Code on Alerts and Indicators, 2009* and MSC.302(87) *Performance Standards for Bridge Alert Management*.

5.5.3 Alarm management on priority and functional levels is to be provided within the integrated bridge system. Alarms and other alerts are to be prioritised according to the urgency and type of response required by the bridge team, as follows:

(a) **Emergency alarms** – alarms which indicate that immediate danger to human life, or to the ship and its machinery exists and that immediate action must be taken.

(b) **Alarms** – conditions requiring immediate attention and action by the bridge team:
- to avoid any kind of hazardous situation and to maintain the safe operation of the ship, including escalation of unacknowledged warnings; or
- alerts which indicate that a caller is in distress or has an urgent message to transmit.

(c) **Warnings** – conditions or situations which require immediate attention for precautionary reasons, to make the bridge team aware of conditions which are not immediately hazardous, but may become so.

(d) **Cautions** – awareness of a condition which still requires attention out of the ordinary consideration of the situation or of given information.

5.5.4 Appropriate alarm management is to be provided. This includes prioritisation, distribution and recording of alarms and other alerts as required.

5.5.5 Within each priority, alerts are to be arranged in groups, in order to reduce the quantity of information presented to the operator. More detailed information on the group alarm is to be readily available from the integrated bridge system on request.

5.5.6 Group alarms may be arranged on the bridge to indicate machinery faults, but alarms associated with faults requiring speed or power reduction or the automatic shutdown of propulsion machinery are to be identified by separate group alarms or by individual alarm parameters.

5.5.7 The following alarms are not to be grouped:
- Emergency alarms.
- Separate group alarms associated with faults requiring speed or power reduction or the automatic shutdown of propulsion machinery.
- Steering gear alarms.
- Navigation light power supply failure alarms, *see* Pt 6, Ch 2,15.6.8.

5.5.8 Alerts are to be displayed in order of priority. Within the priorities, alerts are to be displayed in the order in which they occur. The visual display units are to provide immediate display of new information, regardless of the information display page currently selected. This may be achieved by provision of a dedicated alert monitor, a dedicated area of screen for alerts or other suitable means.

5.5.9 Unacknowledged alarms are to be distinguished by either flashing text or a flashing marker adjacent to the text, and not merely by a change of colour. Acknowledged alarms are to be distinguished by either steady illuminated text or a steady illuminated marker adjacent to the text.

5.5.10 The centralised alarm system is to be capable of displaying at least 20 items simultaneously. There is to be a clear and unambiguous indication that there are additional items requiring attention when the display does not show all active alerts simultaneously, and it is to be possible to display the additional messages and to return to the display containing the highest priority items by single operator actions.

5.5.11 Alerts are to be acknowledged individually. It is to be possible temporarily to silence all audible signals with a single operator action.

5.5.12 The characteristics of audible warning and, where provided, caution signals are to be such that it is possible to differentiate these from audible alarm signals.

5.6 Power supplies

5.6.1 All equipment forming part of the integrated bridge navigation system is to be regarded as navigational equipment and, as such, is to have power supplies in accordance with 4.4.

■ *Section 6* Trials

6.1 General

6.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, tests are to be carried out to ensure satisfactory operation of the navigational equipment. These tests are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are based on the approved test schedule as required by 1.2.1.

6.1.2 For **IBS** Notation, testing at the manufacturer's works and trials on board are to be carried out that cover the individual components and their interaction; and the bridge functions and their integration to form the Integrated Bridge System.

6.1.3 Two copies of the test schedule, signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed on board the ship and the other submitted to LR.

6.1.4 Acceptance tests and trials for Programmable Electronic Systems are to include verification of software lifecycle activities appropriate to the stage in the system's lifecycle at the time of system examination.

Section

■ *Section 1* General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to ships where the class notation **CRC** 'carriage of refrigerated containers' is requested.

1.1.2 This notation may be applied to any ship which has the ability to carry refrigerated containers. The requirements of this Chapter cover refrigerated containers stowed on deck as well as in a hold space. A descriptive notation may be assigned in addition to the **CRC** notation giving details of electrical power and type of cargo.

1.1.3 The requirements are additional to the classification requirements for ships contained in other applicable parts of the Rules.

1.1.4 Ships which comply with the requirements of this Chapter will be eligible for the applicable class notation specified in Pt 1, Ch 2,2.6.

1.1.5 An example of a typical class notation for a container ship classed with LR, fitted with a ventilation system built under Special Survey and fitted with electrical plug-in points for deck stowed refrigerated containers, would be:

✠ **CRC 230/140** to maintain 230 hold-stowed and 140 deck-stowed refrigerated containers operating at their design condition with a 24 hour average external ambient air temperature of 35°C.

1.1.6 An example of a typical class notation for a reefer ship classed with LR, fitted with electrical plug-in points for deck stowed refrigerated containers, would be:

✠ **CRC -/110** to maintain 110 deck-stowed refrigerated containers operating at their design condition with a 24 hour average external ambient air temperature of 35°C.

1.1.7 In addition to any class notation, an appropriate descriptive notation may be assigned to provide additional information about the ship's ability to carry refrigerated containers.

1.1.8 An example of a typical descriptive notation, which may be assigned in addition to the class notation, would be:

crc 2,800 kW provided with a power generating capacity of 2,800 kW dedicated to supplying the container plug-in points.

crc 60%/40% stowage ratio of 60% deep frozen and 40% chilled cargoes

1.1.9 These Rules do not cover any requirements for alarm and monitoring systems that may be fitted to container refrigeration units.

1.2 Novel arrangement and designs

1.2.1 Where the proposed ventilation arrangement is novel in design, or the ventilation system involves the use of an arrangement different from that specified in the following sections, special tests may be required and a suitable descriptive note may be assigned.

1.2.2 The carriage of refrigerated containers in the hold spaces of ships other than dedicated container ships will be given special consideration. The **CRC** and descriptive notations will be assigned provided that the ventilation system is approved, installed and tested in accordance with the requirements of this Chapter.

1.2.3 Where a dedicated fresh water circulation system is installed to supply cooling water to containers fitted with an optional water cooled condenser, the fresh water system will also need to comply with the relevant Sections of Pt 5, Ch 12 of the Rules.

1.3 Definitions

1.3.1 **Balanced ventilation system** means a ventilation system consisting of a combination of forced draught and induced or natural draught, to produce a pressure condition in the hold space approximately equal to atmospheric pressure.

1.3.2 **Blackout** means that the main and auxiliary machinery installations, including the main power supply, are out of operation but the services for bringing them into operation (e.g. compressed air, starting current from batteries, etc.) are available.

1.3.3 **Container cell** means the position of an individual container. This is usually within a set of vertical cell guides and is normally enclosed by transverse stringers located above and below the container.

1.3.4 **Container electrical power supply** means the generated power supply which is dedicated to supplying the total number of refrigerated containers and the hold ventilation system fan motors.

1.3.5 **Container plug-in point** means an electrical socket located at each applicable container location on deck and each cell location below deck being in accordance with Annex L of ISO 1496-2: 1996.

1.3.6 **Design conditions** means the lowest design internal container temperature and the design maximum hold space temperature.

1.3.7 **Hold space** means an enclosed space containing refrigerated containers. The containers are usually restrained within cell guides. For hatch coverless ships, hold space means the space below the hatch coamings.

1.3.8 **Independent ventilation system** means a ventilation system that is in no way connected to another ventilation system and there is no provision available to allow connection to another ventilation system.

1.3.9 **Refrigerated container** means a standard container with a self-contained refrigeration system, located within the outer dimensions of the container, which can be driven by electrical power fed from an external power supply. The refrigeration system may be either a 'clip-on' or an integral type of cooling unit.

1.3.10 **Stack factor** means the ratio of the actual heat flowing into the containers forming the stack, to the heat which would flow into the same containers if all their surfaces were completely exposed to the hold temperature.

1.3.11 **Standard container** means a forty-foot equivalent unit (FEU) standard production container constructed in compliance with LR's *Container Certification Scheme*, or another recognised Container Certification Scheme in accordance with ISO 1492/2 requirements. The container may be of the normal or 'high-cube' type.

1.3.12 **Stowage ratio** means the proportion of deep-frozen cargo in relation to banana or chilled cargoes. Unless specifically stated, the stowage ratio will be deemed to be 50 per cent deep-frozen and 50 per cent chilled cargo.

1.3.13 **Ventilation system** means a forced ventilation arrangement using mechanical fans to supply and/or extract air from the hold space.

■ *Section 2* **Plans and documentation**

2.1 General

2.1.1 The following plans and information regarding the hold ventilation systems and the electrical supplies to container plug-in points are to be submitted in triplicate for appraisal before construction is commenced:

(a) **Plans of ventilation arrangements**:
- Location and installation details of each hold space ventilation system showing duct arrangement and sizes.
- Details of all mechanical ventilation fans including locations, number, duty at design conditions and power consumption.
- Details of air inlets including number, type, size and locations.
- Details of air outlets including number, type, size and locations.
- Details and locations of dampers and flaps, if applicable.

(b) **Plans of hold spaces**:
- Refrigerated container stowage plans, including sectional elevation and plan views.
- Design pressure or vacuum in each hold space.
- Details of hatch cover sealing arrangements.
- Personnel access arrangements.
- Details and locations of hold temperature measurement sensors.
- Details of any pressure/vacuum safety valves if applicable.

(c) **Ventilation throughput**:
- Specified air throughput rate and proposed method of measurement.
- Design temperature rise in the hold space and corresponding diurnal external ambient air temperature and relative humidity.
- Schematic arrangement of the ventilation system showing proposed air volume and velocity at junctions.

(d) **Plans of deck-stowed containers**:
- Refrigerated container stowage plans, including sectional elevation and plan views.
- Details of access arrangements for maintenance and monitoring of refrigeration units fitted to deck-stowed containers.

(e) **Hull structure**:
- Details of associated openings through the hull structure are to be submitted.

(f) **Electrical**. In addition to the applicable requirements of Pt 6, Ch 2,1.2, the following information and plans specific to the container plug-in points and ventilation system are to be submitted:
- Power supply arrangements to the deck stowed refrigerated containers.
- Power supply arrangements to the hold space stowed refrigerated containers.
- Power supply arrangements to the ventilation system.
- Single-line diagram of the ventilation system. This is to include rating of motors, insulation type, size and current loading of cables and make, type and rating of protective devices.

- A schedule of normal operating loads of the ventilation system estimated for the design conditions expected.

(g) **Control equipment**. In addition to the applicable requirements of Pt 6, Ch 1,1.2, the following information and plans specific to the ventilation system are to be submitted:
- Line diagram of control circuits.
- List of monitored, control and alarm points.
- Locations of control panels and consoles.
- Details of alarm system, including location of control panel and audible and visual warning devices.

(h) **Testing**:
- Details of the testing and commissioning programme, including instrumentation to be used, are to be submitted.

■ *Section 3* Ventilation and hold temperature

3.1 Ventilation system

3.1.1 Means are to be provided to maintain the hold space at an acceptable temperature. This can be achieved by either; the direct removal of the waste heat from the refrigerant equipment of each container, or by the dissipation of the waste heat using large quantities of external ambient air. In each case the system is to be arranged in such a way as to minimise its effect on the hold space temperature. This may be accomplished by the use of a ventilation system of a mechanical supply and/or extract type.

3.1.2 The selection of a maximum allowable hold temperature is to be agreed between the designer and Operator/Owner. Whilst the recommendations given in these Rules do not stipulate a maximum allowable hold temperature, generally it should not exceed 45°C dry bulb. Guidance should be sought from container manufacturers on the maximum allowable ambient air temperature. When determining the maximum allowable hold temperature, the maximum number of refrigerated containers within the hold space, operating at their design condition, is to be taken into consideration.

3.1.3 The ventilation system is to have sufficient capacity to remove or dissipate the heat from each designated refrigerated container cell and maintain the hold temperature at or below the maximum allowable hold temperature.

3.1.4 The volume of air to be supplied or exhausted from a hold space per refrigerated container is at the discretion of the ventilation system designer. For guidance purposes, an indication of the amount of air required for a standard FEU having an air cooled condenser operating at the example notation as stated in 1.1.5 is as follows:

Simple supply only system	90 m^3/min
Supply and exhaust duct system	75 m^3/min
Sealed exhaust system	37 m^3/min

3.1.5 The design of the hold space is to be compatible with the type of ventilation system proposed. For example, for supply and ducted exhaust systems, the semi enclosure of each stringer level may be beneficial. For a simple supply only system the provision of multiple gratings in each stringer level would benefit the free circulation and removal of warm air.

3.1.6 Only container cells served by the ventilation system are to be used for the transportation of refrigerated containers.

3.1.7 The design heat rejection for each container cell and the total hold space heat rejection, including any heat imparted from the ventilation system fans, if applicable, are to be stated. Guidance on heat rejection values which may be used is given below.

3.1.8 The minimum quantity of air supplied or extracted for each container cell and for each hold space is dependent on the type of system proposed and to be stated.

3.1.9 The ventilation system designer is to stipulate the maximum allowable back pressure occurring within the hold space. Due regard needs to be given to this value when selecting the ventilation fans and their ability to operate efficiently again the proposed maximum back pressure. The lower the back pressure, the more efficient the system and, hence, the lower the electrical power requirement to drive the fan motors for a given air throughput.

3.1.10 For supply air systems, the air outlet at each container location is to be such as to provide a flow of air towards the container's integral refrigeration system. Consideration should be given to the use of movable spigot outlets or ducting to allow both standard and high-cube containers to be stowed in any location.

3.1.11 The positions of supply air inlets and exhaust air outlets are to be such as to reduce the possibility of short-cycling. An adequate distance is to be maintained between inlet and outlet vents on the open deck.

3.1.12 The effect of warm exhaust air on deck-stowed refrigerated containers is to be taken into consideration. Similarly, the effect of warm exhaust air from deck-stowed refrigerated containers on the inlet air to the hold is to be considered.

3.1.13 Arrangements are to be provided to permit a rapid shutdown and effective closure of the ventilation system in each hold space in case of fire.

3.1.14 Ventilation ducts which penetrate the deck and/or hatch coaming, including dampers and/or closures, are to be made of steel and their arrangement is to be to the satisfaction of the relevant Administration. The use of non-metallic flexible ducts, local to each container location, will be acceptable provided the material demonstrates suitable low flame spread characteristics.

3.2 Heat balance

3.2.1 The amount of heat absorbed from the hold space by each container, which is used to determine the design air change rate, is to be stated.

3.2.2 The heat gain or loss from all adjacent spaces, such as fuel oil tanks, ballast tanks, engine room, etc., is to be stated.

3.2.3 The heat rejection from the refrigeration unit of a standard TEU or FEU container when working at low temperature (minus 18°C), chill temperature (2°C) and banana carriage temperature (13°C), used to determine the design air change rate, is to be stated. The following FEU values may be used for guidance purposes:

Frozen cargo (minus 18°C/38°C)	7,0 kW
Chill cargo (2°C/38°C)	10,0 kW
Banana cargo (13°C/38°C)	13,0 kW.

3.2.4 The above heat rejection values are for the container during normal operation after the cooling down period of a non-precooled cargo.

3.2.5 The stowage ratio, for the carriage of containers at different internal temperatures, which is used to determine the design air change rate, is to be stated.

3.2.6 When an extraction ventilation system is proposed, a stack factor of 0,9 may be used in the heat balance calculations. If a ventilation system using supply air only is proposed, then no stack factor can be allowed.

3.3 Fan redundancy

3.3.1 A single supply or exhaust fan is not to be used for multiple container stack locations.

3.3.2 Individual container cells may be fed by a system having a single mechanical fan or fans to supply and/or extract air.

3.3.3 Installed standby fans are not required. However, a minimum of one replacement fan, or fan blade assembly and motor, of each size is to be carried onboard. Fans are to be arranged to enable each to be replaced whilst the remaining systems remain in operation.

3.4 Hull structures

3.4.1 Special consideration will be given to installations using hull spaces for air distribution, rather than dedicated ductwork.

3.4.2 Consideration is to be given to measures to prevent ingress of water into air inlets and exhaust outlets, where applicable.

■ *Section 4* Electrical, including container plug-in sockets

4.1 General

4.1.1 In addition to the requirements of Pt 6, Ch 2, the following are to be complied with:

(a) Electrical power for the ventilation system is to be provided by one or more separate feeder circuit(s) from the main switchboard.

(b) Under sea-going conditions, the number and rating of service generators are to be sufficient to supply all container plug-in socket outlets and the hold space ventilation system in addition to the ship's essential services, when any one generating set is out of action.

4.1.2 The choice between a low (440 V) or high (6,600 V) distribution system serving the container plug-in point is considered a purely commercial decision. Consideration needs to be given to the fault level of the generating equipment selected and the total generating capacity of the ship. Independent of the system voltage, only the dedicated plug-in socket outlet kW value will be stated in the notation.

4.1.3 Where a distribution system exceeding 1000 V a.c. is employed, the plug-in socket outlets for each hold space may be fed from a local transformer and the following are to be complied with:

(a) Transformers are to be fed from individual circuits divided between different sections of the main switchboard.

(b) The electrical power for the ventilation system may be fed locally from each transformer.

4.1.4 Container plug-in socket outlets are to comply with the requirements of Pt 6, Ch 2,13.6.

4.2 Plug-in socket outlet supply transformers

4.2.1 A standby transformer serving the container plug-in socket outlets is to be provided. However, if the CRC notation is not assigned, then there is no specific requirement covering the installation of a standby power supply.

4.2.2 If a standby transformer is to be provided, then the exact requirements are open to interpretation and consideration should be given to the contents of IACS Unified Interpretation SC 83 with regard to the equipment provided.

4.3 Container plug-in socket outlets

4.3.1 The distribution and sub-circuit cabling for the container plug-in socket outlets is to be rated at the full load capacity (maximum rated capacity).

4.3.2 Groups of container plug-in socket outlets may be fed from a number of independent sub circuits.

4.3.3 Sub circuits are to be able to be individually switched, thus allowing a sequential start up after a prolonged (12 hours) blackout. A suitable procedure is to be proposed and approved that takes into consideration the requirements of 4.4 in addition to the requirements of Pt 6, Ch 2.

4.4 Generated power for plug-in socket outlets

4.4.1 When determining the dedicated generating power for the plug-in socket outlets, the electrical power drawn by the refrigeration unit of a standard TEU and FEU refrigerated container when working at both low temperature (minus 18°C) and chill temperature (2°C), is to be stated.

4.4.2 The following values for various cargoes operating at normal design conditions may be used for guidance purposes:

4.4.3 Twenty foot equivalent unit (TEU):

Frozen cargo (minus 18°C/38°C)	5,5 kW
Chill cargo (2°C/38°C)	7,5 kW
Banana cargo (13°C/38°C)	*see* 4.4.5

4.4.4 Forty foot equivalent unit (FEU) including high-cube containers:

Frozen cargo (minus 18°C/38°C)	8,5 kW
Chill cargo (2°C/38°C)	11,0 kW
Banana cargo (13°C/38°C)	*see* 4.4.5

4.4.5 If the Owner, charterer or operator has operational data indicating that, for the ship's specific trade (for example banana only cargoes), the power provision for the refrigerated containers requirements exceeds those stated above, then these higher values should be substituted and submitted for consideration.

4.4.6 The above values are for the container during normal operation after the cooling-down period of a non-pre-cooled cargo.

4.4.7 An overall diversity factor may be applied to the container's total power requirement. Consideration is to be given to Pt 6, Ch 2,5.6. This diversity factor is to be applied to all refrigerated container cell locations. For guidance purposes, the diversity factor is not generally to be less than 0,75.

■ *Section 5* Instrumentation, control and alarm systems

5.1 General

5.1.1 The alarm system is to indicate failure of each independent ventilation system in each hold space. If a balanced ventilation system is proposed, indication of failure for each individual part is to be given. The alarm system may be integral with the machinery space alarm system or, if fitted, the refrigerated container monitoring system.

5.1.2 Alarms are to be initiated in a manned location. Where alarms are displayed as group alarms in the main machinery space alarm system, provision is to be made to identify individual alarms at a separate control panel.

5.1.3 Alarms are to give both an audible and visual warning.

5.2 Hold space temperature monitoring

5.2.1 A minimum of two temperature sensors are to be provided in each hold space carrying refrigerated containers. The sensors are to be positioned to give an indication of the mean air temperature occurring in the hold space used for the carriage of refrigerated containers. Sensors are to be positioned so as not to be directly affected by warm air from the condensers.

5.2.2 The hold temperature is to be continually monitored. Temperatures are to be recorded, either automatically or manually as a hold temperature log. If temperatures are to be logged manually, then the mean temperature in each hold space is to be recorded.

5.2.3 If the mean hold space temperature rises above the design maximum, then an alarm is to be initiated.

5.3 Container refrigeration system alarms

5.3.1 These Rules do not cover any requirements for alarm and monitoring systems fitted to containers. It is acceptable to utilise the container power supply cables to transmit signals to a suitable receiver or data logger.

■ *Section 6* Hold access and maintenance access arrangements

6.1 Hold pressure/vacuum

6.1.1 The maximum permitted pressure or vacuum that may occur in the hold space is to be stated. It is proposed that a value, in accordance with the contents of Pt 3, Ch 1,9.6.4, may be considered as a maximum value. An over-pressure of 0,15 bar may be used for guidance purposes. If the ventilation system is capable of producing a positive pressure or vacuum in excess of the design allowable figure, then means are to be provided to protect the hold space against the effect of over pressure or vacuum. If axial supply fans are proposed, even if aerofoil fan blades are fitted, it is unlikely that the fans will be able to produce a pressure above 0,025 bar (250 mm water gauge).

6.1.2 If required, consideration is to be given to the use of a pressure or vacuum relief device or other arrangement set to operate below the maximum allowable hold pressure or vacuum.

6.1.3 The proposed pressure or vacuum relief device for each hold space is to be of adequate size.

6.2 Hold access arrangements

6.2.1 Suitable means are to be provided to allow personnel safe access to each hold space when the ventilation system is in operation. Consideration is to be given to the possible over pressure or partial vacuum that may occur in the hold space. The use of an airlock arrangement may need to be considered.

6.3 Maintenance access arrangements

6.3.1 Free access to each applicable container cell and hold space is to be provided to allow replacement of refrigeration equipment in the event of failure or malfunction.

6.3.2 Adequate access is to be provided to allow plugging in, data recording or retrieval and general maintenance of all deck- and hold-stowed refrigerated containers. Suitable means are to be provided to allow the removal of the compressor and electric motor from each refrigerated container.

6.3.3 Suitable safe access is to be provided to each tier of deck-stowed refrigerated containers to allow electrical connection, monitoring and maintenance. The use of fixed platforms, such as lashing bridges, should be proposed where possible.

■ *Section 7* Water cooler refrigeration units

7.1 Cooling water system

7.1.1 A minimum of two independently operated circulation pumps are to be installed. One of the pumps may be used for other services, such as a general service pump.

7.1.2 The capacity of each pump should be sufficient to supply each container at the required flow rate with an excess capacity of at least 10 per cent. This required flow rate should be obtained from the container manufacturer.

7.1.3 The fresh water system is to provide sufficient flow and even distribution to each container location. This is to be achieved using all possible combinations of fresh water pumps and dedicated refrigerated container cells.

7.1.4 The temperature of the cooling water is to be maintained in accordance with the container manufacturer's recommendations.

7.1.5 Flexible hoses are to be utilised for connecting the water supply and return pipes. The connectors on the ends of the flexible hoses are to be of a type that self-closes on disconnection. Adequate valves are to be provided to allow isolation of each cargo hold sub-circuit in the event of a leak or pipe fracture.

7.1.6 A minimum of two fresh-water to sea-water heat exchangers are to be provided. Each is to be rated at 100 per cent of the required cooling duty at the notation conditions. The second heat exchanger may be a standby or part of a common central system such as that used for main engine cooling duties. The heat exchangers are to be supplied by a minimum of two separate sea-water pumps.

7.1.7 If metal pipes are used, the contents of Pt 5, Ch 12,10.8 are to be given due consideration.

■ *Section 8* Deck-stowed refrigerated containers

8.1 General

8.1.1 Consideration is to be given to the effect of the warm air discharged from the condenser of each deck-stowed refrigerated container. When refrigerated containers are stowed on only two tiers high, it is considered that the warm air from each condenser is dissipated without any undue effect on adjacent containers.

8.1.2 If containers are to be carried three or more tiers high, then consideration is to be given to limiting the effect of short-cycling warm discharge air within the central section of the stack. The proposed method or methods for dealing with this effect are to be stated. Possible options would include reserving the central cells of each stack for non-refrigerated containers, to reduce the block effect or providing fans and ductwork to supply ambient temperature air to the bottom of each vertical stack. Trials of any proposed system are to be undertaken.

8.1.3 Any adverse effect that the warm air discharged from the hold space ventilation system has on the deck stowed refrigerated containers is to be minimised. Similarly, the warm air discharged from the deck stowed refrigerated containers is to be shielded from entering the hold space ventilating system.

Section 9 Inspection and testing on completion

9.1 General

9.1.1 On completion of construction and all appropriate safety checks, the acceptance tests prescribed in 9.2 are to be carried out. Their purpose is to verify the correct functioning of the installation and its ability to maintain the air throughput required for the assignment of the intended class notation.

9.1.2 The proposed test schedules, including methods of testing and details of the test equipment to be provided are to be submitted to LR before the tests commence. The proposed test methods are to be appropriate for the design of the system installed and are to include such acceptance criteria as:

(a) Volume of air to be supplied and/or exhausted at each container cell location.
(b) Maximum allowable deviation from this air volume.
(c) Maximum allowable pressure within the hold space when the system is under normal operating conditions.

9.1.3 Trials of the air distribution system within the hold spaces are to be witnessed by LR surveyors before the ship is put into service and prior to the **CRC** notation certificate being issued. These trials are to be in addition to any tests which may have been carried out whilst commissioning the system.

9.2 Acceptance tests

9.2.1 The acceptance tests (*see also* 9.2.2 and 9.2.3) are to comprise the following:

(a) Control and alarm systems are to be tested to demonstrate that they operate correctly, *see also* Pt 6, Ch 1,2.3.
(b) The accuracy, calibration and functioning of all instrumentation is to be verified.
(c) For supply air systems: Verification of each supply fan's output when running at maximum speed. Verification of the air discharge rate and operation of any distribution arrangements at each individual container cell location. During the test, all supply fans serving the hold space are to be operated simultaneously, thus replicating normal operating conditions. If a common or multiple supply fan distribution system is fitted, then the arrangements are to be verified; firstly, with all supply fans in operation and, secondly, with any one fan out of action.
(d) For exhaust air systems: Verification of each exhaust fan's output when running at maximum speed. The volume of air being extracted from each individual container cell location is to be verified with each exhaust fan running at maximum speed. All exhaust fans serving the same hold space are to be operated simultaneously thus replicating normal operating conditions.
(e) For combined supply and exhaust air systems: Verification of each supply and exhaust fan's output when both are running at maximum speed. The volume of air being supplied and extracted from each individual container cell location is to be verified. All fans serving the same hold space are to be operated simultaneously thus replicating normal operating conditions.
(f) If the supply and/or exhaust ductwork is prefabricated and installed in one piece testing at the manufacturer's works may be accepted provided the following are considered:
    - Any change in the supply and/or exhaust fan(s) output due to differences in electricity supply.
    - Any de-rating of the fan throughput due to a back pressure or partial vacuum occurring within the hold space during normal operating conditions.
    - Verification of the test results is to be undertaken in a single hold space.
(g) Where the air volume required to meet the class notation cannot be verified during testing for practical reasons, assignment of the notation is to be deferred until it is demonstrated that the system is able to achieve the specified air throughput within each hold space during a loaded passage.

9.2.2 Where a number of identical fan and ductwork installations are constructed and fitted within each hold space, the acceptance trials required in 9.2.1 need only be carried out in two separate hold spaces, provided that the results are satisfactory.

9.2.3 Where the same system is installed on a number of identical sister ships for the same Owner and by the same shipyard, the testing in accordance with 9.2.1 will only be required on the first ship of the series, provided that the results are satisfactory.

9.2.4 The effect of exhausting warm hold space ventilation air on the operation of the integral air-cooled condensers of deck stowed containers is to be established under normal operational conditions. The discharge from hold space discharges is to be suitably modified if necessary.

9.3 Testing of cooling water system

9.3.1 Cooling water piping that is welded *in situ* is to be hydraulically strength tested at 1,5 times the design pressure, but in no case less than 3,5 bar g.

9.3.2 A distribution test is to be carried out to ensure that even fresh water distribution to each container as well as sufficient flow is achieved. As the fresh water system may be somewhat complicated, this test should be carried out with care, using all possible combinations of fresh water pumps installed.

9.3.3 If required, the distribution test can be carried out without containers, utilising flexible hoses for connecting the water supply and return pipes together. The return valves should be partly closed or flexible pipe may be crimped to represent the condenser pressure drop. Water flow meters are to be installed at the highest and the lowest container levels to verify equal water flow.

9.3.4 The capacity of each pump should be measured by a flow meter with an accuracy of ±3 per cent. Alternatively, this capacity could be obtained from the manufacturer's curves if the static pressure difference across a pump under test conditions is measured.

9.3.5 Sea-water pumps and heat exchangers are normally subjected to a functional test only.

■ *Section 10*
Spare gear

10.1 General

10.1.1 Adequate spares, together with the tools necessary for maintenance or repair of the ventilation systems are to be carried. The spares are to be determined by the Owner according to the design and intended service.

10.1.2 A minimum of one replacement fan, or complete fan impeller and motor assembly for each size fitted is to be carried onboard.

10.1.3 The maintenance of the spares is the responsibility of the Owner.

■ *Section 1* General requirements

1.1 Application

1.1.1 This Chapter contains requirements for the control of operational pollution.

1.1.2 Compliance with this Chapter is optional. An LR classed ship meeting the requirements of this Chapter will be eligible for **ECO** class notation, which will be recorded in the *Register Book*.

1.1.3 Additional requirements may be imposed by the National Administration with which the ship is registered and/or by the Authority within whose territorial jurisdiction it is intended to operate. Where such additional requirements are relevant to the ship, compliance with those Regulations is the responsibility of the Owner. If specifically requested, Lloyd's Register (hereinafter referred to as 'LR') may provide suitable certification or statement of compliance.

1.1.4 LR is to be advised of any matter that relates to the environmental performance of the ship that would affect the assignment of the **ECO** class notation.

1.2 ECO class notation: minimum requirements and additional characters

1.2.1 Section 2 states the minimum requirements to be met for assignment of the **ECO** notation.

1.2.2 Section 3 contains additional requirements. Ships complying with these requirements will be eligible for one or more of the following associated supplementary characters, as applicable:

A	Anti-fouling coatings.
BIO	Bio-fouling.
BWT	Ballast water treatment.
CRM	Cargo residue minimisation.
EEDI-1, **EEDI-2**, **EEDI-3**	Energy efficiency design index.
SEEMP, **EnMS**	Ship energy efficiency management
GW	Grey water.
IBTS	Integrated Bilge Water Treatment System
IHM	Inventory of hazardous materials.
NOx-1, **NOx-2**, **NOx-3**	Nitrogen Oxides (NO_x) exhaust emissions.
OW	Oily bilge water.
P	Protected oil tanks.
R	Refrigeration systems.
SOx, **DIST**	Sulphur Oxides (SO_x) exhaust emissions.
TC	Enhanced tank cleaning.
VECS-L, **VOC-R**	Vapour emission control systems (tankers only).

1.3 Transfer of class ships

1.3.1 A ship classed with another IACS class society that transfers to LR class will be eligible for the class notation **ECO(TOC)** if it holds the previous society's environmental class notation at the time of the transfer of class. However, ships with **ECO(TOC)** notation are not eligible for any of the supplementary characters listed in 1.2.2.

1.3.2 To maintain the **ECO(TOC)** notation a ship must implement and maintain the operational procedures listed in 1.5.4, as applicable.

1.4 Definitions

1.4.1 The following definitions are applicable:

- **Animal carcasses** means the bodies of any animals that are carried on board as cargo and that die or are euthanised during the voyage.
- **Antifouling Convention** means the International Convention on Control of Harmful Antifouling Systems on Ships. This Convention prohibits the use of organotin anti-fouling systems on ships and was adopted by the International Maritime Organization (IMO) in October 2001.
- **Ballast Water Convention** means the International Convention for the Control and Management of Ships' Ballast Water and Sediments. This international legislation was developed by the IMO to regulate discharges of ballast water and reduce the risk of introducing non-native species from ships' ballast water.
- **Cargo Residues** means the remnants of any cargo which is not covered by other Annexes to MARPOL and which remains on the deck or in holds following loading or unloading, including loading and unloading excess or spillage, whether in wet or dry conditions or entrained in wash water. This does not include cargo dust remaining on the deck after sweeping or dust on the external surfaces of the ship.
- **Cooking oil** means any type of edible oil or animal fat used or intended to be used for the preparation or cooking of food. This does not include the food that is prepared using these oils.
- **Domestic wastes** mean all types of wastes not covered by other Annexes that are generated in the accommodation spaces on board the ship. Domestic waste does not include grey water.
- **Garbage** means all kinds of food wastes, domestic wastes and operational wastes, all plastics, cargo residues, cooking oil, fishing gear, and animal carcasses generated during the normal operation of the ship and is liable to be disposed of continuously or periodically, except where those substances are defined or listed in other Annexes to MARPOL. Garbage does not include fresh fish and parts thereof which are generated as a

result of fishing activities undertaken during the voyage, or as a result of aquaculture activities which involve the transport of fish, including shellfish for placement in the aquaculture facility and the transport of harvested fish, including shellfish from such facilities to shore for processing.

- **Geometric mean** means the *n*th root of the product of *n* numbers.
- **Grey water** is drainage from dishwater, galley sink, shower, laundry, bath and washbasin drains and does not include drainage from toilets, urinals, hospitals, and animal spaces, as defined in Regulation 1.3 of MARPOL Annex IV and does not include drainage from cargo spaces.
- **Incinerator ashes** means ash and clinkers resulting from shipboard incinerators used for the incineration of garbage.
- **Leakage detection system** means a calibrated mechanical, electrical or electronic device for detecting leakage of refrigerant gases which, on detection, alerts the operator.
- **MARPOL** or **MARPOL 73/78** is the International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978.
- **Operational wastes** means all solid wastes (including slurries) not covered by other Annexes that are collected on board during normal maintenance or operations of a ship, or used for cargo stowage and handling. Operational wastes also include cleaning agents and additives contained in the cargo hold and external wash water. Operational wastes do not include grey water, bilge water, or other similar discharges essential to the operation of a ship, taking into account the guidelines developed by the Organisation.
- **Operator** means the natural or legal person exercising actual power over the technical functioning of the equipment and systems.
- **Refrigerant system log book** means a method of maintaining a record of maintenance, calibration, refrigerant charging, leak detection, recovery, etc. The log book may take the form of a stand-alone book, a series of log sheets or form part of the engine room log.
- **SEEMP** means a Ship Energy Efficiency Management Plan, and is a ship-specific manual which aims to improve the energy efficiency of ship operations.
- **Thermotolerant coliforms** is the group of coliform bacteria which produce gas from lactose in 48 hours at 44,5°C. They are also referred to as ‘faecal coliforms’; however, the term ‘thermotolerant coliforms’ is now accepted as more appropriate, since not all of these organisms are of faecal origin.
- **VECS** means vapour emission control system.
- **VOC** means volatile organic compound.

1.5 Information to be submitted

1.5.1 The following are to be submitted:

(a) One copy of every Certificate listed in 1.5.3.
(b) Two copies of the Operational Procedures listed in 1.5.4.
(c) One copy of all plans and information listed in 1.5.5.

1.5.2 For existing ships the certificates, information and plans listed in 1.5.3 to 1.5.5 are to be submitted for approval prior to the **ECO** Initial Survey for assignment of the **ECO** notation, *see* 4.1.1. For new ships, information and plans listed in 1.5.3 and 1.5.5 are to be submitted for approval prior to the **ECO** Initial Survey. However, the operational procedures listed in 1.5.4 may be submitted up to six months after the ship enters into service.

1.5.3 Certificates:

(a) MARPOL certificates or statements on behalf of the ship’s Flag State, including:
- Engine International Air Pollution Prevention (EIAPP) Certificate or Statement of Compliance with the NO_x emission requirements of MARPOL Annex VI for each engine to which Regulation 13 applies;
- International Energy Efficiency Certificate.

(b) Safety Management Certificate (SMC) and Document of Compliance (DOC) in accordance with the International Safety Management Code (ISM Code).
(c) Incinerator Type Approval Certificate or equivalent, as required by 2.9.2.
(d) TBT-free anti-fouling system certificate.
(e) Sewage system and, where fitted, sewage treatment system statement of compliance with the requirements of USCG 33 CFR 159 and/or MARPOL 73/78 Annex IV.
(f) Vapour emission control system certificate or statement of compliance with the requirements of USCG 46 CFR 39 or the IMO Standards for Vapour Emission Control Systems (MSC Circular 585) (oil tankers carrying crude oil only).
(g) VOC reducing device Type Approval Certificate or equivalent as required by (supplementary character **VOC-R**).
(h) ISO 50001 (Energy Management) Certificate, issued by an accredited organisation (supplementary character **EnMS** only).

1.5.4 Operational procedures:

(a) Procedures to be adopted to ensure that the ship’s NO_x certification is maintained.
(b) Oil fuel management for the control of SO_x emissions.
(c) Refrigerant management including adding and recovering refrigerant charge, leak detection and sample log book.
(d) Retention and disposal of spilled or spent foam, chemical or liquid based fire-fighting media, as applicable.
(e) Oil pollution prevention measures.
(f) Garbage management.
(g) Sewage treatment and discharge control.
(h) Precautionary measures to minimise the transfer of non-native organisms in ballast water.
(j) Ballast Water Management Plan (all ships).
(k) Ship Energy Efficiency Management Plan.
(l) Vapour management plan (tankers carrying crude oil only).
(m) Grey water treatment or holding and discharge (supplementary character **GW** only).
(n) Procedures for maintaining the inventory of hazardous materials (supplementary character **IHM** only).

1.5.5 Information and plans:

(a) SERS registration number or statement of membership of alternative scheme from IACS Member service provider.
(b) Details of engine make and model, rated power, rated speed and duty cycle for all installed engines falling within the scope of MARPOL Annex VI, Regulation 13.
(c) Description of the method(s) by which the NO_x certified value has been achieved. The supplementary characters (**NOx-1** and **NOx-2**) and NO_x Technical File for the engine plus NO_x reducing device (**NOx-3** supplementary character). .
(d) Details and location of each permanently installed refrigeration system (including those used for cargo temperature control, air conditioning, provision rooms and chiller units).
(e) Mass of refrigerant charge in each system and the refrigerant designation (e.g., R-134a) in accordance with ISO 817.
(f) Refrigerant plant general arrangement drawing showing number and locations of the refrigerant leak detectors.
(g) Details of fire-extinguishing media to be used in fixed fire-fighting systems and portable extinguishers.
(h) Bilge holding, waste oil and sludge tank capacities and piping arrangements.
(j) Arrangements of non-cargo oil loading and discharge connections together with associated drip trays and drainage systems.
(k) Oil fuel storage, settling and service tank high level alarms/overflow systems.
(l) Cargo and ballast tank arrangements (tankers only).
(m) Cargo and ballast piping system plans, including cargo tank overfill prevention arrangements (tankers only).
(n) Arrangements of tanker cargo manifolds together with associated drip trays and drainage systems.
(o) Details of sewage treatment and handling systems.
(p) Capacity of sewage holding and/or treatment system.
(q) Maximum numbers of crew and passengers.
(r) Details of incinerator arrangements, as applicable, associated piping systems, control and monitoring equipment.
(s) Hull coating system.
(t) Ballast water treatment arrangements, as applicable (for supplementary **BWT** character only).
(u) Energy Efficiency Design Index Statement of Compliance or certificate (supplementary characters **EEDI-1**, **EEDI-2** and **EEDI-3** only).
(v) Details of grey water treatment plant and effluent quality (for supplementary **GW** character only).
(w) Inventory of Hazardous Materials Statement of Compliance.
(x) Arrangements for protected oil tanks (for supplementary **P** character only).
(y) Shadow area diagrams (supplementary character **TC** only).
(z) Details of self-contained vapour recovery systems, where fitted, required for **VOC-R** character; for tankers carrying crude oil as applicable (*see* 2.13.2); and for **VECS-L** character as applicable (*see* 3.16.3).
(aa) LR Statement of SEEMP conformance and associated documentation (supplementary character **SEEMP** only).
(ab) Any information relating to the environmental performance of the ship, which may influence the assignment of the **ECO** notation.

1.6 Alterations and additions

1.6.1 When an alteration, amendment, deletion or addition to the approved arrangements and procedures is proposed, appropriate details are to be submitted for approval.

■ *Section 2*
Minimum requirements

2.1 General

2.1.1 It is a prerequisite for assignment of the **ECO** notation that the ship:

(a) complies with the Anti-fouling Convention, the Ballast Water Convention, except as modified by 2.12.4, and all Annexes to MARPOL 73/78, as amended, applicable to the ship;
(b) has a valid Safety Management Certificate (SMC), in accordance with the ISM Code issued by the Flag State Administration with which the ship is registered or a duly authorised organisation complying with Resolution A.739(18) and authorised by the National Authority with which the ship is registered; and
(c) is enrolled in LR's Ship Emergency Response Service (SERS) or the equivalent scheme of another IACS Member.

2.1.2 Where a ship, by virtue of its gross tonnage, is not required by the MARPOL Convention to have MARPOL Certification, the following are to be maintained:

(a) An Oil Record Book in accordance with MARPOL Annex I.
(b) A garbage management plan and record book in accordance with MARPOL Revised Annex V.

2.1.3 Where a ship, by virtue of its gross tonnage, is not required by the Antifouling Convention to have certification, an antifouling system (AFS) declaration in the format shown in Appendix 2 of Annex 4 to the Convention is to be maintained onboard.

2.1.4 Where a ship, by virtue of its gross tonnage is not required to have a SMC, it is exempt from 2.1.1(b).

2.1.5 High speed craft, as defined in LR's *Rules and Regulations for the Classification of Special Service Craft,* will be the subject of special consideration.

2.1.6 Offshore supply vessels that are less than 100 m in length, as per MSC 235(82), are exempt from the requirement to be enrolled in LR's Ship Emergency Response Service (SERS) or the equivalent scheme of another IACS member.

2.2 Nitrogen oxides (NO_x)

2.2.1 These requirements apply to all installed diesel engines with an individual output power greater than 130 kW, other than those used solely for emergency purposes on the ship on which the engine is installed. There are no specific requirements relating to NO_x emissions from boilers, incinerators or gas turbine installations.

2.2.2 All engines falling within the scope of MARPOL Annex VI, Regulation 13 are to comply with its provisions and meet the NO_x emission limits applicable to the date of constr uction of the ship or, where relevant, the engine installation date.

2.2.3 **EIAPP** certification or Statement of Compliance is to be issued by, or on behalf of, the Flag State.

2.2.4 Alternative arrangements providing an equivalent level of environmental protection will be considered.

2.3 Sulphur oxides (SO_x)

2.3.1 Emissions of SO_x are to be controlled by limiting the sulphur content of oil fuels used on board.

2.3.2 The maximum sulphur content of oil fuel to be used on board is not to exceed 3,00 per cent m/m.

2.3.3 Where the grade of fuel normally used cannot be obtained with the appropriate fuel sulphur level, then a better grade of fuel meeting this requirement will need to be purchased.

2.3.4 An oil fuel management system is to detail the maximum sulphur content to be specified when ordering oil fuels and the means adopted to verify that the sulphur content of oil fuels supplied meets that requirement. This management system is to include the practices to be adopted to ensure that appropriate low sulphur oil fuels are used when the ship is within IMO designated 'Emission Control Areas established for SO_x and particulate matter control' and/or the jurisdiction of other local, national or regional 'SO_x Emission Control regimes' as applicable.

2.3.5 Where testing to determine the sulphur content of fuel received on board is to be carried out, a representative sample is to be drawn at the time of delivery from the ship's bunker manifold using the manual or automatic sampling methods defined in ISO 3170 or 3171, or their national respective equivalents. Fuel sulphur content is to be subsequently determined using the laboratory test method ISO 8754-2003: *Determination of sulphur content – Energy-dispersive X-ray fluorescence spectrometry*.

2.3.6 Alternative arrangements providing an equivalent level of environmental protection will be considered. If an exhaust gas cleaning system is fitted, it is to be certified to MPEC.184(59).

2.4 Energy management

2.4.1 A Ship Energy Efficiency Management Plan (SEEMP) is to be retained on board according to the provisions of Regulation 22 of MARPOL Annex VI and subsequently be reviewed by LR.

2.4.2 The SEEMP is to be developed in accordance with MEPC.213(63) *Guidelines for the Development of a Ship Energy Efficiency Management Plan (SEEMP)*.

2.5 Refrigeration systems

2.5.1 These requirements apply to all permanently installed refrigeration and air conditioning installations on board. These requirements do not apply to stand-alone refrigerators, freezers and ice makers used in galleys, pantries, bars and crew accommodation.

2.5.2 The use of chlorofluorocarbons (CFCs) in existing, and hydrochlorofluorocarbons (HCFCs) in new, refrigeration or air conditioning installations is prohibited.

2.5.3 If halocarbon refrigerants are used, they are to have an Ozone Depleting Potential (ODP) rating of zero and a Global Warming Potential (GWP) of less than 1950, based on a 100-year time horizon.

2.5.4 Systems are to be arranged with suitable means of isolation so that maintenance, servicing or repair work may be undertaken without releasing the refrigerant charge into the atmosphere. Unavoidable minimal releases are acceptable when using recovery units.

2.5.5 For the purposes of refrigerant recovery, the compressors are to be capable of evacuating a system charge into a liquid receiver. Additionally, recovery units are to be provided to evacuate a system either into the existing liquid receiver or into cylinders dedicated for this purpose. The number of cylinders is to be sufficient to contain the complete charge between points of isolation in the system.

2.5.6 Where different refrigerants are in use they are not to be mixed during evacuation of systems.

2.5.7 Refrigerant leakage is to be minimised by leak prevention and periodic leak detection procedures. The frequency of leak detection and the maximum allowable annual leakage rate is dependent on the charge of each system and is specified in Table 11.2.1.

Table 11.2.1 Refrigerant leak testing – maximum periodicity

Charge size	Periodicity	Leakage
under 3 kg	6 months	10%
3–30 kg	3 months	10%
30–300 kg	Monthly	5%
Over 300 kg	Monthly	<3%

2.5.8 Records are to be maintained demonstrating that leak testing is carried out in accordance with the periodicity specified in Table 11.2.1 by qualified personnel holding relevant certification, using either direct or indirect measuring methods and calibrated instruments where applicable.

2.5.9 A leak detection system appropriate to the refrigerant is to be provided to monitor continuously the spaces into which the refrigerant could leak. An alarm is to be activated to give warning in a permanently manned location when the concentration of refrigerant in the space exceeds a predetermined limit, (25 ppm for ammonia; 300 ppm for halogenated fluorocarbons). Remedial measures to repair the leakage are to be implemented as soon as practicable after an alarm is activated. Each leak detection system is to be checked at least once every 12 months to ensure proper functionality. The system is to be maintained and calibrated in accordance with the manufacturer's recommendations and recorded in the log book.

2.5.10 Procedures for refrigerant management including adding and recovering refrigerant charge, leak detection and the means adopted to control the loss and leakage of refrigerants are to be established and implemented.

2.5.11 Refrigerant inventory and log book records are to be maintained covering:
(a) Refrigerant added to each system.
(b) Refrigerant leaks, including remedial actions.
(c) Refrigerant recovered and storage location.
(d) Refrigerant disposal including quantity and location.
(e) Details of personnel suitably experienced or with an applicable qualification for maintenance of the onboard refrigerant system(s), including relevant certification.

2.5.12 After a leak has been identified, repaired and recorded it is to be rechecked prior to the system entering normal service. All applications, independent of charge size, are to be checked for leakage within one month after a leak has been repaired to ensure that the repair remains effective.

2.5.13 Records demonstrating the implementation of the operational procedures specified in 2.5.10, as applicable, are to be maintained. These records are to be kept on board for a minimum period of three years, in a readily accessible form, and are to be available for inspection by LR Surveyors, as required.

2.5.14 A refrigerant log book is to be maintained for the lifetime of the system. It must record the quantity and type of refrigerant installed and the quantities added and recovered during servicing, maintenance and final disposal.

2.5.15 All personnel involved in the following activities must be suitably experienced or possess an applicable qualification:
(a) installation, servicing or maintenance of the refrigeration equipment covered by the **ECO** Notation;
(b) checking such equipment for any leakages of refrigerant gases; or
(c) repairing, or carrying out work to prevent, such leakages.

2.6 Fire-fighting systems

2.6.1 The use of halon or halo-carbons as the fire-extinguishing medium in fixed fire-fighting systems or portable extinguishers is not permitted.

2.6.2 Where foam concentrates or other chemical or liquid based fire-fighting media with the potential to cause environmental pollution are used, instructions and procedures are to be provided for the safe containment and disposal of spilled media and other contaminated products during routine maintenance and, where practicable, following emergency use.

2.7 Oil pollution prevention

2.7.1 All ships are to comply with the requirements of 2.7.2 to 2.7.12. In addition, tankers are to comply with the requirements of 2.8.

2.7.2 Drainage from machinery space bilges is to be discharged to sea in accordance with the requirements of MARPOL 73/78, Annex I or retained onboard for discharge ashore.

2.7.3 The oil-in-water content of the water discharged is to be less than 15 ppm. Oily bilge water is to be discharged through approved oil filtering equipment and a 15 ppm alarm combined with a device for automatically stopping any discharge to sea when the oil content in the discharge exceeds 15 ppm. Full records of all discharges are to be kept.

2.7.4 The loading or discharge connections and vent pipes/overflows associated with oil fuels, lubricating oils, hydraulic oils and other oils are to be fitted with drip trays. Drip trays fitted to loading or discharge connections are to be fitted with closed drainage systems except on tankers where alternative arrangements will be considered.

2.7.5 Oil fuel storage, settling and service tanks are to be fitted with high level alarms and/or acceptable overflow systems.

2.7.6 The tank arrangement and engine room management procedures are to ensure that any leakages and waste oil from machinery and equipment are collected prior to disposal ashore or incineration. At all times, there is to be sufficient capacity to store a complete lubricating oil charge from the largest engine used for propulsion or electrical generating purposes. The tank arrangement is to allow the lubricating oil charge subsequently to be renovated or to be discharged ashore.

2.7.7 For those ships which only operate on distillate fuel, the tank arrangements in 2.7.6 and sludge tanks may be combined to form a single tank. Where such a combined tank is fitted, the total capacity is to be equal to or greater than the aggregated total of the required individual tank capacities.

2.7.8 The bilge holding tank, the tank arrangements in 2.7.6 and the sludge tank are to be arranged to facilitate the periodic removal of accumulated sediments and other material.

2.7.9 Discharge piping systems to deck from the bilge holding tank, and the tank arrangements in 2.7.6, are to be separate from the oil fuel loading and transfer systems. Their piping systems are to be terminated with the standard discharge connections specified in MARPOL Annex I, Regulation 13.

2.7.10 Means are to be provided for the collection and recovery of any oil spilled on decks.

2.7.11 For ships delivered after 1 August 2010, fuel oil tanks with a capacity of greater than 60 m^3, except overflow tanks, are to be located in a protected location away from the ship's side or bottom shell plating. Tanks are to be located in accordance with the requirements relating to fuel oil tank protection given in MARPOL Annex I, Regulation 12A.

2.7.12 Procedures covering the handling of all oils and oily wastes are to be established and implemented. As a minimum, these are to cover:

(a) loading, storage and transfer of oil fuels, lubricants, hydraulic oil, thermal heating oil and drummed oil products;
(b) storage, transfer, discharge and disposal of oily mixtures contained in the ship's sludge, bilge holding and waste oil tanks and machinery space bilges;
(c) recovery of any oil spilled on decks.

2.8 Arrangements on ships carrying oil cargoes in bulk

2.8.1 The constructional requirements of MARPOL Annex I, Regulations 19 and 20 as applicable, are to apply to all oil tankers greater than 600 tonnes deadweight.

2.8.2 Cargo tanks are to be fitted with high level alarms and/or acceptable overflow systems.

2.8.3 The cargo area is to have arrangements to collect accidental outflow of oil under overfilling conditions. Accidental oil spills are to be discharged to a slop tank or collecting tank. These tanks are not be located in the double hull space.

2.8.4 Cargo tank ballasting arrangements and segregated ballast systems are to be connected to separate and distinct sea chests.

2.8.5 A non-return valve is to be provided to isolate the cargo piping system from the sea connections.

2.8.6 Cargo manifold connections are to be fitted with drip trays with closed drainage systems.

2.8.7 Cargo manifold terminal pieces are to be designed, where practicable, in accordance with the relevant Oil Companies International Marine Forum (OCIMF) Recommendations for tanker manifolds and associated equipment.

2.8.8 Procedures covering ship to ship transfer of bulk liquid cargoes are to be established for ships engaged in the transfer of oil cargo at sea (STS Operations as defined in MARPOL Annex 1 Ch 8 Regulations 40, 41 and 42). These are to be agreed with LR, and implemented.

2.9 Garbage handling and disposal

2.9.1 A garbage management plan, developed in accordance with IMO Resolution MEPC 201(62), is to be available and implemented. This plan, *inter alia*, shall include:

(a) identification of the sources of garbage;
(b) means of minimising garbage production;
(c) procedures for the safe and hygienic collection, segregation, storing, processing and disposal of garbage, including the use of the equipment (compactors, comminuters, incinerators or other devices) on board. These procedures are to cover all garbage generated during the normal operation of the ship. The disposal of the following materials is to be specifically covered:
    - Cargo residues.
    - Cargo associated wastes.
    - Waste oil.
    - Paint and painting materials.
    - Medical wastes.
    - Large metal objects such as oil drums and machinery components.
    - Ropes: metal, synthetic or natural fibre.
    - Rust/scale debris.
    - Ballast tank sediments.
    - Equipment containing refrigerants.
    - Plastic.
    - Food waste.
    - Cooking oil.
    - Domestic waste.
    - Fishing gear.
    - Operational waste.
    - Incinerator ashes.
    - Animal carcasses.

2.9.2 Where fitted, incinerators are to be designed and constructed in accordance with the requirements of IMO Resolution MEPC 76(40). A type approval certificate issued by LR, another IACS Member or the relevant Flag State Administration is to be provided. As an alternative, a Declaration of Conformity issued under the EU Marine Equipment Directive is acceptable.

2.9.3 Where incineration is to be carried out, procedures are to be developed and implemented, covering:

(a) operation, documentation and training in accordance with the requirements of MARPOL Annex VI, Regulation 16, irrespective of ship construction or incinerator installation date; and
(b) prevention of incineration within areas where incineration is prohibited by the Coastal State Administration.

2.9.4 Cargo residues are included in the definition of garbage within the meaning of revised Annex V, Regulation 1.9 and may be discharged in accordance with Regulations 4.1.3 and 6.1.2. However, cargo material contained in the cargo hold bilge water should not be treated as cargo residues if the cargo material is not harmful to the marine environment and the bilge water is discharged from a loaded hold through the ship's fixed piping bilge drainage system.

2.9.5 The discharge of cargo residues is to be based on the physical, chemical and biological properties of the substances and may require special handling not normally provided by reception facilities, although ports receiving such cargoes should have adequate reception facilities for all relevant residues, including when entrained in wash water.

2.10 Sewage treatment

2.10.1 Where fitted, the sewage treatment system is to be approved in accordance with MEPC Resolution 159(55). As an alternative, a Declaration of Conformity issued under the EU Marine Equipment Directive is acceptable.

2.10.2 The capacity of the sewage treatment system, is to be sufficient for the maximum number of persons on board. Where 'black water' only is treated, the minimum capacity is to be 115 litres/person/day for a conventional flushing system or 15 litres/person/day for a vacuum system. Where both 'black water' and 'grey water' are treated, an additional allowance of 300 litres per person, per day (made up from 85 litres of galley grey water, 40 litres of laundry grey water and 175 litres of cabin and domestic grey water) is to be made.

2.10.3 Procedures for the operation of a sewage treatment system, including the certification of performance, are to be established and implemented. Records are to be maintained of maintenance, repair, remedial work and disinfectant dosing rates.

2.10.4 The manufacturer's restriction on materials, which may be disposed of through the sewage treatment system, are to be clearly displayed at each input point.

2.10.5 The disinfectant dosing points of the sewage treatment system are to be readily accessible. Ready access is also to be provided for the taking of samples.

2.10.6 As an alternative to treatment, sewage and/or grey water may be retained on board. The sewage holding tank(s) and grey water holding tank(s) are to be of adequate capacity, taking into account the operation of the ship, the number of persons on board and other relevant factors (*see* guidance figures in 2.10.2). The tank is to be fitted with a visual contents gauge and a high level alarm.

2.10.7 Means are to be provided to aerate holding tanks to prevent the development of anaerobic conditions, taking into account MSC Circular 648.

2.10.8 Records are to be maintained detailing discharges from the holding tank. These are to include:

(a) the date, location and quantity of sewage discharged from the holding tank either ashore or at sea in accordance with MEPC Resolution.157(55);
(b) rate of discharge of raw sewage;
(c) distance from land and ship's speed, when sewage is discharged to sea.

2.10.9 Ventilation pipes from the sewage system are to be independent of other vent systems.

2.10.10 A suitable piping system from the sewage treatment system or holding tank is to be provided to allow discharge from the system/tank to shore reception facilities. The systems discharge pipe is to terminate with a standard discharge connection complying with the requirements of MARPOL Annex IV, Regulation 10.

2.10.11 Procedures for the cleaning and safe entry of sewage treatment systems and holding tanks, including the use of suitable personal protective equipment, are to be provided and implemented.

2.11 Hull anti-fouling systems

2.11.1 The application of anti-fouling systems containing TBT above the level specified in the Antifouling Convention is prohibited.

2.12 Ballast water

2.12.1 All ships carrying ballast water, to which the Ballast Water Convention applies, are to have on board, and to implement, a ballast water management plan approved by LR or by another IACS member.

2.12.2 The ballast water management plan is to meet the requirements of Regulation B-1 of the International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004 and encompass the recommendations in IMO Resolution MEPC 127(53).

2.12.3 For new ships intending to undertake ballast water exchange, the guidance on ballast water exchange design and construction standards within IMO Resolution MEPC 149(55) is to be taken account of, as far as practicable.

2.12.4 A ship should carry out ballast water exchange in accordance with the convention; however, a ballast water treatment system is not required to be installed and used until such time as required by Regulation B-3 of the Convention and the Convention has entered into force.

2.12.5 A ballast water record book is to be kept on board and is to be used to record all ballast water operations.

2.13 VOC management

2.13.1 Tankers carrying crude oil are required to develop and implement a VOC Management Plan in accordance with IMO Guidelines for the Development of a Volatile Organic Compound (VOC) Management Plan for tankers carrying crude oil (Resolution MEPC.185(59)) that has been approved by LR or by, or on behalf of, the ship's Flag State.

2.13.2 For all tankers carrying crude oil, a Vapour Emission Control System is to be fitted which has been designed and constructed in accordance with the requirements of USCG 46, CFR 39 or the IMO Standards for Vapour Emission Control Systems (MSC Circular 585). A Certificate or Statement of Compliance issued by LR or a competent Authority recognised by LR is to be provided. As an alternative, a self-contained Vapour Recovery System, which is of a type approved by LR and which achieves equivalent performance to the systems above, may be fitted.

■ *Section 3*
Supplementary characters

3.1 Hull anti-fouling systems – A character

3.1.1 For assignment of the **A** character, the anti-fouling system applied to the ship's hull is to be listed as biocide-free in the Lloyd's Register List of Approved Products.

3.2 Bio-fouling – BIO character

3.2.1 For the assignment of the **BIO** character, the ship is to have in place bio-fouling management plans, developed in accordance with IMO Resolution MEPC.207(62): 2011 *Guidelines for the Control and Management of Ship's Biofouling to Minimise the Transfer of Invasive Aquatic Species*. In addition, the Bio-fouling Management Plan is to be reviewed by LR for conformance with MEPC.207(62).

3.2.2 The ship is also to have on board a Bio-fouling Record Book in the format shown in Appendix 32 of MEPC.207(62) that contains at least the following:

- Details of the anti-fouling systems and operational practices used (where appropriate, as recorded in the Anti-fouling System Certificate), where and when it was installed, areas of the ship that are coated, its maintenance and, where applicable, its operation; dates and location of dry-dockings/slippings, including the date the ship was refloated, and any measures taken to remove bio-fouling or to renew or repair the anti-fouling system;
- The date and location of in-water inspections, the results of those inspections and any corrective action taken to deal with observed bio-fouling;
- The dates and details of inspection and maintenance of internal sea-water cooling systems, the results of those inspections, and any corrective action taken to deal with observed bio-fouling and any reported blockages; and
- Details of when the ship has been operating outside its normal operating profile, including any details of when the ship was laid-up or inactive for extended periods of time.

3.3 Ballast water treatment – BWT characters

3.3.1 Where a ballast water treatment system is installed, the character **BWT** will be assigned, provided that the treatment system is installed, utilised and approved in accordance with MEPC 174(58) or MEPC.125(53).

3.3.2 As an alternative to a system approved in accordance with MEPC.174(58) or MEPC.125(53), a system meeting the requirements of Regulation D-4 *Prototype Ballast Water Treatment Technologies* of the BWM Convention will be accepted.

3.3.3 A ballast water record book for the purpose of recording all ballast water operations and use of the treatment system is to be available on board and maintained.

3.3.4 New ships are to take account of the guidance on design and construction to facilitate sediment control within IMO Resolutions MEPC 150(55) and MEPC 206(62), as far as is practicable.

3.4 Cargo residue minimisation – CRM character

3.4.1 For assignment of the **CRM** character, cargo residue is to be minimised.

3.4.2 In accordance with MARPOL Annex II, Resolution 12.3, individual cargo tanks are not to retain more than 60 litres of residue in the tank and associated piping.

3.4.3 A performance test is to be conducted in accordance with appendix 5 of MARPOL Annex II and a record of the test results retained on board.

3.5 Energy Efficiency Design Index – EEDI-1, EEDI-2, EEDI-3 characters

3.5.1 For assignment of the **EEDI-1**, **EEDI-2** and **EEDI-3** characters, the 'attained' EEDI must be equal to or less than the applicable reference line.

3.5.2 The 'attained' Energy Efficiency Design Index is to be established in accordance with the 2012 Guidelines on the method of calculation of attained EEDI for new ships (MEPC.203(62)) and verified in accordance with LR's procedure for verifying EEDI values.

3.5.3 For ships constructed before 1 January 2015, the **EEDI-1** character will be assigned when the 'attained' EEDI is less than or equal to the EEDI Phase 1 requirement (i.e., 10 per cent less than the applicable reference line).

3.5.4 For ships constructed before 1 January 2020, the **EEDI-2** character will be assigned when the 'attained' EEDI is less than or equal to the EEDI Phase 2 requirement (i.e., 15 per cent less than the applicable reference line for general cargo ships and refrigerated cargo ships or 20 per cent less than the applicable reference line for other ship types).

3.5.5 For ships constructed before 1 January 2025, the **EEDI-3** character will be assigned when the 'attained' EEDI is less than or equal to the EEDI Phase 3 requirement (i.e., 30 per cent less than the applicable reference line).

3.6 Energy management – SEEMP and EnMS characters

3.6.1 For assignment of the **SEEMP** character, and in addition to the requirements specified in 2.4, a SEEMP is to be reviewed by LR to check that it is in alignment with the IMO *Guidelines for the Development of a Ship Energy Efficiency Management Plan (SEEMP)* (MEPC.213(63) and reflects industry guidelines as applicable. This is to be demonstrated by the LR SEEMP Statement of Conformance and associated documentation.

3.6.2 For the assignment of the **EnMS** character, certification under ISO 50001 (Energy Management) is to be issued by an accredited organisation and is to be applicable to the management and operation of the ship.

3.7 Integrated bilge water treatment system – IBTS character

3.7.1 These requirements apply to ships with an integrated bilge water system.

3.7.2 For assignment of the **IBTS** character, the ship is to have an integrated bilge water system designed and installed to meet the requirements of the *Revised Guidelines for Systems for Handling Oily Wastes in Machinery Spaces of Ships* and incorporating *Guidance Notes for an Integrated Bilge Water Treatment System (IBTS)* – (12 November 2008) contained in MEPC.1/Circ.642 & 643 as amended by MEPC.1/Circ. 676 & 760.

3.7.3 Ships are to have on board a Statement of Fact on Installation of an Integrated Bilge Water Treatment System (IBTS), issued by LR.

3.8 Grey water – GW character

3.8.1 For assignment of the **GW** character where a plant for the treatment of grey water is installed, the plant discharge effluent is to meet the standards specified in 3.8.2 or 3.8.3, as applicable. The **GW** character will also be assigned where grey water is retained onboard in dedicated holding tank(s) for discharge ashore, subject to the requirements specified in 3.8.4 to 3.8.9 being met.

3.8.2 Where it is not intended that the effluent is recycled or re-used for any purpose, the effluent of the grey water treatment plant is to meet the following standards:

(a) Thermotolerant coliforms:
The geometric mean of the thermotolerant coliform count of samples of effluent taken during a test period is not to exceed 100 thermotolerant coliforms/100 ml as determined by membrane filter, multiple tube fermentation or an equivalent analytical procedure.

(b) Total suspended solids:
- Where the equipment is tested onshore, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed 35 mg/l.
- Where the equipment is tested onboard the ship, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed the suspended solids content of the ambient (flushing) water used onboard plus 35 mg/l.
- The method of testing is to be as given in Resolution MEPC.159(55).

(c) Biochemical Oxygen Demand (BOD_5) and chemical oxygen demand (COD):
- The geometric mean of a 5-day Biochemical Oxygen Demand (BOD_5) is not to exceed 25 mg/l. The chemical oxygen demand (COD) is not to exceed 125 mg/l. Test methods are to be ISO 15705:2002 for COD and ISO 5815-1:2003 for carbonaceous BOD_5 or other internationally accepted equivalent test standards.

(d) pH: The pH of the samples of effluent taken during the test period is to be between 6 and 8,5.

(e) Zero or non-detected values: For thermotolerant coliforms, zero values are to be replaced with a value of 1 thermotolerant coliform/100 ml to allow the calculation of the geometric mean. For total suspended solids, BOD_5 and COD values below the limit of detection are to be replaced with one half the limit of detection to allow the calculation of the geometric mean.

3.8.3 Where it is intended that the effluent of the grey water treatment plant is to be re-used or recycled for any purpose, the effluent is to meet the potable water quality standards of the Flag or Port State Administration, as appropriate.

3.8.4 As an alternative to treatment, where grey water is retained onboard in dedicated holding tank(s) for discharge ashore the holding tank(s) is to be of adequate capacity taking into account the operation of the ship, the number of persons on board and other relevant factors. Each tank is to be fitted with a means to open the tank, means to verify visually the contents of the tank and a high level alarm. *See* 2.11.2.

3.8.5 Means are to be provided to aerate the tanks to prevent the development of anaerobic conditions, taking into account IMO MSC/Circ.648 *Guidelines for the Operation, Inspection and Maintenance of Ship Sewage Systems*.

3.8.6 Ventilation pipes from the grey water treatment system and, where provided, from holding tank(s) are to be independent of other ventilation systems.

3.8.7 A suitable piping system from the grey water treatment system or holding tank(s) is to be provided to allow discharge to shore reception facilities. The discharge pipe is to terminate with a standard discharge connection complying with the requirements of MARPOL Annex IV, Regulation 10. Any connection from the grey water system to the sewage discharge is to be via a screw down non-return valve.

3.8.8 Records of grey water treatment and/or discharge are to be maintained. A single record book may be utilised for both grey water and sewage records. Records detailing discharges from the holding tank(s) are to include:

(a) the date, location and quantity of grey water discharged from the holding tank(s) either ashore or at sea;
(b) rate of discharge of untreated grey water;
(c) distance from land and ship's speed, when untreated grey water is discharged to sea.

3.8.9 Procedures for the cleaning and safe entry of grey water treatment systems and holding tanks, including the use of suitable personal protective equipment, are to be provided and implemented.

3.9 Inventory of hazardous materials – IHM character

3.9.1 For assignment of the IHM character, the ship is to possess an inventory of hazardous materials in compliance with Regulation 5 of the *Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships*.

3.9.2 The inventory is to be independently verified by LR.

3.9.3 Procedures covering maintenance of the inventory of hazardous materials throughout the ship's life are to be established and implemented. The procedures are to address, *inter alia*, new installations containing hazardous materials specified in appendices 1 and 2 of the *Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships* and relevant changes in the ship's structure and equipment.

3.10 Nitrogen oxides – NOx-1, NOx-2, NOx-3 characters

3.10.1 For assignment of the **NOx-1** or **NOx-2** character, the total weighted value of NO_x emissions from all installed diesel engines defined within 2.2.1 is not to exceed 80 per cent of the total weighted NO_x emission limits specified in MARPOL Annex VI, Regulation 13.

3.10.2 The total weighted emission value for the ship (*WV*) is to be calculated as follows:

$$WV_{[ship]} = \frac{WAEV_{[cert]}}{WAEV_{[IMO]}}$$

where

$$WAEV_{[cert]} = \frac{\sum_{n=1}^{n} (NO_{x[cert]}.P}{\sum_{n=1}^{n} (P)}$$

$$WAEV_{[IMO]} = \frac{\sum_{n=1}^{n} (NO_{x[IMO]}.P}{\sum_{n=1}^{n} (P)}$$

n = the number of individual engines on board the ship
P = the rated power, in kW, of each individual installed engine
$NO_{x[cert]}$ = the certified NO_x emission value, in g/kWh, for each individual engine
$NO_{x[IMO]}$ = the NO_x emission limit value of each individual engine, in g/kWh, applicable at the date of construction of the ship, or installation date of the engine, as applicable, as specified in Regulation 13 of Annex VI to MARPOL.

3.10.3 For ships constructed before 1 January 2011, the **NOx-1** character will be assigned when:

$$\frac{WAEV_{[cert]}}{WAEV_{[IMO]}} \leq 0{,}80$$

For ships constructed on or after 1 January 2011, the **NOx-2** character will be assigned when:

$$\frac{WAEV_{[cert]}}{WAEV_{[IMO]}} \leq 0{,}80$$

3.10.4 For assignment of the **NOx-3** character, engines, as defined in 2.2.1, and any associated NO_x emission abatement systems are to be certified as meeting the Tier 3 NO_x emission limits specified in MARPOL Annex VI, Regulation 13.5.1.1.

3.10.5 Equipment and systems used to control NO_x emission levels are to:

(a) be arranged so that failure will not prevent continued safe operation of the engine;
(b) be operated in accordance with manufacturer's instructions;
(c) be designed, constructed and installed to ensure structure integrity and freedom from significant vibration;
(d) be designed to include adequate hatches for inspection and maintenance purposes; and
(e) be instrumented to record operation. Records of operation and the degree of control are to be maintained.

Alternative control arrangements will be given special consideration.

3.10.6 Procedures covering the use and maintenance of the equipment and systems used to control NO_x are to be established and implemented. Records are to be maintained which demonstrate the operation of the equipment and systems and the resultant level of NO_x emissions to the atmosphere.

3.10.7 Where engines constructed before 1 January 2000 are not certified in accordance with MARPOL Annex VI, the test procedure and measurement method are to be in accordance with either the Simplified Measurement Method or Direct Measurement and Monitoring Method given in Chapter 6 of the IMO NO_x Technical Code 2008.

3.10.8 Where engines are constructed on or after 1 January 2000, the NO_x emission value is to be established in accordance with the NO_x Technical Code 2000.

3.10.9 In the case where the individual engines are 'family' or 'group' engines, as defined in the NO_x Technical Code, the respective certified emission value is to be taken as that of the relevant Parent Engine.

3.11 Oily bilge water – OW character

3.11.1 For assignment of the **OW** character, all drainage from machinery space bilges is to be discharged ashore, except under exceptional circumstances.

3.11.2 Adequate capacity for storage of oily bilge water between discharges ashore is to be provided.

3.11.3 Alternatively, discharge to sea is permitted where it can be demonstrated that the oil-in-water content of the water discharged is less than 5 ppm.

3.11.4 The bilge alarm, set at 5 ppm, is to be recalibrated or retested every five years by the manufacturer or other acceptable alternative and full records of the recalibration or retesting are to be kept on board.

3.11.5 Full records of all discharges are to be kept.

3.12 Protected oil tanks – P character

3.12.1 For assignment of the **P** character, in addition to compliance with the requirements of 2.8.11, all oil fuel, lubricating oil and hydraulic oil tanks are to be located in a protected location away from the ship's side or bottom shell plating.

3.12.2 Oil fuel, lubricating oil and hydraulic oil tanks are to be located in accordance with the requirements relating to fuel oil tank protection given in MARPOL Annex I, Regulation 12A, paragraphs 6, 7 and 8. The performance standard specified in paragraph 11 of Regulation 12A will not be accepted.

3.12.3 Main engine lubricating oil drain tanks and fuel overflow tanks are excluded.

3.12.4 Arrangements providing equivalent protection will be given special consideration.

3.12.5 Suction wells may protrude below oil fuel tanks provided they are as small as possible and the distance between the tank bottom and the ship's bottom shell plating is not reduced by more than 50 per cent.

3.13 Refrigeration systems – R character

3.13.1 For assignment of the **R** character, natural substances are to be used as the refrigerants in all main refrigeration systems such as cargo systems, provision rooms and air conditioning.

3.13.2 Small factory-built refrigeration system(s) that use fluorinated refrigerants, having a Global Warming Potential (GWP) of less than 1950 are allowable.

3.13.3 The GWP value is based on the 100-year time horizon.

3.14 Sulphur oxides – DIST and SOx character

3.14.1 For assignment of the **DIST** character, ships must meet the requirements of LR's Descriptive Note **DIST(M, AB, I, IG)**, as applicable.

3.14.2 For assignment of the **SOx** character, all fuel used on board is to be:
(a) distillate with a sulphur content not exceeding 0,10 per cent m/m; or
(b) an alternative fuel or a hybrid fuel management solution which has a resulting sulphur content which is not to exceed 0,10 per cent m/m.

3.14.3 The sampling, fuel sulphur analysis methods and verification requirements stipulated in 2.3.4 and 2.3.5 are to be complied with.

3.14.4 Alternative arrangements providing an equivalent level of environmental protection will be considered for the assignment of the **SOx** character. If an Exhaust Gas Cleaning System is fitted, it is to be certified to MEPC.184(59).

3.15 Enhanced tank cleaning – TC character

3.15.1 For the assignment of the **TC** character, oil and chemical tankers are to be provided with tank washing equipment meeting the standards specified in 3.15.2 to 3.15.8.

3.15.2 Cargo tanks are to be served by individual pumps.

3.15.3 Permanent tank washing machines shall be type approved in accordance with the revised IMO Resolution A.446(XI) - *Revised Specifications for the Design, Operation and Control of Crude Oil Washing Systems*, and their method of support is to be acceptable to LR.

3.15.4 At the design stage the following minimum procedures are to be used to determine the area of the tank surface covered by direct impingement (longitudinals, brackets, stiffeners, ladders, pipework, corrugations on corrugated bulkheads and face plates can be ignored):
(a) using suitable structural plans, lines are set out from the tips of each machine to those parts of the tank within the range of the jets; or
(b) a pinpoint of light simulating the tip of the tank washing machine in a scale model of the tank are to be used.
Alternative methods of measurement will be considered.

3.15.5 Additional tank washing equipment, which may be portable, is also to be provided to enable washing of the shadow areas without the necessity to enter the tanks. The use of portable machines to wash the shadow areas is not to be undertaken where the last cargo in the tank has toxic or low ignition properties, reacts with water or has other properties specified in chapter 15 of the *International Bulk Chemical Code* which would prevent water washing or opening of the tank to allow the use of portable washing machines.

3.15.6 A back-up system to provide cleaning capability in the event of failure of one tank washing machine is to be provided.

3.15.7 Heating equipment is to be provided for a tank washing medium which achieves a minimum temperature of 85°C at the connection to the tank washing machine.

3.15.8 The effectiveness of the tank washing system is to be confirmed by tank inspections or other means as required by LR. The confirmation is to be carried out when the ship is in service. For ships fitted with crude oil washing system(s) the confirmation will be carried out as part of the MARPOL Annex **I** survey and need not be carried out separately.

3.16 Vapour emission control systems – VECS-L and VOC-R characters

3.16.1 Tankers carrying crude oil, petroleum products or chemicals having a flash point not exceeding 60ºC (closed-cup test) will be assigned the **VECS-L**, **VOC-R** character(s), provided the requirements of 3.16.2 and/or 3.16.3 respectively are complied with, as applicable.

3.16.2 For assignment of the **VECS-L** character, a vapour emission control system is to be fitted, which, in addition to 3.15.2, has been designed and constructed to meet the requirements for vapour balancing in accordance with USCG 46, CFR 39.40 for service vessels.

3.16.3 For assignment of the **VOC-R** character, a self-contained system capable of preventing vapour emission formation during loading is to be fitted. This vapour emission prevention system is to be of a type approved by LR and is to reduce vapour emission formation by at least 75 per cent (v/v) as compared to an equivalent ship to which no vapour emissions prevention system has been fitted.

■ *Section 4* Survey requirements

4.1 Initial Survey and Audit

4.1.1 Following satisfactory review of the plans and other information submitted, (*see* 1.5), an **ECO** Initial Survey is to be undertaken for ships under construction or in service.

4.1.2 At the **ECO** Initial Survey, the Surveyor is to be satisfied that the requirements of these Rules, including those relating to any requested supplementary characters, are complied with. The Surveyor is to verify that the hull and machinery arrangements are in accordance with the approved documentation. The installed equipment, together with associated control and alarm systems, is to be demonstrated under working conditions.

4.1.3 Following the successful completion of the Initial Survey, the **ECO** notation may be assigned to a ship. The **ECO** notation will be valid, in the first instance, until the first **ECO** Annual Survey. At the first Annual Survey, an audit of the operational procedures as required by these Rules is to be undertaken. Prior to the LR audit, the operational procedures must have been fully implemented and audited by the Operator and the applicable record books must contain in-service records for a period of at least 3 months.

4.1.4 Audits are to confirm by direct observation, examination of internal audit reports and scrutiny of records that each of the procedures has been implemented over the preceding period. It is also to be verified that:

(a) the required resources and equipment have been provided; and
(b) the ship's staff are aware of their duties and responsibilities, and can perform the assigned tasks.

4.2 Periodical Surveys and Audits

4.2.1 **ECO** Annual Surveys and Audits are to be held on all ships to which the **ECO** notation applies within three months of each anniversary of assignment of the full **ECO** notation.

4.2.2 At the **ECO** Annual Survey and Audit, the Surveyor is to be satisfied that the arrangements and equipment comply with these Rules and operating procedures have been implemented. As far as possible, the installed equipment, together with associated control and alarm systems, are to be demonstrated under working conditions. Additionally:
(a) where changes to arrangements or equipment fitted to meet the requirements of these Rules have been made, it is to be verified that these changes are in accordance with approved documentation; and
(b) records for the preceding 12 months are to be reviewed.

4.2.3 **ECO** Audits are to be undertaken in accordance with the requirements given in 4.1.4.

4.2.4 Where the periodical surveys and audits are not completed in accordance with 4.2.1, the **ECO** Notation will be suspended. Re-instatement will be subject to surveys being held appropriate to the age of the ship and the circumstances of the case.

4.2.5 Where the periodical surveys and audits identify non-conformances, the **ECO** notation will be suspended. Re-instatement will be as directed by the Classification Committee, appropriate to the circumstances of the case.

4.3 Change of company

4.3.1 Where the company (as defined in the ISM Code) changes, the **ECO** notation will be suspended.

4.3.2 The new company may adopt the previously approved procedures as required by these Rules or may compile new procedures.

4.3.3 Following implementation of the approved procedures, an audit, in accordance with the requirements in 4.1.3 and 4.1.4, is to be undertaken.

4.3.4 The **ECO** notation will be re-assigned following successful completion of the audit provided that the ship has a valid Safety Management Certificate (SMC) and the general requirements given in 2.1.1 are complied with.

Section

■ *Section 1* General requirements

1.1 Scope

1.1.1 These Rules set down the criteria for the assessment of the noise and vibration on ships and are applied in addition to the other relevant requirements of the *Rules and Regulations for the Classification of Ships* (hereinafter referred to as the Rules for Ships).

1.1.2 The requirements of this Chapter may be applied where no other statutory requirements exist.

1.1.3 These Rules provide for two alternatives:
(a) **Class Notations** which indicate that the ship has been assessed and complies with noise and vibration criteria in these Rules and that a periodic survey regime has been established for the lifetime of the ship.
(b) **Certificate of Compliance** which provides evidence that the ship has been assessed and found to comply with the noise and vibration criteria in these Rules.

1.1.4 Spaces that comply with the noise level limits specified in Table 12.2.4 and under Acceptance Numeral 3 in Tables 12.2.1 and 12.2.3, will meet the requirements of section 4 of IMO Resolution MSC.337(91), when measured in accordance with the requirements of Chapters 2 and 3 of that Resolution.

1.1.5 Spaces that comply with the noise level limits specified under Acceptance Numerals 1 and 2 in Tables 12.2.1 and 12.2.3, will achieve enhanced levels of passenger and crew comfort as applicable, when measured in accordance with the requirements of Chapters 2 and 3 of IMO Resolution MSC.337(91). All vessels can apply for *Acceptance Numerals 1 and 2.*

1.1.6 These Rules recognise existing National and International Standards and specify levels of noise and vibration currently achievable using good engineering practice. Compliance with these requirements will be assessed by review of procedures, inspection and measurement of the relevant parameters and pre-survey reviews. Inspections and measurements are to be conducted, witnessed or assessed by LR's Surveyors unless otherwise agreed by Lloyd's Register (hereinafter referred to as LR).

1.1.7 Accommodation comfort is a function of ship type and layout. These Rules address two types of ship:
(a) Passenger (e.g., cruise ships, ro-ro ferries).
(b) Cargo (e.g., container ships, tankers).

1.1.8 These Rules include levels of noise and vibration which should be verified by measurements following completion of the ship. It is recommended that the Builders undertake calculations of noise and vibration characteristics so that any potential problem areas can be identified and control measures implemented.

1.1.9 The sound pressure levels for audible alarms and public address systems fitted in accordance with other sections of the Rules are to satisfy IMO Resolution A.1021(26) *Code on Alerts and Indicators, 2009*.

1.2 Definitions

1.2.1 **Passenger spaces** are defined as all areas intended for passenger use, and include the following:
(a) Passenger cabins.
(b) Public spaces (e.g., restaurants, hospital, lounges, reading and games rooms, gymnasiums, corridors, shops).
(c) Open deck recreation areas.

1.2.2 **Crew spaces** are defined as all areas intended for crew use only, and include the following:
(a) Accommodation spaces (e.g., cabins, offices, mess rooms, recreation rooms).
(b) Work spaces.
(c) Navigation spaces.

1.2.3 **Noise level** is defined as the A-weighted sound pressure level measured in accordance with ISO 2923.

1.2.4 **Vibration level** is defined by the application of ISO 6954:2000:
The vibration level is defined as the overall frequency weighted r.m.s. value of vibration during a period of steady-state operation over the frequency range 1 to 80 Hz.

1.3 Class notations

1.3.1 The class notations described in 1.3.2 to 1.3.6 provide standards for noise and vibration levels in different spaces at the time of delivery and during the ships life if substantial changes to the machinery installation or interior arrangements are made.

1.3.2 The **PAC** (Passenger Accommodation Comfort), **CAC** (Crew Accommodation Comfort) and **PCAC** (Passenger and Crew Accommodation Comfort) notations are optional and are primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance, using these requirements as the basis for the assessment and a LR Certificate of Compliance issued (*see* 1.1.3(b) and 1.4).

1.3.3 The **PAC** notation indicates that the passenger accommodation meets the acceptance criteria whilst the **CAC** notation indicates that the crew accommodation and work areas meet the acceptance criteria. The **PCAC** notation indicates that the passenger and crew spaces both meet the acceptance criteria.

1.3.4 For ships which achieve the noise and vibration comfort standards specified in these Rules, the notation **PAC**, **CAC** or **PCAC** will be assigned.

1.3.5 Following the **PAC** or **CAC** notation, numerals **1**, **2** or **3** will indicate the acceptance criteria to which the noise and vibration levels have been assessed. In the case of the **PCAC** notation, two numerals will be assigned. The first will indicate the acceptance criteria for passenger accommodation, whilst the second will indicate the crew comfort criteria.

1.3.6 For particular vessels, impact insulation and transient noise in accordance with 2.5 and 2.6 together with any additional or more stringent noise and vibration criteria may be assessed within the scope of the notations where agreed between the Owner, Builder and LR.

1.4 Certificate of Compliance

1.4.1 A Certificate of Compliance records that a ship has been designed and constructed to satisfy the noise and vibration criteria contained in these Rules. This is to be confirmed by measurements and reporting in accordance with Sections 4 and 5.

1.4.2 A Certificate of Compliance is optional and if requested, any ship can be assessed for compliance using the Rule requirements as basis for assessment.

1.4.3 Where noise and vibration levels are at variance with those prescribed by these Rules, these will be added to the certificate for information purposes.

1.4.4 A Certificate of Compliance will be issued after the initial survey required by Section 6.

■ *Section 2*
Noise

2.1 Assessment criteria

2.1.1 Where a space is occupied by both passengers and crew, the more stringent of the relevant requirements apply unless agreed between the Builder and Owner and advised to LR.

2.2 Passenger accommodation and public spaces

2.2.1 Under test conditions specified in 4.2, the applicable noise levels specified in Table 12.2.1 should not generally be exceeded. *See* 2.2.3.

Table 12.2.1 Passenger ships – Maximum noise levels in dB(A)

Location		Acceptance Numeral 1	2	3
Passenger cabins:	Standard Superior	49 45	52 47	55 50
Public spaces:	Excluding shops Shops	55 60	58 62	62 65
Medical centre:		50	55	60
Theatre/auditorium		50	55	60
Open deck recreation areas (excluding swimming pools and similar)		67	72	72
Swimming pools and similar		70	75	75

NOTES
1. The levels may be exceeded by 5dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks.
2 The levels may be exceeded by 3dB(A) in accommodation above the propellers for three decks above the mooring deck.
3. The levels for open deck recreation areas refer to ship generated noise only. On open deck spaces the noise generated from the effects of wind and waves can be considered separately to limits agreed between the Builder and Owner and advised to LR for the trial conditions.

2.2.2 For cabins bordering discotheques and similar entertainment areas, the deck and bulkhead sound insulation is to be sufficient to ensure that the maximum cabin noise levels are not exceeded even when high external noise levels prevail.

2.2.3 Acceptance of noise levels greater than those specified in Table 12.2.1 may be considered where agreed between the Owner and Builder. Not more than 20 per cent of the passenger cabins, 30 per cent of the public spaces and 20 per cent of the crew cabins should exceed the relevant noise criteria by more than 3 dB(A).

2.2.4 Acoustic insulation of bulkheads and decks between passenger spaces is to be generally in accordance with the values of the weighted apparent sound reduction index R_w as given in Table 12.2.2, calculated using ISO 717/1. *See also* 2.2.6.

2.2.5 For the purpose of selecting acoustic sound insulation, the following sound noise levels may be used with the agreement of the Owner and Builder:

(a) Cabins – 80 dB(A).
(b) Dining Rooms – 85 dB(A).
(c) Corridors – 90 dB(A).
(d) Discotheques, Theatres, Entertainment Areas – 105 dB(A).

2.2.6 Acceptance of bulkhead and deck acoustic insulation values less than those specified in Table 12.2.2 may be considered where agreed between the Owner and Builder. Not more than 20 per cent of the interfaces tested should have airborne sound insulation indices, R_w, more than 3 dB(A) lower than the minimum specified values.

Table 12.2.2 Minimum air-borne sound insulation indices, R_w

Location		Acceptance Numeral		
		1	2	3
Passenger cabins:	Standard Superior	40 45	38 42	37 40
Cabin to corridor:	Standard Superior	38 42	36 40	34 37
Cabin to stairway:	Standard Superior	47 50	45 47	43 45
Cabin to public space (excluding corridors/stairwells and discotheques):	Standard Superior	52 55	48 50	48 50
Discotheques to cabins		60	60	60
Discotheques to stairwells and public spaces		52	52	52
Cabin to machinery rooms and engine casing		55	53	50

2.3 Crew accommodation and work areas

2.3.1 Under the applicable test conditions specified in 4.2, the noise levels specified in Tables 12.2.3 and 12.2.4 are not to be exceeded.

Table 12.2.3 Crew accommodation – Maximum noise levels in dB(A)

Location	Acceptance Numeral			
	1	2	3	
			Ships <10,000 grt	Ships ≥10,000 grt
Sleeping cabins, hospitals	50	53	60	55
Offices, conference rooms and day cabins	55	58	65	60
Mess rooms, lounges, reception areas and recreation rooms within accommodation	55	58	65	60
Recreation areas on open deck	67	72	75	75
Alleyways, changing rooms, bathrooms, lockers	70	75	75	75
NOTE The levels may be exceeded by 5dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks.				

Table 12.2.4 Crew work areas – maximum noise levels in dB(A)

Location	dB(A) level
Machinery space(continuously manned) e.g. stores	90
Machinery space(not continuously manned) e.g. pump, refrigeration, thrusters or fan rooms	110
Workshops and non-specified work spaces	85
Machinery control rooms	75
Wheelhouse	65
Look-out posts e.g., at bridge wing or window Additional limits: • 250 Hz band • 500 Hz band (measured according to IMO A.343(IX))	70 68 63
Radio room	60
Galleys and pantries: • Equipment not working • Individual items at 1 metre	 75 80
Normally unoccupied spaces (e.g. holds, decks)	90
Ship's whistle, on bridge or forecastle	110

2.3.2 Crew space insulation is to comply with the requirements of IMO Resolution MSC.337(91).

2.4 Maximum noise levels

2.4.1 Where the measured noise level exceeds the specified criterion by 3 dB(A), or contains subjectively annoying low frequency or tonal components, the noise rating (NR) number is to be established in accordance with the graph shown in Fig. 12.2.1. This is achieved by plotting the linear octave band levels on the graph; the NR number is that NR curve to which the highest plotted octave band level is anywhere tangent. The specified criterion may be considered satisfied if the NR number does not exceed the specified A-weighted value minus 5 dB(A).

2.4.2 Guidance on maximum acceptable sound pressure levels and noise exposure limits for crew spaces is given in IMO Resolution MSC.337(91).

2.5 Impact insulation

2.5.1 Where agreed between the Owner, Builder and LR, enhanced criteria for noise levels recognising the effects of impact sound pressures may be applied in accordance with 2.5.2 to 2.5.5.

2.5.2 For passenger and crew cabins located below or adjacent to dance floors, stages, aerobics and gymnasium areas, jogging tracks or other areas where impact noise is generated, the normalised impact sound pressure level measured within the cabins is not to exceed 45 dB.

2.5.3 For public rooms under dance floors, stages, aerobics and gymnasium areas, jogging tracks or other areas where impact noise is generated, the normalised impact sound pressure level within the space is not to exceed 55 dB.

2.5.4 For passenger cabins, the normalised impact sound pressure level, $L_{n,w}$, calculated using ISO 717/2, is to be generally in accordance with the values stated in Table 12.2.5. *See also* 2.5.5.

Table 12.2.5 Passenger cabins normalised impact maximum sound pressure level $L_{n,w}$

Location	dB
Below decks covered with carpet and soft materials	50
Below decks covered in hard materials (such as wood, marble or similar)	60
Below dance floors, theatre or sports rooms	45

2.5.5 Acceptance of normalised impact sound pressure levels greater than those specified in Table 12.2.5 may be considered for assignment of the applicable class notation where agreed between the Owner, Builder and LR. No more than 20 per cent of the passenger cabins tested should exceed the levels specified by more than 3 dB.

2.6 Transient noise

2.6.1 Where agreed between the Owner, Builder and LR, enhanced criteria for transient noise levels may be applied in accordance with 2.6.2.

2.6.2 The maximum sound pressure level (L_{max}) emanating from any machinery or system caused by a single event that produces a noise 'spike' compared to the reference condition sound level (such as vacuum systems or valve operations) is not to cause an increase in noise in comparison with the reference condition as below:

(a) Passenger cabins and public areas: +2 dB(A)
(b) Officer cabins: +2 dB(A)
(c) Crew cabins and public areas: +3 dB(A)

A tolerance of +1 dB(A) may be applied to 5 per cent of cabins and public areas in each fire zone on each deck. This criterion is generally applicable to the specified maximum noise levels for the space concerned.

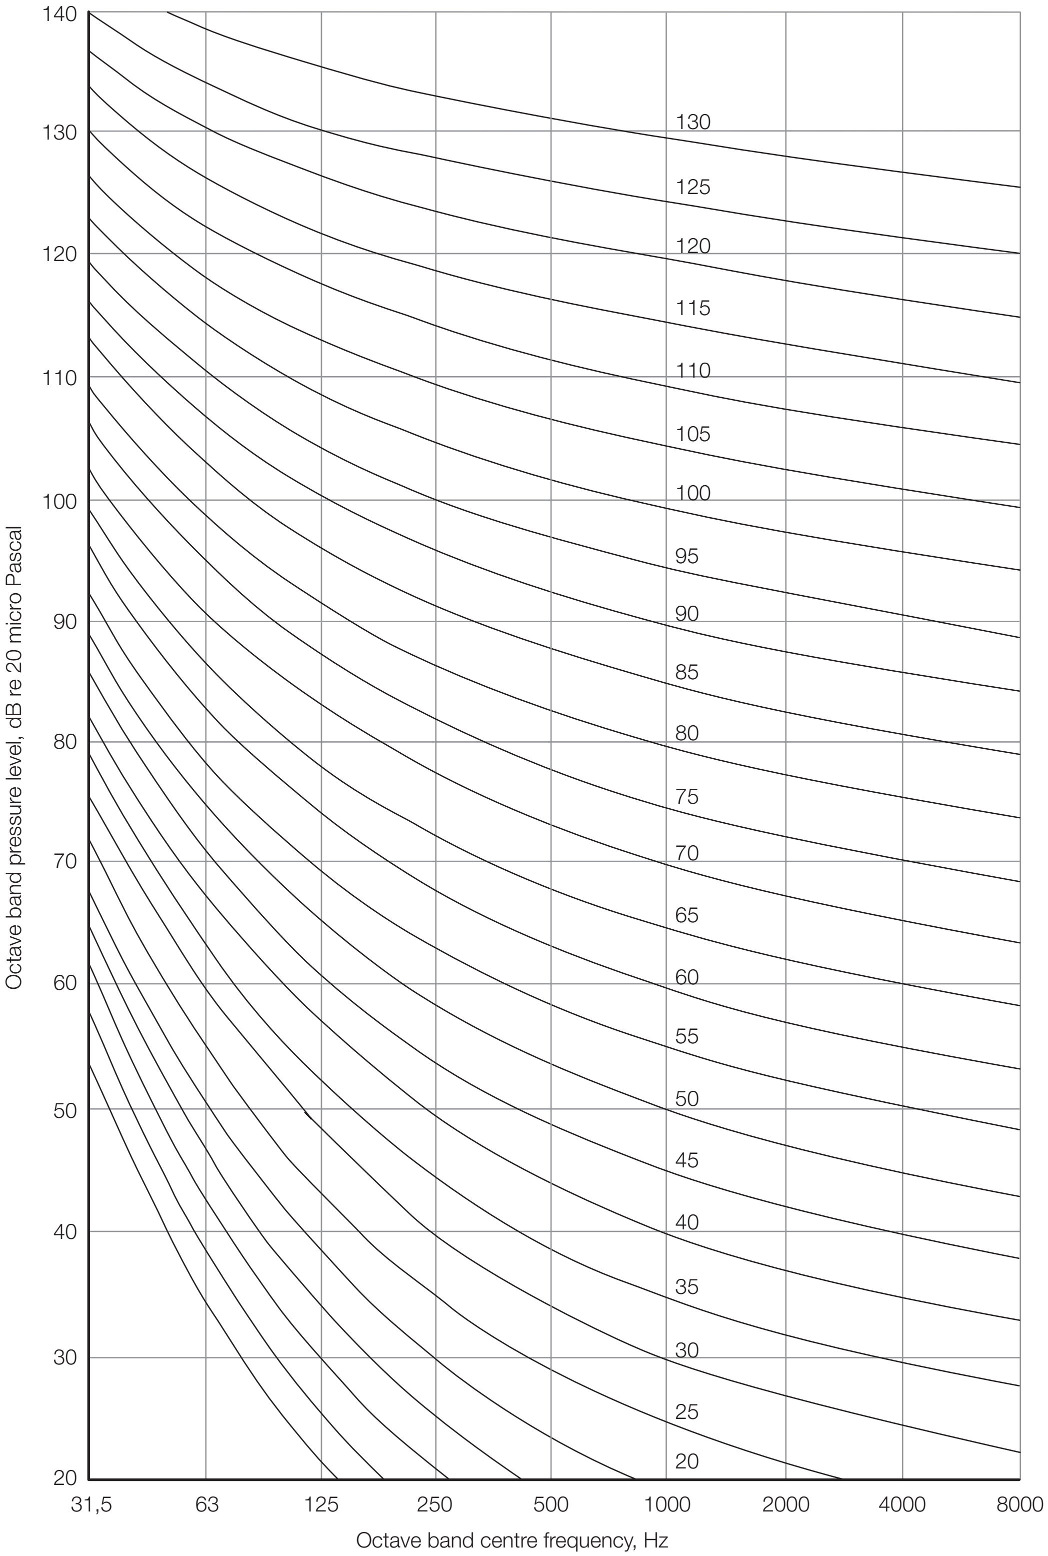

Fig. 12.2.1 Noise rating curves

Section 3 **Vibration**

3.1 Assessment criteria

3.1.1 Where a space is occupied by both passengers and crew, the more stringent of the relevant requirements apply unless agreed between the Builder and Owner and this agreement advised to LR.

3.1.2 The limits apply to vertical, fore and aft and athwartship vibrations which are to be assessed separately.

3.1.3 Under test conditions specified in 4.2, the applicable vibration levels specified in Tables 12.3.1 and 12.3.2 should not be exceeded.

Table 12.3.1 Passenger ship – Maximum vibration levels

Standard	ISO 6954:2000		
Units:	Peak velocity (1–80 Hz) velocity mm/s rms		
	Acceptance Numeral		
Location	1	2	3
Passenger cabin Luxury	1,5	1,8	2,1
Passenger cabin Standard	1,8	2,1	2,4
Public spaces	2,0	2,5	3,0
Open recreation decks	2,5	3,0	3,5
NOTE The vibration level may be exceeded by 0,3 mm/s in the ship's aft body directly above the propellers.			

Table 12.3.2 Crew spaces – Maximum vibration levels

Standard:	ISO 6954:2000
Units:	Frequency weighted (1-80 Hz) velocity mm/s rms
Location	
Accommodation and navigation spaces	3,5
Work spaces	5,0

3.1.4 Acceptance of vibration levels greater than those specified in Tables 12.3.1 and 12.3.2 may be considered for assignment of the applicable class notation where agreed between the Owner, Builder and LR.

3.2 Passenger accommodation and public spaces

3.2.1 Passenger spaces are to comply with the overall vibration levels specified in Tables 12.3.1 and 12.3.2.

3.2.2 No more than 20 per cent of all passenger spaces/areas and public spaces should exceed the relevant vibration criteria specified in Tables 12.3.1 and 12.3.2 by more than 0,3 mm/s.

3.3 Crew accommodation and work spaces

3.3.1 Crew spaces are to comply with the overall vibration levels specified in Table 12.3.2.

Section 4 **Testing**

4.1 Measurement procedures

4.1.1 These requirements take precedence where quoted standards may differ.

4.1.2 The trial measurements may be undertaken by an approved technical organisation as defined in 4.7 or by LR. In the former case, the measurements are to be witnessed by a LR Surveyor.

4.1.3 Subject to agreement by LR and the Owner/ Operator, the measurements may be undertaken by the Builder. In this case, the measurements are to be witnessed by a LR Surveyor.

4.2 Test conditions

4.2.1 Test conditions for the surveys are to be in accordance with those detailed in ISO 2923 and ISO 6954:2000 as applicable.

4.2.2 The intended operating and loading conditions of the ship during assessment surveys are to be submitted to LR for agreement, prior to commencement of surveys.

4.2.3 Surveys are to be conducted when the ship is fully outfitted and all systems contributing to noise and vibration levels are operational.
NOTE
All systems operational are to include those systems that may operate simultaneously with others during normal ship operation.

4.2.4 The test conditions required for the vibration and noise measurements are to be in accordance with the following conditions:

(a) For passenger ships, prior to measurement surveys being carried out, the ship operating condition where the worst conditions are experienced between 0 and 85 per cent maximum continuous rating of the propulsion machinery is to be determined. To establish this condition, four measurement positions are to be defined with the agreement of LR and measurements taken of the parameters of interest at ship speeds corresponding to percentages of the maximum continuous rating of the propulsion machinery increasing up to 40 per cent MCR in 10 per cent intervals and from 40 per cent in 5 per cent intervals up to the 85 per cent maximum continuous rating of the propulsion machinery. If the 85 per cent maximum continuous rating condition is found to be the worst condition, then this will form the trial operating conditions. However, if a lower speed condition is found to be worse than the 85 per cent maximum continuous rating condition then both that condition and the 85 per cent maximum continuous rating condition will form the trial operating conditions. Where unavoidable any barred range within the values required for the trial operating condition may be excluded on agreement between Owner and Builder subject to approval by LR.

(b) The power absorbed by the propeller(s) is to be that defined in 4.2.4(a). Alternatively, by special agreement, some lesser power could be accepted if it can be demonstrated by the Owner that this would correspond to a more representative normal service condition.

(c) Auxiliary machinery essential for the ship's operating conditions together with HVAC systems are to be running at their normal rated capacity during the noise and vibration trials. Combinations of auxiliary machinery operation may be necessary. In addition, the following equipment is to be running if appropriate: stabilisers, waste treatment equipment, swimming pool and jacuzzi equipment.

(d) For sea-going ships, measurements are to be taken with the ship proceeding ahead, at a constant speed and course, in a depth of water not less than five times the draught of the ship. For other ships, an appropriate water depth is to be agreed with LR prior to the trials.

(e) Trials are to be conducted in sea conditions not greater than sea state 3 on the WMO sea state code. In addition, noise measurements should not be taken when the wind force exceeds 4 on the Beaufort scale.

(f) The ship is to be at a displacement and trim representative of an operating condition.

(g) Rudder angle variations are to be limited to ±2° of the midship position and rudder movements are to be kept to a minimum throughout the measurement periods.

(h) In addition, for ships which are designed to spend a considerable period of time in harbour, the noise and vibration, are to be measured for this condition, with the auxiliary machinery and HVAC systems running at their normal rated capacity.

(j) For passenger ships, intermittently run equipment such as transverse propulsion units are to be operated at 60 per cent of their rated power for additional measurements in surrounding ship areas.

4.2.5 Prior to survey, a test programme is to be submitted for approval by LR. This programme is to contain details of the following:

(a) Measurement locations indicated on a general arrangement of the ship.

(b) The ship's loading condition during survey.

(c) The machinery operating condition, including HVAC system, during survey.

(d) Noise and vibration measuring equipment.

4.3 Noise measurements

4.3.1 Noise measurements are to be conducted in accordance with ISO 2923 and IMO Resolution MSC.337(91). Measurements of noise levels are to be carried out using precision grade sound level meters conforming to IEC 60651, Type 1 or 2. Subject to demonstration, equivalent standards are acceptable.

4.3.2 Where the measured noise level exceeds the relevant criterion by 3 dB(A), or contains subjectively annoying low frequency noise or obvious tonal components, octave band readings are to be taken, with centre frequencies from 31,5 Hz to 8 kHz.

4.3.3 When outfitting is complete, and all soft furnishings are in place, sound insulation indices for passenger spaces are to be determined in accordance with ISO 140. Cabin to cabin indices are to be determined from a minimum of three locations within the passenger accommodation, the number of test locations being agreed with LR.

4.3.4 If required, impact sound measurements are to be carried out in accordance with ISO 140/7 and presented in accordance with ISO 717/2. *See* 4.4.4.

4.4 Noise measurement locations

4.4.1 Measurement locations are to be chosen so that the assessment represents the overall noise environment on board the ship. In addition to the requirements of IMO Resolution MSC.337(91) for crew spaces, all public spaces and at least 50 per cent of passenger cabins in the after third of the ship, and 25 per cent elsewhere, are to be surveyed. Distribution of the measurement locations is to be agreed by LR.

4.4.2 During measurement trials, recognised noise sources are to be operated at their normal level of noise output (e.g. machinery at design rating).

4.4.3 In larger sized spaces, where noise levels may vary considerably, such as restaurants, lounges, atria and open deck recreation areas, measurements are to be taken at locations not greater than 7 m apart.

4.4.4 The number of and locations for impact noise measurements are to be agreed between the Builder, Owner and LR. The measurements are to be carried out when the ship is in harbour. The number and location of measurements are to take account of all different combinations of construction, areas of application, types of cabin and spaces below.

4.5 Vibration measurements

4.5.1 Vibration measurements are to be conducted in accordance with ISO 6954:2000.

4.5.2 Measurements are to be made with instrumentation meeting the requirements of ISO 8041.

4.5.3 Vibration levels are to be given in terms of the velocity measurement appropriate to the version of the standard being used and should be measured over a period of not less than one minute.

4.6 Vibration measurement locations

4.6.1 Measurement locations are to be chosen so that the assessment represents the overall vibration environment onboard the ship. To minimise survey times, readings may be taken at the locations previously defined for the noise assessment part of the survey.

4.6.2 In cabins, vibration readings are to be taken in the centre of the floor area. The measurements are to indicate the vibration of the deck structure. In large spaces, such as restaurants, sufficient measurements are required to define the vibration profile.

4.6.3 Where deck coverings make transducer attachment impracticable, use of a small steel plate having a mass of at least 1 kg, with spikes as appropriate, is permissible.

4.6.4 At all locations, vibrations in the vertical direction are to be assessed. Sufficient measurements in the athwartships and fore and aft directions are to be taken to define global deck vibrations.

4.7 Approved technical organisation

4.7.1 An approved technical organisation for the purposes of these Rules is one that is acceptable to the Owner and LR with proven capability in noise and vibration measurement and satisfies all the criteria set out below:

(a) Have instrumentation whose calibration, both before and after the measurements, can be traced back to National Standards and, hence, back to International Standards.
(b) Have analysis procedures capable of data reduction to the requirements and standards set out in these Rules.
(c) Be able to provide a written report in English with contents as defined by Section 5.

■ *Section 5* Noise and vibration survey reporting

5.1 General

5.1.1 Prior to survey, a noise and vibration measurement plan is to be agreed by the Owner, Builder and LR.

5.1.2 The survey report is to comprise the data and analysis for both noise and vibration and is to be submitted to LR for consideration.

5.1.3 The survey report is to be prepared by the organisation undertaking the trial measurements, which may be an approved technical organisation or LR.

5.1.4 The survey report is to be submitted to LR's London Office (MCS/TID) for evaluation and confirmation that the results are in accordance with the noise and vibration levels specified in these Rules and/or agreed between the Owner and Builder. The assignment of a Class Notation or the issue of a Statement of Compliance will be subject to confirmation by LR MCS/TID.

5.2 Noise

5.2.1 The reporting of results is to comply with ISO 2923 and IMO Resolution MSC.337(91), and is to include:

(a) Measurement locations indicated on a general arrangement plan including, where possible, the measured dB(A) level.
(b) Tabulated dB(A) noise levels, together with octave band analysis for positions where the level exceeds the specified criterion by 3 dB(A), or where subjectively annoying low frequency or tonal components were present. The Noise Rating number is also to be given where octave band analyses have been conducted.
(c) Ship and machinery details.
(d) Trial details:
    - Loading condition.
    - Machinery operating condition.
    - Speed.
    - Average water depth under keel.
    - Weather conditions.
    - Sea state.
(e) Details of measuring and analysis equipment (e.g. manufacturer, type and serial numbers), including frequency analysis parameters (e.g., resolution, averaging time, window function).
(f) Copies of the relevant instrument calibration certificates, together with the results of field calibration checks

5.3 Vibration

5.3.1 The report is to contain the following information:

(a) Measurement positions indicated on a general arrangement plan.
(b) Where ISO 6964:2000 is used, the frequency-weighted overall r.m.s. vibration levels tabulated for all measurement locations calculated using the weighting functions and methodology stated in the standard.
(c) Ship and machinery details.
(d) Trial details:
- Loading condition.
- Machinery operating condition.
- Speed.
- Average water depth under keel.
- Weather conditions.
- Sea state.

(e) Frequency analysis parameters (e.g. resolution, averaging time and window function), if the analysis is done in the frequency domain.
(f) Copies of the relevant instrument calibration certificates, together with the results of field calibration.

■ *Section 6* Non-periodical survey requirements

6.1 Class notation assignment

6.1.1 Where the assignment of a Class Notation or a Statement of Compliance is requested, an Initial Survey is to comprise sea trial or initial in-service testing, reporting and assessment against the criteria set out in these Rules.

6.1.2 The sea trial or initial in-service testing requirements are set out in Section 4, and are to be reported in accordance with Section 5 and evaluated against the requirements of Sections 2 and 3.

6.2 Maintenance of class notation through-life and following modifications

6.2.1 Where an Owner has requested assignment of a Class Notation, arrangements are to be agreed between LR and the Owner to record observations/complaints of excessive noise and vibration that have been such as to disturb the comfort of passengers and crew. The records of the observations are to be made available to the attending LR Surveyor at each Annual Survey.

6.2.2 Where the observations indicate that the noise and/or vibration levels may exceed the criteria relating to the Class Notation requirements and those measured at the Initial Survey, a measurement programme is to be agreed between the Owner and LR and measurements taken in accordance with these Rules.

6.2.3 A Renewal Survey may be required following modifications, alterations or repairs including replacement of major machinery items. It is the responsibility of the Owner to advise LR of such modifications.

■ *Section 7* Referenced standards

7.1 Noise

7.1.1 The following National and International Standards for noise are referred to in these Rules:

- ISO 2923, *Acoustics – Measurement of noise on board vessels*.
- ISO 717/1, *Acoustics – Rating of sound insulation in buildings and of building elements; Part 1: Airborne sound insulation*.
- ISO 717/2, *Acoustics – Rating of sound insulation in buildings and of building elements; Part 2: Impact sound insulation*.
- IMO Resolution MSC.337(91), *Adoption of the code of noise levels on board ships*.
- IEC Publication 651, *Sound level meters*.
- ISO140/4, *Acoustics – Measurement of sound insulation in buildings and of building elements; Part 4: Field measurements of airborne sound insulation between rooms*.
- ISO 140/7, *Acoustics – Measurement of sound insulation in buildings and of building elements; Part 7: Field measurements of impact sound insulation of floors*.

7.2 Vibration

7.2.1 The following National and International Standards for vibration are referred to in these Rules:

- ISO 6954:2000, *Mechanical vibration and shock – Guidelines for the measurement, reporting and evaluation of vibration with regard to habitability on passenger and merchant ships*.
- ISO 8041, *Human response to vibration. Measuring instrumentation*.

■ *Section 1* General

1.1 General

1.1.1 These optional requirements apply to the safety, reliability and availability of shipboard machinery, electrical and control engineering arrangements installed to permit continued operation of services by connection to an external electrical power supply in port. These requirements are additional to those applicable in other Parts of the Rules. Regular operation of ship's services from an external electrical power supply is often referred to as On-shore Power Supply, Cold Ironing, High Voltage Shore Connection or Alternative Marine Power.

1.1.2 These requirements are intended for application to the shipboard elements of designs where the connection(s) with external power supply arrangements are achieved by either extending ship cables from the ship to the external power supply connection points or by bringing external cables on board to connect to shipboard connection points. However, external equipment and machinery (including shore based transformers, circuit breakers, gantries, cables, connectors and control engineering arrangements) are not covered by classification or these requirements.

1.1.3 Compliance with these requirements is intended to assess the suitability of shipboard arrangements for the documented intended application and only addresses compatibility with external power supply arrangements that are suitable for connection to the installed ship arrangements.

1.1.4 Assessment of the overall compatibility and suitability of an external electrical power supply (including combined electrical and control engineering assessments, compliance with applicable regulations, operating practices and risk assessment, etc., as applicable) is necessary before connection and is the responsibility of the Owner. Elements of the overall assessment of compatibility will be required to be completed in advance to prepare for a ship visit to a port where it is intended to connect to an external power supply due to the need to involve competent and responsible parties.

1.2 Authorities and administrations

1.2.1 Additional requirements and/or restrictions may be imposed by the National Authority with which the ship is registered and/or by the appropriate Administration or Authorities within whose jurisdiction the ship is intended to operate and/or by the Owners or Authorities responsible for an external electrical power supply. Where such additional requirements are relevant, compliance is the responsibility of the Owner. If specifically requested, Lloyd's Register (hereinafter referred to as 'LR') may be able to provide a suitable statement of compliance.

1.2.2 Where additional requirements imposed by an Authority or Administration would result in a departure from the requirements of this Chapter, details demonstrating that safety, availability and reliability will not be adversely affected are to be submitted to LR for consideration.

1.3 Class notations

1.3.1 **OPS** machinery class notation may be assigned where machinery, electrical and control engineering arrangements installed onboard to permit continued operation of services by connection to an external electrical power supply are assessed and found to comply with the requirements of this Chapter.

1.4 Plans and information

1.4.1 Three copies of the plans and particulars in 1.4.2 to 1.4.9 are to be submitted for consideration.

1.4.2 Operating Manuals that describe the intended methods of connection together with operating and monitoring instructions. Assessments of the external supplies that are to be connected to the ship together with the mooring and environmental conditions are to be included. Details of equipment and arrangements necessary to ensure safety when connecting, disconnecting, transferring electrical load, testing and operating are to be incorporated.

1.4.3 A Design Statement which details the Defined Operations. This statement is to include a description of the operating capability, functionality, limits and restrictions; in terms of:

- Connection Equipment, *see* 1.6.2;
- Connection Equipment routes;
- mooring arrangements;
- environmental conditions including tidal and weather and, where applicable, electromagnetic conditions required to ensure compatibility or prevent damage caused by heating or sparking;
- Connection Equipment suitability for hazardous areas, *see* 2.1.4 and Pt 6, Ch 2,1.2.6
- arrangements for an external connection cable to be brought on board, where provided;
- Separation details, *see* 3.2.7;
- the rating of the arrangements;
- ratings and requirements for external power supplies, *see* 3.1.10; and
- the services to be supplied.

1.4.4 Arrangement plans of equipment, control stations, locations, routes to and from connections, openings and accesses and flexible or movable arrangements.

1.4.5 Operational and construction details of Connection Equipment, including any flexible or adjusting arrangements, including plugs and socket-outlets, *see* 3.3.8.

1.4.6 Plans for control and electrical engineering arrangements required by Pt 6, Ch 1 and 2, as applicable.

1.4.7 Details of type tests for Connection cables, plugs and socket-outlets required by 3.3.6.

1.4.8 Details of supplementary arrangements required to protect equipment from exposure to moisture, condensation or temperatures outside their rating.

1.4.9 Schedule of testing at manufacturers' works, initial surveys and trials. The test schedules are to address the defined operations and are to include normal operations and failure conditions.

1.5 Additions and alterations

1.5.1 When an alteration or addition to the approved arrangements is proposed, including changes to the defined service profile, details are to be submitted for consideration.

1.6 Definitions

1.6.1 'Defined Operations' include the application, connection, electrical load transfer, in-service operation, failure response, disconnection and stowage of the connection to an external power supply.

1.6.2 'Connection Equipment' is the ship equipment used to connect permanently installed ship equipment with external electrical power supply connection points in accordance with the Design Statement. This includes, as applicable, flexible cables, plugs and socket-outlets, slip rings or other power conductors or control connections, and support and management measures for these connections. For the purposes of this Chapter, 'Connection Equipment' does not include external equipment, *see* 1.1.

■ *Section 2*
Essential features

2.1 General requirements

2.1.1 Connection equipment is to be designed to be compatible with ship mooring arrangements and the limits of acceptable forces, moments and deflections on correctly applied Connection Equipment resulting from the movement of the moored ship under normal operational circumstances is to be defined in the Design Statement.

2.1.2 Electrical and control engineering arrangements for operation with external electrical power supplies are to be in accordance with the requirements of Pt 6, Ch 1 and 2, as applicable.

2.1.3 Connection to an external electrical power supply is not to adversely affect the availability of main, auxiliary or emergency machinery, including ship sources of electrical power to allow ship power to be restored. Details of arrangements provided to maintain availability (for example, pre-heating and lubrication and availability of starting, fuel, lubrication, air and auxiliary systems) are to be included in the Design Statement, *see also* 4.5 and 5.1.9.

2.1.4 The permanent or temporary installation of electrical equipment in areas containing flammable gas or vapour and/or combustible dust, is to be minimised as far as is consistent with operational necessity and the provision of facilities enhancing the overall safety of the ship and connection to an external power supply. Where it is necessary to install electrical equipment in these areas, the arrangements are to be in accordance with the requirements of Pt 6, Ch 2,14. The suitability of electrical Connection Equipment for operation in areas containing flammable gas and/or vapour and/or combustible dust while in port is to be defined in the Design Statement and should, additionally, address the implications for Connection Equipment extended ashore, where applicable, and the suitability for operation in berths requiring extended, hazardous areas.

2.1.5 As far as practicable, Connection Equipment is to be located outside of areas where it could be damaged by in-port activities under normal operational circumstances.

2.1.6 Consideration may be given to arrangements that are considered by LR to provide an equivalent level of safety. Evidence demonstrating compliance with IEC/ISO/IEEE 80005-1: *Electrical installations in ships – Special features: High-voltage shore connection systems*, or a relevant National Standard, may be submitted for consideration of acceptability by LR.

■ *Section 3*
Electrical connection

3.1 General

3.1.1 A connection cubicle is to be provided at a convenient location for the reception or extension of connection cable(s) for connection to the external electrical power supply connection points. The connection cubicle is to contain terminals for the connection cable(s) that can be isolated.

3.1.2 Power connections with external electrical power supply arrangements may be made with either suitable connections or by using socket-outlets and plugs in accordance with 3.3.

3.1.3 Suitable cables, permanently fixed, are to be provided from the connection cubicle to the Connection Circuit-Breaker switchboard, with on-board overcurrent protection situated at or as close as is practicable to the connection cubicle. Connection Equipment to this overcurrent protection is to be installed in a manner such as to minimise the risk of short-circuit.

3.1.4 Where shipboard connection cables are extended to the external electrical power supply connection points, the connection cubicle is to be situated as close as practicable on board to the point where they are extended from the ship.

3.1.5 Means are to be provided to permit the quality of insulation between Connection Equipment conductors, and between the conductors and earth to be measured to verify suitability prior to the connection of an external power supply. The means of verifying satisfactory insulation quality of Connection Equipment in hazardous areas is to be addressed in the Operating Manuals, *see* 1.4.2.

3.1.6 An earth connection is to be provided for connecting the hull to an earth appropriate for the external electrical power supply which is being connected.

3.1.7 For high voltage connections, means are to be provided, as applicable to the design, to either:
(a) permit termination of circuits used by external power supply equipment to monitor the continuity of the earth connection referred to in 3.1.6; or
(b) monitor the continuity of the earth connection referred to in 3.1.6, *see* 5.3.8.

3.1.8 Means are to be provided for checking the phase sequence of the incoming supply.

3.1.9 An indicator is to be provided at the Connection Circuit-Breaker switchboard, and at the connection cubicle if in a different location, in order to show when connections are energised.

3.1.10 Requirements for an external electrical power supply to be connected are to be defined in the Design Statement and this is to detail the following:
- connections, including control, alarm and safety systems and data communication links;
- emergency Shut-Down requirements, *see* 5.3;
- nominal voltage(s) or voltage range;
- nominal frequency or frequency range;
- number of phases and system of supply;
- rated current or apparent power;
- quality of power supply;
- reference to protection system design, including protection characteristics for the Connection Circuit-Breaker;
- maximum permitted prospective fault level;
- minimum supply apparent power or current capacity;
- earth fault limiting requirements for earthed high voltage connections;
- isolation and earthing; and
- supply requirements for lightning and surge protection, galvanic isolation of supply circuit from other ships, etc.

Required electrical characteristics are to address steady state, transient and fault conditions, as necessary.

3.1.11 A notice is to be provided at the connection cubicle referencing the Operating Manuals and Design Statement and advising of the requirement to ensure that external electrical power supplies satisfy the requirements of 3.1.10 prior to connection. *See* 1.1.4 for the conducting of the assessment of overall compatibility.

3.2 Connection Equipment

3.2.1 Connection Equipment support and management arrangements, including those for control engineering arrangements, are to be arranged not to apply damaging forces or tension to correctly applied equipment. Support arrangements are to ensure that the weight of connected cable is not borne by cable end terminations or connections, including those in plugs or socket-outlets.

3.2.2 Connection Equipment arrangements are to be such as not to coil or twist correctly applied equipment in a manner that would result in heating or physical tension beyond its rating during Defined Operations.

3.2.3 Where Connection Equipment passes through support or management arrangements or structural openings or is placed against structures, it is to be suitably protected against damage having regard to the Defined Operations.

3.2.4 Connection Equipment routes are not to reduce the effectiveness of openings required for the safety of the ship, for instance bulkhead or deck penetrations, watertight or fire doors.

3.2.5 Connection Equipment support and management arrangements are to be able to operate satisfactorily without damage during the Defined Operations.

3.2.6 Means are to be provided for Connection Equipment to be readily and safely adjusted in response to tidal changes, and other movements that could lead to damage or failure of connections, during the Defined Operations.

3.2.7 Connections with external electrical power supply arrangements are to be designed to prevent damage to the ship structure or Connection Equipment cable reels, cranes and/or gantries as a result of the connections separating in the event of the ship leaving a berth inadvertently or as a result of high cable tension for other reasons. Evidence of compliance with this requirement is to be included in the submission required by 1.4.3 and is to identify Connection Equipment (weak points) that will be damaged, if any, in the event of separation. Damage to connection cables, plugs and socket-outlets or other identified equipment may be considered.

3.2.8 Connection Equipment cable reels, cranes and/or gantries used to manage, handle or adjust connection cables, plugs and/or socket-outlets, are to be designed and manufactured in accordance with applicable LR Rules or a marine standard acceptable to LR. A manufacturer's certificate verifying suitability for safe and effective operation for the Defined Operations and service profile is to be submitted.

3.2.9 The manufacturer's certificate referred to in 3.2.8 is to be in the English language and include the following information:

(a) Design and manufacturing standard(s) used.
(b) Materials used for construction of key components and their sources.
(c) Details of the quality control system applied during design, manufacture and testing.
(d) Details of any existing type approval or type testing.
(e) Details of installation and testing recommendations.

The manufacturer is to have a recognised quality management system certified by an IACS member or a Notified Body.

3.2.10 Connection cubicle and connection equipment locations are to have warning notices placed in prominent positions to indicate the presence of moving equipment, electricity and high voltage as applicable.

3.2.11 Effective means are to be provided to prevent the accumulation of moisture and condensation within equipment enclosures. Failure of heaters and/or ventilation fans provided to satisfy this requirement is to activate an alarm at a machinery control station that is attended while connected to an external power supply. The installation of open deck enclosures for high voltage connections is to be minimised to that required for the Defined Operations; a technical justification, including proposed degree of protection ratings, is to be included in the submission required by 1.4.8.

3.2.12 Connection Equipment support and management arrangements are to ensure that the correctly applied equipment is kept clear of areas where they may be exposed to moisture or temperatures outside their rating.

3.2.13 Arrangements are to be provided for stowage of on-board equipment when not in use such that equipment:

- will not be exposed to environmental conditions outside its rating;
- can be stowed, stored and removed without damage; and
- does not present a hazard during normal ship operation.

Adapters, extensions and parts dismantled after use are also to be provided with stowage arrangements.

3.3 Connection cables, plugs and socket-outlets

3.3.1 Plugs and socket-outlets for external electrical power supply connection points, including those for external control engineering arrangements, are to be designed, constructed and tested in accordance with IEC 62613-1: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC Systems) – Part 1: General requirements* or a relevant National Standard.

3.3.2 Plugs are to conform to applicable requirements that ensure compatibility with the intended socket-outlet type. Compatible plugs and socket-outlets are to be in accordance with IEC 62613-2: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC-Systems) – Part 2: Dimensional compatibility and interchangeability requirements for accessories to be used by various types of ships* or a relevant National Standard.

3.3.3 Type tests are to be carried out on power connection plug and socket-outlets and cables, in accordance with IEC 62613-1: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC Systems) – Part 1: General requirements* and Annex A.3 of the IEC/ISO/IEEE 80005-1:2012: *Electrical installations in ships – Special features: High-voltage shore connection systems* respectively or a relevant National Standard, to verify design suitability for the intended application described in the Design Statement. Type test reports are to be submitted that include details of the standards, the tests conducted and their order and the acceptance criteria. Alternative proposals may be submitted for consideration.

3.3.4 Power connection plugs and socket-outlets are to be assigned with ratings based on testing in accordance with IEC 62613-1: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC Systems) – Part 1: General requirements* or a relevant National Standard. Details are to be provided in the submission required by 1.4.5.

3.3.5 Power connection plugs and socket-outlets are to be located to minimise the potential of arc flash hazards and suitable warning notices are to be provided at locations along Connection Equipment routes, including power connection plugs and socket-outlets operational locations.

3.3.6 Connection Equipment power cables are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 3* or, alternatively, surveyed by the Surveyors during manufacture and testing to assess compliance with 3.3.3 and application of an acceptable quality management system. Connection equipment cables are to be installed so as to minimise the risk of short-circuit when correctly applied.

3.4 Containers

3.4.1 Connection Equipment installed in removable containers is to satisfy the additional requirements of this sub-Section.

3.4.2 Containers are to be for the ship's exclusive use and are to be provided with a permanent notice indicating the ship name and IMO Ship Number.

3.4.3 Container locations are to be designated and identified in the plans required by 1.4.4 and provided with fixings that are suitable for the Defined Operations. Procedures for container fixing, use and movement are to be included in the Operating Manuals.

3.4.4 The container type is to be a steel, closed type, weatherproof construction sufficient to prevent damage during expected use, for example during loading and unloading.

3.4.5 Measures necessary to prevent movement of the container when the container has electrical cables connected are to be provided.

3.4.6 Suitable protection is to be provided to prevent damage to Connection Equipment at the container entry points.

3.4.7 Suitable safe access is to be provided to the container for the Defined Operations, inspection and maintenance.

3.4.8 Container entry points are to be provided with suitable sealing arrangements to prevent the ingress of water into the container.

3.4.9 Containers are to be provided with effective means of ventilation. Where a container ventilation fan is provided, alarms are to be provided in accordance with 3.2.11.

3.5 High voltage in the presence of personnel

3.5.1 The Defined Operations are, as far as is practical, not to require personnel to be in the vicinity of high voltage equipment when it is energised.

3.5.2 For high voltage:
(a) switchgear and control gear assemblies;
(b) cable reels, cranes and gantries; and
(c) mounting enclosures for socket-outlets used to connect flexible cables to fixed connections;

arrangements are to be made to protect personnel in the event of gases, arc flash or vapours escaping under pressure as the result of arcing due to an internal fault. Where the Defined Operations require personnel to be in the vicinity of such equipment when it is energised, this may be achieved by an assembly that has been tested in accordance with Annex A of IEC 62271-200 and qualified for classification IAC (internal arc classification), or equivalent.

■ *Section 4* Electrical system

4.1 Electrical load transfer

4.1.1 'Dead transfer' arrangements are to be provided that permit transfer between operation using ship sources of electrical power and an external electrical power supply by disconnecting one from the ship distribution system and then connecting the other to the dead system.

4.1.2 Additional arrangements for connecting ship sources of electrical power and an external electrical power supply in parallel temporarily to transfer load from one to the other only are permitted, provided these are in accordance with 4.1.3 to 4.1.9.

4.1.3 Means to automatically synchronise a ship source of electrical power with an external electrical power supply and connect them in parallel for load transfer when requested by operating staff are to be provided.

4.1.4 Means to automatically transfer load between a ship source of electrical power and an external electrical power supply following their connection in parallel, are to be provided. The load transfer is to be completed in as short a time as practicable without causing machinery or equipment failure or operation of protective devices and this time is to be used as the basis for defining the Transfer Time Limit required by 4.1.5.

4.1.5 When transferring of load between ship sources of electrical power and an external electrical power supply exceeds a defined Transfer Time Limit then, arrangements are to be such that:
- the transfer is aborted;
- load is removed from the ship sources of electrical power or external electrical power supply that was intended to take the load; and then
- the Connection Circuit-Breaker is opened.

An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply when the Transfer Time Limit is exceeded and is to indicate the return to previous operating conditions.

4.1.6 The Transfer Time Limit referred to in 4.1.5 may be adjustable to match the ability of an external electrical power supply to accept and shed load. Setting of the Transfer Time Limit is to be demonstrated to the attending Surveyor at Surveys and Trials, *see* 6.1.

4.1.7 An external power supply may only be connected in parallel with a single ship source of electrical power. Arrangements are to be provided to ensure that this requirement is satisfied before and during parallel connection. Details of alternative proposals may be submitted for consideration.

4.1.8 Arrangements provided to adjust ship sources of electrical power to allow connection in parallel and transfer of load are not to cause machinery or equipment failure, operation of protective devices or damage under normal conditions or in the event of a failure.

4.1.9 Where load reductions are required to transfer load they are not to result in loss of essential services or the loss of availability of emergency services. Means are to be provided to readily make necessary load reductions and re-instate supplies following transfer.

4.2 Capacity

4.2.1 Arrangements for operating from external supplies are to be sufficiently rated to supply the following:
- essential services normally required in port;
- emergency services;
- services required to ensure ready availability of non-operating main and auxiliary machinery;
- services required to prevent damage to cargo or stores; and
- the services required for the Defined Operations.

The schedule of loads required by Pt 6, Ch 2,1.3.3 is to incorporate operation when connected to an external electrical power supply.

4.2.2 The maximum electrical step load switched on or off is not to cause the power supply quality to exceed the parameters given in Pt 6, Ch 2,1.8 or failure when connected to an external electrical power supply in accordance with the defined requirements, *see* 3.1.10.

4.2.3 Consideration is to be given to providing means to inhibit automatically the connection of large motors, or the connection of other large loads, that the arrangements are not rated to supply when connected to an external electrical power supply having the defined minimum apparent power or current capacity, *see* 3.1.10 and Pt 6, Ch 2,6.9.4.

4.3 Protection

4.3.1 Where an external electrical power supply is not arranged to operate in parallel with ship sources of electrical power, the connection to the external electrical power supply is to be provided with a Connection Circuit-Breaker arranged to open simultaneously, in the event of short-circuit, overload or undervoltage, all insulated poles.

4.3.2 Where an external electrical power supply is arranged to operate in parallel with ship sources of electrical power during load transfer, the connection to the external electrical power supply is to be provided with a Connection Circuit-Breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an undervoltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in accordance with the rating defined in the Design Statement; a fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the circuit breaker.

4.3.3 The electrical system, including short-circuit protective device rating, is to be suitable for the highest prospective fault level at the point of installation. The short-circuit current calculations required by Pt 6, Ch 2,1.2.6 are to identify the system state that would result in the highest prospective fault level. The highest prospective fault level may occur during parallel connection with an external power supply and the resulting combination of:

(a) ship sources of electrical power, taking into account 4.1.7; and

(b) an external electrical power supply having the defined maximum permitted prospective fault level, *see* 3.1.10.

Details of alternative proposals may be submitted for consideration.

4.3.4 The connection circuit is to be arranged such that contamination due to the products of arcing as a result of a fault in the Connection Circuit-Breaker enclosure on the external power supply side will not result in essential or emergency services not being available when supplied by ship sources of electrical power.

4.3.5 Initial connection of an external electrical power supply to the ship switchboards or converter equipment to connect to ship loads is to be arranged to be made by closing of the Connection Circuit-Breaker only.

4.3.6 Converter equipment used to connect an external electrical power supply to the ship electrical system is to ensure that a supply that would result in damage is not applied to the connected ship electrical systems in the event of a failure.

4.3.7 The voltage and time delay settings of the Connection Circuit-Breaker undervoltage release mechanism(s) are to be selected to ensure that the discriminative action required by Pt 6, Ch 2,6.1.1(a) is maintained.

4.3.8 Means are to be provided to prevent closure of the Connection Circuit-Breaker when a connected external electrical power supply has a different phase rotation or has a voltage or frequency that does not match the ship electrical system rating within the tolerances defined by Pt 6, Ch 2,1.8.2 or 1.8.4. Signals are to be provided, where necessary, to allow comparison with ship electrical system characteristics.

4.3.9 Connection power circuits are to be provided with protection against earth faults in accordance with Pt 6, Ch 2,6.4.

4.4 Interlocking and synchronising arrangements

4.4.1 External electrical power supply connections are to be provided with instruments and devices on board equivalent to those required for alternating current generators by Pt 6, Ch 2,7.11.1 where synchronising is not provided, or by Pt 6, Ch 2,7.11.2 to 7.11.3 where synchronising for load transfer is provided. *See also* Pt 6, Ch 2,7.11 and 7.12.

4.4.2 Means are to be provided to ensure that a source of electrical power or electrical power supply can only be connected to other live parts when synchronised. *See also* 4.1.2 for temporary parallel connection for load transfer.

4.4.3 The arrangements are to prevent Connection Equipment power conductors being made live by connecting to the ship electrical system.

4.4.4 The simultaneous connection of a ship source of electrical power and external electrical power supply to the same dead part of the electrical system is to be prevented.

4.4.5 For high-voltage connections, suitable means are to be provided to earth the connection power circuit so that it is discharged and so maintained that it is safe to touch.

4.4.6 Means provided to connect a connection power circuit to earth are to be arranged such that the circuit may only be earthed when it is isolated.

4.4.7 Interlocking arrangements are to be provided to prevent the connection of a high-voltage external power supply to a switchboard connected to earth using the means required by Pt 6, Ch 2,7.8.

4.5 Ship power restoration

4.5.1 When the ship main source of electrical power is shut-down and failure of the connected external electrical power supply occurs, the Connection Circuit-Breaker is to be arranged to automatically open followed by:

(a) connection of the emergency source of electrical power to emergency services in accordance with Pt 6, Ch 2,3.2.8(a)(ii), 3.2.8(b)(ii) to (iii), 3.3.8(a)(ii) or 3.3.8(b)(ii) to (iii) as applicable; and
(b) automatic connection of the transitional source of electrical power to emergency services in accordance with Pt 6, Ch 2,3.2.7 or 3.3.7 as applicable; and
(c) automatic starting and connecting to the main switchboard of the main source of electrical power and automatic sequential restarting of essential services, in as short a time as is practicable. *See also* 2.1.3 and Pt 6, Ch 2,2.2.3.

Failures include loss of power, disconnection, phase failure and quality of supply outside the tolerances given in Pt 6, Ch 2,1.8.2 or 1.8.4.

4.5.2 An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply to indicate activation of the automatic power supply failure response required by 4.5.1. The alarm is to indicate the failure that caused the activation.

4.5.3 The automatic power supply failure response required by 4.5.1 is to be inhibited during the 'dead transfer' required by 4.1.1 but arrangements are to permit personnel to readily revert to operation from ship sources of electrical power if the 'dead transfer' to the external electrical power supply is not completed.

■ *Section 5* Control and monitoring

5.1 General

5.1.1 Control engineering arrangements are to be in accordance with Pt 6, Ch 1, as applicable. The connection of, and the electrical load transfer to and from, an external electrical power supply are only to be controlled on board using shipboard arrangements.

5.1.2 External control of ship equipment may only be provided when in accordance with 5.1.5. Otherwise, external arrangements may be used to send requests for action to ship personnel for consideration.

5.1.3 Integration or connection with external, control, alarm and safety systems is to be 'fail-safe'.

5.1.4 The effects of failure of control, alarm and safety system and data communication link connections are to be documented along with resulting failure responses in the submission required by 1.4.6.

5.1.5 Details of proposals that would involve external control of ship equipment to respond to potentially hazardous situations detected externally are to be submitted for consideration. Provided that the arrangements are considered to be in accordance with the provisions of an acceptable and relevant standard, the following external control functions may be permitted:

- initiation of load reductions;
- initiation of electrical load transfer to ship sources of electrical power; and
- initiation of Emergency Shut-Down.

5.1.6 The connection power circuit is to be isolated, and for high-voltage connections connected to earth so that it is discharged and so maintained that it is safe to touch, until the connections necessary for safe and effective operation are correctly established, including control, alarm and safety system and data communication link connections.

5.1.7 Following the correct establishment of the necessary connections in accordance with 5.1.6:

- where applicable, the connection power circuit may be disconnected from earth; and arranged such that only then
- may the request to make the external power supply connection points live described in 5.1.8 be sent.

5.1.8 Ship control system arrangements are to be provided to request the external electrical power supply conductors to be:

- where applicable, disconnected from earth; and then
- made live up to the connection points.

5.1.9 An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply upon failure of arrangements required to maintain ready availability in accordance with 2.1.3 (for example pre-heating).

5.1.10 Additional alarms with their associated safeguards are indicated in Table 13.5.1. These are in addition to those required by other Parts of the Rules.

5.1.11 Means are to be provided to allow testing of control, alarm and safety system connections with external arrangements, including operation of Emergency Shut-Down facilities, before electrical connection to an external power supply.

5.1.12 If, depending upon the in-port shipboard work organisation, no machinery control stations are continuously attended while connected to an external power supply, then alarm transfer arrangements that activate an audible indication to warn relevant duty personnel of alarm initiation may be accepted. An audible warning from any portable devices is to be provided in the event of loss of the wireless link.

Table 13.5.1 Additional alarms and associated safeguards

5.2 Connection Equipment control and monitoring

5.2.1 Connection Equipment is to be capable of unattended operation under normal operating conditions after correct application of the connection. Remote indication of active ship equipment faults at a machinery control station that is attended when connected to an external electrical power supply is to be provided. Details of arrangements that involve periodic attendance to inspect and adjust Connection Equipment may be submitted for consideration.

5.2.2 A control station is to be provided locally to Connection Equipment cable reel, cranes and gantries that permits identification of faults and permits safe and effective supervision and control of this equipment in the foreseeable environmental conditions.

5.2.3 A fixed means of two-way voice communication with a machinery control station that is attended when connected to an external electrical power supply is to be provided at the control station required by 5.2.2.

5.2.4 The control station required by 5.2.2 is to be provided with a means for operators to:
- select manual control; or
- lock equipment in position; or
- where provided, select automatic adjustment.

This status is to be indicated remotely at a machinery control station that is attended when connected to an external electrical power supply.

5.2.5 When the equipment status selection referred to in 5.2.4 is changed whilst an external electrical power supply is connected, an alarm is to be activated at a machinery control station that is attended when connected to an external electrical power supply.

5.2.6 Where correctly applied connection equipment is not protected from submersion in the water between the ship and shore (e.g. submersible equipment, equipment routing or slack cable prevention by torque control), an alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply when Connection Equipment approaches a situation where it may be submerged in the water between the ship and shore, for instance due to tidal changes. The time between alarm initiation and possible exposure to this water is to be sufficient to allow the equipment to be attended and adjusted prior to exposure to water.

5.3 Emergency Shut-Down

5.3.1 The requirements of this sub-Section apply to arrangements for the emergency disconnection of live electrical power from the connection to an external electrical power supply.

5.3.2 Emergency Shut-Down facilities are to be provided that, when activated, will instantaneously:
- isolate the connection from ship electrical power supplies; and
- request isolation of the external electrical power supply connection points.

5.3.3 High-voltage Connection Equipment is to be either:
(a) provided with permanent arrangements for manual discharging and routed to prevent personnel access to live connection cables and connection points by barriers and/or adequate distance(s) under expected operating conditions; or
(b) automatically discharged so that it is safe to touch with immediate initiation of switching device closure following the isolation from ship and shore electrical power supplies required by 5.3.2.

5.3.4 For ships that are intended to connect in ports where Connection Equipment may move into a hazardous area associated with the terminal or port area as a result of the ship inadvertently leaving the berthed position (slipping/breaking of moorings, etc.), this condition is to be included in the Design Statement. The arrangements are to comply with 5.3.3(b) and, additionally, other electrically powered connection equipment that is not intrinsically safe is to be arranged for automatic isolation.

5.3.5 Means are to be provided to detect or predict tension in the external electrical power supply connection cable that activate the Emergency Shut-Down facilities described in 5.3.2 before damage occurs. Where alternative arrangements to tension detection are proposed (automatic break-away release, connectors with shear bolts and pilot lines, connection with ship/shore Emergency Shut-Down system, etc.), details are to be submitted for consideration.

5.3.6 To detect and react to the withdrawal of plugs from socket-outlets while power supply connections are live, the Emergency Shut-Down facilities described in 5.3.2 are to be activated before the necessary degree of protection is no longer achieved or power connections are broken by the removal of a plug from a connected socket-outlet, including in-line connections.

5.3.7 For high-voltage connection points on board where the means of locking together plugs and socket-outlets required by 3.3.4 are not interlocked to prevent removal from the locked position when the Connection Equipment power connections are not discharged so that they are safe to touch, the Emergency Shut-Down facilities described in 5.3.2 are to be activated when connected plugs are moved from the locked position. Consideration may be given to relaxing this requirement when evidence is submitted which demonstrates that appropriate controls and procedures acceptable to LR are in place to control personnel access plugs and socket-outlets.

5.3.8 Where connection power plugs are connected to socket-outlets mounted on a switchgear enclosure, arrangements are to be provided to activate the Emergency Shut-Down facilities described in 5.3.2 in as short a time as practicable in the event of an arc occurring in the enclosure at the rear of the socket-outlets.

5.3.9 Where 3.1.7(b) applies, the Emergency Shut-Down facilities described in 5.3.2 are to be activated in the event of loss of earth connection continuity being detected.

5.3.10 Means to manually activate the Emergency Shut-Down facilities described in 5.3.2 are to be provided at:
- a machinery control station that is attended when connected to an external electrical power supply;
- in close proximity to the connection cubicle; and
- at the switchboard where the fixed cable from the shore connection cubicle are received.

Additional manual activation facilities may also be provided at other locations where it is considered necessary. The means of activation are to be visible and prominent, prevent inadvertent operation and require a manual action to reset.

5.3.11 An alarm to indicate activation of the Emergency Shut-Down is to be provided at a machinery control station that is attended when connected to an external electrical power supply. The alarm is to indicate the cause of the activation. For power supply restoration, *see* 4.5.1 to 4.5.3.

■ *Section 6* Testing, trials and surveys

6.1 General

6.1.1 The testing and trials required by 6.1.2 to 6.1.5 are to be successfully completed to the Surveyor's satisfaction before **OPS** notation may be assigned. Where appropriate test facilities cannot be provided, trials are likely to require the additional co-operation of a port facility with a suitable external electrical power supply and the ability to operate the defined services to be supplied during these trials and allow the testing described to be conducted.

6.1.2 Electrical and control engineering equipment is to be surveyed at manufacturer's works and undergo survey and operational trials on board in accordance with the approved test schedules and applicable testing requirements in Pt 6, Ch 1 and Ch 2.

6.1.3 In addition to 6.1.2, the following Connection Equipment, where applicable, is to be surveyed by the Surveyors during manufacture and testing:
- filters;
- converters; and
- slip ring assemblies.

6.1.4 Cable reels, cranes and/or gantry drives for Connection Equipment are to be surveyed and tested in accordance with applicable LR Rules and 3.2.9(e).

6.1.5 Trials are to be conducted when connected to a compatible external electrical power supply in accordance with 3.1.10 to demonstrate to the attending Surveyor that the Rules have been complied with in respect of:

(a) operation of connection management arrangements;
(b) trials on cable lifting appliances (for example cable reels or cranes) are to be conducted that demonstrate suitability for the maximum mechanical load and duty required by the Defined Operations within the service profile contained in the Design Statement, including connection of extensions or adapters;
(c) satisfactory performance of the connection and Connection Equipment throughout the Defined Operations, including a run with the defined services to be supplied operational;
(d) temperature of electrical joints, connections, circuit-breakers and fuses;
(e) the operation of electrical load transfer arrangements, (including Transfer Time Limit setting), electrical system protection and interlocking devices, Emergency Shut-Down arrangements and other safety devices and ship power restoration;
(f) where acceptable type-test evidence is not submitted, connection break-away, *see* 3.2.7;
(g) voltage regulation when the maximum load is suddenly thrown off and when starting the largest motor connected to the system;
(h) where more than one external power supply connection can be operated in parallel, satisfactory load sharing at loads up to normal working load; and
(j) voltage drop is to be measured, where necessary, to verify that this is not in excess of that specified in Pt 6, Ch 2,1.8.

6.1.6 Arrangements are to be:

- examined at Annual Survey; and
- examined and functionally tested whilst connected to an external electrical power supply during the Complete Surveys of machinery or, where this is not practical, within 12 months of the due date of the Complete Surveys of machinery.

This is to include examination of Connection Equipment.

Section 1 Requirements for machinery and engineering systems of unconventional design

1.1 General – Scope and objectives

1.1.1 Consistent with the aims of the IMO guidelines for Formal Safety Assessment (MSC-MEPC.2/Circ.12), the requirements of this Section aim to ensure that risks to maritime safety and the environment, stemming from the introduction of machinery or engineering systems of unconventional design, are addressed insofar as they affect the objectives of classification.

1.1.2 The requirements of this section are to be satisfied where:

(a) machinery is required to be constructed, installed and tested in accordance with Lloyds Register's (hereinafter referred to as LR) Rules and Regulations and for which the corresponding machinery class notation is to be assigned (*see* Pt 1, Ch 2,2.4); and

(b) the machinery and engineering systems are considered by LR to be of an unconventional design and which, as a result, are not directly addressed by LR's extant Rules and Regulations.

1.1.3 It is to be noted that as well as the requirements of this section, the general requirements of LR's Rules and Regulations are also to be satisfied as far as they are applicable.

1.1.4 Compliance with ISO15288 *Systems Engineering – System Life Cycle Processes* or an acceptable equivalent National Standard may be accepted as meeting the requirements of 1.3 to 1.11.

1.2 Information to be submitted

1.2.1 Information is to be submitted for assessment of compliance with the general requirements of LR's Rules and Regulations, including the general requirements for:

(a) Machinery, *see* Pt 5, Ch 1.

(b) Steam raising plant and pressure vessels, *see* Pt 5, Ch 10.

(c) Machinery and ship piping systems, *see* Pt 5, Ch 12 to Ch 14.

(d) Control engineering, *see* Pt 6, Ch 1.

(e) Electrical engineering, *see* Pt 6, Ch 2.

(f) Materials, *see Rules for the Manufacture, Testing and Certification of Materials*.

1.2.2 In addition to the information identified in 1.2.1, the information described in 1.2.3 and 1.2.4 is also to be submitted for consideration.

1.2.3 General description detailing the extent of the machinery or engineering system, the shipboard services it is to provide, its operating principles, and its functionality and capability when operating in the environment to which it is likely to be exposed under both normal and foreseeable abnormal conditions. The general description is to be supported by the following information as applicable:

(a) System block diagram.

(b) Piping and instrumentation diagrams.

(c) Description of operating modes, including:
Start-up, shut-down, automatic, reversionary, manual and emergency.

(d) Description of safety related arrangements, including:
Safeguards, automatic safety systems and interfaces with ships safety systems.

(e) Description of connections to other shipboard machinery, equipment and systems, including:
Electrical, mechanical, fluids and automation.

(f) Plans of physical arrangements, including:
Location, operational access and maintenance access.

(g) Operating manuals, including:
Instructions for start-up, operation, shut-down, instructions for maintenance, instructions for adjustments to the performance and functionality and details of risk mitigation arrangements.

(h) Maintenance manuals, including:
Instructions for routine maintenance, repair following failure, disposal of components and recommended spares inventory.

1.2.4 Project process documentation including:

(a) Project Management Plan, *see* 1.3.

(b) Requirements Definition Document, *see* 1.4.

(c) Quality Assurance Plan, *see* 1.5.

(d) Design Definition Document, *see* 1.6.

(e) Risk Management Plan, *see* 1.7.

(f) Configuration Management Plan, *see* 1.8.

(g) Verification Plan, *see* 1.9.

(h) Integration Plan, *see* 1.10.

(j) Validation Plan (certification and survey), *see* 1.11.

1.3 Project management

1.3.1 A project management procedure is to be established in order to define and manage the key project processes. The project processes are to include the processes described in 1.4 to 1.11.

1.3.2 For the entire project, and each of the processes within the project, the project management procedure is to define the following:

(a) Activities to be carried out.

(b) Required inputs and outputs.

(c) Roles of key personnel.

(d) Responsibilities of key personnel.

(e) Competence of key personnel.

(f) Schedules for the activities.

1.4 Requirements definition

1.4.1 A requirements definition procedure is to be established in order to define the functional behaviour and performance of the machinery or engineering system required by individual stakeholders, in the environments to which the machinery or engineering system is likely to be exposed under both normal and foreseeable emergency conditions.

1.4.2 The procedure is to take account of requirements resulting from key stakeholders, including:
(a) Ship's owner.
(b) Ship's operator.
(c) Ship's crew.
(d) Shipyard.
(e) Systems integrator.
(f) Designers.
(g) Maintenance personnel.
(h) Surveyors.
(j) Manufacturers and suppliers.
(k) National Administration.
(l) LR.

1.4.3 The procedure is to take account of requirements resulting from the following influences:
(a) Ship operations, including:
Underway, manoeuvring, pilotage, docking, alongside and training exercises.
(b) Ship conditions, including:
Normal operation, abnormal operation, blackout, deadship, fire in a single compartment and flooding of a single compartment.
(c) Environmental conditions, including:
Temperature, humidity, water spray, salt mist, vibration, shock, inclination, electrical fields and magnetic fields.
(d) Applicable provisions, including:
Statutory legislation, classification requirements, international standards, national standards and codes of practice.
(e) Expected users, including:
Multi-national users with a range of national languages and cultures, fatigued users, users without dedicated training, and maintenance and survey personnel.
(f) Design, construction and operational constraints, including:
Effect of particular design decisions or component choices on other aspects of design, risk and production engineering compromises, verification, integration and validation considerations, maintenance and disposal, and changes in use.

1.4.4 The procedure is to specify the functional behaviour and performance requirements and is to identify the source of the requirements.

1.5 Quality assurance

1.5.1 A quality assurance procedure is to be established in order to ensure that the quality of the machinery or engineering system is in accordance with a defined quality management system.

1.5.2 The procedure is to define the specific quality controls to be applied during the project in order to satisfy the requirements of the quality management system.

1.5.3 The quality management system is to satisfy the requirements of ISO9001:2000 *Quality management systems – Requirements*, or an equivalent acceptable National Standard.

1.6 Design definition

1.6.1 A design definition procedure is to be established in order to define the requirements for the design of machinery or an engineering system which satisfies stakeholder requirements, quality assurance requirements and complies with basic internationally recognised design requirements for safety and functionality.

1.6.2 The procedure is to ensure that the design of the machinery or engineering system satisfies:
(a) Statutory legislation.
(b) LR's requirements.
(c) International Standards and Codes of Practice where relevant.

1.6.3 The procedure is to take account of stakeholder requirements, *see* 1.4.

1.6.4 The procedure is to take account of quality assurance requirements, *see* 1.5.

1.6.5 The procedure is to ensure that the requirements for the design of major components and subsystems of the machinery or engineering system can be verified before and after integration.

1.6.6 The procedure is to specify the design requirements and is to identify the source of the requirements.

1.6.7 Any deviations from stakeholder requirements are to be identified, justified and accepted by the originating stakeholder.

1.7 Risk management

1.7.1 A risk management procedure is to be established in order to ensure that any risks stemming from the introduction of the machinery or engineering system are addressed, in particular risks affecting:
(a) The structural strength and integrity of the ship's hull.
(b) The safety of shipboard machinery and engineering systems.
(c) The safety of shipboard personnel.
(d) The reliability of essential and emergency machinery and engineering systems.
(e) The environment.

1.7.2 The procedure is to consider the hazards associated with installation, operation, maintenance and disposal, both with the machinery or engineering system functioning correctly and following any reasonably foreseeable failure.

1.7.3 The procedure is to take account of stakeholder requirements, *see* 1.4.

1.7.4 The procedure is to take account of design requirements, *see* 1.6.

1.7.5 The procedure is to ensure that hazards are identified using acceptable and recognised hazard identification techniques, and that the effects of the following influences are considered:

(a) Ship operations, including:
Underway, manoeuvring, pilotage, docking, alongside and maintenance, commissioning and trials.
(b) Ship conditions, including:
Normal operation, blackout, dead-ship, fire in a single compartment and flooding of a single compartment.
(c) Modes of operation, including:
Start-up, running, shut-down, automatic, reversionary, manual and emergency.
(d) Environmental conditions, including:
Temperature, humidity, water spray, salt mist, vibration, shock, inclination, electrical fields and magnetic fields.
(e) Dependencies, including:
Power, fuel, air, cooling, heating, data and human input.
(f) Environmental impact, including:
Emissions to air, discharges to water, noise and waste products.
(g) Failures, including:
Human error, supply failure, system, machinery, equipment and component failure, random, systematic and common cause failures.

1.7.6 The procedure is to ensure that risks are analysed using acceptable and recognised risk analysis techniques and that the following effects are considered:

(a) Local effects:
Loss of function, component damage, fire, explosion, electric shock, harmful releases and hazardous releases.
(b) End effects on:
Services essential to the safety of the ship, services essential to the safety of shipboard personnel and services essential to the protection of the environment.

1.7.7 The procedure is to ensure that risks are eliminated wherever possible. Risks which cannot be eliminated are to be mitigated as necessary.

1.7.8 Details of risks, and the means by which they are mitigated, are to be included in the operating manual, *see* 1.2.3.

1.8 Configuration management

1.8.1 A configuration management procedure is to be established in order to ensure traceability of the configuration of the machinery or engineering system, its subsystems and its components.

1.8.2 The procedure is to identify items essential for the safety or operation of the machinery or engineering system (configuration control items) which could foreseeably be changed during the lifetime of the machinery or engineering system, including:

(a) Documentation.
(b) Software.
(c) Sensors.
(d) Actuators.
(e) Instrumentation.
(f) Valves.
(g) Pumps.

1.8.3 The procedure is to take account of the design requirements, *see* 1.6.

1.8.4 The procedure is to include items used to mitigate risks, *see* 1.7.

1.8.5 The procedure is to ensure that any changes to configuration control items are:

(a) Identified.
(b) Recorded.
(c) Evaluated.
(d) Approved.
(e) Incorporated.
(f) Verified.

1.9 Verification

1.9.1 A verification procedure is to be established in order to ensure that subsystems and major components of the machinery or engineering system satisfy their design requirements.

1.9.2 The procedure is to verify design requirements, *see* 1.6.

1.9.3 The procedure is to identify the requirements to be verified, the means by which they are to be verified, and the points in the project at which verification is to be carried out.

1.9.4 The procedure is to be based on one or a combination of the following activities as appropriate:

(a) Design review.
(b) Product inspection.
(c) Process audit.
(d) Product testing.

1.10 Integration

1.10.1 An integration procedure is to be established in order to ensure that the machinery or engineering system is assembled in a sequence which allows verification of individual subsystems and major components following integration in advance of validating the entire machinery or engineering system.

1.10.2 The procedure is to take account of the verification requirements, *see* 1.9.

1.10.3 The procedure is to identify the subsystems and major components, the sequence in which they are to be integrated, the points in the project at which integration is to be carried out, and the points in the project at which verification is to be carried out.

1.11 Validation (certification and survey)

1.11.1 A validation procedure is to be established in order to ensure the functional behaviour and performance of the machinery or engineering system meets with its functional and performance requirements.

1.11.2 The procedure is to validate stakeholder requirements, *see* 1.4.

1.11.3 The procedure is to validate arrangements required to mitigate risks, *see* 1.7.

1.11.4 The procedure is to validate the traceability of the configuration control items, *see* 1.8.

1.11.5 The procedure is to identify the requirements to be validated, the means by which they are be validated and the points in the project at which validation is to be carried out, including:
(a) Factory acceptance testing.
(b) Integration testing.
(c) Commissioning.
(d) Sea trials.
(e) Survey.

Section

Section 1
General requirements

1.1 General

1.1.1 This Chapter states the requirements for ships having centralised refrigeration systems, designed to reject heat from refrigerated stores or from the air-conditioning and ventilation arrangements fitted to both passenger and crew accommodation spaces and are in addition to the relevant requirements of Parts 5 and 6.

1.1.2 The requirements, which are optional, cover arrangements, equipment, and systems necessary for provision stores and air-conditioning arrangements as defined in 1.1.3 and 1.1.4.

1.1.3 The refrigeration system is to include the refrigeration compressor(s), condenser(s), evaporator(s), direct expansion air handling and fan coil units, interconnecting primary refrigerant piping system and fittings.

NOTE

For the purpose of these Rules, the term primary refrigerant system, unless otherwise stated, applies to primary refrigerant systems and secondary refrigerant systems containing volatile refrigerants.

1.1.4 These requirements are intended to mitigate risks associated with the safety of refrigeration and air-conditioning machinery, and do not cover air distribution ductwork, chilled water systems or the calculation and verification of air flow rates and cooling loads within the air conditioned or refrigerated spaces. The method used to calculate the capacity of the air-conditioning refrigeration equipment is the responsibility of the Shipbuilder and Owner and should be in accordance with a recognised code or standard such as ISO 7547:2002 *Ships and marine technology – Air-conditioning and ventilation of accommodation spaces – Design conditions and basis of calculations* or, ASHRAE 26-1996(RA2006) *Mechanical Refrigeration and Air-Conditioning Installations Aboard Ship*.

1.1.5 Ships complying with the applicable requirements of this Chapter will be eligible for the optional machinery class notation **RPA** (Refrigeration Machinery for Provision Stores and Air-conditioning).

1.2 Plans and information

1.2.1 The following plans and particulars, as applicable, and any others which may be specially requested for the refrigerating plant and systems, are to be submitted in triplicate for approval, before construction is commenced:

(a) Schematic plans, including full particulars of piping and instrumentations, for:
   - (i) primary and secondary refrigerant systems containing a volatile fluid;
   - (ii) air cooler defrosting arrangements; and
   - (iii) condenser cooling water systems.

(b) Detailed dimensioned plans and material specifications for:
   - (i) reciprocating compressor crankshaft and crankcase, where exposed to refrigerant pressure;
   - (ii) rotary-type compressor rotors and casing;
   - (iii) condensers, both shell and tube, and plate type;
   - (iv) evaporators, both shell and tube, and plate type;
   - (v) air coolers or arrangement of air cooling pipe grids and construction method;
   - (vi) liquid receivers;
   - (vii) oil separators; and
   - (viii) any other pressure vessels or heat exchangers containing primary refrigerants, *see* Pt 5, Ch 11,6.1.

(c) General arrangement of refrigerating machinery compartments in elevation and plan, showing location and arrangement of the plant, ventilation details and location of temperature sensors and refrigerant vapour detectors.

(d) Details of automatic controls, alarms and safety systems, *see* Pt 6, Ch 1,1.

(e) Details of primary refrigerant level indicators.

(f) Capacity calculations for pressure relief valves and/or bursting discs, and inlet and discharge pipework pressure drop calculations.

(g) Programme of tests to be conducted on completion of the installation, *see* Section 7.

1.2.2 In addition to the applicable requirements detailed in 1.2.1, the following information is also to be submitted for air-conditioning refrigeration equipment:

(a) Details of direct expansion fan coil units (FCUs).

(b) Details of cooling coils, fitted to air handling units (AHUs) that contain primary refrigerant.

(c) General arrangement drawing showing the location of the air-conditioning refrigeration equipment, direct expansion FCUs and AHUs throughout the ship.

(d) Details of pressure testing procedures for the refrigeration equipment.

1.2.3 Plans showing the general arrangement of refrigeration plant compartments, together with a description of the equipment and arrangements installed for isolation and distribution of ventilation air and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms and control stations.

1.2.4 A statement of the intended design system capacity for the intended operating conditions for verification purposes at the trials required by 7.2.1

1.2.5 A schedule of testing and trials to demonstrate that systems are capable of operating as designed and as required by Section 7.

1.2.6 Operating manuals are to be submitted for information. The manuals are to include the following information:
(a) Particulars and a description of the systems.
(b) Operating instructions for the equipment and systems.
(c) Maintenance instructions for the installed arrangements.

1.2.7 Evidence that the required performance of refrigeration systems, pump and fan equipment is capable of being maintained under ambient and inclination operating conditions defined in Pt 5, Ch 1,3.5 and 3.6 is to be provided by the manufacturer.

■ *Section 2* Construction and installation

2.1 Materials

2.1.1 The selection of materials for piping systems in provision store refrigeration systems is to take account of the following:
(a) The pressures and temperatures of the refrigerant fluids.
(b) Locations of systems and equipment.
(c) Compatibility of materials.
(d) Fluid flow rates and static pressure conditions.
(e) Minimising corrosion and erosion through life of system.
(f) Refrigerant flammability and toxicity.

2.1.2 Pipes, valves and fittings are in general to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable subject to the restrictions in Pt 5, Ch 12,5.

2.1.3 Where applicable, the piping systems are to comply with the requirements of Pt 5, Ch 12.

2.2 Equipment – Selection and installation

2.2.1 Pressure vessels in provision store and air-conditioning refrigeration systems are to be in accordance with Pt 5, Ch 11.

2.2.2 Valves and flexible hose lengths are to comply with the relevant requirements of Pt 5, Ch 12.

2.2.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.

2.2.4 Suitable means for expansion are to be made, where necessary, in each range of pipes.

2.2.5 Suitable protection is to be provided for all pipes and equipment situated where they are liable to mechanical damage.

2.2.6 All moving parts are to be provided with guards to minimise danger to personnel.

2.2.7 Primary refrigerant pipework, serving AHUs and FCUs, which pass through bulkheads and deckheads is to comply with the requirements of SOLAS Chapter II-2, Regulation 9.3.

2.3 Valves and relief devices

2.3.1 Valves are to be fitted in places where they are readily accessible at all times.

2.3.2 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by a locking wire with a lead seal or similar arrangement, *see also* 2.4.4.

2.4 Refrigerant systems

2.4.1 The primary refrigerants ammonia, hydrocarbons or carbon dioxide shall not be used in direct expansion FCUs located in accommodation spaces. The use of these refrigerants in machinery spaces, such as a separate AHU compartment, may be accepted subject to suitable safety arrangements being provided to the satisfaction of Lloyd's Register (hereinafter referred to as LR).

2.4.2 Compartments containing refrigeration plant are to be provided with refrigerant gas leak detectors with an alarm. *See* Section 4.

2.4.3 The design of refrigeration systems is to permit maintenance and repair without unavoidable loss of refrigerant to atmosphere. To minimise refrigerant release to the atmosphere, refrigerant recovery units are to be provided to allow evacuation of a system prior to maintenance.

2.4.4 Refrigeration systems are to be provided with relief devices which are arranged with sufficient margins to avoid circumstances that would allow an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that overpressure due to fire conditions can be safely relieved.

2.4.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The refrigerant flow capacity of the valve or disc is to exceed the full load compressor capacity for the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

2.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of a stop or automatic control or check valve is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device. Pressure vessels that are connected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any pressure vessel.

2.4.7 Omission of one of the specified relief devices and changeover device, as required by 2.4.6, will be accepted where:

(a) vessels are of less than 300 litres internal gross volume; or
(b) vessels discharge into the low pressure side of the system by means of a relief valve.

2.4.8 Sections of systems and components that could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.

2.4.9 Where any hermetic or semi-hermetic compressor has the electric motor cooled by the circulating refrigerant, the following arrangements are to be provided:

(a) Refrigeration circuits are to contain no more than one hermetic or semi-hermetic compressors.
(b) Each compressor motor is to be fitted with a thermal cut-out device to protect the motor against overheating.
(c) Each refrigerant circuit is to contain a suitable arrangement to allow debris or contaminants from a motor failure to be removed.
(d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of Pt 5, Ch 11 and Pt 5, Ch 17 as applicable. Plans are to be submitted for consideration as required by Pt 5, Ch 11,1.6.

2.5 Air handling unit(s) (AHUs) for air-conditioning systems

2.5.1 Evaporator coils as fitted to direct expansion AHUs are to be considered for approval and plans are to be submitted, *see also* 1.2.2. All other equipment fitted to an AHU, such as air filtration, dehumidification, heating and humidification systems are outside the scope of these Rules and are the responsibility of the Shipyard and Owner.

2.5.2 Each AHU is to be provided with suitable drip trays and drainage arrangements to remove any condensate which may form.

2.5.3 The installation arrangements of AHUs are to be such as to allow sufficient space for the withdrawal and replacement of the refrigerant cooling coil.

2.6 Air coolers and cooling grids for provision store refrigeration systems

2.6.1 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.

2.6.2 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. When a store operates at temperatures at, or lower than 0°C, provision is to be made for the prevention of freezing of the condensate.

2.6.3 The installation arrangements of air coolers are to be such that when the refrigerated spaces are loaded with provisions, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.

2.6.4 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

2.7 Design pressures

2.7.1 The design pressure of the system will be regarded as equal to its maximum working pressure, *see* 2.7.5.

2.7.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No pressure relief valve or other protective device is to be set to a pressure higher than the maximum working pressure.

2.7.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure side of the system. For carbon dioxide design pressures, *see* 2.7.6.

2.7.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be determined from 1,11 × P_b, where P_b is an allowance for the compressor high pressure cut-out. P_b is to be not less than to 1,11 × P_a, where P_a is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure of the refrigerant at plus 46°C.

2.7.5 Design pressures applicable to refrigerants are to be not less than the values given in Table 15.2.1 when condensers are sea-water cooled. The design pressure for other refrigerants and condensing arrangements is to be agreed with LR.

Table 15.2.1 Design pressure limits

Refrigerant	Pressure, (bar g)	
	High	Low
R-717	21,2	17,2
R-22	20,6	16,7
R-290	18,1	14,7
R-600a	6,4	5,2
R-134a	13,4	10,9
R-407C	23,5	19,0
R-410A	34,5	28,0
R-507A	25,3	20,5
R-404A	24,8	20,1
R-744	*See* 2.7.6	

NOTE
In view of increasing world-wide restrictive legislation and phasing out of the HCFC refrigerant R-22, it is recommended that this refrigerant should not be used in new installations.

2.7.6 The proposed design pressure for a carbon dioxide system is to be stated, taking account of the maximum working pressure and the maximum pressure at rest conditions. Where the maximum pressure at rest condition is maintained by the fitting of a supplementary refrigeration unit, condensing the vapour in a holding vessel, supporting calculation is to be provided to show that this can be undertaken with a local ambient temperature of 45°C. The holding vessel is to be thermally insulated to prevent the operation of the relief devices within a 24 hour period after stopping the supplementary refrigeration unit at an ambient temperature of 45°C and an initial pressure equal to the starting pressure of the refrigeration unit.

2.7.7 Where a carbon dioxide system is designed for hot gas defrosting, due regard is to be given to the possibility of a higher pressure being imposed on the low pressure system. The design pressure for the hot gas defrosting section of the system is to be 10 per cent greater than the maximum pressure experienced during defrosting.

2.8 Insulation materials

2.8.1 Where applicable, having regard to their location and environmental conditions, insulation arrangements are to have:

(a) materials suitably resistant to fire;
(b) insulation lining suitably resistant to flame spread;
(c) effective protection against penetration of water vapour; and
(d) adequate protection against mechanical damage.

2.8.2 The potential for smoke generation and toxicity of insulation materials is to be in accordance with SOLAS Chapter II-2, Part B, Regulation 6.

2.8.3 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted.

2.8.4 Prefabricated panel systems are to be fitted with suitable pressure equalising devices.

2.8.5 All low temperature pipework, valves and fittings are to be provided with suitable thermal insulation. *See* Pt 6, Ch 3,4.11.10.

2.9 Manufacture and certification

2.9.1 Pressure vessels satisfying the conditions listed in Pt 5, Ch 11,1.6.1 are to be constructed in accordance with the requirements of Pt 5, Ch 11 and 17. Plans are to be submitted for consideration as required by Pt 5, Ch 11,1.6.

2.9.2 Other equipment, apart from applicable pressure vessels and heat exchangers, used for air-conditioning or provision stores refrigeration systems are not required to be constructed under survey.

2.9.3 All major items of equipment, containing refrigerant, such as compressors, condensers, AHU cooling coils and FCUs shall be supplied with a manufacturer's works certificate providing details of the design and test pressures.

■ *Section 3*
Refrigerating machinery and refrigerant storage compartment arrangements

3.1 General

3.1.1 Refrigerating machinery is to be installed in a well ventilated compartment. In general, the arrangements are to be such that all components of the refrigerating machinery can be readily opened up for inspection or replacement. Space is to be provided for the withdrawal and renewal of the tubes in 'shell-and-tube' type evaporators (secondary refrigerant coolers) and condensers. Proposals for alternative arrangements are to be submitted to LR for consideration.

3.1.2 Refrigerating machinery using toxic and/or flammable refrigerants is to be located outside the main machinery space in a separate gastight compartment.

3.1.3 Where the refrigerating machinery is located in a separate gastight compartment, outside the main machinery space, this compartment is to be equipped with effective mechanical ventilation to provide 30 air changes per hour based upon the total volume of the space. The mechanical ventilation system is to have two methods of control, one of which is to be operable from outside the compartment.

3.1.4 Openings for pipes, electrical cables and other fittings in bulkheads and decks are to be fitted with gastight seals.

3.2 Gas storage compartments

3.2.1 Portable steel cylinders containing reserve supplies of refrigerant are to be stored in a well ventilated compartment reserved solely for this purpose.

3.2.2 The storage compartment is to be provided with a mechanical ventilation system providing 10 air changes per hour.

3.2.3 The storage compartment is to be provided with a suitable vapour detection system, *see* Section 4.

3.2.4 The storage compartment is to be provided with suitable water drainage arrangements not connected with the main machinery spaces.

3.2.5 Steel storage cylinders are to be of an approved type and are to be filled to a level suitable for an ambient temperature of plus 46°C.

3.2.6 The storage compartment is to be provided with racks to facilitate secure stowage of the cylinders.

3.3 Pressure testing at manufacturers' works

3.3.1 Components intended for use with a primary refrigerant are to be subject to pressure testing procedures as detailed in Table 15.3.1.

Table 15.3.1 Test pressure

Component	Test pressure, (bar g)	
	Pressure test	Tightness test
(1) Pressure vessels	*See* Pt 5, Ch 11	1,0*p*
(2) Compressor cylinders/ crankcase/casing	1,5*p*	1,0*p*
(3) Valves and fittings	2,0*p*	1,0*p*
(4) Pressure piping, fabricated. headers, air coolers, etc.	1,5*p*	1,0*p*
NOTE *p* is the design pressure as defined in 2.7.		

3.3.2 Component pressure tests are to be hydraulic or where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.

3.3.3 Component tightness tests are to be carried out only after completion of satisfactory pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.

3.3.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure which, in no case is to be less than 3,5 bar g.

3.4 Pressure test after installation on board ship

3.4.1 For primary refrigerant piping welded in place, pressure tests of the welds are to be carried out at a test pressure of 1,5*p*. This will normally take the form of a pneumatic test (*see* 3.4.2) since hydraulic testing media such as water are not acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.

3.4.2 Pneumatic pressure tests are to be carried out using a suitable inert gas.

NOTE

Where pneumatic testing is used, adequate safety precautions recognising the hazards involved should be observed to prevent danger to personnel and to minimise risk to property.

3.4.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by 3.4.1 and 3.4.2 may be omitted provided non-destructive examination has been carried out by an approved operator to the satisfaction of LR and in accordance with the requirements of Pt 5, Ch 17,6.

3.4.4 After completion of the test required by 3.4.1, 3.4.2 or 3.4.3, a tightness test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the surveyor.

3.4.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure which, in no case is to be less than 3,5 bar g.

■ *Section 4*
Refrigerant detection systems

4.1 General

4.1.1 A fixed refrigerant detection system is to be provided in the refrigerating machinery compartment or space and ventilation outlet ducts when the ventilation system is shared with other compartments.

4.1.2 The alarm system is to comply with the requirements of Pt 6, Ch 1 and, as a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and at a high-level concentration corresponding to the refrigerant's safe occupational level.

4.1.3 Detection equipment is to be so designed that it may be readily tested and calibrated; any failure of the equipment is to initiate an alarm.

4.1.4 The location of the detectors is to be determined relative to the layouts of the individual compartments and machinery spaces and are to be indicated in the plan submission.

4.1.5 Audible and visual alarms are to be activated, located both inside and outside the affected space. The alarms are to be readily identifiable and be visible and audible in all locations within the space housing the refrigeration equipment.

■ *Section 5* Control and monitoring and electrical power arrangements

5.1 General

5.1.1 Control engineering arrangements are to comply with Pt 6, Ch 1 as applicable.

5.1.2 All cooling and secondary refrigerant pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at each control station.

5.1.3 The power to all independently driven ventilation fans is to be capable of being stopped from position(s) outside the fire boundary which will remain readily accessible in the event of fire occurring in any space, as well as from the local control panel.

5.1.4 Electrical engineering arrangements are to comply with Pt 6, Ch 2.

5.1.5 Refrigeration compressors are to be provided with the following instrumentation and automatic shutdowns:

(a) Indication of suction pressure (saturated temperature), including intermediate stage when applicable.
(b) Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
(c) Indication of lubricating oil pressure.
(d) Indication of cumulative running hours (screw compressors).
(e) Automatic shutdown in the event of low lubricating oil pressure.
(f) Automatic shutdown in the event of high discharge pressure, *see also* 5.1.13.
(g) Automatic shutdown in the event of low suction pressure.

5.1.6 For refrigeration compressors greater than 25 kW, the following instrumentation, additional to that required by 5.1.5, is to be provided:

(a) Indication of lubricating oil temperature.
(b) Indication of condenser cooling water outlet temperature.
(c) Indication of cumulative running hours (reciprocating compressors).
(d) Indication of suction and discharge temperatures.

5.1.7 Alarms are to be initiated in the event of the following fault conditions with refrigeration compressors:

(a) High discharge pressure.
(b) Low suction pressure.
(c) Low oil pressure.
(d) High discharge temperature.
(e) High oil temperature.
(f) Motor shutdown.

5.1.8 Refrigeration plants are to be provided with the following alarms as applicable:

(a) Failure of condenser cooling water pumps.
(b) High condenser cooling water outlet temperature.
(c) Failure of air cooler fans.
(d) High and low refrigerated air delivery temperatures.
(e) High secondary refrigerant temperatures.
(f) Failure of secondary refrigerant pump.
(g) Low level in secondary refrigerant header tank.

5.1.9 Where the air-conditioning/refrigerating system is fitted with automatic or remote controls, so that, under normal operating conditions, no manual intervention by the operators is required, it is to be provided with the alarms required by 5.1.6 to 5.1.8 in accordance with the relevant requirements of Pt 6, Ch 1.

5.1.10 Where more than one compressor is fitted, the control sequence is to be such as to allow one machine to stop in the event of a reduction in cooling duty. Provision is to be made to allow selection of the lead machine to equalise running hours.

5.1.11 To allow the equipment to be isolated from the power supply in the event of a failure or refrigerant leak, refrigeration compressors and AHUs are to be fitted with local emergency stop switches.

5.1.12 AHUs are to be provided with the following instrumentation as a minimum:

(a) Indication of primary refrigerant outlet pressure and temperature; and
(b) Indication of outlet air temperature.

5.1.13 Compressors are to be provided with automatic shutdown in the event of high discharge pressure. For refrigeration systems where the maximum working pressure is less than or equal to 40 bar g, the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,9 of the maximum working pressure. For refrigeration systems where the maximum working pressure is greater than 40 bar g, the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,95 of the maximum working pressure.

Section 6
Personnel safety equipment and systems

6.1 Personnel safety equipment

6.1.1 Access doors to the refrigerated spaces are to open outwards, alternatively sliding doors may be used where the door is external to the space.

6.1.2 Access ways to the refrigerated spaces are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.

6.1.3 Access ways and refrigerated compartments are to be provided with an independent lighting system in accordance with the requirements of Pt 6, Ch 2,5.7.2 and 5.7.4, with the means of locking the switches in the 'on' position.

6.1.4 Arrangements are to be such that means are provided for both opening the room door(s) and sounding the alarm required by 6.2.2 from inside refrigerated spaces.

6.1.5 Where ammonia is used in refrigerating systems, the following items of safety equipment are to be provided as a minimum, and positioned in accessible protected storage (e.g. locked glass fronted cabinets) located outside the machinery compartment:
(a) Two sets of ammonia protective clothing (including helmet, boots and gloves).
(b) Two portable battery powered hand lamps (to be of certified safe-type).
(c) Two sets of self-contained breathing apparatus (compressed air).
(d) Two full face mask respirators.
(e) Two fire-resistant life-lines.
(f) Two firemen's axes.
(g) Two heavy duty adjustable spanners.
(h) Two wheel wrenches.
(j) Irrigation facilities or eye wash bottles containing an eye wash solution, distilled water or non-carbonated mineral water.
(k) Hand or foot-operated douches providing a copious supply of clean water, located outside the compartment's doors.

6.2 Personnel warning systems

6.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.

6.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the system is to alarm and must indicate their well-being by accepting the warning.

6.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.

6.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.

6.2.5 In the event that the crew member(s) fails to respond and accept the warning within an agreed specified time, the system is to immediately initiate an alarm on the bridge and at the main control station, or subsidiary control stations as appropriate. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.

6.2.6 The system is to comply with the relevant requirements of Pt 6, Ch 1.

Section 7
Testing and trials

7.1 Testing

7.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. *See* Pt 5, Ch 11 and Ch 12,8.

7.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.

7.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.

7.1.4 Testing is to cover the following items:
(a) Verification of control, alarm and safety systems.
(b) Simulation tests for failure of refrigeration equipment, to verify correct functioning of alarms and systems in service.
(c) Verification of accuracy, calibration and functioning of temperature control for refrigeration systems.

7.2 Trials

7.2.1 Acceptance trials, as stipulated in this Section, are to be conducted. It is to be demonstrated that the provision store or air-conditioning refrigerating system capacity meets the design duty. As far as is practicable, the trials are to represent the operating conditions that will be encountered in service. For example, the condenser cooling water flow should be restricted so that the compressor discharge pressure is at the design value.

Rules and Regulations for the Classification of Ships

Part 8
Rules for Ice and Cold Operations
July 2014

Lloyd's Register

Chapter Contents

Contents

Contents

Contents

■ *Section 1* Scope

1.1 General

1.1.1 The following requirements are for ships intended for operations in ice and cold conditions.

1.1.2 Guidance on the appropriate requirements and notations is provided in Table 1.1.1.

1.1.3 At the Owner's request and in order to enhance safety and awareness on board during ship operation, the **ShipRight SEA(ICE)** *Ship Event Analysis Procedure* may be applied. This procedure may be applied to all ships where it is intended to provide a hull surveillance system for monitoring of the ship's hull girder stresses and local ice loads when the ship is navigating in ice, and warning the ship's personnel that the load levels or the frequency and magnitude of ice impacts are approaching a level where corrective action is advisable. *See* Pt 1, Ch 2,2.8.3 and Pt 3, Ch 16,5.

1.1.4 At the Owner's request and in order to enhance safety, the **ShipRight FDA ICE** *Fatigue Induced by Ice Loading Procedure* may be applied. This procedure is supplementary to the FDA procedures and is to assess fatigue damage induced by ice loads for ships navigating in ice-covered regions. The objective of the **ShipRight FDA ICE** procedure is to provide technical guidelines to assess fatigue at the end connections of stiffeners in the ice belt regions under ice loading. *See* Pt 1, Ch 2,2.3.17 and Pt 3, Ch 16,3.

				Prolonged duration	**Winterisation A(*T*)**

■ *Section 2*

Ice environment

2.1 General

2.1.1 This Section is intended to give assistance on the selection of a suitable ice class notation for the operation of ships in ice-covered regions.

2.1.2 The Owner is to confirm which notation is most suitable for their requirements. Ultimately, the responsibility rests with the master of the ship and their assessment of the ice and temperature conditions at the time.

2.1.3 The documentation supplied to the ship is to contain the ice class notation adopted, any operation limits for the ship and guidance on the type of ice that can be navigated for the nominated ice class.

2.2 Definitions

2.2.1 The World Meteorological Organisation's, WMO, definitions for sea ice thickness are given in Table 1.2.1.

Table 1.2.1 WMO defintion of ice conditions

Ice conditions	Ice thickness
Medium first-year	1,2 m
Thin first-year, second stage	0,7 m
Thin first-year, first stage	0,5 m
Grey-white	0,3 m
Grey	0,15 m

2.2.2 Table 1.2.2 defines the ice classes in relation to the Rules and the equivalent Internationally Recognised Standards.

Table 1.2.2 Comparison of ice Standards

Lloyd's Register class notation	*Finnish-Swedish Ice Class*	Canadian type
Ice Class 1AS FS(+) **Ice Class IAS FS**	IA Super	A
Ice Class 1A FS(+) **Ice Class 1A FS**	IA	B
Ice Class 1B FS(+) **Ice Class 1B FS**	IB	C
Ice Class 1C FS(+) **Ice Class 1C FS**	IC	D
Ice Class 1D	—	D
Ice Class 1E	—	E

2.3 Application

2.3.1 The variable nature of ice conditions is such that the average limits of the conditions are not easily defined. However, it is possible to plot the probable limits of the ice flows and the ice edge for each season. *See* Figs. 1.2.1 to 1.2.4, and Table 1.2.3.

2.3.2 Operation with **Ice Class 1C FS** may be possible up to 150 nm inside the 7/10 region shown depending on the severity of the winter. Operation with **Ice Class 1A FS** may be possible up to 150 nm inside the medium first-year ice shown depending on the severity of the winter. Operation up to the multi-year ice is possible most years with **Ice Class 1AS FS**.

Table 1.2.3 Concentration of ice

Free ice	 0/10		
Open water	 <1/10		
Very open drift	 1/10	 2/10	 3/10
Open drift	 4/10	 5/10	 6/10
Close pack/drift	 7/10	 8/10	
Very close pack	 9/10	 9+/10	
Compact/consolidated ice	 10/10		

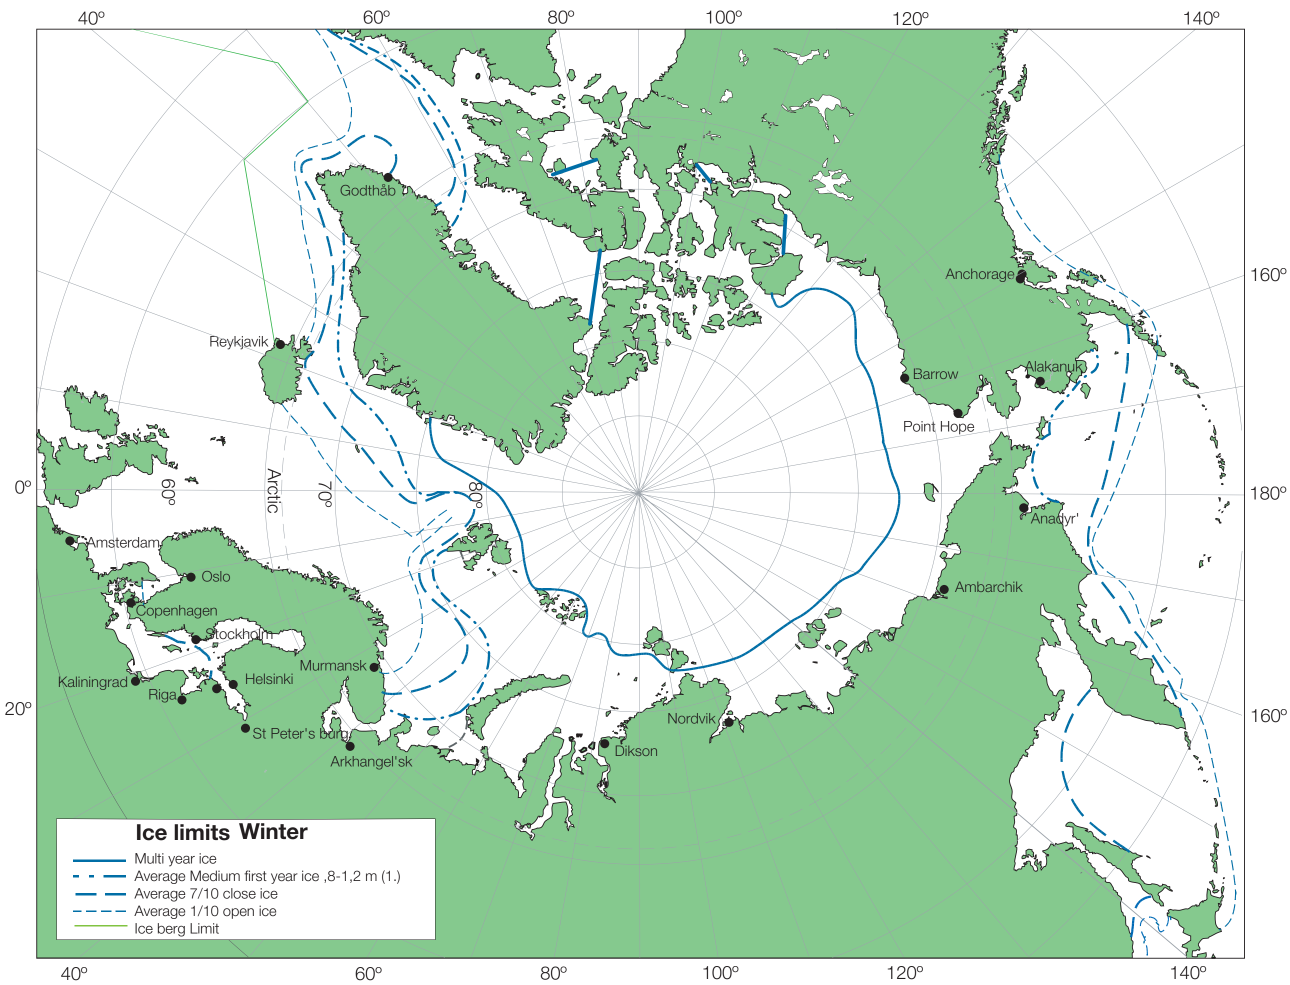

Fig. 1.2.1 Ice Limits for the Arctic Winter

2.3.3 Operation in the region between 7/10 and 1/10 in the ice-covered regions is possible with due care for ships with no ice class. For ships operating for extended periods in these areas, it will be necessary to specify and design for a minimum temperature for the hull materials. To cover all situations for a non-ice class ship, the material requirements of *The Provisional Rules for the Winterisation of Ships* are recommended.

2.4 Ice Class notations

2.4.1 Where the requirements of Chapter 2 are complied with, the ship will be eligible for a special features notation as defined in Pt 1, Ch 2,2.1.9, *see also* Table 1.1.1.

2.4.2 In general, an **Ice Class** Notation contained in this Part of the Rules will only be assigned where the vessel has been assigned a **✠LMC** notation. A **[✠]LMC** notation may be accepted where ice class machinery items are not included within the scope of the propulsion arrangements for acceptance of a manufacturer's certificate, *see* Pt 1, Ch 1.

2.5 National Authority requirements

2.5.1 Certain areas of operation may require compliance or demonstration of equivalence with National Authority requirements. Table 1.2.2 gives the equivalence of National Authority requirements.

2.5.2 The standards of ice strengthening required by the Rules have been accepted by the Finnish and Swedish Boards of Navigation as being such as to warrant assignment of the Ice Classes given in Table 1.2.2.

2.5.3 Ships intending to navigate in the Canadian Arctic must comply with the *Canadian Arctic Shipping Pollution Prevention Regulations established by the Consolidated Regulations of Canada, 1978, Chapter 353*, in respect of which Lloyd's Register is authorised to issue Arctic Pollution Prevention Certificates.

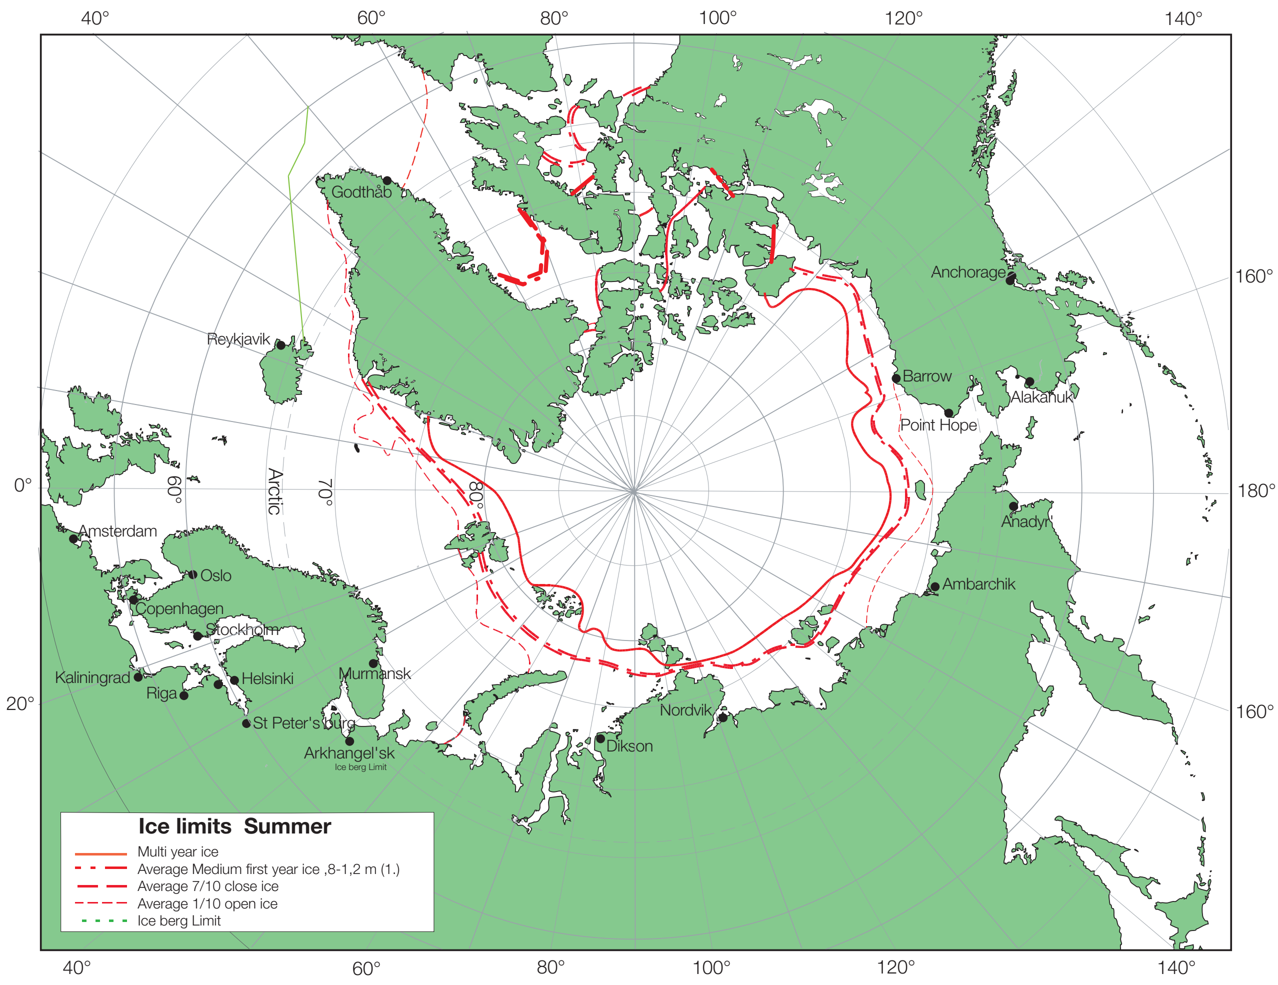

Fig. 1.2.2 Ice Limits for the Arctic Summer

2.5.4 The Canadian Arctic areas have been divided into zones relative to the severity of the ice conditions experienced and, in addition to geographic boundaries, each zone has seasonal limits affecting the necessary Ice Class notation required to permit operations at a particular time of year. It is the responsibility of the Owner to determine which notation is most suitable for their requirements.

2.5.5 The Canadian Authorities recognise that in the period November 6 to July 31 and any extension to that period declared by the Canadian Coast Guard, oil and bulk chemical tankers which qualify for Canadian Type A, B, C and D as indicated in Table 1.2.2 are suitable for operating in designated ice control zones within Canadian waters, off the east coast of Canada south of 60° north latitude. For all Type E tankers operating in this zone during the specified period, the Canadian Authorities will require either additional hull strength in way of the forward wing cargo tanks port and starboard, or the level of oil or chemical in these tanks to be not higher than one metre below the waterline of the ship in her condition of transit. Where the latter arrangement is adopted, the effect on longitudinal strength is to be considered.

2.5.6 For ships intending to navigate in Finnish-Swedish waters and having a **Polar Ice Class notation**, consideration may need to be given to the installed engine power such that it complies with the applicable *Finnish-Swedish Ice Class Rules*, *see* Ch 2,7.

2.6 Ice conditions

2.6.1 Charts and images for the current and recent ice conditions in all areas of the world plus information on icebergs can be found from the National Ice Centre on the world wide web at:

www.natice.noaa.gov

2.6.2 Daily ice information and consultation is available from the Canadian ice service which is part of the Canadian department of the environment. Their web site can be found at:

www.ice-glaces.ec.gc.ca

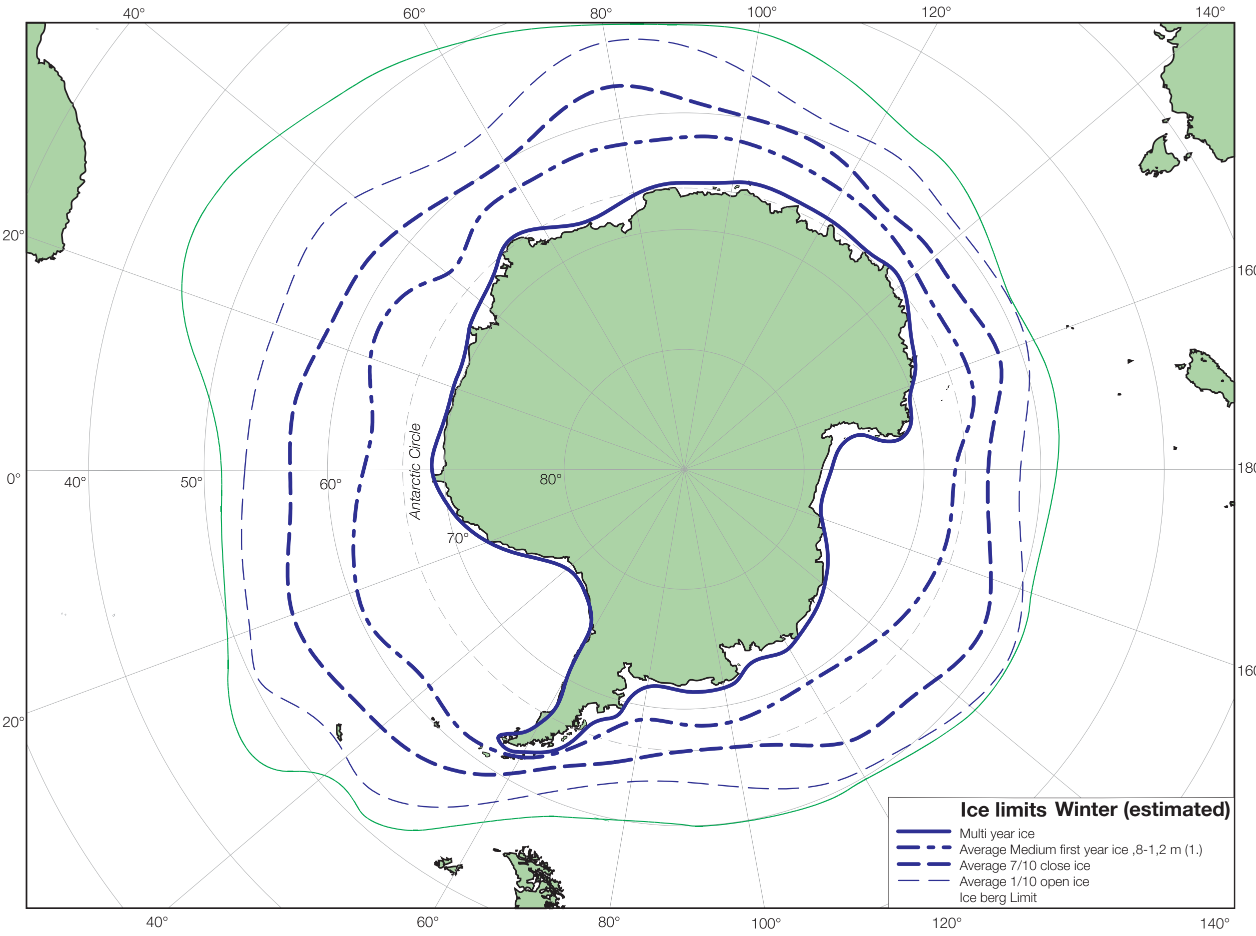

Fig. 1.2.3 Ice Limits for the Antarctic Winter

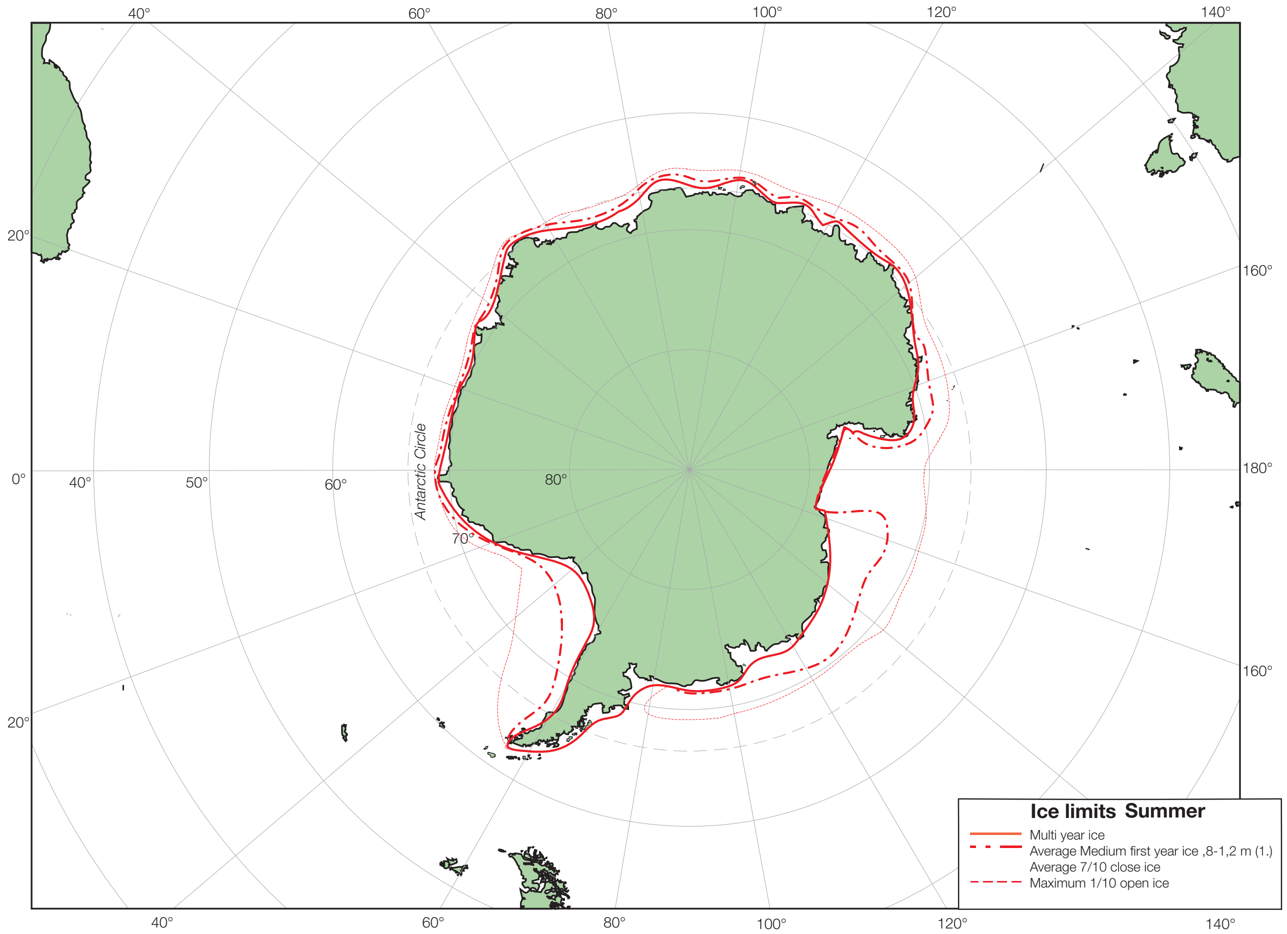

Fig. 1.2.4 Ice Limits for the Antarctic Summer

Section 3
Air environment

3.1 Air temperature

3.1.1 For ships intended to operate in cold regions, the temperature on exposed surfaces is to be considered. *See The Provisional Rules for the Winterisation of Ships*.

3.1.2 The average external design air temperature is to be taken as the lowest mean daily average air temperature in the area of operation:

where

Mean = statistical mean over a minimum of 20 years
Average = average during one day and one night
Lowest = lowest during the year
MDHT = Mean Daily High Temperature
MDAT = Mean Daily Average Temperature
MDLT = Mean Daily Low Temperature

Fig. 1.3.1 shows the definition graphically.

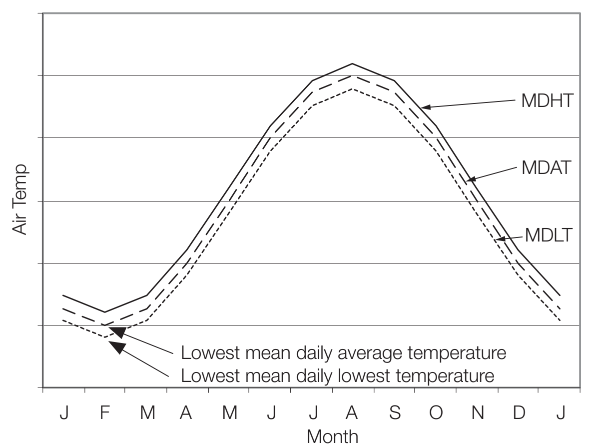

Fig. 1.3.1 Air temperature

3.1.3 The lowest external design air temperature is to be taken as the lowest mean daily lowest air temperature in the area of operation. Where reliable environmental records for contemplated operational areas exist, the lowest external design air temperature may be obtained after the exclusions of all recorded values having a probability of occurrence of less than 3 per cent.

3.1.4 Lowest mean daily average air temperatures for the Arctic and Antarctic are provided in Figs. 1.3.2 and 1.3.3.

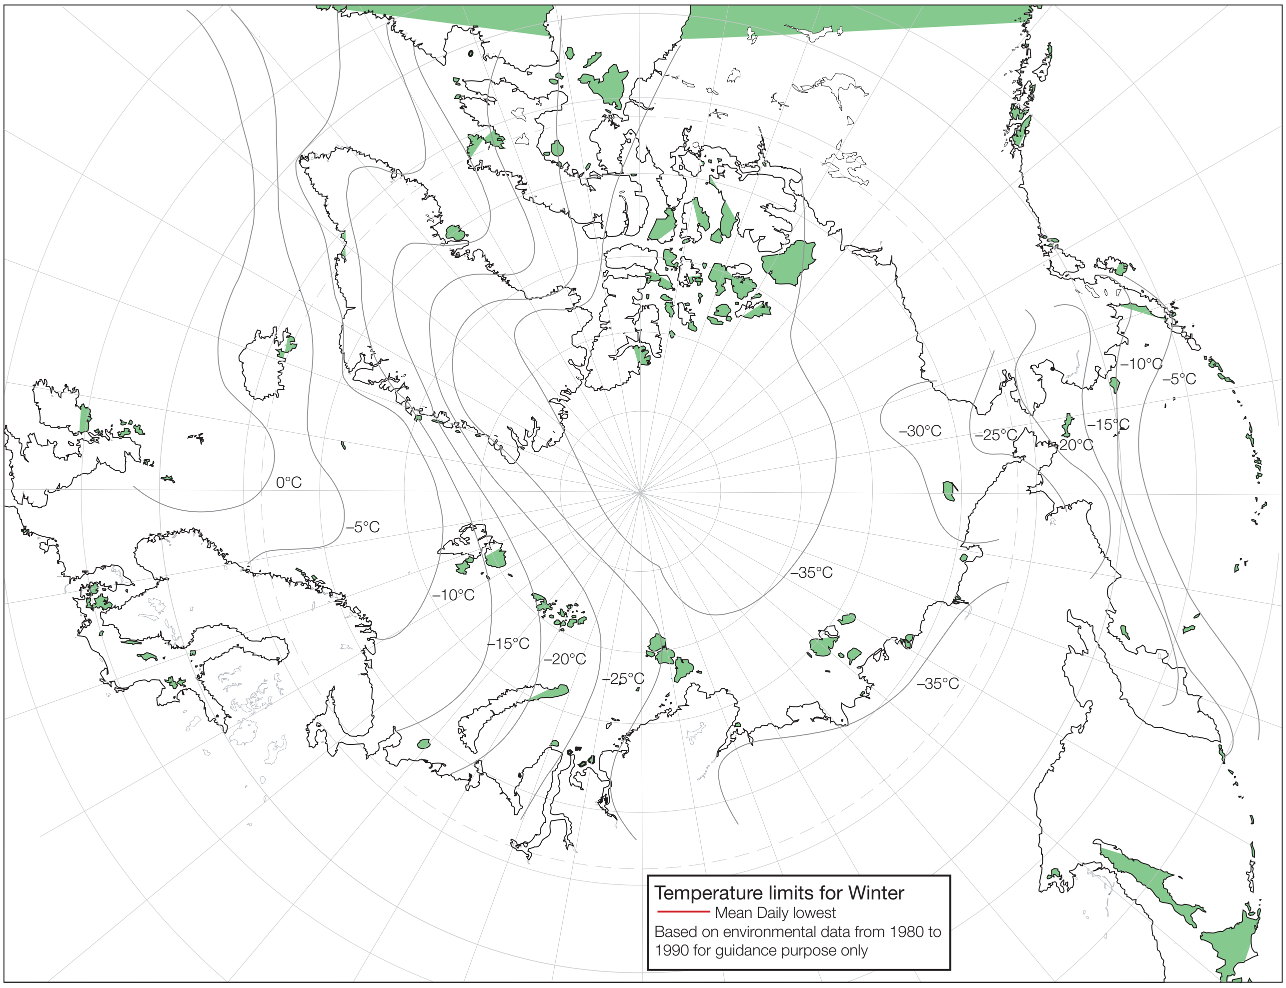

Fig. 1.3.2 Lowest mean daily air temperatures for the Arctic

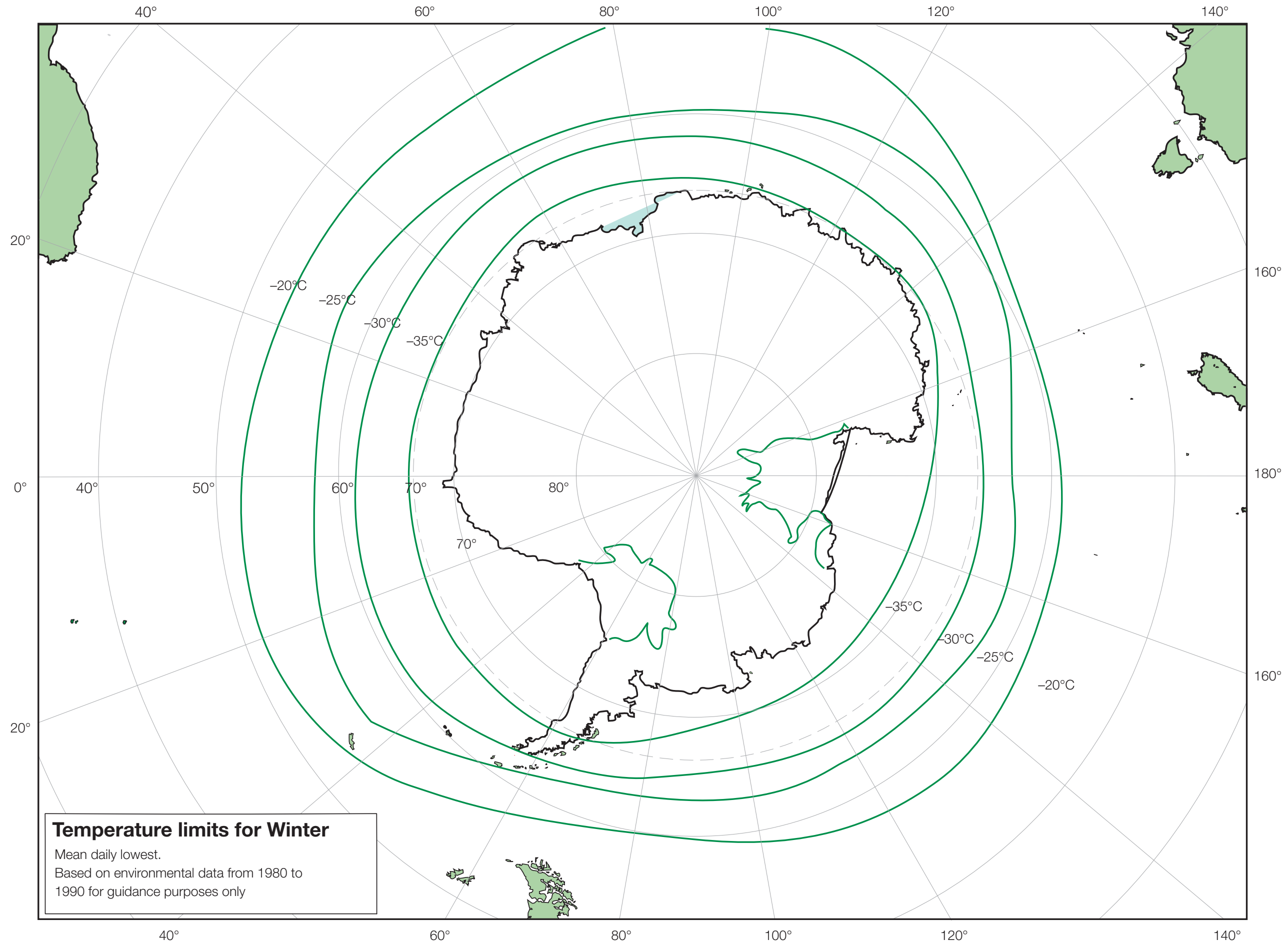

Fig. 1.3.3 Lowest mean daily air temperatures for the Antarctic

Section 4
Icing environment

4.1 Ice accretion

4.1.1 For ships intended to operate in cold regions, the build up of ice on exposed surfaces is to be considered. *See The Provisional Rules for the Winterisation of Ships*.

4.1.2 Icing is to be considered for vessels operating in the following areas, *see* Figs. 1.4.1 and 1.4.2.

- The area north of latitude 65°30´N, between longitude 28°W and the West coast of Iceland; north of the north coast of Iceland; north of the rhumb line running from latitude 66°N, longitude 15°W to latitude 73°30´N, longitude 15°E, north of latitude 73°30´N between longitude 15°E and 35°E, and east of longitude 35°E, as well as north of latitude 56°N in the Baltic Sea.
- The area north of latitude 43°N bounded in the west by the North American coast and the east by the rhumb line running from latitude 43°N, longitude 48°W to latitude 63°N, longitude 28°W and thence along longitude 28°W.
- All sea areas north of the North American continent west of the areas defined in subparagraphs above.
- The Bering and Okhotsk Seas and the Tartary Strait during the icing season.
- South of latitude 60°S.

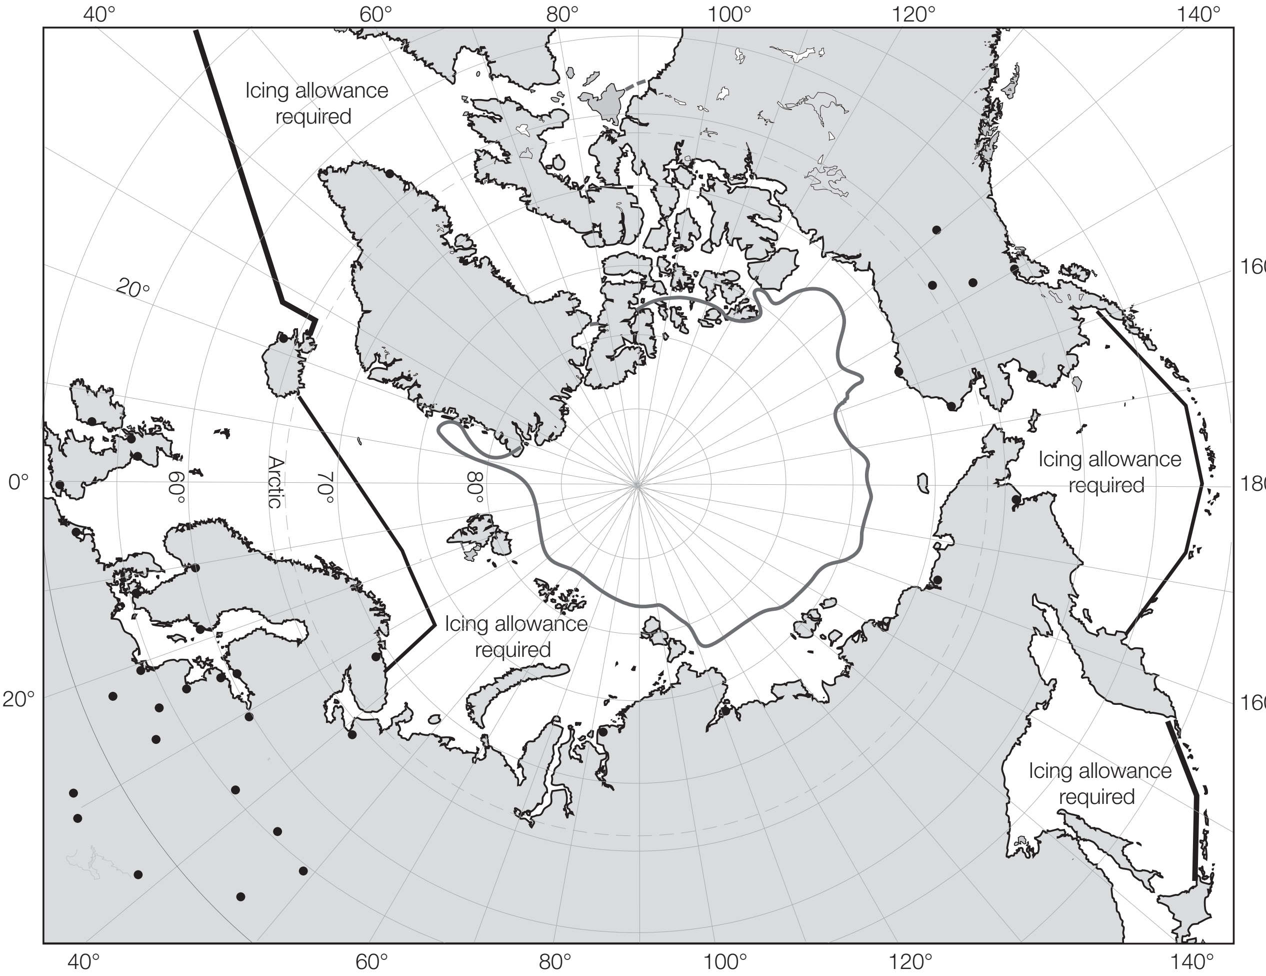

Fig. 1.4.1 Ice accretion limits for the Arctic

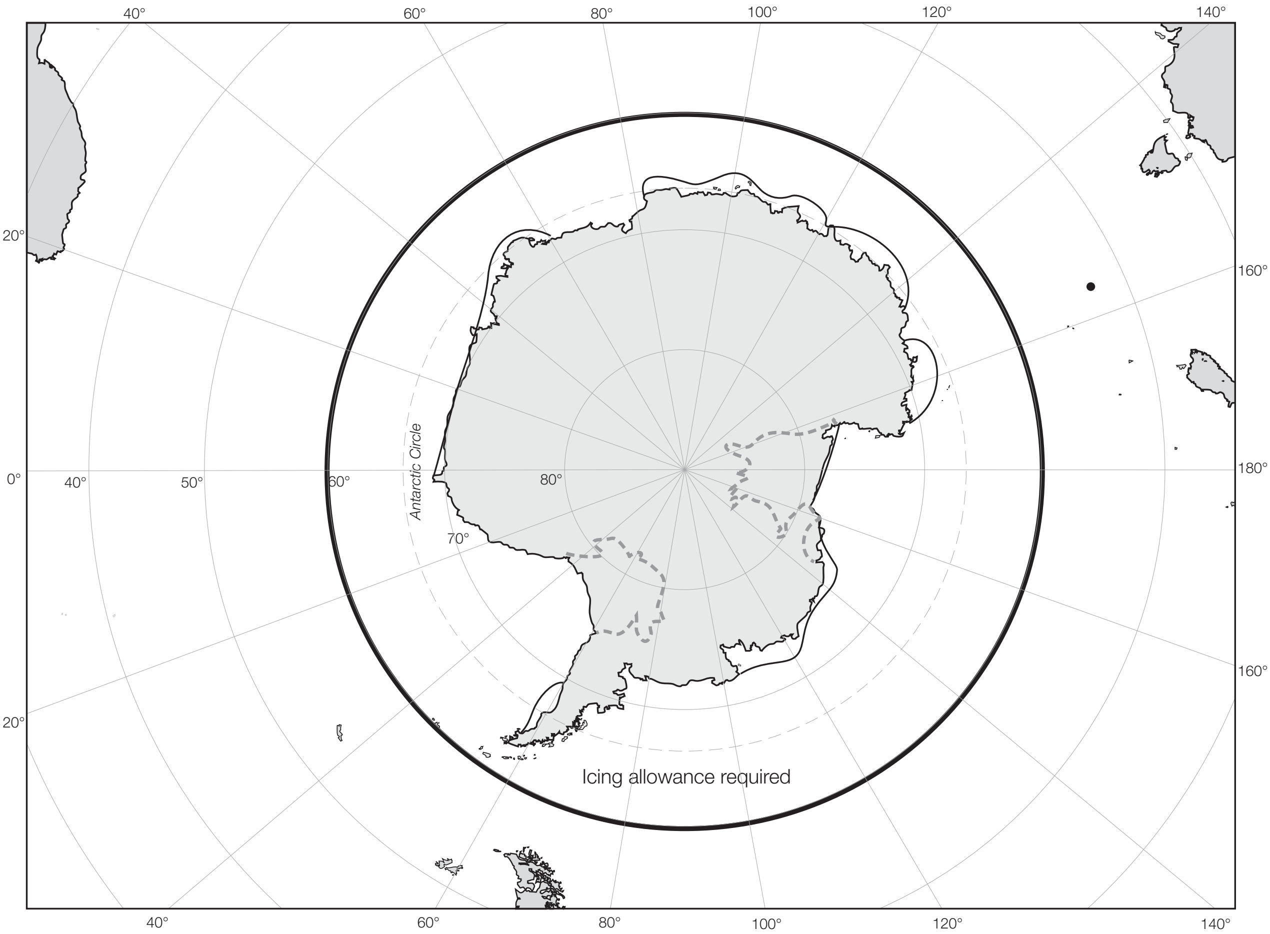

Fig. 1.4.2 Ice accretion limits for the Antarctic

■ *Section 1* Strengthening requirements for navigation in ice – Application of requirements

1.1 Additional strengthening

1.1.1 Where additional strengthening is fitted in accordance with the requirements given in this Chapter, an appropriate special features notation will be assigned. It is the responsibility of the Owner to determine which notation is most suitable for his requirements.

1.1.2 Where a special features notation is desired, the ship is to comply with the requirements of the applicable Sections, in addition to those for sea-going service, so far as they are applicable.

1.1.3 Where the hull and machinery are constructed so as to comply with the requirements of different ice classes, then the assigned Ice Class Notation will be indicated for the combination as the lower of these classes on the Certificate of Class. Any compliance of the hull or machinery with the requirements of a higher ice class will be indicated in square brackets after the main notation. Other supplementary information that would influence the ice performance will also be indicated. For example, a ship hull built in compliance with **1B FS** and the machinery in compliance with **1AS FS** would be assigned the Notation **Ice Class 1B FS [1AS FS Machinery]** or **Ice Class 1B FS [1AS FS azimuth thrusters]** where azimuth thrusters are included in the approval.

1.1.4 The vertical extent of the ice strengthening is related to the ice light and ice load waterlines, which are defined in 2.2. The maximum and minimum draughts at the fore, amidships and aft ends (for the lowest ice class) will be stated on the Certificate of Class.

1.1.5 The installed and required minimum engine output (for the lowest ice class), *see* Section 7, will be stated on the Certificate of Class.

1.2 Application for light ice conditions

1.2.1 The requirements for **Ice Class IE** are for ships with length less than 150 m and are intended to navigate in very light first-year ice conditions, such as in brash ice and small ice pieces. The requirements of Sections 4 and 5 are to be complied with.

1.2.2 The requirements for **Ice Class 1D** are for ships intended to navigate in light first-year ice conditions. The requirements for strengthening the forward region, the rudder and steering arrangements for **Ice Class 1C FS** are applicable.

1.3 Application for first-year ice conditions

1.3.1 Ships that comply with the requirements of the Finnish Swedish Ice Class Rules and Sections 6 and 7, for **Ice Class IA Super**, **IA**, **IB** and **IC** may be assigned the corresponding notations **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** or **Ice Class 1C FS**. The *Finnish-Swedish Ice Class Rules* may be obtained from the following website:
www.trafi.fi

1.3.2 For ships where the ice class notation **Ice Class 1AS FS(+)**, **Ice Class 1A FS(+)**, **Ice Class 1B FS(+)** or **Ice Class 1C FS(+)** is requested, the requirements of the *Finnish-Swedish Ice Class Rules*, and Sections 8 and 9 are to be complied with.

1.4 Application for multi-year ice conditions

1.4.1 The requirements for strengthening for navigation in ice, as given in Sections 10 and 11, are intended for ships operating in multi-year ice in Arctic or Antarctic ice conditions under their own power and constructed of steel, except icebreakers, *see* 1.5.1.

1.4.2 Ships that comply with Sections 10 and 11 can be considered for a Polar Class (**PC**) notation as listed in Table 2.1.1.

Table 2.1.1 Polar class descriptions

Polar Class	Ice description (based on WMO Sea Ice Nomenclature)
Ice Class PC 1	Year-round operation in all Polar waters
Ice Class PC 2	Year-round operation in moderate multi-year ice conditions
Ice Class PC 3	Year-round operation in second-year ice which may include multi-year ice inclusions
Ice Class PC 4	Year-round operation in thick first-year ice which may include old ice inclusions
Ice Class PC 5	Year-round operation in medium first-year ice which may include old ice inclusions
Ice Class PC 6	Summer/autumn operation in medium first-year ice which may include old ice inclusions
Ice Class PC 7	Summer/autumn operation in thin first-year ice which may include old ice inclusions

1.4.3 The Polar Class (**PC**) notations and descriptions are given in Table 2.1.1. It is the responsibility of the Owner to select an appropriate Polar Class. The descriptions in Table 2.1.1 are intended to guide owners, designers and administrations in selecting an appropriate Polar Class to match the requirements for the ship with its intended voyage or service.

1.4.4 The Polar Class notation is used throughout Sections 10 and 11 to convey the differences between classes with respect to operational capability and strength.

1.5 Icebreakers

1.5.1 Sea-going ships specially designed for ice-breaking duties will be assigned the ship type notation 'Icebreaker' in addition to the special features notation appropriate to the degree of ice strengthening provided. 'Icebreaker' refers to any ship having an operational profile that includes escort or ice management functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, and having a class certificate endorsed with this notation. The additional ship type notations may be assigned as follows:

Icebreaker Refers to a ship having an operational profile that includes escort, research or support functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, *see* 10.8.4.

Icebreaker(+) Refers to a ship for which the powering and dimensions of the hull structure and propulsion machinery necessary to undertake the operational profile as determined by selection of a primary function have been assessed, *see* Section 12.

1.6 Loading manual

1.6.1 Sufficient information is to be supplied to the Master of every ship to enable him to arrange loading and ballasting in such a way as to avoid the creation of unacceptable stresses in the ship's structure. The following information is to be included in the vessel's loading manual:

(a) Upper and lower ice waterline.
(b) Propeller immersion.
(c) Indication of whether the vessel is strengthened for icebreaker towing.

■ *Section 2* General hull requirements for navigation in ice – All Ice Classes

2.1 General

2.1.1 The following Sections are to be complied with for all Ice Classes, where applicable. Alternative arrangements to attain similar performance will be specially considered.

2.1.2 The ballast capacity of the ship is to be sufficient to give adequate propeller immersion in all ice navigating conditions without trimming the ship in such a manner that the actual waterline at the bow is below the lower ice waterline.

2.1.3 Fresh water and sea-water ballast tanks, the tops of which are situated above the design ballast waterline and adjacent to the shell, which are intended to be used in ice and cold navigating conditions, are to be provided with means to prevent freezing. Measures are to be provided to demonstrate that they protect against the following:

(a) hull structural damage from pumping water creating a vacuum beneath a layer of ice across the top of the water in the tank, and
(b) hull structural damage from ice expansion, and
(c) engineering systems, such as piping systems and components, damage from ice expansion or ice blockage, and
(d) engineering systems, such as piping systems and components, damage from ice pieces melting or dislodging from upper sections of the tank.

Heating coils are considered an effective means for tanks entirely above the waterline. Heating coils or other effective means such as continuous circulation, air bubbling and/or tank pressure/engineering systems alarms are considered effective for tanks partially below the waterline. Alternatively, demonstration that the above hazards have been mitigated is to be submitted through theoretical calculations, service experience, experimental tests, or a combination thereof.

2.1.4 These Rules are formulated for both transverse and longitudinal framing systems but it is recommended that, whenever practicable, transverse framing is selected.

2.1.5 These Rules assume that when approaching ice infested waters, the ship's speed will be reduced appropriately. The vertical extent of ice strengthening for ships intended to operate at speeds exceeding 15 knots in areas containing isolated ice floes will be specially considered.

2.1.6 An icebreaking ship is to have a hull form at the fore end adapted to break ice effectively. It is recommended that bulbous bows are not fitted to **Ice Class 1AS** ships.

2.1.7 The stern of an icebreaking ship is to have a form such that broken ice is effectively displaced.

2.1.8 Where it is desired to make provision for short tow operations, the bow area is to be suitably reinforced. Similarly, icebreakers may require local reinforcement in way of the stern fork.

2.1.9 Shell strakes in way of ice strengthening area for plates are to be grade B/AH.

2.1.10 To prevent unintended contact and permit close tow operations, provision of a bow ice knife (plate fitted between stem and bulbous bow) is not recommended for ships intended to navigate with icebreaker escort.

2.2 Definitions

2.2.1 The upper and lower ice waterlines upon which the design of the vessel has been based is to be indicated in the classification certificate. The upper ice waterline (UIWL) is to be defined by the maximum draughts fore, amidships and aft. The lower ice waterline (LIWL) is to be defined by the minimum draughts fore, amidships and aft.

2.2.2 The lower ice waterline is to be determined with due regard to the vessel's ice-going capability in the ballast loading conditions (e.g. propeller submergence).

2.2.3 The upper ice waterline (UIWL) and lower ice waterline (LIWL) are to be indicated on the plans. For navigation in certain geographical areas, the relevant National Authority may require the maximum Ice Class draught to be marked on the ship in a specified manner.

2.2.4 **Displacement** Δ is the displacement at the upper ice waterline (UIWL) when floating in water having a relative density of 1,0. For first-year ice class Rules, the displacement is in tonnes. For multi-year ice class Rules, the displacement is in kilo tonnes.

2.2.5 **Shaft power**, P_0, is the maximum propulsion shaft power, in kW, for which the machinery is to be classed.

2.3 Rudder and steering arrangements

2.3.1 Rudder stoppers working on the rudder blade or rudder head are to be fitted.

■ *Section 3* General machinery requirements for navigation in ice – All Ice Classes

3.1 Materials for shafting

3.1.1 The following Sections are to be complied with for all Ice Classes, where applicable. Alternative arrangements to attain similar performance will be considered.

3.1.2 All components of the main propulsion system are to be of steel or other approved ductile material.

3.2 Materials for propellers

3.2.1 Propellers and propeller blades are to be of cast steel or copper alloys and are to be manufactured, tested and certified in accordance with Ch 4,1, Ch 4,5 and Ch 9,1 of the Rules for Materials respectively.

3.2.2 For steel propellers, the elongation of the material used is to be not less than 15 per cent for a test piece length of 5*d*. Charpy impact tests are to be carried out in accordance with the requirements of the Rules for Materials.

3.2.3 Cast steel load transmitting components of controllable pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of Ch 4,5 of the Rules for Materials.

3.2.4 Forged steel load transmitting components of controllable pitch propellers are to be manufactured, tested, and certified in accordance with Ch 5,1 and Ch 5,2 of the Rules for Materials. Impact tests are to be carried out at minus 10°C and the average energy value is to be not less than 20 J.

3.2.5 Spheroidal cast iron load transmitting-components of controllable-pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of Table 7.3.2 in Ch 7,3 of the Rules for Materials.

3.3 Ship-side valves

3.3.1 The sea inlet and overboard discharge valves which are situated at or below the maximum Load Line, are to be provided with low pressure steam or compressed air connection for clearing purposes, *see* Pt 5, Ch 13. Provisions need not be applied for the discharge from the main engine and central cooling water system for first-year and multi-year ice classes.

3.3.2 When steam is not available for clearing, it is recommended that arrangements be made for supplying water for machinery cooling purposes by circulating from ballast tanks(s) of adequate capacity, preferably situated in the double bottom. Such tank(s) must be used only for storage of water ballast or fresh water.

3.4 Fire pumps in motor ships

3.4.1 In motor ships where clearing steam is not available, fire pumps are to be provided with suctions from a suitable sea water inlet which is maintained ice-free at all times.

3.4.2 At least one of the fire pumps is to be connected to a sea chest which is provided with de-icing arrangements.

3.5 Main propulsion and essential auxiliary engines

3.5.1 Sea inlets for the cooling water system are to be provided with arrangements to maintain ice free cooling water arrangements as given by IMO *Guidance on Design and Construction of Sea Inlets under Slush Ice Conditions MSC/Circ.504* or by the *Finnish Swedish Ice Class Rules*. Alternative arrangements will be considered, such as by circulating engine cooling water via designated tanks where heat balance calculations have demonstrated that the engines are capable of operating at their maximum continuous rating.

3.5.2 For electric propulsion systems, the total engine output for propulsion provided by generator sets/central generation system is to be based on the calculation with one set out of action, *see* Pt 6, Ch 2,16.

■ *Section 4* Hull requirements for light ice conditions – Ice Classes 1D and 1E

4.1 Ice Class 1D

4.1.1 The requirements for strengthening the forward region for **Ice Class 1C FS** are applicable. *See* Section 6.

4.2 Ice Class 1E – General

4.2.1 These requirements apply to ships with length less than 150 m and which are intended to operate in very light first-year ice conditions. Where additional strengthening is fitted in accordance with the requirements of this sub-Section, the notation **Ice Class 1E** will be assigned.

4.2.2 The requirements for shell plating need only be applied in the shaded region shown in Fig. 2.4.1. The requirements for framing need only be applied forward of the flat of side.

4.2.3 For longitudinally framed ships, the scantlings of shell plating and framing are to comply with the requirements of **Ice Class 1C FS** using 0,9 times the ice pressure.

4.2.4 For transversely framed ships, the requirements of 4.3 to 4.7 are to be applied.

4.2.5 Where the structural requirements of **Ice Class 1C FS** give lesser scantlings than the requirements of this sub-Section, the lesser scantlings may be applied.

4.3 Shell plating

4.3.1 The shell plating thickness within the region shown in Fig. 2.4.1 is not to be less than:

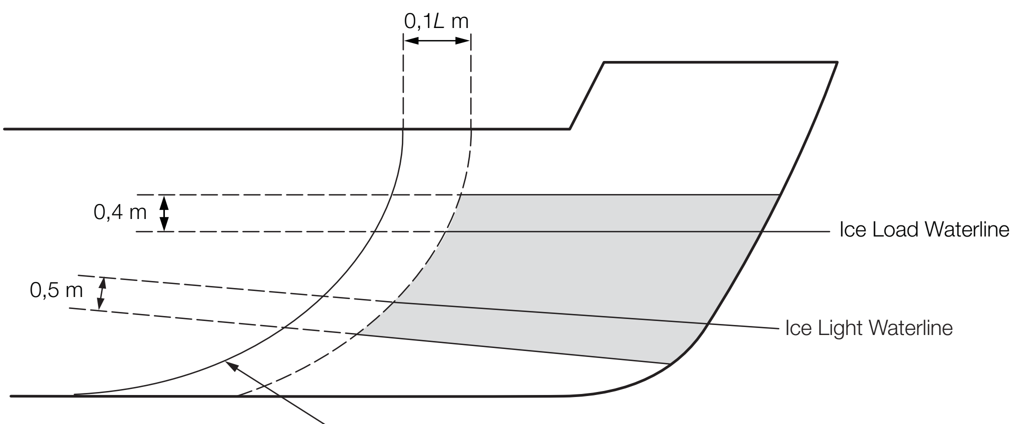
$$t = 21{,}75s\sqrt{k\left(\frac{BL^2}{110000}+1\right)\left(1{,}3-\frac{4{,}2}{(0{,}26/s+1{,}8)^2}\right)} + 2 \text{ mm}$$

where

s = spacing of main frames, in metres

L and B = are defined in Pt 3, Ch 1,6.1

k = is defined in Pt 3, Ch 2,1.2.



Ice Load Waterline and Ice Light Waterline are defined in 7.2
L, as defined in Ch 1,6.1

Fig. 2.4.1 Extent of application of plating requirements

4.4 Transverse framing

4.4.1 The section modulus of main frames forward of the flat of side is not to be less than:

$$z = 6{,}08slk\left(\frac{BL^2}{140000} + 1{,}23\right)\left(7 - \frac{1}{2l}\right) \text{ cm}^3$$

but need not be taken as greater than:

$z = s\,L\,T$

where

s = spacing of main frames, in metres
l = span, in metres
L and B = are defined in Pt 3, Ch 1,6.1
k = is defined in Pt 3, Ch 2,1.2.

4.4.2 Intermediate ice frames are to be fitted in the region forward of the flat of side and are to extend from 0,62 m above the upper ice waterline to 1 m below the lower ice waterline.

4.4.3 Intermediate ice frames aft of the collision bulkhead are to have a section modulus not less than 65 per cent of that given in 4.4.1.

4.4.4 Intermediate ice frames forward of the collision bulkhead are to have a section modulus not less than 40 per cent of that given in 4.4.1.

4.5 Primary longitudinal members supporting ice frames

4.5.1 Forward of the collision bulkhead, in single deck ships, an ice stringer is to be fitted approximately 0,25 m below the upper ice waterline and is to have scantlings in accordance with Table 5.4.4 in Pt 3, Ch 5.

4.5.2 Aft of the collision bulkhead a series of tripping brackets are to be fitted at each main and intermediate frame at the same level as the ice stringer to a distance 0,1*L* aft of the flat of side.

4.6 Stern frame and rudder

4.6.1 The rudder and stern frame scantlings are to be in accordance with 6.5. However, the ship's speed need not be taken as greater than 14 knots. The hull form factor and the rudder profile coefficients are to be taken as 1,0.

4.7 Weld connections

4.7.1 Weld connections to the shell plating forward of the collision bulkhead are to be double continuous.

■ *Section 5* Machinery requirements for light ice conditions – Ice Classes 1D and 1E

5.1 General

5.1.1 Where the notation **Ice Class 1D** or **Ice Class 1E** is desired, the requirements of this Section, in addition to those for open water service, are to be complied with.

5.1.2 The requirements need not be taken as greater than those for **Ice Class 1C FS**.

5.2 Engine power

5.2.1 The total engine output is to be not less than determined by the following formula:

$P = 0{,}72LB$ kW

where

L = Rule length, in metres, *see* Pt 3, Ch 1,6.1.1
B = moulded breadth of ship, in metres, *see* Pt 3, Ch 1,6.1.3.

5.3 Main engine shafting and propellers

5.3.1 The diameters of the shafting and propeller blade thickness as required by the Rules for open water service are to be increased by the percentages as given in Table 2.5.1. No increase in the diameter of crankshafts, thrustshafts or intermediate shafts is required.

Table 2.5.1 Increase for main engine shafting and propellers

Screwshaft, increase in diameter as required by Pt 5, Ch 6,3.5	5%
Propeller, increase in blade thickness at root and at 60 per cent radius as required by Pt 5, Ch 7,3.1	8%
Keyless propeller fitting, increase in mean torque as defined in Pt 5, Ch 7,3.2	15%

5.3.2 The screwshaft may be tapered at the forward end in accordance with Pt 5, Ch 6,3.5.3 and Pt 5, Ch 6,3.5.4 subject to the increase in diameter of 5 per cent as required by 5.3.1.

5.4 Minimum propeller blade tip thickness

5.4.1 The tip thickness, t, of the blade at 95 per cent radius is to be not less than that obtained by the following formula:

$$t = 0{,}14\,(T + 57)\sqrt[3]{\frac{430}{\sigma_u}} \text{ mm}$$

where

T = blade root thickness required by 5.3.1, in mm

σ_u = specified minimum tensile strength of material, in N/mm^2.

5.5 Blade edge thickness

5.5.1 The edges of the blades are to be suitably thickened for the operating conditions but are to be not less than 50 per cent of the required tip thickness, t, measured at 1,25 times tip thickness, t, from the edge. For controllable pitch propellers, this requirement need only be applied to the leading edges of the blades.

5.6 Cooling water lines

5.6.1 Connections are to be fitted between the cooling water overboard discharge lines and sea inlets for main and/or auxiliary engine cooling water systems so that warm water may be used to assist in maintaining the suction pipes free from ice.

5.6.2 Where the cooling water inlet valves are fitted to a common water box, the connections from the cooling water discharge lines may be led to the water box in a position as near as possible to the inlet valves.

■ *Section 6*
Hull requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D

6.1 General

6.1.1 In addition to the requirements of the *Finnish-Swedish Ice Class Rules*, the following Sections are to be complied with for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS**, **Ice Class 1C FS** and **Ice Class 1D**, where applicable. Alternative arrangements to attain similar performance will be considered.

6.2 Framing – General requirements

6.2.1 Where a frame intersects a boundary between two of the hull regions the scantling requirements applicable will be those for the forward region if the forward midship boundary is intersected or for the midship region if the aft midship boundary is intersected.

6.2.2 The effective weld area attaching ice frames to primary members is not to be less than the shear area for the frames.

6.2.3 Asymmertrical frames and frames which are not at right angles to the shell (web less than 90 degrees to the shell) shall be supported against tripping by brackets, intercostals, stringers or similar, at a distance not exceeding 1300 mm. For **Ice Class 1D**, the distance may be increased to 2000 mm. For frames with spans greater than 4 m the extent of anti-tripping supports is to be applied to all regions. For frames with spans less than or equal to 4 m the extent is to be as given in Table 2.6.1. FEA may be carried out to demonstrate equivalent support of alternative arrangements.

Table 2.6.1 Extent of anti-tripping supports

Ice Class	Extent of anti-tripping supports
1AS FS	All regions
1A FS	Forward and midship regions
1B FS	Forward region
1C FS	Forward region
1D	Forward region

6.3 Primary longitudinal members supporting transverse ice framing

6.3.1 The webs of primary longitudinal members supporting transverse ice frames are to be stiffened and connected to the main or intermediate frames so that the distance, r, between such stiffening is not to be greater than given according to the following formula:

$$r = \sqrt{\frac{291t^3}{\alpha_o\,\gamma^2}} \text{ mm}$$

where

t = thickness, in mm, of the primary longitudinal member adjacent to the shell plating

α_o = longitudinal distribution factor as given in Table 2.6.2

γ = (a) Forward region

$$\gamma = 0{,}653 + 3{,}217\sqrt{P_0\,\Delta} \times 10^{-5}$$

$$\gamma = 0{,}876 + 9{,}908\sqrt{P_0\,\Delta} \times 10^{-6}$$

or

γ = 1,0, whichever is the least

= (b) Midship and aft regions

$$\gamma = 0{,}653 + 9{,}908\sqrt{P_0\,\Delta} \times 10^{-6}$$

or

γ = 1,0, whichever is the least

P_0 and Δ = are as defined in 2.2.

6.3.2 The minimum thickness of the web plating of longitudinal primary members is to comply with the requirements of Pt 3, Ch 10,4.

6.4 Stem

6.4.1 The stem is to be made of rolled, cast or forged steel or of shaped steel plates. A sharp edged stem, as shown in Fig. 2.6.1, improves the manoeuvrability of the ship in ice. Where a sharp angle stem is fitted, the section modulus as given in 6.4.2 and 6.4.3 is to apply to the stem section only, otherwise the section modulus may be applied including side plates.

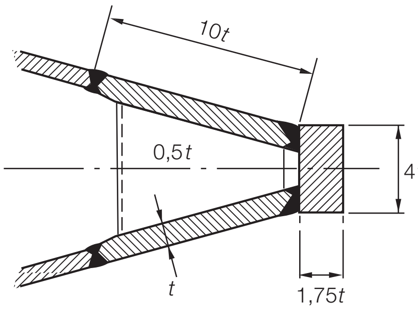


Fig. 2.6.1 A sharp edged stem

6.4.2 The section modulus of the stem in the fore and aft direction is not to be less than determined in accordance with the following formula:

$Z = 1500\,(\alpha_o\,\gamma^2)^{3/2}$ cm^3

where

α_o = longitudinal distribution factor for the forward region as given in Table 2.6.2

γ = is defined in 6.3.1.

Table 2.6.2 Longitudinal distribution factor α_o

Ice Class	α_o		
	Forward	Midship	Aft
1AS FS	1,00	0,98	0,89
1A FS	0,87	0,75	0,64
1B FS	0,78	0,64	0,51
1C FS	0,68	0,53	0,37
1D	0,68	–	–

6.4.3 The dimensions of a welded stem constructed as shown in Fig. 2.6.1 are to be determined in accordance with the following formula:

$t = 31\sqrt{\alpha_o\,\gamma^2}$ mm

where

t = thickness of the side plates, in mm.

6.4.4 In bulbous bow constructions, the extent of plating below the Ice Light Waterline should be such as to cover that part of the bulb forward of the vertical line originating at the intersection of the Ice Light Waterline and the stem contour at the centreline. A suitably tapered transition piece should be arranged between the reinforced stem plating and keel. However, in no case should the reinforced stem plating extend vertically below the Ice Light Waterline for less than 750 mm. The adjacent strake to the reinforced shaped stem plating of the bulb should be in accordance with the requirements for shell plating.

6.4.5 Where in the ice belt region the radius of the stem or bulb front plating is large, one or more vertical stiffeners are to be fitted in order to meet the section modulus requirement of 6.4.2. In addition, vertical ring stiffening will be required for the bulb.

6.4.6 The dimensions of the stem may be tapered to the requirements of Pt 3, Ch 5,3.3 at the upper deck. The connections of the shell plating to the stem are to be flush.

6.5 Stern

6.5.1 Where the screwshaft diameter exceeds the Rule diameter, the propeller post is to be correspondingly strengthened, *see* Pt 3, Ch 6,7.

6.6 Renewal criteria within ice strengthening area for CSR ships

6.6.1 For double hull oil tankers and bulk carriers that are compliant with the *IACS Common Structural Rules for Double Hull Tankers and IACS Common Structural Rules for Bulk Carriers* respectively, the renewal criteria of the local structure for general corrosion is to be calculated in accordance with the applicable Common Structural Rules renewal criteria.

6.7 Rudder and steering arrangements

6.7.1 Rudder scantlings, posts, rudder horns, solepieces, rudder stocks, steering engine and pintles are to be dimensioned in accordance with Pt 3, Ch 6 and 13 as appropriate. The speed used in the calculations is to be the maximum service speed or that given in Table 2.6.3, whichever is the greater. When used in association with the speed given in Table 2.6.3, the rudder profile coefficients are to be taken as 1,1.

Table 2.6.3 Minimum speed

Ice Class	Minimum speed, in knots
1AS FS	20
1A FS	18
1B FS	16
1C FS	14
1D	14

6.7.2 For double plate rudders, the minimum thickness of plating and horizontal and vertical webs in the main ice belt zone is to be determined as for shell plating in the aft region. For the horizontal and vertical webs, the corrosion-abrasion increment, need not be added. For **Ice Class 1D**, the minimum thickness of plating and webs, of double plate rudders and the extent of application are to be determined as for those in **Ice Class 1C FS**.

6.7.3 Where an ice class notation is included in the class of a ship, the nozzle construction requirements, as defined in Table 13.3.1 in Pt 3, Ch 13, are to be upgraded to include abrasion allowance as follows:

Ice Class	Thickness increment
1AS FS	5 mm
1A FS	4 mm
1B FS	3 mm
1C FS	2 mm
1D	2 mm

However, the thickness of the shroud plating is not to be less than the shell plating for the aft region taking frame spacing s in the formula as 500 mm.

6.7.4 The scantlings of the stock, pintles, gudgeon and solepiece associated with the nozzle are to be increased on the basis given in 6.7.1. However, the diameter of the nozzle stock is to be not less than that calculated in the astern condition taking the astern speed as half the speed given in Table 2.6.3 or the actual astern speed, whichever is the greater.

6.7.5 Nozzles with articulated flaps will be subject to special consideration.

6.7.6 For the Ice Classes **1AS FS** and **1A FS**, the rudder stock and the upper edge of the rudder shall be protected against ice pressure by an ice knife or equivalent means. The ice knife is to extend down to the ice light waterline; this requirement may be waived where this would lead to impracticable ice knifes, e.g. for ships with large draught variations.

6.7.7 For the Ice Classes **1AS FS** and **1A FS**, due regard is to be paid to the excessive load caused by the rudder being forced out of the midship position when backing into an ice ridge. When vessels are intended to operate with significant time in astern operation, then the hull strength is to be based on the method used in the forward region; however, due consideration may be given to the anticipated power in this mode of operation.

6.7.8 Relief valves for hydraulic pressure are to be effective, *see* Pt 5, Ch 19,3.3. The components of the rudder steering gear are to be able to withstand the yield torque of the rudder stock, *see* Pt 5, Ch 19,3.2.2.

■ *Section 7*
Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS

7.1 General

7.1.1 In addition to the requirements of the *Finnish-Swedish Ice Class Rules*, the following Sections are to be complied with for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** and **Ice Class 1C FS**, where applicable. Alternative arrangements to attain similar performance will be specially considered.

7.2 Determination of ice torque

7.2.1 If the propeller is not fully submerged when the ship is in ballast condition, the requirements for **Ice Class 1A FS** is to be used for **Ice Class 1B FS** and **Ice Class 1C FS**.

7.3 Propeller blade sections

7.3.1 Where the blade thickness derived from the *Finnish-Swedish Ice Class Rules* is less than the blade thickness derived by Pt 5, Ch 7,3.1, the latter is to apply.

7.4 Intermediate blade sections

7.4.1 The thickness of other sections is to conform to a smooth curve connecting the section thicknesses as determined by the *Finnish-Swedish Ice Class Rules*.

7.5 Blade edge thickness

7.5.1 The thickness of blade edges is to be not less than 50 per cent of the derived tip thickness, t, measured at 1,25t from edge. For controllable pitch propellers, this applies only to the leading edge.

7.6 Mechanisms for controllable pitch propellers

7.6.1 The strength of mechanisms in the boss of a controllable pitch propeller is to be 1,5 times that of the blade when a load is applied at the radius 0,9D/2 in the weakest direction of the blade.

7.7 Keyless propellers

7.7.1 When it is proposed to use keyless propellers, the fit of the propeller boss to the screwshaft will be specially considered.

7.8 Screwshafts

7.8.1 Where the screwshaft diameter as derived by the *Finnish-Swedish Ice Class Rules* is less than the diameter derived by Pt 5, Ch 6,3.5.1, the latter is to apply.

7.8.2 The diameter, d_s, of the screwshaft determined in accordance with the *Finnish-Swedish Ice Class Rules* is to extend over a length not less than that to the forward edge of the bearing immediately forward of the propeller or $2{,}5d_s$ whichever is the greater.

7.8.3 The shaft may be tapered at the forward end in accordance with Pt 5, Ch 6,3.5.3 and Pt 5, Ch 6,3.5.4, except for **Ice Class 1AS FS** ice strengthening, where these diameters are to be increased by 10 per cent.

7.8.4 For screwshafts in ships intended for the notation **Ice Class 1AS FS** or **Ice Class 1A FS** and where the connection between the propeller and the screwshaft is by means of a key, Charpy impact tests are to be made in accordance with the requirements of Ch 5,3.4.12 of the Rules for Materials.

7.9 Intermediate and thrust shafts

7.9.1 The diameters of intermediate shafts and thrust shafts in external bearings are to comply with Pt 5, Ch 6,3.1 and Pt 5, Ch 6,3.4 respectively, except for **Ice Class 1AS FS** ice strengthening where these diameters are to be increased by 10 per cent.

■ *Section 8*
Hull requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)

8.1 General

8.1.1 The requirements for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** and **Ice Class 1C FS**, as applicable, are to be applied using the installed engine power as given by Section 9.

■ *Section 9*
Machinery requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)

9.1 Powering of ice strengthened ships

9.1.1 For ships that require additional strengthening in ice, the total shaft power installed is to be calculated using the following Sections, but is not to be less than required by the *Finnish-Swedish Ice Class Rules* in force at the time of contract.

9.1.2 Ice strengthened ships which are to be considered to have an icebreaking capability are to be able to develop sufficient thrust to permit continuous mode icebreaking at a speed of at least five knots in ice having a thickness equal to the nominal value for the desired Ice Class and a snow cover of at least 0,3 m.

9.1.3 The shaft power necessary to provide an ice-breaking capability can be determined by the equation:

$$P_1 = 0{,}736 C_1\, C_2\, C_3\, C_4 \left[240Bh\,(1 + h + 0{,}035v^2) + 70S_c\sqrt{L}\right] \text{ kW}$$

where

B = moulded breath of ship, in metres, *see* Pt 3, Ch 1,6.1.3
L = Rule length, in metres, *see* Pt 3, Ch 1,6.1.1
Δ = displacement, in tonnes, *see* Pt 3, Ch 9,7.2.1
$C_1 = \dfrac{1{,}2B}{\sqrt[3]{\Delta}}$ but is not to be taken as less than 1,0
C_2 = 0,9 if the ship is fitted with a controllable pitch propeller, otherwise 1,0
C_3 = 0,9 if the rake of the stem is 45° or less, otherwise 1,0. The product $C_2\, C_3$ is not to be taken as less than 0,85
C_4 = 1,1 if the ship is fitted with a bulbous bow, otherwise 1,0
h = ice thickness
= 1,0 for **Ice Class 1AS FS(+)**
= 0,8 for **Ice Class 1A FS(+)**
= 0,6 for **Ice Class 1B FS(+)**
= 0,4 for **Ice Class 1C FS(+)**
S_c = depth of snow cover
v = ship speed, in knots, when breaking ice of thickness h.

9.2 Materials for shafting

9.2.1 For screwshafts in ships intended for the notation **Ice Class 1AS FS(+)** or **Ice Class 1A FS(+)** and where the connection between the propeller and the screwshaft is by means of a key, Charpy impact tests are to be made in accordance with the requirements of Ch 5,3.4.12 of the Rules for Materials.

Section 10
Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker

10.1 Hull areas

10.1.1 The hull of all polar class ships is divided into areas reflecting the magnitude of the loads that are expected to act upon them, *see* Fig. 2.10.1. In the longitudinal direction, there are four regions:
(a) bow, (*B*);
(b) bow intermediate, (B_i);
(c) midbody, (*M*), and
(d) stern (*S*).
The bow intermediate, midbody and stern regions are further divided in the vertical direction into three regions:
(i) bottom, (*b*)
(ii) lower, (*l*) and
(iii) icebelt (*i*).

10.1.2 The upper ice waterline, UIWL, and lower ice waterline, LIWL, are as defined in 2.2.

10.1.3 In addition to Fig. 2.10.1, at no time is the boundary between the bow and bow intermediate regions to be forward of the intersection point of the line of the stem and the ship baseline.

10.1.4 In addition to Fig. 2.10.1, the aft boundary of the bow region need not be more than 0,45*L* aft of the forward perpendicular, *FP*.

10.1.5 The boundary between the bottom and lower regions is to be taken at the point where the tangent to the shell is inclined 7° from horizontal.

10.1.6 If a ship is intended to operate astern in ice regions, the aft section of the ship is to be designed based on the bow and bow intermediate hull area requirements.

10.2 Design ice loads – General

10.2.1 For ships of all Polar Classes, a glancing impact on the bow is the design scenario for determining the scantlings required to resist ice loads.

10.2.2 The design ice load is characterised by an average pressure, P_a, uniformly distributed over a rectangular load patch of height, *b*, and width, *w*.

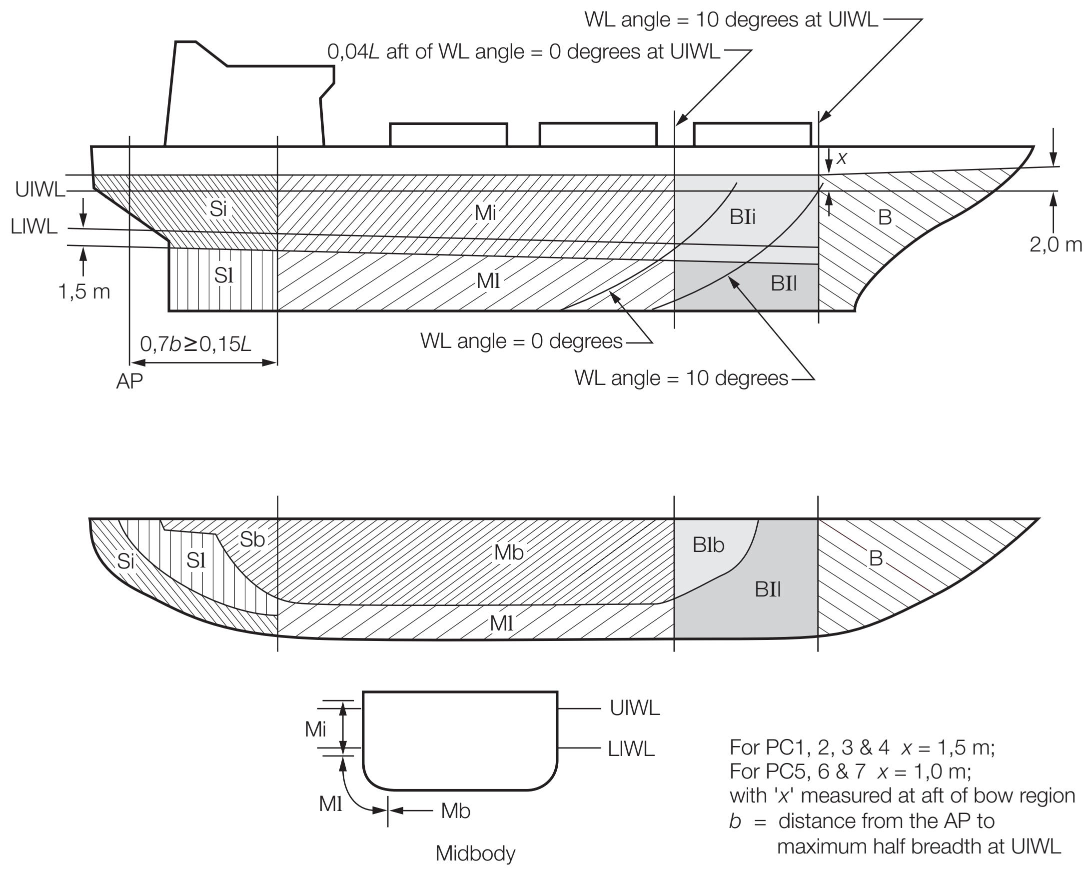

Fig. 2.10.1 Extent of hull areas

10.2.3 Within the bow area of all polar classes, and within the bow intermediate icebelt area of polar classes **PC6** and **PC7**, the ice load parameters are functions of the actual bow shape. To determine the ice load parameters, P_a, b and w, it is required to calculate the following ice load characteristics for sub-regions of the bow area; shape coefficient, f_{ai}, total glancing impact force, F_i, line load, Q_i, and pressure, P_i.

10.2.4 In other ice-strengthened areas, the ice load parameters, P_a, b_{NB} and w_{NB}, are determined independently of the hull shape and based on a fixed load patch aspect ratio, AR = 3.6.

10.2.5 Design ice forces calculated according to 10.3 are only valid for vessels with icebreaking forms. Design ice forces for any other bow forms are to be specially considered.

10.2.6 Ship structures that are not directly subjected to ice loads may still experience inertial loads of stowed cargo and equipment resulting from ship/ice interaction. These inertial loads are to be considered in the design of these structures.

10.3 Glancing impact load characteristics

10.3.1 The parameters defining the glancing impact load characteristics are reflected in the class factors listed in Table 2.10.1.

10.4 Bow area

10.4.1 In the bow area, the force, F, line load, Q, pressure, P, and load patch aspect ratio, AR, associated with the glancing impact load scenario are functions of the hull angles measured at the upper ice waterline, UIWL. The influence of the hull angles is captured through calculation of a bow shape coefficient, fa. The hull angles are defined in Fig. 2.10.2.

10.4.2 The waterline length of the bow region is generally to be divided into four sub-regions of equal length. The force, F, line load, Q, pressure, P, and load patch aspect ratio, AR, are to be calculated with respect to the mid-length position of each sub-region (each maximum of F, Q and P is to be used in the calculation of the ice load parameters P_a, b and w).

10.4.3 The bow area load characteristics are determined as follows:

(a) The shape coefficient, fa_i, is to be taken as

fa_i = $fa_{i,1}$
$fa_{i,2}$
$fa_{i,3}$ whichever is the lesser

where

$$fa_{i,1} = \left(0{,}097 - 0{,}68\left(\frac{x}{L} - 0{,}15\right)^2\right)\frac{\alpha_i}{\sqrt{\beta'_i}}$$

$$fa_{i,2} = \frac{1{,}2C_F}{\sin(\beta'_i)\,C_C\,\Delta^{0{,}64}}$$

$fa_{i,3}$ = 0,60
i = sub-region considered
L = ship length as defined in Pt 3, Ch 1,6.1.1, but measured on the upper ice waterline (UIWL), in metres
x = distance from the forward perpendicular (FP) to station under consideration, in metres
α = waterline angle, in degrees, *see* Fig. 2.10.2
β' = normal frame angle, in degrees, *see* Fig. 2.10.2
Δ = ship displacement, in kilo tonnes, not to be taken less than 5
C_C = crushing failure class factor from Table 2.10.1
C_F = flexural failure class factor from Table 2.10.1

(b) Force, F_i:

$F_i = fa_i\,C_C\,\Delta^{0{,}64}$ MN

where
i = sub-region considered
fa_i = shape coefficient of sub-region, i
C_C = crushing failure class factor from Table 2.10.1
Δ = ship displacement, in kilo tonnes, not to be taken less than 5

(c) Load patch aspect ratio, AR_i:

$AR_i = 7{,}46 \sin(\beta'_i)$
$AR_i \geq 1{,}3$

where
i = sub-region considered
β'_i = normal frame angle of sub-region i, in degrees

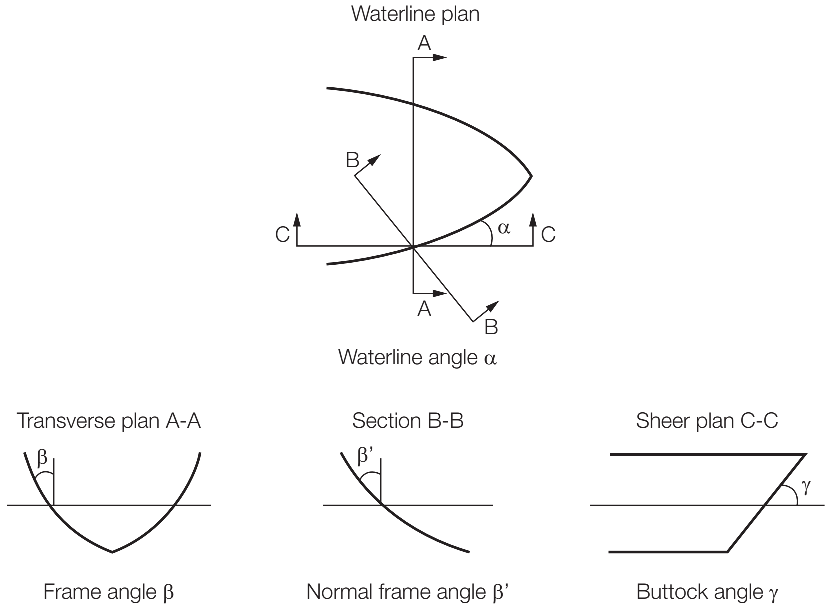
(d) Line load, Q_i:

$$Q_i = \frac{F_i^{0{,}61}\,C_D}{AR_i^{0{,}35}} \quad \text{MN/m}$$

where
i = sub-region considered
F_i = force of sub-region i, in MN
C_D = load patch dimensions class factor from Table 2.10.1
AR_i = load patch aspect ratio of sub-region i

Table 2.10.1 Class factors

Polar Class	Crushing failure class factor	Flexural failure class factor	Load patch dimensions class factor	Displacement class factor	Longitudinal strength class factor
	C_C	C_F	C_D	C_{DI}	C_L
PC1	17,69	68,60	2,01	250	7,46
PC2	9,89	46,80	1,75	210	5,46
PC3	6,06	21,17	1,53	180	4,17
PC4	4,50	13,48	1,42	130	3,15
PC5	3,10	9,00	1,31	70	2,50
PC6	2,40	5,49	1,17	40	2,37
PC7	1,80	4,06	1,11	22	1,81



where

β' = normal frame angle at upper ice waterline, in degrees

α_S = upper ice waterline angle, in degrees

γ = buttock angle at upper ice waterline (angle of buttock line measured from horizontal), in degrees

$\tan(\beta) = \dfrac{\tan(\alpha)}{\tan(\gamma)}$

$\tan(\beta') = \tan(\beta)\cos(\alpha)$

Fig. 2.10.2 Definition of hull angles

(e) Pressure, P_i:

$P_i = F_i^{0,22} C_D^2 AR_i^{0,3}$ MPa

where

I = sub-region considered

F_i = force of sub-region i, in MN

C_D = load patch dimensions class factor from Table 2.10.1

AR_i = load patch aspect ratio of sub-region i.

10.5 Hull areas other than the bow

10.5.1 In the hull areas other than the bow, the force, F_{NB}, and line load, Q_{NB}, used in the determination of the load patch dimensions, b_{NB}, w_{NB}, and design pressure, P_a, are determined as follows:

(a) Force, F_{NB}:

$F_{NB} = 0{,}36 C_C\ \Delta_F$ MN

where

C_C = crushing force class factor from Table 2.10.1

Δ_F = ship displacement factor

= $\Delta^{0,64}$ if $\Delta \le C_{DI}$

= $C_{DI}^{0,64} + 0{,}10\,(\Delta - C_{DI})$ if $\Delta > C_{DI}$

Δ = ship displacement, in kilo tonnes, not to be taken less than 10

C_{DI} = displacement class factor from Table 2.10.1

(b) Line Load, Q_{NB}:

$Q_{NB} = 0{,}639 F_{NB}^{0,61} C_D$ MN/m

where

F_{NB} = force from 10.5.1(a), in MN

C_D = load patch dimensions class factor from Table 2.10.1.

10.6 Design load patch

10.6.1 In the bow area, and the bow Intermediate Icebelt area for ships with class notation **PC6** and **PC7**, the design load patch has dimensions of width, w_B, and height, b_B, defined as follows:

$$w_B = \frac{F_B}{Q_B} \text{ m}$$

$$b_B = \frac{Q_B}{P_B} \text{ m}$$

where

F_B = maximum F_i in the bow area, in MN

Q_B = maximum Q_i in the bow area, in MN/m

P_B = maximum P_i in the bow area, in MPa.

10.6.2 In hull areas other than those covered by 10.6.1, the design load patch has dimensions of width, w_{NB}, and height, b_{NB}, defined as follows:

$$w_{NB} = \frac{F_{NB}}{Q_{NB}} \text{ m}$$

$$b_{NB} = \frac{w_{NB}}{3{,}6} \text{ m}$$

where

F_{NB} = force determined using 10.5.1(a), in MN

Q_{NB} = line load determined using 10.5.1(b), in MN/m.

10.7 Pressure within the design load patch

10.7.1 The average pressure, P_a, within a design load patch is determined as follows:

$$P_a = \frac{F}{bw} \text{ MPa}$$

where

F = F_B or F_{NB} as appropriate for the hull area under consideration, in MN
b = b_B or b_{NB} as appropriate for the hull area under consideration, in metres
w = w_B or w_{NB} as appropriate for the hull area under consideration, in metres.

10.7.2 Areas of higher, concentrated pressure exist within the load patch. In general, smaller areas have higher local pressures. Accordingly, the peak pressure factors listed in Table 2.10.2 are used to account for the pressure concentration on localised structural members.

10.8 Hull area factors

10.8.1 Associated with each hull area is an area factor that reflects the relative magnitude of the load expected in that area. The area factor, *AF*, for each hull area is listed in Table 2.10.3.

10.8.2 In the event that a structural member spans across the boundary of a hull area, the largest hull area factor is to be used in the scantling determination of the member.

Table 2.10.2 Peak pressure factors

Structural member		Peak pressure factor, K_i
Plating	Transversely framed Longitudinally framed	$K_p = (1,8 - s) \geq 1,2$ $K_p = (2,2 - 1,2s) \geq 1,5$
Frames in transverse framing systems	With load distributing stringers With no load distributing stringers	$K_t = (1,6 - s) \geq 1,0$ $K_t = (1,8 - s) \geq 1,2$
Load carrying stringers Side and bottom longitudinals Web frames		$K_s = 1$ if $S_w \geq 0,5w$ $K_s = 2 - \frac{2S_w}{w}$ if $S_w < 0,5w$
Symbols		
s = frame or longitudinal spacing, in metres S_w = web frame spacing, in metres w = ice load patch width, in metres		

Table 2.10.3 Hull area factors (*AF*)

Hull area		Area	Polar Class						
			PC1	**PC2**	**PC3**	**PC4**	**PC5**	**PC6**	**PC7**
Bow (*B*)	All	B	1,00	1,00	1,00	1,00	1,00	1,00	1,00

NOTES
1. *See* 10.2.3.
2. Indicates that strengthening for ice loads is not necessary.

10.8.3 Due to their increased manoeuvrability, ships having propulsion arrangements with azimuthing thruster(s) or podded propellers shall have specially considered stern icebelt, S_i, and stern lower, S_l, hull area factors.

10.8.4 Area factors to be applied to ships assigned the notation **Icebreaker** are given in Table 2.10.4.

10.9 Shell plate requirements

10.9.1 The required minimum shell plate thickness, t, is given by:

$$t = t_{net} + t_s \quad \text{mm}$$

where

t_{net} = plate thickness required to resist ice loads according to 10.9.2, in mm

t_s = corrosion and abrasion allowance according to 10.16, in mm.

10.9.2 The thickness of shell plating required to resist the design ice load, t_{net}, depends on the orientation of the framing. The plating, including all bottom plating, i.e., plating in hull areas B_{lb}, M_b and S_b, the net thickness is given by Table 2.10.5.

10.10 Framing – General

10.10.1 Framing members of Polar class ships are to be designed to withstand the ice loads defined in 10.2.

10.10.2 The term 'framing member' refers to transverse and longitudinal local frames, load-carrying stringers and web frames in the areas of the hull exposed to ice pressure, *see* Fig. 2.10.1. Where load-distributing stringers have been fitted, the arrangement and scantlings of these are to be suitably designed.

10.10.3 The strength of a framing member is dependent upon the fixity that is provided at its supports. Fixity can be assumed where framing members are either continuous through the support or attached to a supporting section with a connection bracket. In other cases, simple support is to be assumed unless the connection can be demonstrated to provide significant rotational restraint. Fixity is to be ensured at the support of any framing which terminates within an ice-strengthened area.

10.10.4 The details of framing member intersection with other framing members, including plated structures, as well as the details for securing the ends of framing members at supporting sections, are to be in accordance with Pt 3, Ch 10.

10.10.5 The design span of a framing member is to be determined on the basis of its moulded length. If brackets are fitted, the design span may be reduced in accordance with Pt 3, Ch 3.

10.10.6 When calculating the section modulus and shear area of a framing member, the net thicknesses of the web, flange (if fitted) and attached shell plating are to be used. The shear area of a framing member may include that material contained over the full depth of the member, i.e. web area including portion of flange, if fitted, but excluding attached shell plating.

10.10.7 The actual net effective shear area, A_w, of a framing member is given by:

$$A_w = \frac{h\, t_{wn} \sin\varphi_w}{100} \quad \text{cm}^2$$

where

h = height of stiffener, in mm, *see* Fig. 2.10.4

t_{wn} = net web thickness, in mm

= $t_w - t_c$

t_w = as built web thickness, in mm, *see* Fig. 2.10.4

t_c = corrosion deduction, in mm, to be subtracted from the web and flange thickness (as specified by t_s in 10.16.3)

φ_w = smallest angle between shell plate and stiffener web, measured at the midspan of the stiffener, *see* Fig. 2.10.4. The angle φ_w may be taken as 90° provided the smallest angle is not less than 75°.

Table 2.10.4 Hull area factors (AF) for icebreaker

	Bi	B*l*i	B*ll*	Blb	Mi	M*l*	Mb	Si	S*l*	Sb
PC1	1	0,90	0,70	0,55	0,70	0,50	0,30	0,94	0,56	0,35
PC2	1	0,85	0,65	0,50	0,65	0,45	0,30	0,88	0,50	0,30
PC3	1	0,85	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30
PC4	1	0,85	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30

PC7	1	1	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30

Table 2.10.5 Shell plate thickness

Transversely framed plating	Obliquely framed plating	Longitudinally framed plating	
$\Omega \geq 70°$	$70° > \Omega > 20°$	$\Omega \leq 20°$	
		$b \geq s$	$b < s$
$t_{net} = \dfrac{500s\sqrt{\dfrac{AF\,K_p\,P_a}{\sigma_y}}}{1 + \dfrac{s}{2b}}$ mm	linear interpolation	$t_{net} = \dfrac{500s\sqrt{\dfrac{AF\,K_p\,P_a}{\sigma_y}}}{1 + \dfrac{s}{2l}}$ mm	$t_{net} = \dfrac{500s\sqrt{\dfrac{AF\,K_p\,P_a}{\sigma_y}}\sqrt{\dfrac{2b}{s} - \left(\dfrac{b}{s}\right)^2}}{1 + \dfrac{s}{2l}}$ mm

Symbols

Ω = smallest angle between the chord of the waterline and the line of the first level framing as illustrated in Fig. 2.10.3, in degrees
s = transverse frame spacing in transversely-framed ships or longitudinal frame spacing in longitudinally-framed ships, in metres
AF = hull area factor from Table 2.10.3
K_p = peak pressure factor from Table 2.10.2
P_a = average patch pressure according to 10.7.1, in MPa
σ_y = minimum upper yield stress of the material, in N/mm^2
b = height of design load patch, in m, where $b \leq l - \dfrac{s}{4}$ in the case of transversely framed plating
l = distance between frame supports, i.e. equal to the frame span as given in 10.10.5, but not reduced for any fitted end brackets, in metres. When a load-distributing stringer is fitted, the length, l, need not be taken larger than the distance from the stringer to the most distant frame support

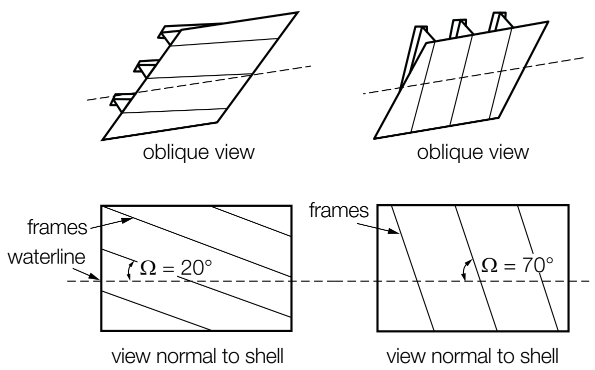

Fig. 2.10.3 Shell framing angle Ω

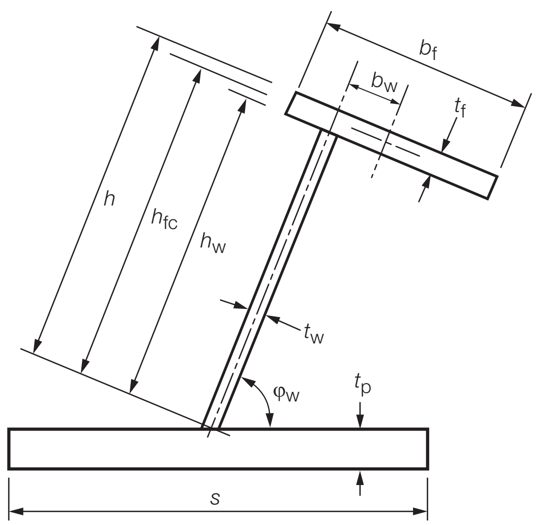

Fig. 2.10.4 Stiffener geometry

10.10.8 When the cross-sectional area of the attached plate flange exceeds the cross-sectional area of the local frame, the actual net effective plastic section modulus, Z_p, is given by:

$$Z_p = \frac{A_{pn}\, t_{pn}}{20} + \frac{h_w^2\, t_{wn} \sin\varphi_w}{2000} + \frac{A_{fn}\,(h_{fc} \sin\varphi_w - b_w \cos\varphi_w)}{10} \ \text{cm}^3$$

where

A_{pn} = net cross-sectional area of the local frame, in cm^2
t_{pn} = fitted net shell plate thickness, in mm, (shall comply with t_{net} as required by 10.9.2)
h_w = height of local frame web, in mm, *see* Fig. 2.10.4
A_{fn} = net cross-sectional area of local frame flange, in cm^2
h_{fc} = height of local frame measured to centre of the flange area, in mm, *see* Fig. 2.10.4
b_w = distance from mid thickness plane of local frame web to the centre of the flange area, in mm, *see* Fig. 2.10.4

h, t_w, t_c and φ_w are as given in 10.10.7
s as given in 10.9.2.

10.10.9 When the cross-sectional area of the local frame exceeds the cross-sectional area of the attached plate flange, the plastic neutral axis is located a distance z_{na} above the attached shell plate, given by:

$$z_{na} = \frac{100\, A_{fn} + h_w\, t_{wn} - 1000 t_{pn}\, s}{2 t_{wn}} \ \text{mm}$$

and the net effective plastic section modulus, Z_p, is given by:

$$Z_p = t_{pn}\, s \left(z_{na} \; \frac{t_{pn}}{2}\right) \sin\varphi_w + \left(\frac{((h_w - z_{na})^2 + z_{na}^2)\, t_{wn} \sin\varphi_w}{2000} + \frac{A_{fn}\,((h_{fc} - z_{na}) \sin\varphi_w - b_w \cos\varphi_w)}{10}\right) \text{cm}^3$$

10.10.10 In the case of oblique framing arrangement (70° > Ω > 20°, where Ω is defined as given in 10.9.2), linear interpolation is to be used.

10.11 Framing – Transversely-framed side structures and bottom structures

10.11.1 The local frames in transversely-framed side structures and in bottom structures (i.e., hull areas B_{Ib}, M_b and S_b) are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

10.11.2 The actual net effective shear area of the frame, A_w, as defined in 10.10.7, is to comply with the following condition:

$$A_w \geq A_t$$

where

$$A_t = 5000\, l_L\, s\, \frac{AF\, K_t\, P_a}{0{,}577 \sigma_y} \ \text{cm}^2$$

l_L = length of loaded portion of span, in metres
= need not exceed the lesser of a and b
a = frame span as defined in 10.10.5, in metres
b = height of design ice load patch according to 10.6, in metres
s = transverse frame spacing, in metres
AF = hull area factor from Table 2.10.3
K_t = peak pressure factor from Table 2.10.2
P_a = average pressure within load patch according to 2.10.7, in MPa
σ_y = minimum upper yield stress of the material, in N/mm^2

10.11.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in 10.10.8 or 10.10.9, is to comply with the following conditions and is to be the greatest of the two load conditions:

(a) ice load acting at the midspan of the transverse frame, and
(b) the ice load acting near a support.

$$Z_p \geq Z_{pt}$$

where

$$Z_{pt} = \frac{100^3\, l_L\, Y\, s\, AF\, K_t\, P_a\, a\, A_1}{4 \sigma_y} \ \text{cm}^3$$

$$Y = 1 - \frac{l_L}{2a}$$

A_1 = reflects the two conditions and is to be taken as the greater of A_{1A} or A_{1B}

$$A_{1A} = \frac{1}{1 + \frac{j}{2} + k_w \frac{j}{2}\left(\sqrt{1 - a_1^2} - 1\right)}$$

$$A_{1B} = \frac{1 - \frac{1}{2 a_1 Y}}{0{,}275 + 1{,}44 k_z^{0{,}7}}$$

j = 1 for framing with one simple support outside the ice strengthened areas
= 2 for framing without any simple supports

$$a_1 = \frac{A_t}{A_w}$$

A_t = rule minimum shear area of transverse frame as given in 10.11.2, in cm^2
A_w = effective net shear area of transverse frame (calculated according to 10.10.7), in cm^2

$$k_w = \frac{1}{1 + \frac{2 A_{fn}}{A_w}}$$

A_{fn} = as given in 10.10.8

$k_z = \dfrac{z_p}{Z_p}$ in general

$= 0$ when the frame is arranged with end bracket

z_p = sum of individual plastic section modulii of flange and shell plate as fitted, in cm^3

$$= \frac{\dfrac{b_f\, t_{fn}^2}{4} + \dfrac{b_e\, t_{pn}^2}{4}}{1000}$$

b_f = flange breadth, in mm, *see* Fig. 2.10.4

t_{fn} = net flange thickness, in mm

$= t_f - t_c$

t_c = as given in 10.10.7

t_f = as-built flange thickness, in mm, *see* Fig. 2.10.4

t_{pn} = the fitted net shell plate thickness, in mm, but is not to be less than t_n as given in 10.9

b_e = effective width of shell plate flange, in mm

$= 500s$

Z_p = net effective plastic section modulus of transverse frame (calculated according to 10.10.8 or 10.10.9), in cm^3

AF, K_t, P_a, l_L, b, s, a and σ_y are as given in 10.11.2.

10.11.4 The scantlings of the frame are to meet the structural stability requirements of 10.14.

10.12 Framing – Side longitudinals (longitudinally framed ships)

10.12.1 Side longitudinals are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

10.12.2 The actual net effective shear area of the frame, A_w, as defined in 10.10.7, is to comply with the following condition:

$A_w \geq A_L$

where

$$A_L = \frac{5000\, AF\, K_s\, P_a\, b_1\, a}{0{,}577\sigma_y} \text{ cm}^2$$

AF = hull area factor from Table 2.10.3

K_s = peak pressure factor from Table 2.10.2

P_a = average pressure within load patch according to 10.7.1, in MPa

$b_1 = k_o\, b_2$ m

$k_o = 1 - \dfrac{0{,}3}{b'}$

$b' = \dfrac{b}{s}$

b = height of design ice load patch from 10.6, in metres

s = spacing of longitudinal frames, in metres

$b_2 = b\,(1 - 0{,}25b')$ m if $b' < 2$

$= s$ m if $b' \geq 2$

a = longitudinal design span as given in 10.10.5, in metres

σ_y = minimum upper yield stress of the material, in N/mm^2

10.12.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in 10.10.8 or 10.10.9, is to comply with the following condition:

$Z_p \geq Z_{pL}$

where

$$Z_{pL} = \frac{100^3\, AF\, K_s\, P_a\, b_1\, a^2\, A_4}{8\sigma_y} \text{ cm}^3$$

$$A_4 = \frac{1}{2 + k_{wl}\left(\sqrt{1 - a_4^2} - 1\right)}$$

$$a_4 = \frac{A_L}{A_w}$$

A_L = rule minimum shear area for longitudinal as given in 10.12.2, in cm^2

A_w = net effective shear area of longitudinal (calculated according to 10.10.7), in cm^2

$$k_{wl} = \frac{1}{1 + \dfrac{2A_{fn}}{A_w}}$$

A_{fn} = as given in 10.10.8

AF, K_s, P_a, b_1, a and σ_y are as given in 10.12.2.

10.12.4 The scantlings of the longitudinals are to meet the structural stability requirements of 10.14.

10.13 Framing – Web frame and load carrying stringers

10.13.1 Web frames and load-carrying stringers are to be designed to withstand the ice load patch as defined in 10.7. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised.

10.13.2 Web frames and load-carrying stringers are to be dimensioned to take into account the combined effects of shear and bending. Where these members form part of a structural grillage system, appropriate methods of analysis are to be used. Where the structural configuration is such that members do not form part of a grillage system, the appropriate peak pressure factor, K_i, from Table 2.10.2 is to be used. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

10.13.3 The scantlings of web frames and load-carrying stringers are to meet the structural stability requirements of 10.14.

10.14 Framing – Structural stability

10.14.1 To prevent local buckling in the web, the ratio of web height, h_w, to net web thickness, t_{wn}, of any framing member is not to exceed:

For flat bar sections: $\dfrac{h_w}{t_{wn}} \le \dfrac{282}{\sqrt{\sigma_y}}$

For bulb, tee and angle sections: $\dfrac{h_w}{t_{wn}} \le \dfrac{805}{\sqrt{\sigma_y}}$

where
h_w = web height
t_{wn} = net web thickness
σ_y = minimum upper yield stress of the shell plate in way of the framing member, in N/mm^2

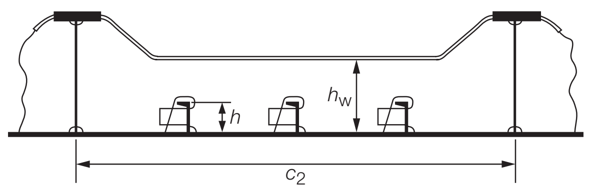

Fig. 2.10.5 Parameter definition for web stiffening

10.14.2 Framing members for which it is not practicable to meet the requirements of 10.14.1 (e.g., load carrying stringers or deep web frames) are required to have their webs effectively stiffened. The scantlings of the web stiffeners are to ensure the structural stability of the framing member. The minimum net web thickness for these framing members is given by:

$$t_{wn} = 2{,}63 \times 10^{-3}\, c_1 \sqrt{\frac{\sigma_y}{5{,}34 + 4\left(\frac{c_1}{c_2}\right)^2}} \text{ mm}$$

where
c_1 = $h_w - 0{,}8h$ mm
h_w = web height of stringer/web frame, in mm, *see* Fig. 2.10.5
h = height of framing member penetrating the member under consideration (to be taken as zero if no such framing member is fitted), in mm, *see* Fig. 2.10.5
c_2 = spacing between supporting structure oriented perpendicular to the member under consideration, in mm, *see* Fig. 2.10.5
σ_y = minimum upper yield stress of the material, in N/mm^2

10.14.3 In addition, the following is to be satisfied:

$$t_{wn} \ge 0{,}35 t_{pn} \sqrt{\frac{\sigma_y}{235}}$$

where
σ_y = minimum upper yield stress of the shell plate in way of the framing member, in N/mm^2
t_{wn} = net thickness of the web, in mm
t_{pn} = net thickness of the shell plate in way the framing member, in mm.

10.14.4 To prevent local flange buckling of welded profiles, the following are to be satisfied:

(a) The flange width, b_f, in mm, is not to be less than five times the net thickness of the web, t_{wn}.
(b) The flange outstand, b_o, in mm, is to meet the following requirement:

$$\frac{b_o}{t_{fn}} \le \frac{155}{\sqrt{\sigma_y}}$$

where
t_{fn} = net thickness of flange, in mm
σ_y = minimum upper yield stress of the material, in N/mm^2.

10.15 Plated structures

10.15.1 Plated structures are those stiffened plate elements in contact with the hull and subject to ice loads. These requirements are applicable to an inboard extent which is the lesser of:

(a) web height of adjacent parallel web frame or stringer; or
(b) 2,5 times the depth of framing that intersects the plated structure.

10.15.2 The thickness of the plating and the scantlings of attached stiffeners are to be such that the degree of end fixity necessary for the shell framing is ensured.

10.15.3 The stability of the plated structure is to adequately withstand the ice loads defined in 10.7.

10.16 Corrosion/abrasion additions and steel renewal

10.16.1 Effective protection against corrosion and ice-induced abrasion is recommended for all external surfaces of the shell plating for all Polar ships.

10.16.2 The values of corrosion/abrasion additions, t_s, to be used in determining the shell plate thickness for each Polar Class are listed in Table 2.10.6.

10.16.3 Polar ships are to have a minimum corrosion/abrasion addition of t_s = 1,0 mm applied to all internal structures within the ice strengthened hull areas, including plated members adjacent to the shell, as well as stiffener webs and flanges.

10.16.4 Steel renewal for ice strengthened structures is required when the gauged thickness is less than t_n + 0,5 mm.

10.17 Materials

10.17.1 Plating materials for hull structures are to be not less than those given in Tables 2.10.8 to 2.10.11 based on the as-built thickness of the material, the Polar ice class notation assigned to the ship and the material class of structural members given in 10.17.2.

Table 2.10.6 Corrosion/abrasion additions for shell plating

Hull area	t_s, in mm					
	With effective protection			Without effective protection		
	PC1 to **PC3**	**PC4** and **PC5**	**PC6** and **PC7**	**PC1** to **PC3**	**PC4** and **PC5**	**PC6** and **PC7**
Bow; Bow Intermediate Icebelt	3,5	2,5	2,0	7,0	5,0	4,0
Bow Intermediate Lower; Midbody & Stern Icebelt	2,5	2,0	2,0	5,0	4,0	3,0
Midbody and Stern Lower; Bottom	2,0	2,0	2,0	4,0	3,0	2,5

10.17.2 Material classes specified in Table 2.2.1 in Pt 3, Ch 2, are applicable to polar ships regardless of the ship's length. In addition, material classes for weather and sea exposed structural members and for members attached to the weather and sea exposed plating are given in Table 2.10.7. Where the material classes in Table 2.10.7 and those in Table 2.2.1 in Pt 3, Ch 2 differ, the higher material class is to be applied.

10.17.3 Steel grades for all plating and attached framing of hull structures and appendages situated below the level of 0,3 m below the lower waterline, as shown in Fig. 2.10.6, are to be obtained from Table 2.2.2 in Pt 3, Ch 2, based on the material class for Structural Members in Table 2.10.7 above, regardless of Polar Class.

10.17.4 Steel grades for all weather exposed plating of hull structures and appendages situated above the level of 0,3 m below the lower ice waterline, as shown in Fig. 2.10.6, are to be not less than given in Table 2.10.8 to Table 2.10.10.

10.17.5 Steel grades for all inboard framing members attached to weather exposed plating are to be not less than given in Table 2.10.11. This applies to all inboard framing members as well as to other contiguous inboard members (e.g. bulkheads, decks) within 600 mm of the exposed plating.

Table 2.10.7 Material classes for structural members of polar ships

Structural members	Material Class
Shell plating within the bow and bow intermediate icebelt hull areas (B, B_{Ii})	II
Plating materials for stem and stern frames, rudder horn, rudder, propeller nozzle, shaft brackets, ice skeg, ice knife and other appendages subject to ice impact loads	II
All weather and sea exposed SPECIAL, as defined in Table 2.2.1 in Pt 3, Ch 2, structural members within 0,2L from FP	II
All weather and sea exposed SECONDARY and PRIMARY, as defined in Table 2.2.1 in Pt 3, Ch 2, structural members outside 0,4L amidships	I
All inboard framing members attached to the weather and sea-exposed plating including any contiguous inboard member within 600 mm of the plating	I
Weather-exposed plating and attached framing in cargo holds of ships which by nature of their trade have their cargo hold hatches open during cold weather operations	I

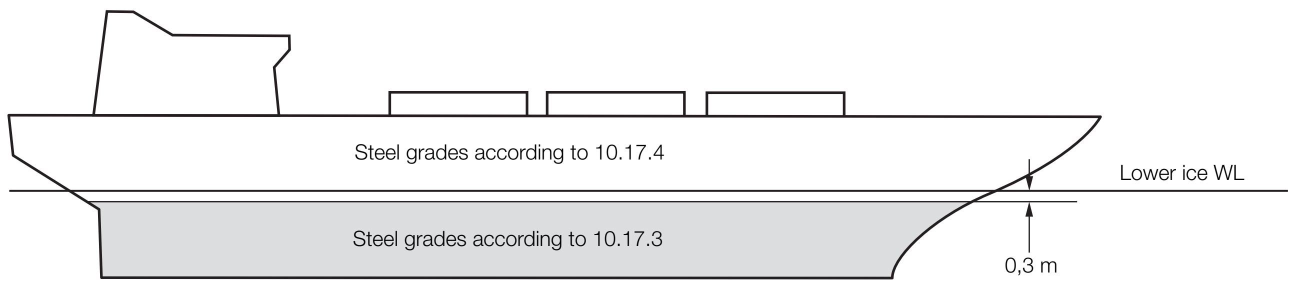

Fig. 2.10.6 Steel grade requirements for submerged and weather exposed shell plating

NOTES
1. Includes weather exposed plating of hull structures and appendages, as well as their outboard framing members, situated above a level of 0,3 m below the lowest ice waterline.
2. Grades D, DH are allowed for a single strake of side shell plating not more than 1,8 m wide from 0,3 m below the lowest ice waterline.

10.17.6 Castings are to have specified properties consistent with the expected service temperature for the cast component.

10.18 Longitudinal strength – Application

10.18.1 Ice loads need only be combined with still water loads. The combined stresses are to be compared against permissible bending and shear stresses at different locations along the ship's length. In addition, sufficient local buckling strength is also to be verified.

Table 2.10.10 Steel grades for weather exposed plating

10.19 Design vertical ice force at the bow

10.19.1 The design vertical ice force at the bow, F_{IB}, is to be taken as the lesser of $F_{IB,1}$ or $F_{IB,2}$:

$$F_{IB,1} = 0{,}534 C_L K_I^{0,15} \sin^{0,2}(\gamma_s)\sqrt{DK_h} \quad \text{MN}$$

$$F_{IB,2} = 1{,}2 C_F \quad \text{MN}$$

where

K_I = indentation parameter

$= \dfrac{K_f}{K_h}$

K_f = for blunt bow forms:

$$K_f = \left(\frac{2C\,B^{(1-e_b)}}{1+e_b}\right)^{0,9} \tan(\gamma_s)^{-0,9(1+e_b)}$$

= for wedge bow forms (α_s < 80 deg), e_b = 1 and the above simplifies to:

$$K_f = \left(\frac{\tan(\alpha_s)}{\tan^2(\gamma_s)}\right)^{0,9}$$

α_s = waterline angle measured in way of the stem at the upper ice waterline (UIWL), in degrees, *see* Fig. 2.10.7

K_h = $0{,}01 A_{wp}$ MN/m

C_L = longitudinal strength class factor from Table 2.10.1

e_b = bow shape exponent which best describes the waterplane (*see* Figs. 2.10.7 and 2.10.8). An approximate e_b determined by a simple fit is acceptable

= 1,0 for a simple wedge bow form
= 0,4 to 0,6 for a spoon bow form
= 0 for a landing craft bow form

γ_s = stem angle to be measured between the horizontal axis and the stem tangent at the upper ice waterline, in degrees (buttock angle as per Fig. 2.10.2 measured on the centreline)

$$C = \frac{1}{2\left(\dfrac{L_B}{B}\right)^{eb}}$$

B = ship moulded breadth, in metres

L_B = bow length, in m, used in the equation:

$$y = \frac{B}{2\left(\dfrac{x}{L_B}\right)^{eb}} \quad \text{(\textit{see} Figs. 2.10.7 and 2.10.8)}$$

Δ = ship displacement, in kilo tonnes, not to be taken less than 10

A_{wp} = ship waterplane area, in m^2

C_F = flexural failure class factor from Table 2.10.1

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

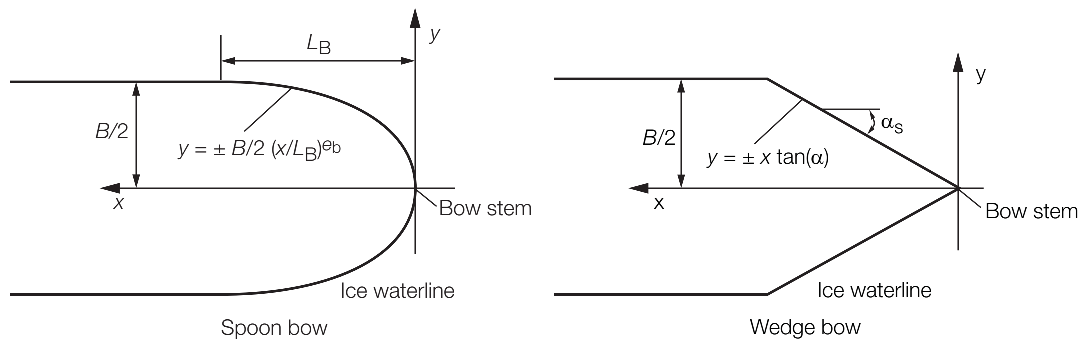

Fig. 2.10.7 Bow shape definition

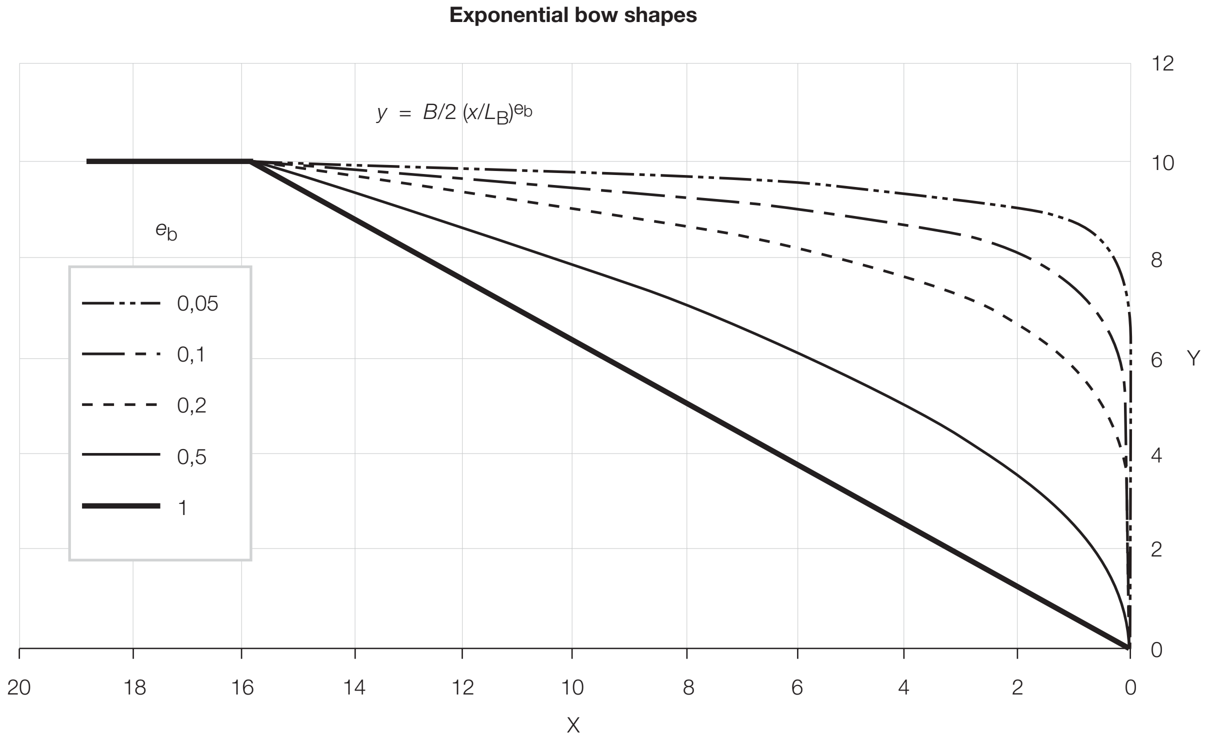

Fig. 2.10.8 Illustration of effect on the bow shape e_b, for B = 20 and L_B = 16

10.20 Design vertical shear force

10.20.1 The design vertical ice shear force, F_I, along the hull girder is to be taken as:

$F_I = C_f \, F_{IB}$ MN

where

C_f = longitudinal distribution factor to be taken as follows:

(a) Positive shear force

C_f = 0,0 between the aft end of L and 0,6L from aft

C_f = 1,0 between 0,9L from aft and the forward end of L

(b) Negative shear force

C_f = 0,0 at the aft end of L

C_f = –0,5 between 0,2L and 0,6L from aft

C_f = 0,0 between 0,8L from aft and the forward end of L

Intermediate values are to be determined by linear interpolation.

10.20.2 The applied vertical shear stress, τ_a, is to be determined along the hull girder in a similar manner as in Pt 3, Ch 4 by substituting the design vertical ice shear force for the design vertical wave shear force.

10.21 Design vertical ice bending moment

10.21.1 The design vertical ice bending moment, M_I, along the hull girder is to be taken as:

$M_I = 0{,}1 C_m \, L \sin^{-0,2}(\gamma_s) \, F_{IB}$ MNm

where

L = ship length, as defined in Pt 3, Ch 1,6.1.1, but measured on the upper ice waterline (UIWL), in metres

γ_{stem} = as given in 10.19.1

F_{IB} = design vertical ice force at the bow, in MN

C_m = longitudinal distribution factor for design vertical ice bending moment to be taken as follows:

C_m = 0,0 at the aft end of L

C_m = 1,0 between 0,5L and 0,7L from aft

C_m = 0,3 at 0,95L from aft

C_m = 0,0 at the forward end of L

Intermediate values are to be determined by linear interpolation.

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

10.21.2 The applied vertical bending stress, σ_a, is to be determined along the hull girder in a similar manner as in Pt 3, Ch 4, by substituting the design vertical ice bending moment for the design vertical wave bending moment. The ship still water bending moment is to be taken as the maximum sagging moment.

10.22 Longitudinal strength criteria

10.22.1 The strength criteria provided in Table 2.10.12 are to be satisfied. The design stress is not to exceed the permissible stress.

Table 2.10.12 Longitudinal strength criteria

Failure mode	Applied stress	Permissible stress $\frac{\sigma_y}{\sigma_u} \le 0{,}7$	Permissible stress $\frac{\sigma_y}{\sigma_u} > 0{,}7$
Tension	σ_a	$\eta \, \sigma_y$	$\eta \, 0{,}41(\sigma_u + \sigma_y)$
Shear	τ_a	$\frac{\eta \, \sigma_y}{\sqrt{3}}$	$\frac{\eta \, 0{,}41(\sigma_u + \sigma_y)}{\sqrt{3}}$
Buckling	σ_a	σ for plating and for web plating of stiffeners $\frac{\sigma_c}{1{,}1}$ for stiffeners	
	τ_a	τ_c	

Symbols

σ_a = applied vertical bending stress, in N/mm^2
τ_a = applied vertical shear stress, in N/mm^2
σ_y = minimum upper yield stress of the material, in N/mm^2
σ_u = ultimate tensile strength of material, in N/mm^2
σ_c = critical buckling stress in compression, according to Pt 3, Ch 4, in N/mm^2
τ_c = critical buckling stress in shear, according to Pt 3, Ch 4, in N/mm^2
η = 0,8

10.23 Stem and stern frames

10.23.1 The stem and stern frame are to be suitably designed. The stem and stern requirements of the *Finnish-Swedish Ice Class Rules* are to be additionally considered, *see* Section 1.

10.24 Appendages

10.24.1 All appendages are to be designed to withstand forces appropriate for the location of their attachment to the hull structure or their position within a hull area.

10.25 Local details

10.25.1 Local design details are to be suitably designed to transfer ice-induced loads to supporting structure (bending moments and shear forces).

10.25.2 The loads carried by a member in way of cut-outs are not to cause instability. Where necessary, the structure is to be stiffened.

10.26 Direct calculations

10.26.1 Direct calculations are not to be utilised as an alternative to the analytical procedures prescribed in this Section.

10.26.2 Where direct calculation is used to check the strength of structural systems, the load patch specified in 10.2 is to be applied.

10.27 Welding

10.27.1 All welding within ice-strengthened areas is to be of the double continuous type.

10.27.2 Continuity of strength is to be ensured at all structural connections.

Section 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7

11.1 Application

11.1.1 The contents of this Section apply to main propulsion, steering gear, emergency and essential auxiliary systems essential for the safety of the ship and the survivability of the crew and systems and equipment required by assigned optional classification notations, e.g. navigational equipment associated with the notations **NAV1** or **IBS**.

11.1.2 For **PC6** and **PC7**, the requirements will be considered with respect to compliance with the *Finnish-Swedish Ice Class Rules*.

11.2 Drawings and particulars to be submitted

11.2.1 The following drawings and particulars to be submitted:

(a) Details of the environmental conditions and the required ice class for the machinery, if different from ship's ice class.

(b) Detailed drawings of the main propulsion machinery. Description of the main propulsion, steering, emergency and essential auxiliaries are to include operational limitations. Information on essential main propulsion load control functions.

(c) Description detailing how main, emergency and auxiliary systems are located and protected to prevent problems from freezing, ice and snow and evidence of their capability to operate in intended environmental conditions.

(d) Calculations and documentation indicating compliance with the requirements of this Section.

11.3 System design

11.3.1 Systems, subject to damage by freezing, are to be drainable.

11.3.2 Single screw vessels classed PC1 to PC5 inclusive are to have means provided to ensure sufficient vessel operation in the case of propeller damage including CP mechanism.

11.4 Materials exposed to sea-water

11.4.1 Materials exposed to sea-water, such as propeller blades, propeller hub and blade bolts are to have an elongation not less than 15 per cent on a test piece the length of which is five times the diameter. Charpy V impact test are to be carried out for other than bronze and austenitic steel materials. Test pieces taken from the propeller castings are to be representative of the thickest section of the blade. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at minus 10°C.

11.5 Materials exposed to sea-water temperature

11.5.1 Materials exposed to sea-water temperature are to be of steel or other approved ductile material. An average impact energy value of 20 J taken from three tests is to be obtained at minus 10°C.

11.6 Materials exposed to low air temperature

11.6.1 Materials of essential components exposed to low air temperature shall be of steel or other approved ductile material. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at 10°C below the lowest design temperature. *See also The Provisional Rules for the Winterisation of Ships*.

11.7 Propeller ice interaction

11.7.1 These Rules cover open and ducted type propellers situated at the stern of a vessel having controllable pitch or fixed pitch blades. Ice loads on bow propellers and pulling type propellers are to receive special consideration. The given loads are expected, single occurrence, maximum values for the whole ship's service life for normal operational conditions. These loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. These Rules apply also for azimuthing (geared and podded) thrusters considering loads due to propeller ice interaction. However, ice loads due to ice impacts on the body of azimuthing thrusters are not covered by this Section.

11.7.2 The loads given in 11.7 are total loads (unless otherwise stated) during ice interaction and are to be applied separately (unless otherwise stated) and are intended for component strength calculations only. The different loads given here are to be applied separately.

11.7.3 F_b is a force bending a propeller blade backwards when the propeller mills an ice block while rotating ahead. F_f is a force bending a propeller blade forwards when a propeller interacts with an ice block while rotating ahead.

11.8 Ice class factors

11.8.1 Table 2.11.1 lists the design ice thickness and ice strength index to be used for estimation of the propeller ice loads.

Table 2.11.1 Propeller ice loads index

Ice Class	H_{ice}, in metres	S_{ice}	S_{qice}
PC1	4,0	1,2	1,15
PC2	3,5	1,1	1,15
PC3	3,0	1,1	1,15
PC4	2,5	1,1	1,15
PC5	2,0	1,1	1,15
PC6	1,75	1,0	1,00
PC7	1,5	1,0	1,00
where H_{ice} = ice thickness for machinery strength design S_{ice} = ice strength index for blade ice force S_{qice} = ice strength index for blade ice torque			

11.9 Design ice loads for open propeller

11.9.1 The maximum backward blade force, F_b, is to be taken as:
when
$D < D_{limit}$

$$F_b = -27 S_{ice} (nD)^{0,7} \left(\frac{EAR}{Z}\right)^{0,3} D^2 \quad \text{kN}$$

when
$D \geq D_{limit}$

$$F_b = -23 S_{ice} (nD)^{0,7} \left(\frac{EAR}{Z}\right)^{0,3} (H_{ice})^{1,4} D \quad \text{kN}$$

where
D_{limit} = $0,85(H_{ice})^{1,4}$
n = the nominal rotational speed in rev/sec (at MCR free running condition) for CP-propeller and 85 per cent of the nominal rotational speed (at MCR free running condition) for a FP-propeller (regardless of driving engine type).

11.9.2 F_b is to be applied as a uniform pressure distribution to an area on the back (suction) side of the blade for the following load cases:
(a) Load case 1: from 0,6R to the tip and from the blade leading edge to a value of 0,2 chord length
(b) Load case 2: a load equal to 50 per cent of the F_b is to be applied on the propeller tip area outside of 0,9R
(c) Load case 5: for reversible propellers, a load equal to 60 per cent of the F_b is to be applied from 0,6R to the tip and from the blade trailing edge to a value of 0,2 chord length.
See load cases 1, 2, and 5 in Table 2.11.4.

11.9.3 The maximum forward blade force, F_f, is to be taken as:
when
$D < D_{limit}$

$$F_f = 250 \left(\frac{EAR}{Z}\right) D^2 \quad \text{kN}$$

when
$D \geq D_{limit}$

$$F_f = 500 \left(\frac{1}{1 - \frac{d}{D}}\right) H_{ice} \left(\frac{EAR}{Z}\right) D \quad \text{kN}$$

where

$$D_{limit} = \left(\frac{2}{1 - \frac{d}{D}}\right) H_{ice} \quad \text{m}$$

d = propeller hub diameter, in metres
D = propeller diameter, in metres
EAR = expanded blade area ratio
Z = number of propeller blades.

11.9.4 F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side of the blade for the following loads cases:
(a) Load case 3: from 0,6R to the tip and from the blade leading edge to a value of 0,2 chord length.
(b) Load case 4: a load equal to 50 per cent of F_f is to be applied on the propeller tip area outside of 0,9R.
(c) Load case 5: for reversible propellers a load equal to 60 per cent of F_f is to be applied from 0,6R to the tip and from the blade trailing edge to a value of 0,2 chord length.
See load cases 3, 4 and 5 in Table 2.11.4.

11.9.5 The blade spindle torque, Q_{smax}, around the spindle axis of the blade fitting is to be calculated both for the load cases described in 11.9.1 and 11.9.3 for F_h and F_f. If these spindle torque values are less than the default value given below, the default minimum value is to be used:

$$Q_{smax} = 0,25 F C_{0,7} \quad \text{kNm}$$

where
$C_{0,7}$ = length of the blade chord at 0,7R radius, in m
F = F_h or F_f whichever has the greater absolute value.

11.9.6 The maximum propeller ice torque applied to the propeller is to be taken as:

when $D < D_{limit}$

$$Q_{max} = 105\left(1 - \frac{d}{D}\right) S_{qice}\left(\frac{P_{0,7}}{D}\right)^{0,16}\left(\frac{t_{0,7}}{D}\right)^{0,6}(nD)^{0,17} D^3 \quad \text{kNm}$$

when $D \geq D_{limit}$

$$Q_{max} = 202\left(1 - \frac{d}{D}\right) S_{qice} H_{ice}^{1,1}\left(\frac{P_{0,7}}{D}\right)^{0,16}\left(\frac{t_{0,7}}{D}\right)^{0,6}(nD)^{0,17} D^{1,9} \quad \text{kNm}$$

where

D_{limit} = $1,81H_{ice}$

S_{qice} = ice strength index for blade ice torque

$P_{0,7}$ = propeller pitch at 0,7*R*, in m

= for CP propellers, $P_{0,7}$ is to correspond to MCR in bollard condition. If not known, $P_{0,7}$ is to be taken as $0,7P_{0,7n}$

$P_{0,7n}$ = propeller pitch at MCR free running condition

$t_{0,7}$ = maximum thickness at 0,7*R*

n = the rotational propeller speed in rev/sec , at bollard condition. If not known, n is to be taken as follows:
for CP propellers and FP propellers driven by turbine or electric motor = n_n
for FP propellers driven by diesel engine = $0,85n_n$

n_n = the nominal rotational speed at MCR, free running condition.

11.9.7 The maximum propeller ice thrust applied to the shaft is to be taken as:

T_f = $1,1F_f$

T_b = $1,1F_b$.

11.10 Design ice loads for ducted propellers

11.10.1 The maximum backward blade force, F_b is to be taken as:

when $D < D_{limit}$

$$F_b = -9,5\, S_{ice}\left(\frac{EAR}{Z}\right)^{0,3}(nD)^{0,7} D^2$$

when $D \geq D_{limit}$

$$F_b = -66\, S_{ice}\left(\frac{EAR}{Z}\right)^{0,3}(nD)^{0,7} D^{0,6}(H_{ice})^{1,4}$$

where

D_{limit} = $4\, H_{ice}$

n = as in 11.9.1.

11.10.2 F_b is to be applied as a uniform pressure distribution to an area on the back side for the following load cases:

(a) Load case 1: on the back of the blade from 0,6*R* to the tip and from the blade leading edge to a value of 0,2 chord length

(b) Load case 5: for reversible rotation propellers a load equal to 60 per cent of F_b is applied on the blade face from 0,6*R* to the tip and from the blade trailing edge to a value of 0,2 chord length.

See load cases 1 and 5 in Table 2.11.5.

11.10.3 The maximum forward blade force, F_f, is to be taken as:

when

$D \leq D_{limit}$

$$F_f = 250\left(\frac{EAR}{Z}\right) D^2 \quad \text{kN}$$

when

$D > D_{limit}$

$$F_f = 500\left(\frac{EAR}{Z}\right) D\left(\frac{1}{1 - \frac{d}{D}}\right) H_{ice} \quad \text{kN}$$

where

$$D_{limit} = \left(\frac{2}{1 - \frac{d}{D}}\right) H_{ice} \quad \text{m}$$

11.10.4 F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side for the following load cases:

(a) Load case 3: on the blade face from 0,6*R* to the tip and from the blade leading edge to a value of 0,5 chord length.

(b) Load case 5: a load equal to 60 per cent F_f is to be applied from 0,6*R* to the tip and from the blade leading edge to a value of 0,2 chord length.

See load cases 3 and 5 in Table 2.11.5.

11.10.5 The maximum propeller ice torque, Q_{max}, applied to the propeller is to be taken as:

when $D \leq D_{limit}$

$$Q_{max} = 74\left(1 - \frac{d}{D}\right)\left(\frac{P_{0,7}}{D}\right)^{0,16}\left(\frac{t_{0,7}}{D}\right)^{0,6}(nD)^{0,17} S_{qice} D^3 \quad \text{kNm}$$

when $D > D_{limit}$

$$Q_{max} = 141\left(1 - \frac{d}{D}\right)\left(\frac{P_{0,7}}{D}\right)^{0,16}\left(\frac{t_{0,7}}{D}\right)^{0,6}(nD)^{0,17} S_{qice} D^{1,9} H_{ice}^{1,1} \quad \text{kNm}$$

where

D_{limit} = $1,8H_{ice}$ in metres

n = the rotational propeller speed, in rps, at bollard condition. If not known, n is to be taken as follows:
for CP propellers and FP propellers driven by turbine or electric motor = n_n
for FP propellers driven by diesel engine = $0,85n_n$

n_n = the nominal rotational speed at MCR at free running condition

$P_{0,7}$ = for CP propellers, propeller pitch, $P_{0,7}$ is to correspond to MCR in bollard condition. If not known, $P_{0,7}$ is to be taken as $0,7P_{0,7n}$

$P_{0,7n}$ = propeller pitch at MCR free running condition.

11.10.6 The spindle torque for CP-mechanism design, Q_{smax}, around the spindle axis of the blade fitting is to be calculated for the load case described in 11.7. If these spindle torque values are less than the default value given below, the default value is to be used:

$$Q_{smax} = 0,25F\, c_{0,7} \quad \text{kNm}$$

where

$C_{0,7}$ = the length of the blade section at 0,7*R*

F = F_b or F_f whichever has the greater absolute value.

11.10.7 The maximum propeller ice thrust (applied to the shaft at the location of the propeller) is to be taken as:

T_f = $1,1F_f$
T_b = $1,1F_b$.

11.11 Design loads on propulsion line – Torque

11.11.1 The propeller ice torque excitation for shaft line dynamic analysis is to be described by a sequence of blade impacts which are of half sine shape and occur at the blade. The torque due to a single blade ice impact as a function of the propeller rotation angle is to be taken as:

when

$\varphi = 0...\alpha_i$

$$Q(\varphi) = C_q\, Q_{max} \sin\left(\varphi \left(\frac{180}{\alpha_i}\right)\right)$$

when

$\varphi = \alpha_i...360$
$Q(\varphi) = 0$

where

C_q = as given in Table 2.11.2
α_i = as given in Table 2.11.2.

11.11.2 The total ice torque is obtained by summing the torque of single blades taking into account the phase shift 360°/Z. The number of propeller revolutions during a milling sequence is to be obtained with the formula:

$N_Q = 2H_{ice}$

where

number of impacts = $Z\, N_Q$ *see* Fig. 2.11.1.

Table 2.11.2 Torque load factors

Torque excitation	Propeller-ice interaction	C_q	α_i.
Case 1	Single ice block	0,50	45
Case 2	Single ice block	0,75	90
Case 3	Single ice block	1,00	135
Case 4	Two ice blocks with 45 degree phase in rotation angle	0,50	45

11.11.3 The milling torque sequence duration is not valid for pulling bow propellers, which are subject to special consideration. The response torque at any shaft component is to be analysed considering excitation torque $Q(\varphi)$ at the propeller, actual engine torque, Q_e, and mass elastic system. Where Q_e is the actual maximum engine torque at considered speed.

11.11.4 The design torque, Q_r, of the shaft component is to be determined by means of torsional vibration analysis of the propulsion line. Calculations are to be carried out for all excitation cases given above and the response is to be applied on top of the mean hydrodynamic torque in bollard condition at considered propeller rotational speed.

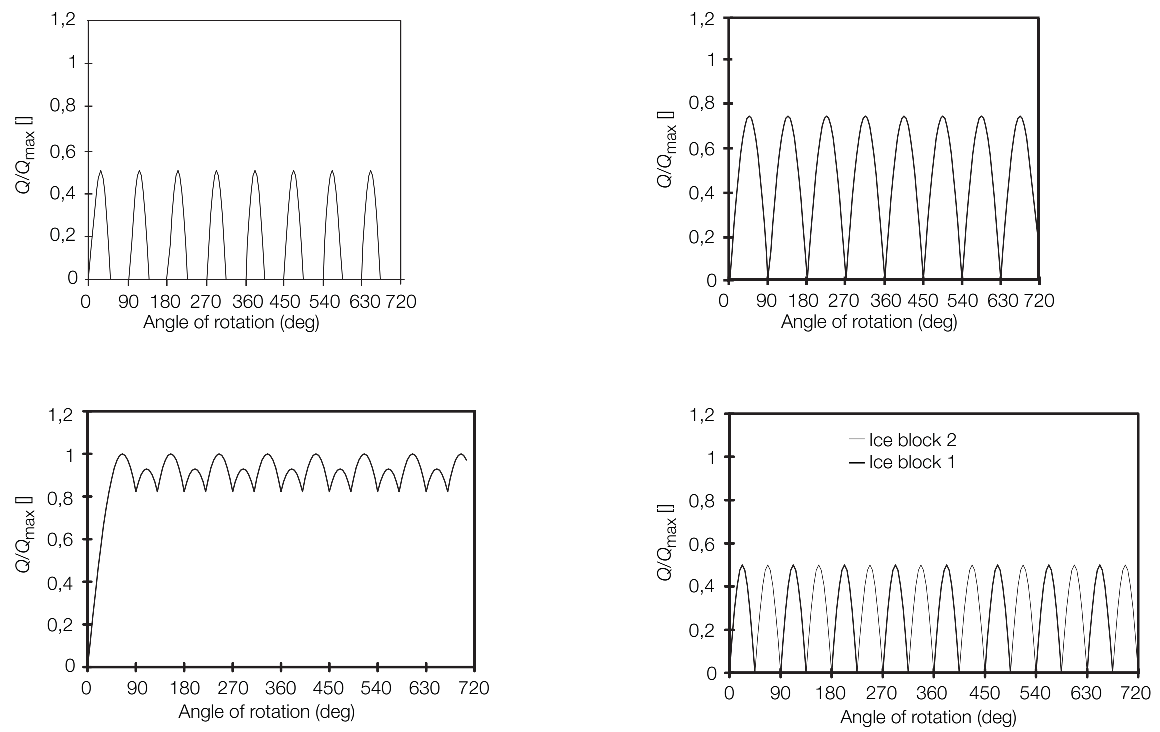

Fig. 2.11.1
The shape of the propeller ice torque excitation for 45, 90, 135 degrees single blade impact sequences and 45 degrees double blade impact sequence (two ice pieces) on a four bladed propeller

11.12 Design loads on propulsion line – Maximum response thrust

11.12.1 The maximum thrust along the propeller shaft line is to be calculated with the formulae below. The factors 2,2 and 1,5 take into account the dynamic magnification due to axial vibration. Alternatively, the propeller thrust magnification factor may be calculated by dynamic analysis

Maximum shaft thrust forwards

$T_r = T_n + 2,2T_f$ kN

Maximum shaft thrust backwards

$T_r = 1,5T_b$ kN

where

T_n = hydrodynamic propeller bollard thrust, in kN. If not known, T_n is to be as given in Table 2.11.3

T_f = maximum forward propeller ice thrust, in kN.

Table 2.11.3 Propeller thrust factor

Propeller type	T_n
CP propellers (open)	1,25T
CP propellers (ducted)	1,10T
FP propellers driven by turbine or electric motor	T
FP propellers driven by diesel engine (open)	0,85T
FP propellers driven by diesel engine (ducted)	0,75T
Symbols	
T = nominal propeller thrust at MCR at free running open water conditions	

Table 2.11.4 Load cases for open propeller

Load case	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from 0,6*R* to the tip and from the leading edge to 0,2 times the chord length.	Load case 2	50% of F_b	Uniform pressure applied on the back of the blade (suction side) on the propeller tip area outside of 0,9*R* radius.	Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from 0,6*R* to the tip and from the leading edge to 0,2 times the chord length.	Load case 4	50% of F_f	Uniform pressure applied on propeller face (pressure side) on the propeller tip area outside of 0,9*R* radius.	Load case 5	60% of F_f or F_b whichever is the greater	Uniform pressure applied on propeller face (pressure side) to an area from 0,6*R* to the tip and from the trailing edge to 0,2 times the chord length.	
Table 2.11.5 Load cases for ducted propeller

Load case	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from 0,6*R* to the tip and from the leading edge to 0,2 times the chord length	Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from 0,6*R* to the tip and from the leading edge to 0,5 times the chord length	Load case 5	60% of F_f or F_b	Uniform pressure applied on propeller face (pressure side) to an area from 0,6*R* to the tip and from the trailing edge to 0,2 times the chord length	
11.13 Design loads on propulsion line – Blade failure load for both open and nozzle propellers

11.13.1 The force is acting at 0,8*R* in the weakest direction of the blade and at a spindle arm of 2/3 of the distance of axis of blade rotation of leading and trailing edge whichever is the greatest. The blade failure load is to be taken as:

$$F_{ex} = \frac{0{,}3c\, t^2\, \sigma_{ref}}{0{,}8D - 2r} \times 10^3 \quad \text{kN}$$

where

σ_{ref} = $0{,}6\sigma_{0,2} + 0{,}4\sigma_u$

$\sigma_{0,2}$ and σ_u = representative values for the blade material

c, *t* and r = the actual chord length, thickness and radius of the cylindrical root section of the blade at the weakest section outside root fillet and typically will be at the termination of the fillet into the blade profile.

11.14 Design – Design principle

11.14.1 The strength of the propulsion line is to be designed:

(a) for maximum loads in 11.7;
(b) such that the plastic bending of a propeller blade will not cause damage in other propulsion line components;
(c) with sufficient fatigue strength.

11.15 Design – Azimuthing main propulsors

11.15.1 In addition to the above requirements, special consideration will be given to the loading cases which are extraordinary for propulsion units when compared with conventional propellers. Estimation of the loading cases must reflect the operational realities of the ship and the thrusters. In this respect, for example, the loads caused by impacts of ice blocks on the propeller hub of a pulling propeller are to be considered. Also, loads due to thrusters operating in an oblique angle to the flow are to be considered. The steering mechanism, the fitting of the unit and the body of the thruster is to be designed to withstand the loss of a blade without damage. The plastic bending of a blade is to be considered in the propeller blade position, which causes the maximum load on the studied component.

11.15.2 Azimuth thrusters are also to be designed for estimated loads due to thruster body/ice interaction as in 10.24.

11.16 Blade design – Maximum blade stresses

11.16.1 Blade stresses are to be calculated using the backward and forward loads given in 11.9 and 11.10. The stresses are to be calculated with recognised and well documented FE-analysis or another acceptable alternative method. The stresses on the blade are not to exceed the allowable stresses, σ_{all}, for the blade material given below. The calculated blade stress for the maximum ice load is to comply with the following:

$$\sigma_{calc} < \sigma_{all} = \frac{\sigma_{ref}}{S}$$

where

S = 1,5

σ_{ref} = reference stress, defined as:
$0,7\sigma_u$
$0,6\ \sigma_{0,2} + 0,4\sigma_u$ whichever is less

σ_u and $\sigma_{0,2}$ = representative values for the blade material.

11.17 Blade design – Blade edge thickness

11.17.1 The blade edge thicknesses, t_{ed}, and tip thickness t_{tip}, are to be greater than t_{edge} given by the following formula:

$$t_{edge} \geq x\ S\ S_{ice} \sqrt{\frac{3P_{ice}}{\sigma_{ref}}}$$

where

x = distance from the blade edge measured along the cylindrical sections from the edge and is to be 2,5 per cent of chord length, however not to be taken greater than 45 mm.
In the tip area (above 0,975R radius) x is to be taken as 2,5 per cent of 0,975R section length and is to be measured perpendicularly to the edge, however not to be taken greater than 45 mm.

S = safety factor
= 2,5 for trailing edges
= 3,5 for leading edges
= 5,0 for tip

S_{ice} = as given in 11.8

p_{ice} = ice pressure
= 16 MPa for leading edge and tip thickness

σ_{ref} = as given in 11.16.

11.17.2 The requirement for edge thickness is to be applied for leading edge and in case of reversible rotation open propellers also for the trailing edge. Tip thickness refers to the maximum measured thickness in the tip area above 0,975R radius. The edge thickness in the area between the position of maximum tip thickness and edge thickness at 0,975 radius has to be interpolated between edge and tip thickness value and smoothly distributed.

11.18 Prime movers

11.18.1 The main engine is to be capable of being started and running the propeller with the CP in full pitch.

11.18.2 Provisions are to be made for heating arrangements to ensure ready starting of the cold emergency power units at an ambient temperature applicable to the Polar class of the ship.

11.18.3 Emergency power units are to be equipped with starting devices with a stored energy capability of at least three consecutive starts at the design temperature in 11.18.2. The source of stored energy is to be protected to preclude critical depletion by the automatic starting system, unless a second independent means of starting is provided. A second source of energy is to be provided for an additional three starts within 30 min., unless manual starting can be demonstrated to be effective.

11.19 Machinery fastening loading accelerations

11.19.1 Essential equipment and main propulsion machinery supports are to be suitable for the accelerations as indicated in the following. Accelerations are to be considered acting independently.

11.19.2 The maximum longitudinal impact acceleration, a_l, at any point along the hull girder is to be taken as:

$$a_l = \left(\frac{F_{IB}}{\Delta}\right)\left\{[1,1\ \tan(\gamma + \phi)] + \frac{7H}{L}\right\} \quad \text{m/s}^2$$

where

F_{IB} = vertical impact force, defined in 10.19

H = distance from the waterline to the point being considered, in metres

L = length between perpendiculars, in metres

ϕ = maximum friction angle between steel and ice, normally taken as 10, in degrees

γ = bow stem angle at waterline, in degrees

Δ = Displacement.

11.19.3 The combined vertical impact acceleration, a_v, at any point along the hull girder, is to be taken as:

$$a_v = 2,5\left(\frac{F_{IB}}{\Delta}\right)F_x \quad \text{m/s}^2$$

where

F_X = 1,3 at the FP
= 0,2 at midships
= 0,4 at the AP
= 1,3 at the AP for vessels conducting icebreaking astern
= intermediate values are to be determined by linear interpolation.

11.19.4 The combined transverse impact acceleration, a_t, at any point along hull girder, is to be taken as:

$$a_t = 3F_i\left(\frac{F_x}{\Delta}\right) \quad \text{m/s}^2$$

where

F_X = 1,5 at the FP
= 0,25 at midships
= 0,5 at the AP
= 1,5 at the AP for vessels conducting icebreaking astern
= intermediate values are to be determined by linear interpolation

F_i = total force normal to shell plating in the bow area due to oblique ice impact, defined in 10.19.

11.20 Auxiliary systems

11.20.1 Machinery is to be protected from the harmful effects of ingestion or accumulation of ice or snow. Where continuous operation is necessary, means are to be provided to purge the system of accumulated ice or snow.

11.20.2 Means are to be provided to prevent damage due to freezing, to tanks containing liquids.

11.20.3 Vent pipes, intake and discharge pipes and associated systems are to be designed to prevent blockage due to freezing or ice and snow accumulation.

11.21 Sea inlets and cooling water systems

11.21.1 Cooling water systems for machinery that are essential for the propulsion and safety of the vessel, including sea chest inlets, are to be designed for the environmental conditions applicable to the ice class.

11.21.2 At least two sea chests are to be arranged as ice boxes for classes **PC1** to **PC5** inclusive. The calculated volume for each of the ice boxes is to be at least 1 m^3 for every 750 kW of the total installed power. For **PC6** and **PC7**, there is to be at least one ice box located preferably near centreline.

11.21.3 Ice boxes are to be designed for an effective separation of ice and venting of air.

11.21.4 Sea inlet valves are to be secured directly to the ice boxes. The valves are to be a full bore type.

11.21.5 Ice boxes and sea bays are to have vent pipes and are to have shut off valves connected directly to the shell.

11.21.6 Means are to be provided to prevent freezing of sea bays, ice boxes, ship side valves and fittings above the load waterline.

11.21.7 Efficient means are to be provided to re-circulate cooling seawater to the ice box. The total sectional area of the circulating pipes is not to be less than the area of the cooling water discharge pipe.

11.21.8 Detachable gratings or manholes are to be provided for ice boxes. Manholes are to be located above the deepest load line. Access is to be provided to the ice box from above.

11.21.9 Openings in ship sides for ice boxes are to be fitted with gratings, or holes or slots in shell plates. The net area through these openings is to be not less than 5 times the area of the inlet pipe. The diameter of holes and width of slot in shell plating is to be not less than 20 mm. Gratings of the ice boxes are to be provided with a means of clearing. Clearing pipes are to be provided with screw-down type non-return valves.

11.22 Ballast tanks

11.22.1 Efficient means are to be provided to prevent freezing in fore and after peak tanks and wing tanks located above the waterline and where otherwise found necessary. *See* 2.1.3 and *The Provisional Rules for the Winterisation of Ships*, 3.2.1.

11.23 Ventilation system

11.23.1 The air intakes for machinery and accommodation ventilation are to be located on both sides of the ship.

11.23.2 Accommodation and ventilation air intakes are to be provided with means of heating.

11.23.3 The temperature of the inlet air provided to machinery from the air intakes is to be suitable for the safe operation of the machinery.

11.24 Alternative design

11.24.1 As an alternative a comprehensive design study may be submitted and may be requested to be validated by an agreed test programme.

■ *Section 12*
Requirements for Icebreaker(+)

12.1 Scope

12.1.1 Where the notation **Icebreaker(+)** is assigned, the arrangement, powering and dimensions of the hull structure and propulsion machinery are to be determined based on the operational profile that corresponds to that which the icebreaker is envisaged to undertake.

12.1.2 The assignment of the notation **Icebreaker(+)** is in addition to the requirements of Section 10 and Section 11 and is assigned in addition to the ice class notations given in Table 2.1.1. *See* 1.5.

12.2 Operational profile

12.2.1 The operational profile to be used for the basis of assignment of the notation **Icebreaker(+)** is to be derived from the icebreaker's function, as selected from 12.4.

12.2.2 The operational profile is only used to select a design basis. It is the responsibility of the Owner and/or Builder to determine the appropriate operational profile of the icebreaker.

12.3 Information to be submitted

12.3.1 For assignment of the notation **Icebreaker(+)**, the operational envelope criteria are to be submitted, which may include the following information, where applicable:

(a) the level icebreaking capability, in terms of speed and ice thickness;
(b) the turning capability in level ice, in terms of diameter and ice thickness; and
(c) the ramming capability, in terms of speed and ice condition.

12.3.2 In addition to the information submitted in 12.3.1, a scenario document, which is design specific, is required to document the operational profile and is to include details of the scenarios selected for deriving and applying ice loads.

12.3.3 The scenario document is to address the requirements in Sections 10 and 11 and provide justification for deviation from those requirements.

12.3.4 The following is to be contained within the submitted scenario document:

(a) icebreaker function;
(b) details of ice conditions assumed;
(c) operational scenarios for hull and propulsion machinery;
(d) identification of critical hull and propulsion machinery scenarios;
(e) description of propulsion machinery and/or hull loading areas with reasons for selection;
(f) proposed strengthening standards for each load area;
(g) arrangement of propulsion devices;
(h) derived load data-based full scale measurement or other predictive means; and
(j) details of, and justification for, deviation from the Rules.

12.3.5 In addition to the information submitted in 12.3.4, an ice pressure plan that indicates the design ice pressures used for the determination of the hull structure is to be submitted.

12.3.6 The operational envelope criteria is to be placed on board the ship.

12.4 Typical operational profiles

12.4.1 Typical operational profiles may be derived from the icebreaker function. Primary icebreaker functions are described in Table 2.12.1. These functions are to form the basis of operational scenarios as required in 12.3.4. Where an alternative function is selected a description of the icebreaker's operational functions is to be included in the scenario document.

12.5 General arrangement

12.5.1 Consideration is to be given to the protection of fuel tanks and other tanks with harmful substances, both in terms of thermal insulation and ice impact protection. A double bottom and double side tanks are to be fitted as specified in Pt 4, Ch 9,1.2.17. However, double side tanks may not be required for small icebreakers (typically less than 60 m), nor complete double bottom height in way of complex hullform arrangements in the fore and aft ends or heeling tanks.

12.5.2 Consideration is to be given to minimise transom sterns, as these hinder the icebreaker's ability to back in ice, and in particular the navigation of ice ridges. A transom stern should not normally extend below the Upper Ice Waterline. Where this cannot be avoided, the transom should be kept as narrow as possible and the scantlings of plating and stiffeners are to be as required for the stern section.

12.5.3 The requirements are based on an effective icebreaker bow form. Icebreaking angles vary depending on the icebreaking form; however, in general, the bow stem angle is not to be greater than 45°, and the bow waterline angle not greater than 40°, *see* Fig. 2.12.1. Where flare of the side shell amidships is proposed, it is recommended that the slope of the side be at least 8°.

Table 2.12.1 Primary icebreaker functions

Primary function	General description	Assumed criticality of operation
Escort	Engaged in icebreaker fleet operations in ice,patrol and search/rescue missions Breaking channel for supporting other ships, close manoeuvring, freeing of beset vessels and, where appropriate, towing vessels	May attempt to follow easiest course when operating alone. Search and rescue operations are undertaken within the bounds of safe operation to the icebreaker and escorted ship
Research	Engaged in independent operations in ice, including deployment of scientists and research equipment Breaking of channels to reach scientific/research bases and escort of ships for re-supply purposes	May re-route or re-schedule to avoid perceived difficult ice conditions
Support	Engaged in independent or icebreaker fleet operations in ice, supply/transit runs to support offshore installations Ice management activities which may include breaking of ice floes and engagement in ice defence of offshore operations/installations	May actively break large/strong ice features to defend the installation

12.5.4 Ice arresters (ice skeg) are recommended for all icebreakers to prevent riding up of the bow and submergence of the aftermost deck edge.

12.5.5 For icebreakers provided with a heel inducing system, it is recommended that the depth of the icebreaker be such that immersion of the deck edge does not occur when the ship, whilst floating at the Upper Ice Waterline, is heeled to an angle of 5° greater than the nominal capacity of the system or 15°, whichever is the greater.

12.5.6 For icebreakers intended to navigate continuously in thick multi-year ice, i.e., PC1, PC2 and PC3, and in relation to the icebreaker function, consideration should be given to the mass of the icebreaker to enable effective ice breaking.

12.5.7 For icebreakers installed with podded propulsion or azimuth thrusters, *see* the *Provisional Rules for Stern First Ice Class Ships*.

12.6 Hull strength

12.6.1 An ice pressure plan is to be submitted as required in 12.3.5. The ice pressure is to consider the adjustment of area factors for additional ice interaction scenarios as well as the crushing failure class factors due to the increased impact speed as well as application with due cognisance of low displacements.

12.6.2 The area factors associated with the ice pressure plan in 12.6.1 are, as a minimum, to comply with the hull area factors given in Table 2.10.3 for the ice class assigned.

12.7 Propulsion and machinery arrangements

12.7.1 Icebreakers are to be equipped with means of propulsion that meet the operational envelope criteria. Demonstration of suitable propulsion power for the operational envelope criteria as specified in 12.3.1, as appropriate, may be from any of the following or other appropriate methods:
(a) theoretical formulation, as given in 12.7.2 and 12.7.3;
(b) technical investigations based on engineering principles;
(c) service experience at the operating ice conditions; and
(d) ice model tests.
Consideration should be given to the applicable speed in relation to the ice thickness, as provided in 12.3.1, and the operational profile.

12.7.2 The propulsion power, at 2 knots, for icebreakers may be expressed as follows, where the ice thickness and icebreaker breadth form the dominant role:

$$P = 1000B^{0,7}\, h^{\left(1{,}4-\frac{2h}{B}\right)} \text{ kW}$$

where
B = breadth of icebreaker, as defined in Pt 3, Ch 1,6.1, in metres
h = nominal level ice thickness, in metres.

12.7.3 The propulsion power, at 2 knots, for icebreakers may be expressed as follows, where 12.7.2 is modified to account for the hullform:

$$P = 96\left(\frac{\theta_{stem}}{\arctan\left(\frac{h}{B}\right)} + \frac{\alpha_{waterline}}{\arctan\left(\frac{B}{L}\right)}\right) B^{0,7}\, h^{\left(1{,}4-\frac{2h}{B}\right)} \text{ kW}$$

where
L = length of icebreaker, as defined in Pt 3, Ch 1,6.1, in metres
B = breadth of icebreaker, as defined in Pt 3, Ch 1,6.1, in metres
h = nominal level ice thickness, in metres
θ_{stem} = stem angle, *see* Fig. 2.12.1
$\alpha_{waterline}$ = waterline angle, *see* Fig. 2.12.1.

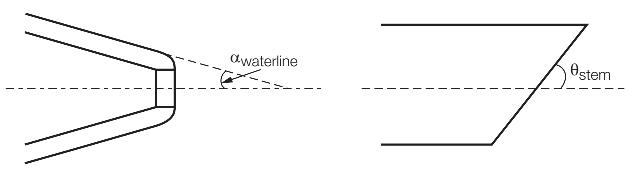

Fig. 2.12.1 Icebreaker stem angles

12.7.4 The formulae given in 12.7.2 and 12.7.3 are based on the broad fleet of icebreaker designs ($60 \le L \le 140$m and $15 \le B \le 28$) and level ice thicknesses ($0{,}5 \le h \le 2$m). Adjustments may therefore be required to account for specific propulsion arrangements, alternative speed criteria, size-mass effects, other L/B ratios and ice conditions.

12.7.5 The propulsion power condition is to be considered, whereby 100 per cent of the rated ahead speed is available for a minimum of 30 minutes. A minimum astern power condition is to be considered, whereby 70 per cent of the rated astern speed is available for a minimum of 30 minutes.

12.7.6 Consideration should be given to machinery protection against over-speeding, excess torque, overloading and overheating.

12.7.7 Propulsion system redundancy is to be considered. Where a machinery redundancy (**PMR**, **SMR** or **PSMR**) notation is to be assigned in addition to an **Icebreaker(+)** notation, the requirements of Pt 5, Ch 22 are to be complied with.

12.7.8 Icebreakers are prone to additional noise and vibration. Conditions when icebreaking are to be considered when applying the rules, see Pt 5, Ch 1,4.3 and Pt 7, Ch 13.

12.8 Rudder and steering arrangements

12.8.1 Rudder posts, rudder horns, solepieces, rudder stocks and pintles are to be dimensioned in accordance with Part 3, Chapters 6 and 13 as appropriate. The speed used in the calculations is to be the maximum service speed or that given in Table 2.12.2, whichever is the greater.

Table 2.12.2 Minimum speeds

Ice thickness, m	Ship speed, kn
1	25
1,5	27
2	29
3	31

12.8.2 In the case of twin rudders operated by a single steering gear, provision is to be made for each rudder to be readily disconnected and secured.

12.8.3 Rudders should be located inboard, clear of the aft end, and as low as practicable to reduce the impact of ice.

12.9 Towing

12.9.1 For escort icebreakers, arrangements for towing are to be provided, including a notch shape in the stern and provision of two chock pipes and two bitts. Consideration should be given for stern plating and framing to be strengthened to withstand impact loads for escorted ship collisions, as well as the propulsion and steering gear layout and protection from contact with bulbous bows. *See* Pt 4, Ch 3, Section 7.

12.10 Winterisation

12.10.1 Where a winterisation notation is assigned in compliance with the *Provisional Rules for the Winterisation of Ships*, the following features are to be additionally considered:
(a) bridge wings are to be fully enclosed;
(b) ice removal measures, through heating arrangements, are to be provided to access routes to towing equipment for escort icebreakers;
(c) provisions for evacuation onto ice;
(d) additional search lights for mooring, astern manoeuvring and towing operations;
(e) consideration of a red (flashing) navigation light to be used to indicate when an escort icebreaker is stopped;
(f) provisions to prevent water freezing in water and fluid systems, including research laboratories and services;
(g) consideration of ice accretion in damage condition; and
(h) protection from ice accretion by enclosed aft walkways for icebreakers with an exposed aft deck.

Common Structural Rules for Bulk Carriers

Chapters 1 to 6

July 2013

Lloyd's Register

COMMON STRUCTURAL RULES FOR

BULK CARRIERS

Foreword

1. This version of the Rules is effective as of 1st July 2012.

2. This version incorporates rule changes made to the 1 July 2010 consolidated edition.

3. The Rules contain structural requirements for the Classification of Bulk Carriers of 90 m in length or greater.

4. The Rules contain thirteen chapters.

5. The following table provides a revision history of the Rules.

	Amendment Type / No.	Approval Date	Effective Date *	Reference Rule Edition
1	Corrigenda 1	15 May 2006	1 Apr. 2006	1 Jan 2006 edition
2	Corrigenda 2	29 Jan 2007	1 Apr. 2006	1 Jan 2006 edition
3	Corrigenda 3	19 July 2007	1 Apr. 2006	1 Jan 2006 edition
4	Corrigenda 4	3 Sept 2007	1 Apr. 2006	1 Jan 2006 edition
5	Rule Change Notice 1	30 Nov 2007	1 Apr. 2008	1 Jan 2006 edition
6	Rule Change Notice 2	25 Feb 2008	1 July 2008	1 Jan 2006 edition
7	Corrigenda 5	15 May 2008	1 April 2006	1 Jan 2006 edition

	Amendment Type / No.	Approval Date	Effective Date *	Reference Rule Edition
8	Rule Change Notice 3 (Urgent)	12 Sept 2008	12 Sept 2008	1 Jan 2006 edition
9	Rule Change Notice 1 (1 July 2008 consolidated edition)	30 Jan 2009	1 July 2009	1 July 2008 consolidated edition
10	Rule Change Notice 2 (1 July 2008 consolidated edition)	12 Apr 2010	1 July 2010	1 July 2008 consolidated edition
11	Rule Change Notice 1 (1 July 2010 consolidated edition)	30 Dec 2011	1 July 2012	1 July 2010 consolidated edition
12	Corrigenda 1 (1 July 2012 consolidated edition)	16 July 2012	1 July 2012	1 July 2012 consolidated edition
13	Corrigenda 2 (1 July 2012 consolidated edition)	21 Nov 2012	1 July 2012	1 July 2012 consolidated edition

* For effective date, refer to the implementation statements of relevant Corrigenda / Rule Changes.

Note: When the word '(void)' appears in the text, it means that the concerned part has been deleted. This is to keep the numbering of the remainder unchanged.

Table of Contents

Chapter 13 – Ships in Operation, Renewal Criteria

Chapter 1

General Principles

Section 1 - APPLICATION

1. General

1.1 Structural requirements

1.1.1

These Rules apply to ships classed with the Society and contracted for construction on or after 1 April 2006.

Note: The "contracted for construction" means the date on which the contract to build the ship is signed between the prospective owner and the shipbuilder. For further details regarding the date of "contracted for construction", refer to IACS Procedural Requirement (PR) No.29.

1.1.2

These Rules apply to the hull structures of single side skin and double side skin bulk carriers with unrestricted worldwide navigation, having length L of 90 m or above.

With bulk carrier is intended sea going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended primarily to carry dry cargoes in bulk, excluding ore and combination carriers.

Hybrid bulk carriers, where at least one cargo hold is constructed with hopper tank and topside tank, are covered by the present Rules. The structural strength of members in holds constructed without hopper tank and/or topside tank is to comply with the strength criteria defined in the Rules.

1.1.3

The present Rules contain the IACS requirements for hull scantlings, arrangements, welding, structural details, materials and equipment applicable to all types of bulk carriers having the following characteristics:

- $L < 350$ m
- $L / B > 5$
- $B / D < 2.5$
- $C_B \geq 0.6$

1.1.4

The Rule requirements apply to welded hull structures made of steel having characteristics complying with requirements in Ch 3, Sec 1. The requirements apply also to welded steel ships in which parts of the hull, such as superstructures or small hatch covers, are built in material other than steel, complying with requirements in Ch 3, Sec 1.

1.1.5

Ships whose hull materials are different than those given in [1.1.4] and ships with novel features or unusual hull design are to be individually considered by the Society, on the basis of the principles and criteria adopted in the present Rules.

1.1.6

The scantling draught considered when applying the present Rules is to be not less than that corresponding to the assigned freeboard.

1.1.7
Where scantlings are obtained from direct calculation procedures which are different from those specified in Ch 7, adequate supporting documentation is to be submitted to the Society, as detailed in Sec 2.

1.2 Limits of application to lifting appliances

1.2.1
The fixed parts of lifting appliances, considered as an integral part of the hull, are the structures permanently connected by welding to the ship's hull (for instance crane pedestals, masts, king posts, derrick heel seatings, etc., excluding cranes, derrick booms, ropes, rigging accessories, and, generally, any dismountable parts), only for that part directly interacting with the hull structure. The shrouds of masts embedded in the ship's structure are considered as fixed parts.

1.2.2
The fixed parts of lifting appliances and their connections to the ship's structure may be covered by the Society's Rules for lifting appliances, and / or by the certification (especially the issuance of the Cargo Gear Register) of lifting appliances when required.

1.2.3
The design of the structure supporting fixed lifting appliances and the structure that might be called to support a mobile appliance should be designed taking into account the additional loads that will be imposed on them by the operation of the appliance as declared by the shipbuilder or its sub-contractors.

1.3 Limits of application to welding procedures

1.3.1
The requirements of the present Rules apply also for the preparation, execution and inspection of welded connections in hull structures.
They are to be complemented by the general requirements relevant to fabrication by welding and qualification of welding procedures given by the Society when deemed appropriate by the Society.

2. Rule application

2.1 Ship parts

2.1.1 General
For the purpose of application of the present Rules, the ship is considered as divided into the following three parts:

- fore part
- central part
- aft part.

2.1.2 Fore part
The fore part includes the structures located forward of the collision bulkhead, i.e.:

- the fore peak structures
- the stem.

In addition, it includes:

- the reinforcements of the flat bottom forward area
- the reinforcements of the bow flare area.

2.1.3 Central part

The central part includes the structures located between the collision bulkhead and the after peak bulkhead.

Where the flat bottom forward area or the bow flare area extend aft of the collision bulkhead, they are considered as belonging to the fore part.

2.1.4 Aft part

The aft part includes the structures located aft of the after peak bulkhead.

2.2 Rules applicable to various ship parts

2.2.1

The various chapters and sections are to be applied for the scantling of ship parts according to Tab 1.

Table 1: Chapters and sections applicable for the scantling of ship parts

<table>

</table>

2.3 Rules applicable to other ship items

2.3.1

The various Chapters and Sections are to be applied for the scantling of other ship items according to Tab 2.

Table 2: Chapters and sections applicable for the scantling of other items

Item	Applicable Chapters and Sections
Machinery spaces	Ch 9, Sec 3
Superstructures and deckhouses	Ch 9, Sec 4
Hatch covers	Ch 9, Sec 5
Hull and superstructure openings	Ch 9, Sec 6
Rudders	Ch 10, Sec 1
Bulwarks and guard rails	Ch 10, Sec 2
Equipment	Ch 10, Sec 3

3. Class Notations

3.1 Additional service features BC-A, BC-B and BC-C

3.1.1

The following requirements apply to ships, as defined in [1.1.2], having length *L* of 150 m or above.

3.1.2

Bulk carriers are to be assigned one of the following additional service features:

a) **BC-A**: for bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to **BC-B** conditions.

b) **BC-B**: for bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to **BC-C** conditions.

c) **BC-C**: for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.

3.1.3

The following additional service features are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design in the following cases:

- **{maximum cargo density (in t/m^3)}** for additional service features **BC-A** and **BC-B** if the maximum cargo density is less than 3.0 t/m^3(see also Ch 4, Sec 7, [2.1]).
- **{no MP}** for all additional service features when the ship has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in Ch 4, Sec 7, [3.3].
- **{allowed combination of specified empty holds}** for additional service feature **BC-A** (see also Ch 4, Sec 7, [2.1]).

3.2 Additional class notation GRAB [X]

3.2.1 Application

The additional class notation **GRAB [X]** is mandatory for ships having one of the additional service features **BC-A** or **BC-B**, according to [3.1.2]. For these ships the requirements for the **GRAB [X]** notation given in Ch 12, Sec 1 are to be complied with for an unladen grab weight X equal to or greater than 20 tons.

For all other ships the additional class notation **GRAB [X]** is voluntary.

3.3 Class notation CSR

3.3.1 Application

In addition to the class notations granted by the assigning Society and to the service features and additional class notations defined hereabove, ships fully complying with the present Rules will be assigned the notation **CSR**.

Section 2 - VERIFICATION OF COMPLIANCE

1. General

1.1 New buildings

1.1.1

For new buildings, the plans and documents submitted for approval, as indicated in [2], are to comply with the applicable requirements in Ch 1 to Ch 12 of the present Rules, taking account of the relevant criteria, as the additional service features and classification notation assigned to the ship or the ship length.

1.1.2

When a ship is surveyed by the Society during construction, the Society:

- approves the plans and documentation submitted as required by the Rules
- proceeds with the appraisal of the design of materials and equipment used in the construction of the ship and their inspection at works
- carries out surveys or obtains appropriate evidence to satisfy itself that the scantlings and construction meet the rule requirements in relation to the approved drawings
- attends tests and trials provided for in the Rules
- assigns the construction mark.

1.1.3

The Society defines in specific Rules which materials and equipment used for the construction of ships built under survey are, as a rule, subject to appraisal of their design and to inspection at works, and according to which particulars.

1.1.4

As part of his interventions during the ship's construction, the Surveyor will:

- conduct an overall examination of the parts of the ship covered by the Rules
- examine the construction methods and procedures when required by the Rules
- check selected items covered by the rule requirements
- attend tests and trials where applicable and deemed necessary.

1.2 Ships in service

1.2.1

For ships in service, the requirements in Ch 13 of the present Rules are to be complied with.

2. Documentation to be submitted

2.1 Ships surveyed by the Society during the construction

2.1.1 Plans and documents to be submitted for approval

The plans and documents to be submitted to the Society for approval are listed in Tab 1. In addition, the Society may request for approval or information, other plans and documents deemed necessary for the review of the design.

Structural plans are to show details of connections of the various parts and are to specify the design materials, including, in general, their manufacturing processes, welding procedures and heat treatments. See also Ch 11, Sec 2, [1.4].

2.1.2 Plans and documents to be submitted for information

In addition to those in [2.1.1], the following plans and documents are to be submitted to the Society for information:

- general arrangement
- capacity plan, indicating the volume and position of the centre of gravity of all compartments and tanks
- lines plan
- hydrostatic curves
- lightweight distribution
- docking plan.

In addition, when direct calculation analyses are carried out by the Designer according to the rule requirements, they are to be submitted to the Society (see [3]).

2.2 Ships for which the Society acts on behalf of the relevant Administration

2.2.1 Plans and documents to be submitted for approval

The plans required by the National Regulations concerned are to be submitted to the Society for approval, in addition to those in [2.1].

Table 1: Plans and documents to be submitted for approval

Plan or document	Containing also information on
Midship section Transverse sections Shell expansion Decks and profiles Double bottom Pillar arrangements Framing plan Deep tank and ballast tank bulkheads, wash bulkheads	Class characteristics Main dimensions Minimum ballast draught Frame spacing Contractual service speed Density of cargoes Design loads on decks and double bottom Steel grades Corrosion protection Openings in decks and shell and relevant compensations Boundaries of flat areas in bottom and sides Details of structural reinforcements and/or discontinuities Bilge keel with details of connections to hull structures
Watertight subdivision bulkheads Watertight tunnels	Openings and their closing appliances, if any
Fore part structure	
Aft part structure	
Machinery space structures Foundations of propulsion machinery and boilers	Type, power and rpm of propulsion machinery Mass and centre of gravity of machinery and boilers
Superstructures and deckhouses Machinery space casing	Extension and mechanical properties of the aluminium alloy used (where applicable)
Hatch covers and hatch coamings	Design loads on hatch covers Sealing and securing arrangements, type and position of locking bolts Distance of hatch covers from the summer load waterline and from the fore end
Transverse thruster, if any, general arrangement, tunnel structure, connections of thruster with tunnel and hull structures	
Bulwarks and freeing ports	Arrangement and dimensions of bulwarks and freeing ports on the freeboard deck and superstructure deck
Windows and side scuttles, arrangements and details	
Scuppers and sanitary discharges	
Rudder and rudder horn (1)	Maximum ahead service speed
Sternframe or sternpost, sterntube Propeller shaft boss and brackets (1)	
Plan of watertight doors and scheme of relevant manoeuvring devices	Manoeuvring devices Electrical diagrams of power control and position indication circuits
Plan of outer doors and hatchways	
Derricks and cargo gear Cargo lift structures	Design loads (forces and moments) Connections to the hull structures
Sea chests, stabiliser recesses, etc.	
Hawse pipes	
Plan of manholes	

Plan or document	Containing also information on
Plan of access to and escape from spaces	
Plan of ventilation	Use of spaces and location and height of air vent outlets of various compartments
Plan of tank testing	Testing procedures for the various compartments Height of pipes for testing
Loading manual and loading instruments	Loading conditions as defined in Ch 4, Sec 7 (see also Ch 4, Sec 8)
Equipment number calculation	Geometrical elements for calculation List of equipment Construction and breaking load of steel wires Material, construction, breaking load and relevant elongation of synthetic ropes
(1) Where other steering or propulsion systems are adopted (e.g. steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted. For azimuth propulsion systems, see Ch 10, Sec 1, [11].	

3. Computer programs

3.1 General

3.1.1

In order to increase the flexibility in the structural design direct calculations with computer programs are acceptable (see Ch 7). The aim of such analyses is to assess the structure compliance with the rule requirements.

3.2 General programs

3.2.1

The choice of computer programs according to currently available technology is free. The programs are to be able to manage the model and load cases as required in Ch 7 and/or Ch 8. The programs may be checked by the Society through comparative calculations with predefined test examples. A generally valid approval for a computer program is, however, not given by the Society.

3.2.2

Direct calculations may be used in the following fields:

- global strength
- longitudinal strength
- beams and grillages
- detailed strength.

3.2.3

For such calculation the computer model, the boundary condition and load cases are to be agreed upon with the Society.

The calculation documents are to be submitted including input and output. During the examination it may prove necessary that the Society performs independent comparative calculations.

Section 3 – FUNCTIONAL REQUIREMENTS

1. General

1.1 Application

1.1.1

This section defines the set of requirements relevant to the functions of the ship structures to be complied with during design and construction, to meet the following objectives.

1.2 Design life

1.2.1

The ship is to remain safe and environment-friendly, if properly operated and maintained, for her expected design life, which, unless otherwise specifically stated, is assumed to be equal to 25 years. The actual ship life may be longer or shorter than the design life, depending on the actual conditions and maintenance of the ship, taking into account aging effects, in particular fatigue, coating deterioration, corrosion, wear and tear.

1.3 Environmental conditions

1.3.1

The ship's structural design is to be based on the assumption of trading in the North Atlantic environment for the entire design life. Hence the respective wave conditions, i.e. the statistical wave scatter takes into account the basic principle for structural strength layout.

1.4 Structural safety

1.4.1

The ship is to be designed and constructed, and subsequently operated and maintained by its builders and operators, to minimise the risk for the safety of life at sea and the pollution of the marine environment as the consequence of the total loss of the ship due to structural collapse and subsequent flooding, loss of watertight integrity.

1.5 Structural accessibility

1.5.1

The ship is to be designed and constructed to provide adequate means of access to all spaces and internal structures to enable overall and close-up inspections and thickness measurements.

1.6 Quality of construction

1.6.1

As an objective, ships are to be built in accordance with controlled quality production standards using approved materials as necessary.

2. Definition of functional requirements

2.1 General

2.1.1

The functional requirements relevant to the ship structure are indicated in [2.2] to [2.6].

2.2 Structural strength

2.2.1

Ships are to be designed to withstand, in the intact condition, the environmental conditions during the design life, for the appropriate loading conditions. Structural strength is to be determined against buckling and yielding. Ultimate strength calculations have to include ultimate hull girder capacity and ultimate strength of plates and stiffeners.

2.2.2

Ships are to be designed to have sufficient reserve strength to withstand the wave and internal loads in damaged conditions that are reasonably foreseeable, e.g. collision, grounding or flooding scenarios. Residual strength calculations are to take into account the ultimate reserve capacity of the hull girder, considering permanent deformation and post-buckling behaviour.

2.2.3

Ships are to be assessed according to the expected design fatigue life for representative structural details.

2.3 Coating

2.3.1

Coating, where required, is to be selected as a function of the declared use of the ship spaces, e.g. holds, tanks, cofferdams, etc., materials and application of other corrosion prevention systems, e.g. cathodic protection or other alternative means. The protective coating systems, applied and maintained in accordance with manufacturer’s specifications concerning steel preparation, coating selection, application and maintenance, are to comply with the SOLAS requirements, the flag administration requirements and the Owner specifications.

2.4 Corrosion addition

2.4.1

The corrosion addition to be added to the net scantling required by structural strength calculations is to be adequate for the operating life. The corrosion addition is to be assigned in accordance with the use and exposure of internal and external structure to corrosive agents, such as water, cargo or corrosive atmosphere, in addition to the corrosion prevention systems, e.g. coating, cathodic protection or by alternative means.

2.5 Means of access

2.5.1

Ship structures subject to overall and close-up inspection and thickness measurements are to be provided with means capable of ensuring safe access to the structures. The means of access are to be described in a Ship Structure Access Manual for bulk carriers of 20,000 gross tonnage and over. Reference is made to SOLAS, Chapter II-1, Regulation 3-6.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.6 Construction quality procedures

2.6.1

Specifications for material manufacturing, assembling, joining and welding procedures, steel surface preparation and coating are to be included in the ship construction quality procedures.

3. Other regulations

3.1 International regulations

3.1.1

Attention of designers, shipbuilders and shipowners of ships covered by these Rules is drawn on the following :

Ships are designed, constructed and operated in a complex regulatory framework prescribed internationally by IMO and implemented by flag states or by classification societies on their behalf. Statutory requirements set the standard for statutory aspects of ships such as life saving, subdivisions, stability, fire protection, etc.

These requirements influence the operational and cargo carrying arrangements of the ship and therefore may affect its structural design.

The main international instruments normally to be applied with regard to the strength of bulk carriers are:

- **International Convention for Safety of Life at Sea (SOLAS)**
- **International Convention on Load Lines**

3.2 National regulations

3.2.1

Attention is drawn on the applicable national flag state regulations.

Compliance with these regulations of national administrations is not conditional for class assignment.

4. Workmanship

4.1 Requirements to be complied with by the manufacturer

4.1.1

The manufacturing plant is to be provided with suitable equipment and facilities to enable proper handling of the materials, manufacturing processes, structural components, etc.

The manufacturing plant is to have at its disposal sufficiently qualified personnel. The Society is to be advised of the names and areas of responsibility of the supervisory and control personnel in charge of the project.

4.2 Quality control

4.2.1

As far as required and expedient, the manufacturer's personnel has to examine all structural components both during manufacture and on completion, to ensure that they are complete, that the dimensions are correct and that workmanship is satisfactory and meets the standard of good shipbuilding practice.

Upon inspection and corrections by the manufacturing plant, the structural components are to be shown to the surveyor of the Society for inspection, in suitable sections, normally in unpainted condition and enabling proper access for inspection.

The Surveyor may reject components that have not been adequately checked by the plant and may demand their re-submission upon successful completion of such checks and corrections by the plant.

5. Structural Details

5.1 Details in manufacturing documents

5.1.1

Significant details concerning quality and functional ability of the component concerned are to be entered in the manufacturing documents (workshop drawings, etc.). This includes not only scantlings but - where relevant - such items as surface conditions (e.g. finishing of flame cut edges and weld seams), and special methods of manufacture involved as well as inspection and acceptance requirements and where relevant permissible tolerances. So far as for this aim a standard is used (works or national standard etc.) it is to be submitted to the Society. For weld joint details, see Ch 11, Sec 2.

If, due to missing or insufficient details in the manufacturing documents, the quality or functional ability of the component is doubtful, the Society may require appropriate improvements to be submitted by the manufacturer. This includes the provision of supplementary or additional parts (for example reinforcements) even if these were not required at the time of plan approval.

Section 4 – SYMBOLS AND DEFINITIONS

1. Primary symbols and units

1.1

1.1.1

Unless otherwise specified, the general symbols and their units used in the present Rules are those defined in Tab 1.

Table 1: Primary symbols

Symbol	Meaning	Units
A	Area	m^2
	Sectional area of ordinary stiffeners and primary members	cm^2
B	Moulded breadth of ship (see [2])	m
C	Coefficient	-
D	Depth of ship (see [2])	m
E	Young's modulus	N/mm^2
F	Force and concentrated loads	kN
I	Hull girder inertia	m^4
	Inertia of ordinary stiffeners and primary members	cm^4
L	Length of ship (see [2])	m
M	Bending moment	kN.m
Q	Shear force	kN
S	Spacing of primary supporting members	
T	Draught of ship (see [2])	m
V	Ship's speed	knot
Z	Hull girder section modulus	m^3
a	Acceleration	m/s^2
b	Width of attached plating	m
	Width of face plate of ordinary stiffeners and primary members	mm
g	Gravity acceleration (see [2])	m/s^2
h	Height	m
	Web height of ordinary stiffeners and primary members	mm
k	Material factor (see [2])	-
ℓ	Length / Span of ordinary stiffeners and primary supporting members	m
m	Mass	t
n	Number of items	-
p	Pressure	kN/m^2
r	Radius	mm
	Radius of curvature of plating or bilge radius	m
s	Spacing of ordinary stiffeners	m
t	Thickness	mm
w	Section modulus of ordinary stiffeners and primary supporting members	cm^3
x	X coordinate along longitudinal axis (see [4])	m
y	Y coordinate along transverse axis (see [4])	m
z	Z coordinate along vertical axis (see [4])	m

Symbol	Meaning	Units
γ	Safety factor	-
δ	Deflection / Displacement	mm
θ	Angle	deg
ξ	Weibull shape parameter	-
ρ	Density	t/m^3
σ	Bending stress	N/mm^2
τ	Shear stress	N/mm^2

2. Symbols

2.1 Ship's main data

2.1.1

L : Rule length, in m, defined in [3.1]

L_{LL} : Freeboard length, in m, defined in [3.2]

L_{BP} : Length between perpendiculars, in m, is the length of the ship measured between perpendiculars taken at the extremities of the deepest subdivision load line, i.e. of the waterline which corresponds to the greatest draught permitted by the subdivision requirements which are applicable

FP_{LL} : Forward freeboard perpendicular. The forward freeboard perpendicular is to be taken at the forward end of the length L_{LL} and is to coincide with the foreside of the stem on the waterline on which the length L_{LL} is measured

AP_{LL} : After freeboard perpendicular. The after freeboard perpendicular is to be taken at the aft end of the length L_{LL}.

B : Moulded breadth, in m, defined in [3.4]

D : Depth, in m, defined in [3.5]

T : Moulded draught, in m, defined in [3.6]

T_S : Scantling draught, in m, taken equal to the maximum draught (see also Ch 1, Sec 1, [1.1.6])

T_B : Minimum ballast draught at midship, in m, in normal ballast condition as defined in Ch 4, Sec 7, [2.2.1]

T_{LC} : Midship draught, in m, in the considered loading condition

Δ : Moulded displacement, in tonnes, at draught T, in sea water (density $\rho = 1.025$ t/m^3)

C_B : Total block coefficient

$$C_B = \frac{\Delta}{1.025LBT}$$

V : Maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest seagoing draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

x, y, z : X, Y and Z co-ordinates, in m, of the calculation point with respect to the reference co-ordinate system.

2.2 Materials

2.2.1

E : Young's modulus, in N/mm^2, to be taken equal to:

$E = 2.06.10^5$ N/mm^2, for steels in general

$E = 1.95.10^5$ N/mm^2, for stainless steels

$E = 7.0.10^4$ N/mm^2, for aluminium alloys

R_{eH} : Minimum yield stress, in N/mm^2, of the material

k : Material factor, defined in Ch 3, Sec 1, [2.2]

v : Poisson's ratio. Unless otherwise specified, a value of 0.3 is to be taken into account,

R_m : Ultimate minimum tensile strength, in N/mm^2, of the material

R_Y : Nominal yield stress, in N/mm^2, of the material, to be taken equal to $235/k$ N/mm^2, unless otherwise specified.

2.3 Loads

2.3.1

g : Gravity acceleration, taken equal to 9.81 m/s^2

ρ : Sea water density, taken equal to 1.025 t/m^3

ρ_L : Density, in t/m^3, of the liquid carried

ρ_C : Density, in t/m^3, of the dry bulk cargo carried

C : Wave parameter, taken equal to:

$$C = 10.75 - \left(\frac{300 - L}{100}\right)^{1,5} \quad \text{for } 90 \le L < 300\text{m}$$

$$C = 10.75 \quad \text{for } 300 \le L < 350\text{m}$$

h : Height, in m, of a tank, to be taken as the vertical distance from the bottom to the top of the tank, excluding any small hatchways

z_{TOP} : Vertical distance, in m, of the highest point of the tank from the baseline. For ballast holds, z_{TOP} is the vertical distance, in m, of the top of the hatch coaming from the baseline

ℓ_H : Length, in m, of the compartment

M_{SW} : Design still water bending moment, in kN.m, at the hull transverse section considered:

$M_{SW} = M_{SW,H}$ in hogging conditions

$M_{SW} = M_{SW,S}$ in sagging conditions

M_{WV} : Vertical wave bending moment, in kN.m, at the hull transverse section considered:

$M_{WV} = M_{WV,H}$ in hogging conditions

$M_{WV} = M_{WV,S}$ in sagging conditions

M_{WH} : Horizontal wave bending moment, in kN.m, at the hull transverse section considered,

Q_{SW} : Design still water shear force, in kN, at the hull transverse section considered

Q_{WV} : Vertical wave shear force, in kN, at the hull transverse section considered

p_S : Still water pressure, in kN/m^2

p_W : Wave pressure or dynamic pressures, in kN/m^2

p_{SF}, p_{WF} : Still water and wave pressure, in kN/m^2, in flooded conditions

σ_X : Hull girder normal stress, in N/mm^2

a_X, a_Y, a_Z : Accelerations, in m/s^2, along X, Y and Z directions, respectively

T_R : Roll period, in s

θ : Roll single amplitude, in deg

T_P : Pitch period, in s

Φ : Single pitch amplitude, in deg

k_r : Roll radius of gyration, in m

GM : Metacentric height, in m

λ : Wave length, in m

2.4 Scantlings

2.4.1 Hull girder scantlings

I_Y : Moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis

I_Z : Moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis

Z_{AB},Z_{AD} : Section moduli, in m^3, at bottom and deck, respectively

N : Vertical distance, in m, from the base line to the horizontal neutral axis of the hull transverse section

2.4.2 Local scantlings

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

S : Spacing, in m, of primary supporting members, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffener or primary supporting member, as the case may be, measured along the chord

ℓ_b : Length, in m, of brackets

t_C : Corrosion addition, in mm

h_w : Web height, in mm, of ordinary stiffener or primary supporting member, as the case may be

t_w : Net web thickness, in mm, of ordinary stiffener or primary supporting member, as the case may be

b_f : Face plate width, in mm, of ordinary stiffener or primary supporting member, as the case may be

t_f : Net face plate thickness, in mm, of ordinary stiffener or primary supporting member, as the case may be

t_p : Net thickness, in mm, of the plating attached to an ordinary stiffener or a primary supporting member, as the case may be

b_p : Width, in m, of the plating attached to the stiffener or the primary supporting member, for the yielding check

A_s : Net sectional area, in cm^2, of the stiffener or the primary supporting member, with attached plating of width s

A_{sh} : Net shear sectional area, in cm^2, of the stiffener or the primary supporting member

I : Net moment of inertia, in cm^4, of ordinary stiffener or primary supporting member, as the case may be, without attached plating, around its neutral axis parallel to the plating

I_p : Net polar moment of inertia, in cm^4, of ordinary stiffener or primary supporting member, as the case may be, about its connection to plating

I_w : Net sectional moment of inertia, in cm^6, of ordinary stiffener or primary supporting member, as the case may be, about its connection to plating

I_S : Net moment of inertia, in cm^4, of the stiffener or the primary supporting member, with attached shell plating of width s, about its neutral axis parallel to the plating

Z : Net section modulus, in cm^3, of an ordinary stiffener or a primary supporting member, as the case may be, with attached plating of width b_p

3. Definitions

3.1 Rule length

3.1.1

The rule length L is the distance, in m, measured on the summer load waterline, from the forward side of the stem to the after side of the rudder post, or to the centre of the rudder stock where there is no rudder post. L is to be not less than 96% and need not exceed 97% of the extreme length on the summer load waterline.

3.1.2

In ships without rudder stock (e.g. ships fitted with azimuth thrusters), the rule length L is to be taken equal to 97% of the extreme length on the summer load waterline.

3.1.3

In ships with unusual stem or stern arrangements, the rule length L is considered on a case by case basis.

3.2 Freeboard length

3.2.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(1,a))

The freeboard length L_{LL} is the distance, in m, on the waterline at 85% of the least moulded depth from the top of the keel, measured from the forward side of the stem to the centre of the rudder stock. L_{LL} is to be not less than 96% of the extreme length on the same waterline.

3.2.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(1,c))

Where the stem contour is concave above the water-line at 85% of the least moulded depth, both the forward end of the extreme length and the forward side of the stem are to be taken at the vertical projection to that waterline of the aftermost point of the stem contour (above that waterline) (see Fig 1).

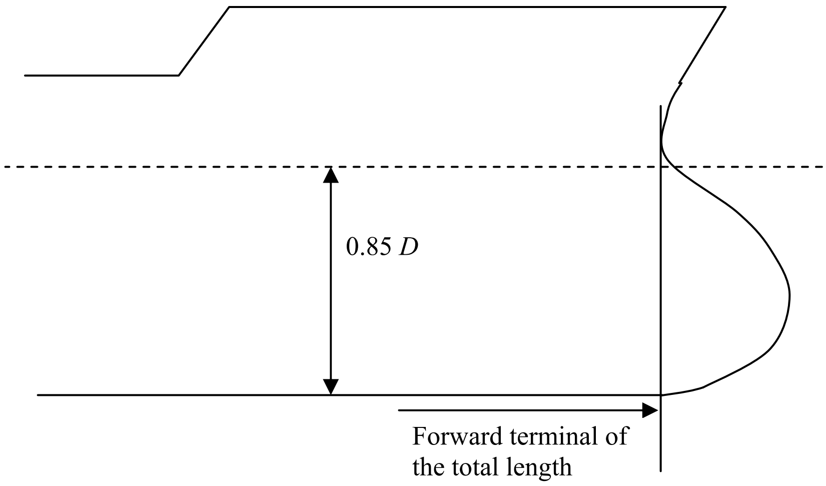

Figure 1: Concave stem contour

3.3 Ends of rule length *L* and midship

3.3.1 Fore end

The fore end (FE) of the rule length *L*, see Fig 2, is the perpendicular to the summer load waterline at the forward side of the stem.

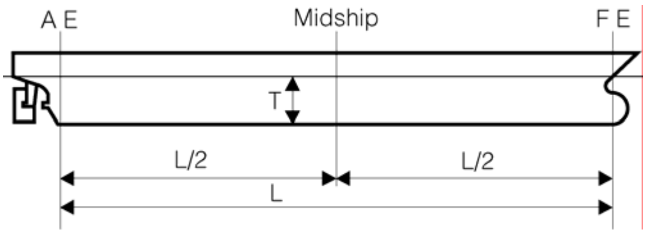

Figure 2: Ends and midship

The aft end (AE) of the rule length *L*, see Fig 2, is the perpendicular to the waterline at a distance *L* aft of the fore end.

3.3.2 Midship

The midship is the perpendicular to the waterline at a distance 0.5*L* aft of the fore end.

3.3.3 Midship part

The midship part of a ship is the part extending 0.4*L* amidships, unless otherwise specified.

3.4 Moulded breadth

3.4.1

The moulded breadth *B* is the greatest moulded breadth, in m, measured amidships below the weather deck.

3.5 Depth

3.5.1

The depth D is the distance, in m, measured vertically on the midship transverse section, from the moulded base line to the top of the deck beam at side on the upper-most continuous deck.

3.6 Moulded draught

3.6.1

The moulded draught T is the distance, in m, measured vertically on the midship transverse section, from the moulded base line to the summer load line.

3.7 Lightweight

3.7.1

The lightweight is the displacement, in t, without cargo, fuel, lubricating oil, ballast water, fresh water and feed water, consumable stores and passengers and crew and their effects.

RCN 2 to July 2008 version (effective from 1July 2010)

3.8 Deadweight

3.8.1

The deadweight is the difference, in t, between the displacement, at the summer draught in sea water of density $\rho = 1.025$ t/m^3, and the lightweight.

3.9 Freeboard deck

3.9.1

Ref. ILLC, as amended (Resolution MSC. 143(77) Reg. 3(9))

The freeboard deck is defined in Regulation 3 of the International Load Line Convention, as amended.

3.10 Bulkhead deck

3.10.1

Ref. SOLAS Reg.II-1/2 .5

The bulkhead deck is the uppermost deck to which the transverse watertight bulkheads, except both peak bulkheads, extend and are made effective.

3.11 Strength deck

3.11.1

The strength deck at a part of ship's length is the uppermost continuous deck at that part to which the shell plates extend.

3.12 Superstructure

3.12.1 General

Ref. ILLC. As amended (Resolution MSC.143(77) Reg. 3(10,a))

A superstructure is a decked structure on the free-board deck, extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 0.04B.

3.12.2 Enclosed and open superstructure

A superstructure may be:

- enclosed, where:
    1) it is enclosed by front, side and aft bulkheads complying with the requirements of Ch 9, Sec 4
    2) all front, side and aft openings are fitted with efficient weathertight means of closing
- open, where it is not enclosed.

3.13 Forecastle

3.13.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(10,g))

A forecastle is a superstructure which extends from the forward perpendicular aft to a point which is forward of the after perpendicular. The forecastle may originate from a point forward of the forward perpendicular.

3.14 Raised quarterdeck

3.14.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 3(10,i))

A raised quarterdeck is a superstructure which extends forward from the after perpendicular, generally has a height less than a normal superstructure, and has an intact front bulkhead (sidescuttles of the non-opening type fitted with efficient deadlights and bolted man hole covers)(see Fig 3). Where the forward bulkhead is not intact due to doors and access openings, the superstructure is then to be considered as a poop.

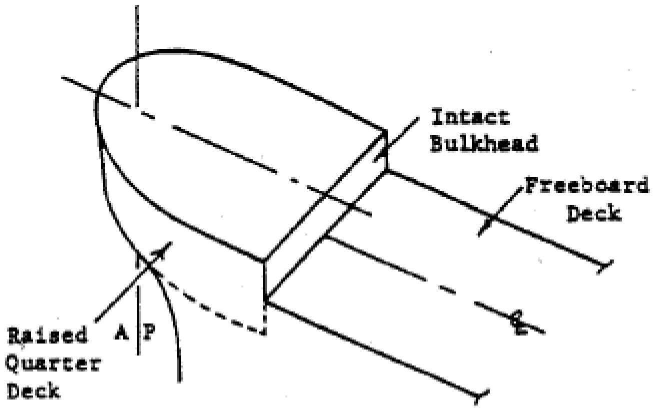

Figure 3: Raised quarter deck

3.15 Deckhouse

3.15.1

A deckhouse is a decked structure other than a superstructure, located on the freeboard deck or above.

3.16 Trunk

3.16.1

A trunk is a decked structure similar to a deckhouse, but not provided with a lower deck.

3.17 Wash bulkhead

3.17.1

A wash bulkhead is a perforated or partial bulkhead in a tank.

3.18 Standard height of superstructure

3.18.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 33)

The standard height of superstructure is defined in Tab 2.

Table 2: Standard height of superstructure

Freeboard length L_{LL}, in m	Standard height h_S, in m	
	Raised quarter deck	All other superstructures
$90 < L_{LL} < 125$	$0.3 + 0.012\ L_{LL}$	$1.05 + 0.01\ L_{LL}$
$L_{LL} \geq 125$	1.80	2.30

3.19 Type A and Type B ships

3.19.1 Type A ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.1)

A Type A ship is one which:

- is designed to carry only liquid cargoes in bulk;
- has a high integrity of the exposed deck with only small access openings to cargo compartments, closed by watertight gasketed covers of steel or equivalent material
- has low permeability of loaded cargo compartments.

A Type A ship is to be assigned a freeboard following the requirements reported in the International Load Line Convention 1966, as amended.

3.19.2 Type B ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.5)

All ships which do not come within the provisions regarding Type A ships stated in [3.19.1] are to be considered as Type B ships.

A Type B ship is to be assigned a freeboard following the requirements reported in the International Load Line Convention 1966, as amended.

3.19.3 Type B-60 ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.9)

A Type B-60 ship is any Type B ship of over 100 metres in length which, according to applicable requirements of in the International Load Line Convention 1966, as amended, is assigned with a value of tabular freeboard which can be reduced up to 60 per cent of the difference between the "B" and "A" tabular values for the appropriate ship lengths.

3.19.4 Type B-100 ship

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 27.10)

A Type B-100 ship is any Type B ship of over 100 metres in length which, according to applicable requirements of in the International Load Line Convention 1966, as amended, is assigned with a value of tabular freeboard which can be reduced up to 100 per cent of the difference between the "B" and "A" tabular values for the appropriate ship lengths.

3.20 Positions 1 and 2

3.20.1 Position 1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 13)

Position 1 includes:

- exposed freeboard and raised quarter decks,
- exposed superstructure decks situated forward of 0.25 L_{LL} from the perpendicular, at the forward side of the stem, to the waterline at 85% of the least moulded depth measured from the top of the keel.

3.20.2 Position 2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 13)

Position 2 includes:

- exposed superstructure decks situated aft of 0.25 L_{LL} from the perpendicular, at the forward side of the stem, to the waterline at 85% of the least moulded depth measured from the top of the keel and located at least one standard height of superstructure above the freeboard deck,
- exposed superstructure decks situated forward of 0.,25 L_{LL} from the perpendicular, at the forward side of the stem, to the waterline at 85% of the least moulded depth measured from the top of the keel and located at least two standard heights of superstructure above the freeboard deck.

3.21 Single Side Skin and Double Side Skin construction

3.21.1 Single side skin construction

A hold of single side skin construction is bounded by the side shell between the inner bottom plating or the hopper tank plating when fitted, and the deck plating or the topside tank plating when fitted.

3.21.2 Double side skin construction

A hold of double side skin construction is bounded by a double side skin, including hopper tank and topside tank when fitted.

RCN 1 to July 2010 version (effective from 1July 2012)

3.22 Bilge

3.22.1 Bilge plating

The bilge plating is the curved plating between the bottom shell and side shell. It is to be taken as follows:

- within the cylindrical part of the ship (see Fig.4):
  from the start of the curvature at the lower turn of bilge on the bottom to the end of the curvature at the upper turn of the bilge,
- outside the cylindrical part of the ship (see Fig.5):
  From the start of the curvature at the lower turn of the bilge on the bottom to the lesser of:
  - a point on the side shell located 0.2D above the baseline/local centreline elevation.
  - the end of the curvature at the upper turn of the bilge.

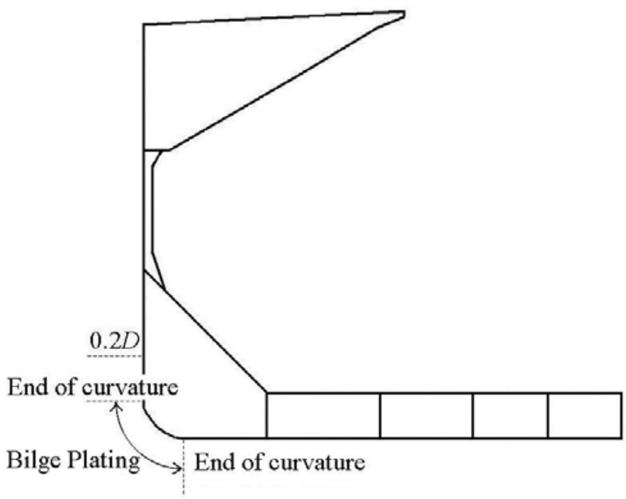

Figure 4: vertical extent of bilge plating within the cylindrical part of the hull

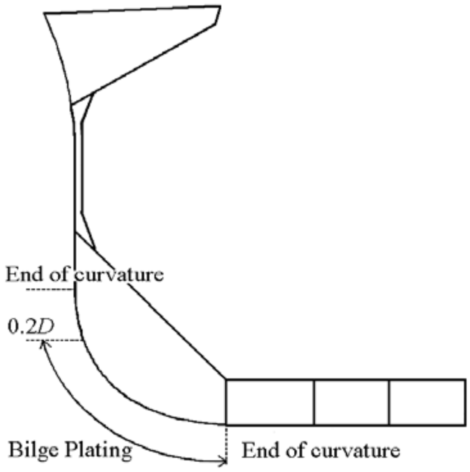

Figure 5: vertical extent of bilge plating outside the cylindrical part of the hull

RCN 1 to July 2010 version (effective from 1July 2012)

4. Reference co-ordinate system

4.1

4.1.1

The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand co-ordinate system (see Fig 6):

- Origin: at the intersection among the longitudinal plane of symmetry of ship, the aft end of L and the baseline
- *X* axis: longitudinal axis, positive forwards
- *Y* axis: transverse axis, positive towards portside
- *Z* axis: vertical axis, positive upwards.

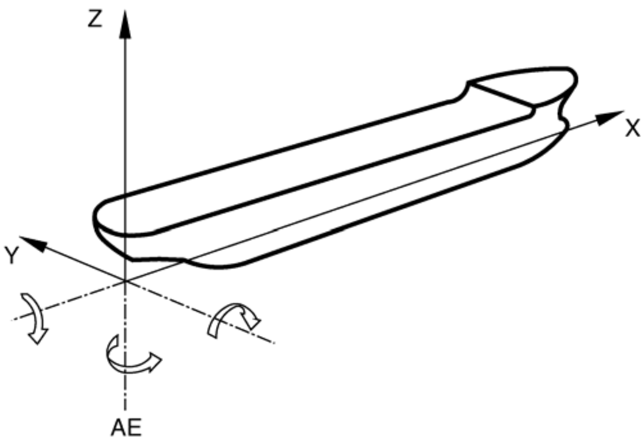

Figure 6: Reference co-ordinate system

4.1.2

Positive rotations are oriented in anti-clockwise direction about the *X*, *Y* and *Z* axes.

Chapter 2

General Arrangement Design

Section 1 - SUBDIVISION ARRANGEMENT

1. Number and arrangement of transverse watertight bulkheads

1.1 Number of watertight bulkheads

1.1.1 General

All ships, in addition to complying with the requirements of [1.1.2], are to have at least the following transverse watertight bulkheads:

- one collision bulkhead
- one after peak bulkhead
- two bulkheads forming the boundaries of the machinery space in ships with machinery amidships, and a bulkhead forward of the machinery space in ships with machinery aft. In the case of ships with an electrical propulsion plant, both the generator room and the engine room are to be enclosed by watertight bulkheads.

1.1.2 Additional bulkheads

For ships not required to comply with subdivision regulations, transverse bulkheads adequately spaced, and not less in number than indicated in Tab 1, are to be fitted.

Table 1: Number of bulkheads

Length (m)	Number of bulkheads for ships with aft machinery (1)	Numbers of bulkheads for other ships
$90 \le L < 105$	4	5
$105 \le L < 120$	5	6
$120 \le L < 145$	6	7
$145 \le L < 165$	7	8
$165 \le L < 190$	8	9
$L \ge 190$	To be defined on a case by case basis	
(1) After peak bulkhead and aft machinery bulkhead are the same.		

2. Collision bulkhead

2.1 Arrangement of collision bulkhead

2.1.1

Ref. SOLAS Ch. II-1, Part B-2, Reg. 12

A collision bulkhead is to be fitted which is to be watertight up to the bulkhead deck. This bulkhead is to be located at a distance from the forward perpendicular FP_{LL} of not less than $0.05L_{LL}$ or 10 m, whichever is the less, and, except as may be permitted by the Society, *not more than $0.08L_{LL}$ or $0.05L_{LL}$+3 m, whichever is the greater.*

RCN 1 to July 2010 version (effective from 1July 2012)

2.1.2

Ref. SOLAS Ch. II-1, Part B, Reg. 11

Where any part of the ship below the waterline extends forward of the forward perpendicular, e.g. a bulbous bow, the distances, in metres, stipulated in [2.1.1] are to be measured from a point either:

• at the mid-length of such extension, or

• at a distance 1.5 per cent of the length L_{LL} of the ship forward of the forward perpendicular, or

• at a distance 3 metres forward of the forward perpendicular,

whichever gives the smallest measurement.

2.1.3

Ref. SOLAS Ch. II-1, Part B, Reg. 11

The bulkhead may have steps or recesses provided they are within the limits prescribed in [2.1.1] or [2.1.2].

No door, manhole, ventilation duct or any other opening is to be fitted in this bulkhead.

3. After peak, machinery space bulkheads and stern tubes

3.1 General

3.1.1

An aft peak bulkhead, enclosing the stern tube and rudder trunk in a watertight compartment, is to be provided. Where the shafting arrangements make enclosure of the stern tube in a watertight compartment impractical alternative arrangements will be specially considered.

3.1.2

The aft peak bulkhead may be stepped below the bulkhead deck, provided that the degree of safety of the ship as regards subdivision is not thereby diminished.

3.1.3

The aft peak bulkhead location on ships powered and/or controlled by equipment that does not require the fitting of a stern tube and/or rudder trunk will also be subject to special consideration.

3.1.4

The aft peak bulkhead may terminate at the first deck above the summer load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor.

RCN 1 to July 2010 version (effective from 1July 2012)

3.1.5 Sterntubes

Ref. SOLAS Ch. II-1, Part B-2, Reg.12

Sterntubes are to be enclosed in a watertight space (or spaces) of moderate volume. Other measures to minimise the danger of water penetrating into the ship in case of damage to sterntube arrangements may be taken at the discretion of the Society.

Corrigenda 1 to July 2012 version (effective from 1July 2012)

4. Number and arrangement of tank bulkheads

4.1 Bulkheads in compartments intended for the carriage of liquid cargoes

4.1.1

The number and location of transverse and longitudinal watertight bulkheads in compartments intended for the carriage of liquid cargoes are to comply with the subdivision requirements to which the ship is subject.

5. Arrangement of transverse watertight bulkheads

5.1 General

5.1.1

Where it is not practicable to arrange a watertight bulkhead in one plane, a stepped bulkhead may be fitted. In this case, the part of the deck which forms the step is to be watertight and equivalent in strength to the bulkhead.

6. Openings in watertight bulkheads

6.1 General

6.1.1

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9 and IMO Res. A.684(17) - Part B

The number of openings in watertight subdivisions is to be kept to a minimum compatible with the design and proper working of the ship. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. The Society may permit relaxation in the watertightness of openings above the freeboard deck, provided that it is demonstrated that any progressive flooding can be easily controlled and that the safety of the ship is not impaired.

6.1.2

No door, manhole ventilation duct or any other opening is permitted in the collision bulkhead below the subdivision deck.

6.1.3

Lead or other heat sensitive materials may not be used in systems which penetrate watertight subdivision bulkheads, where deterioration of such systems in the event of fire would impair the watertight integrity of the bulkheads.

6.1.4

Valves not forming part of a piping system are not permitted in watertight subdivision bulkheads.

6.1.5

The requirements relevant to the degree of tightness, as well as the operating systems, for doors or other closing appliances complying with the provisions in [6.2] and [6.3] are specified in Tab 2.

6.2 Openings in the watertight bulkheads below the freeboard deck

6.2.1 Openings used while at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9

Doors provided to ensure the watertight integrity of internal openings which are used while at sea are to be sliding watertight doors capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure. The power, control and indicators are to be operable in the event of main power failure. Particular attention is to be paid to minimise the effect of control system failure. Each power-operated sliding watertight door is to be provided with an individual hand-operated mechanism. The possibility of opening and closing the door by hand at the door itself from both sides is to be assured.

6.2.2 Openings normally closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9

Access doors and access hatch covers normally closed at sea, intended to ensure the watertight integrity of internal openings, are to be provided with means of indication locally and on the bridge showing whether these doors or hatch covers are open or closed. A notice is to be affixed to each such door or hatch cover to the effect that it is not to be left open. The use of such doors and hatch covers is to be authorised by the officer of the watch.

6.2.3 Doors or ramps in large cargo spaces

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9

Watertight doors or ramps of satisfactory construction may be fitted to internally subdivide large cargo spaces, provided that the Society is satisfied that such doors or ramps are essential. These doors or ramps may be hinged, rolling or sliding doors or ramps, but are not to be remotely con-trolled.

Such doors are to be closed before the voyage commences and are to be kept closed during navigation. Should any of the doors or ramps be accessible during the voyage, they are to be fitted with a device which prevents unauthorised opening.

The word “satisfactory” means that scantlings and sealing requirements for such doors or ramps are to be sufficient to withstand the maximum head of the water at the flooded waterline.

6.2.4 Openings permanently kept closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9

Other closing appliances which are kept permanently closed at sea to ensure the watertight integrity of internal openings are to be provided with a notice which is to be affixed to each such closing appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

6.3 Openings in the bulkheads above the freeboard deck

6.3.1 General

The openings in flooding boundaries located below the waterline at the equilibrium of the final stage of flooding are to be watertight. The openings immersed within the range of the positive righting lever curve are only to be weathertight.

Table 2: Doors

			Sliding type			Hinged type			Rolling type (cargo between deck spaces)
			Remote operation indication on the bridge	Indicator on the bridge	Local operation only	Remote operation indication on the bridge	Indicator on the bridge	Local operation only	
Watertight	Below the freeboard deck	Open at sea	X						
		Normally closed (2)		X			X (3)		
		Remain closed (2)			X (4) (5)			X (4) (5)	X (4) (5)
Weathertight / watertight (1)	Above the freeboard deck	Open at sea	X						
		Normally closed (2)		X			X		
		Remain closed (2)						X (4) (5)	

(1) Watertight doors are required when they are located below the waterline at the equilibrium of the final stage of flooding; otherwise a weathertight door is accepted.
(2) Notice to be affixed on both sides of the door: “to be kept closed at sea”.
(3) Type A ships of 150 m and upwards, and Type B ships with a reduced freeboard may have a hinged watertight door between the engine room and the steering gear space, provided that the sill of this door is above the summer load waterline.
(4) The door is to be closed before the voyage commences.
(5) If the door is accessible during the voyage, a device which prevents unauthorised opening is to be fitted.

6.3.2 Doors used while at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9×

The doors used while at sea are to be sliding doors capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure. The power, control and indicators are to be operable in the event of main power failure. Particular attention is to be paid to minimise the effect of control system failure. Each power-operated sliding watertight door is to be provided with an individual hand-operated mechanism. It should be possible to open and close the door by hand at the door itself from both sides.

6.3.3 Doors normally closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9

The doors normally closed at sea are to be provided with means of indication locally and on the bridge showing whether these doors are open or closed. A notice is to be affixed to each door to the effect that it is not to be left open.

6.3.4 Openings kept permanently closed at sea

Ref. SOLAS Ch. II-1, Part B-1, Reg. 25-9

The doors kept closed at sea are to be hinged doors. Such doors and the other closing appliances which are kept closed at sea are to be provided with a notice affixed to each closing appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

Section 2 - COMPARTMENT ARRANGEMENT

1. Definitions

1.1 Cofferdam

1.1.1

A cofferdam means an empty space arranged so that compartments on each side have no common boundary; a cofferdam may be located vertically or horizontally. As a rule, a cofferdam is to be properly ventilated and of sufficient size to allow proper inspection, maintenance and safe evacuation.

1.2 Machinery spaces of category A

1.2.1

Ref. SOLAS Ch. II-2, Part A, Reg. 3.31

Machinery spaces of category A are those spaces or trunks to such spaces which contain:

- *internal combustion machinery used for main propulsion; or*
- *internal combustion machinery used for purposes other than propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or*
- *any oil fired boiler or fuel oil unit.*

2. Cofferdams

2.1 Cofferdam arrangement

2.1.1

Cofferdams are to be provided between compartments intended for liquid hydrocarbons (fuel oil, lubricating oil) and those intended for fresh water (drinking water, water for propelling machinery and boilers) as well as tanks intended for the carriage of liquid foam for fire extinguishing.

2.1.2

Cofferdams separating fuel oil tanks from lubricating oil tanks and the latter from those intended for the carriage of liquid foam for fire extinguishing or fresh water or boiler feed water may be waived when deemed impracticable or unreasonable by the Society in relation to the characteristics and dimensions of the spaces containing such tanks, provided that:

- the thickness of common boundary plates of adjacent tanks is increased, with respect to the thickness obtained according to Ch 6, Sec 1, by 2 mm in the case of tanks carrying fresh water or boiler feed water, and by 1 mm in all other cases
- the sum of the throats of the weld fillets at the edges of these plates is not less than the thickness of the plates themselves
- the structural test is carried out with a head increased by 1 m with respect to Ch 11, Sec 3.

2.1.3

(Void)

RCN 1 to July 2010 version (effective from 1July 2012)

2.1.4

Cofferdams are only required between fuel oil double bottoms and tanks immediately above where the inner bottom plating is subjected to the head of fuel oil contained therein, as in the case of a double bottom with its top raised at the sides.

Where a corner to corner situation occurs, tanks are not be considered to be adjacent.

Adjacent tanks not separated by cofferdams are to have adequate dimensions to ensure easy inspection.

3. Double bottoms

3.1 General

3.1.1

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1

A double bottom is to be fitted extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

3.1.2

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1

Where a double bottom is required to be fitted, its depth is to satisfy the provisions of Ch 3, Sec 6, [6] and the inner bottom is to be continued out to the ship side in such a manner as to protect the bottom to the turn of the bilge.

3.1.3

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1

Small wells constructed in the double bottom, in connection with the drainage arrangements of holds, are not to extend in depth more than necessary. A well extending to the outer bottom, may, however, be permitted at the after end of the shaft tunnel of the ship. Other wells may be permitted by the Society if it is satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with [3.1].

3.1.4

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1

A double bottom need not be fitted in way of water-tight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not, in the opinion of the Society, thereby impaired.

4. Compartment forward of the collision bulkhead

4.1 General

4.1.1

The fore peak and other compartments located forward of the collision bulkhead may not be arranged for the carriage of fuel oil or other flammable products.

5. Minimum bow height

5.1 General

5.1.1

Ref. ILLC, as amended (Resolution MSC.223(82) Reg. 39(1))

The bow height F_b, defined as the vertical distance at the forward perpendicular between the waterline corresponding to the assigned summer freeboard and the designed trim and the top of the exposed deck at side, is to be not less than:

$F_b = (6075(L_{LL}/100) - 1875(L_{LL}/100)^2 + 200(L_{LL}/100)^3)(2.08 + 0.609C_B - 1.603C_{wf} - 0.0129(L/T_1))$

where:

F_b : *Calculated minimum bow height, in mm*

T_1 : *Draught at 85% of the least moulded depth, in m*

C_{wf} : *Waterplane area coefficient forward of $L_{LL}/2$:*

$$C_{wf} = \frac{A_{wf}}{\frac{L_{LL}}{2}B}$$

A_{wf} : *Waterplane area forward of $L_{LL}/2$ at draught T_1, in m^2.*

For ships to which timber freeboards are assigned, the summer freeboard (and not the timber summer freeboard) is to be assumed when applying the formula above.

RCN 1 to July 2010 version (effective from 1July 2012)

5.1.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39.(2))

Where the bow height required in paragraph [5.1.1] is obtained by sheer, the sheer is to extend for at least 15% of the length of the ship measured from the forward perpendicular. Where it is obtained by fitting a superstructure, such superstructure is to extend from the stem to a point at least 0.07L abaft the forward perpendicular, and is to be enclosed as defined Ch 9, Sec 4.

5.1.3

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(3))

Ships which, to suit exceptional operational requirements, cannot meet the requirements in [5.1.1] and [5.1.2] will be considered by the Society on a case by case basis.

5.1.4

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(4, a))

The sheer of the forecastle deck may be taken into account, even if the length of the forecastle is less than 0.15L, but greater than 0.07L, provided that the forecastle height is not less than one half of standard height of superstructure between 0.07L and the forward perpendicular.

5.1.5

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 39(4, b))

Where the forecastle height is less than one half of the standard height of superstructure, the credited bow height may be determined as follows:

a) *Where the freeboard deck has sheer extending from abaft 0.15L, by a parabolic curve having its origin at 0.15L abaft the forward perpendicular at a height equal to the midship depth of the ship, extended through the point of intersection of forecastle bulkhead and deck, and up to a point at the forward perpendicular not higher than the level of the forecastle deck (as illustrated in Fig 1). However, if the value of the height denoted h_t in Fig 1 is smaller than the value of the height denoted h_b then h_t may be replaced by h_b in the available bow height, where:*

$$h_t = Z_b \left(\frac{0.15L}{x_b} \right)^2 - Z_t$$

Z_b : *As defined in Fig 1*

Z_t : *As defined in Fig 1*

h_f : *Half standard height of superstructure*

b) *Where the freeboard deck has sheer extending for less than 0.15L or has no sheer, by a line from the forecastle deck at side at 0.07L extended parallel to the base line to the forward perpendicular (as illustrated in Fig 2).*

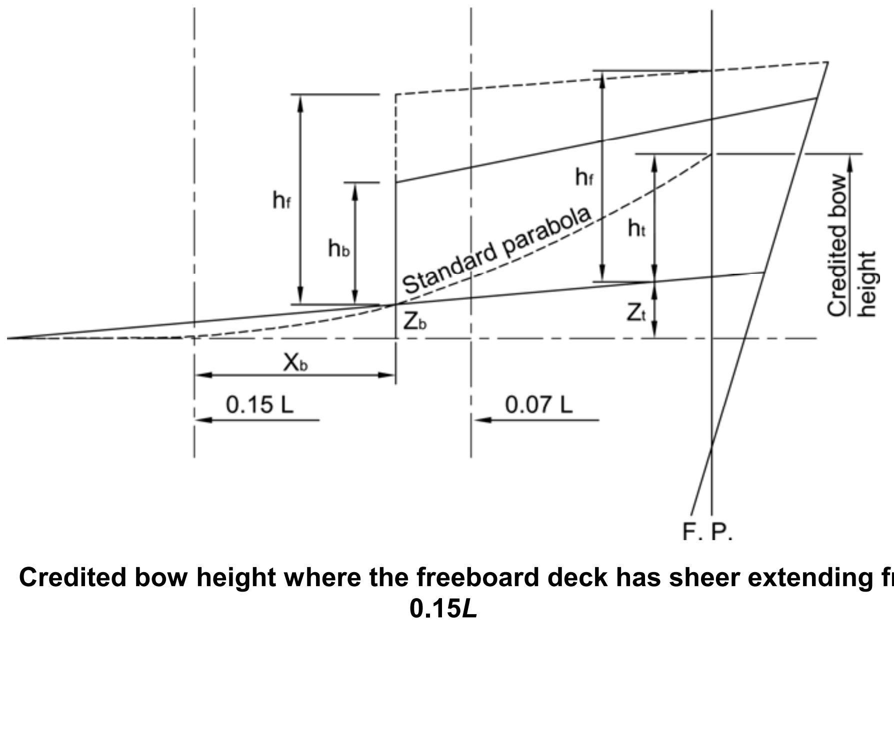

Figure 1: Credited bow height where the freeboard deck has sheer extending from abaft 0.15*L*

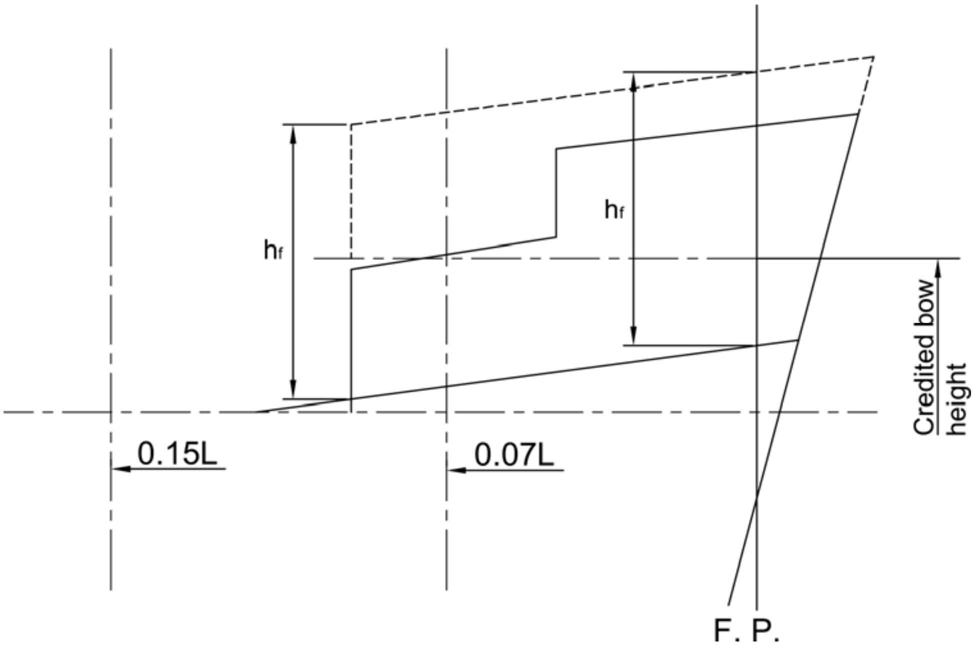

Figure 2: Credited bow height where the freeboard deck has sheer extending for less than 0.15*L*

6. Shaft tunnels

6.1 General

6.1.1

Shaft tunnels are to be watertight.

7. Watertight ventilators and trunks

7.1 General

7.1.1

Ref. SOLAS Ch. II-1, Part B, Reg. 19.1

Watertight ventilators and trunks are to be carried at least up to the freeboard deck.

8. Fuel oil tanks

8.1 General

8.1.1

Ref. SOLAS Ch. II-2, Part B, Reg. 4.2

The arrangements for the storage, distribution and utilisation of the fuel oil are to be such as to ensure the safety of the ship and persons on board.

8.1.2

Ref. SOLAS Ch. II-2, Part B, Reg. 4.2

As far as practicable, fuel oil tanks are to be part of the ship's structure and are to be located outside machinery spaces of category A.

Where fuel oil tanks, other than double bottom tanks, are necessarily located adjacent to or within machinery spaces of category A, at least one of their vertical sides is to be contiguous to the machinery space boundaries, they are preferably to have a common boundary with the double bottom tanks and the area of the tank boundary common with the machinery spaces is to be kept to a minimum.

Where such tanks are situated within the boundaries of machinery spaces of category A, they may not contain fuel oil having a flashpoint of less than 60°C.

8.1.3

Ref. SOLAS Ch. II-2, Part B, Reg. 4.2

Fuel oil tanks may not be located where spillage or leakage therefrom can constitute a hazard by falling on heated surfaces.

Precautions are to be taken to prevent any oil that may escape under pressure from any pump, filter or heater from coming into contact with heated surfaces.

Fuel oil tanks in boiler spaces may not be located immediately above the boilers or in areas subjected to high temperatures, unless special arrangements are provided in agreement with the Society.

8.1.4

Where a compartment intended for goods or coal is situated in proximity of a heated liquid container, suitable thermal insulation is to be provided.

Section 3 - ACCESS ARRANGEMENT

1. General

1.0 Application

1.0.1

This section applies to ships of 20,000 gross tonnage and over.

RCN 2 to July 2008 version (effective from 1 July 2010)

1.1 Means of access to cargo and other spaces

1.1.1

Ref. SOLAS Reg.II-1/3-6 .2.1 (Resolution MSC.151(78))

Each space is to be provided with means of access to enable, throughout the life of a ship, overall and close-up inspections and thickness measurements of the ship's structures. Such means of access are to comply with [1.3] and [2].

1.1.2

Ref. SOLAS Reg.II-1/3-6 .2.2 (Resolution MSC.151(78))

Where a permanent means of access may be susceptible to damage during normal cargo loading and unloading operations or where it is impracticable to fit permanent means of access, the Administration may allow, in lieu thereof, the provision of movable or portable means of access, as specified in [2], provided that the means of attaching, rigging, suspending or supporting the portable means of access forms a permanent part of the ship's structure. All portable equipment are to be capable of being readily erected or deployed by ship's personnel.

1.1.3

Ref. SOLAS Reg.II-1/3-6 .2.3 (Resolution MSC.151(78))

The construction and materials of all means of access and their attachment to the ship's structure are to be to the satisfaction of the Society.

1.2 Safe access to cargo holds, ballast tanks and other spaces

1.2.1

Ref. SOLAS Reg.II-1/3-6 .3.1 (Resolution MSC.151(78)) and IACS UI SC191

Safe access to cargo holds, cofferdams, ballast tanks and other spaces in the cargo area are to be direct from the open deck and such as to ensure their complete inspection. Safe access to double bottom spaces or to forward ballast tanks may be from a pump-room, deep cofferdam, pipe tunnel, cargo hold, double hull space or similar compartment not intended for the carriage of oil or hazardous cargoes.

Access to a double side skin space may be either from a topside tank or double bottom tank or from both.

1.2.2

Ref. SOLAS Reg.II-1/3-6 .3.2 (Resolution MSC.151(78))

Tanks, and subdivisions of tanks, having a length of 35 m or more, are to be fitted with at least two access hatchways and ladders, as far apart as practicable.

Tanks less than 35 m in length are to be served by at least one access hatchway and ladder.

When a tank is subdivided by one or more swash bulkheads or similar obstructions which do not allow ready means of access to the other parts of the tank, at least two hatchways and ladders are to be fitted.

1.2.3

Ref. SOLAS Reg.II-1/3-6 .3.3 (Resolution MSC.151(78))

Each cargo hold is to be provided with at least two means of access as far apart as practicable. In general, these accesses are to be arranged diagonally, for example one access near the forward bulkhead on the port side, the other one near the aft bulkhead on the starboard side.

1.3 General technical specifications

1.3.1

Ref. SOLAS Reg.II-1/3-6 .5.1 (Resolution MSC.151(78)) and IACS UI SC191

For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is to be not less than 600 mm × 600 mm, with corner radii up to 100 mm maximum.

In such a case where as a consequence of structural analysis the stress is to be reduced around the opening, it is considered appropriate to take measures to increase the clear opening, e.g. 600 × 800 with 300 mm radii, in which a clear opening of 600 × 600 mm with corner radii up to 100 mm maximum fits.

When access to a cargo hold is arranged through the cargo hatch, the top of the ladder is to be placed as close as possible to the hatch coaming. Access hatch coamings having a height greater than 900 mm are also to have steps on the outside in conjunction with the ladder.

1.3.2

Ref. SOLAS Reg.II-1/3-6 .5.2 (Resolution MSC.151(78)) and IACS UI SC191

For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum opening is to be not less than 600 mm × 800 mm with corner radii of 300 mm *at a height of not more than 600 mm from the bottom shell plating unless gratings or other foot holds are provided.*

Subject to verification of easy evacuation of injured person on a stretcher the vertical opening 850 mm × 620 mm with wider upper half than 600 mm, while the lower half may be less than 600 mm with the overall height not less than 850 mm is considered acceptable alternative to the opening of 600 mm × 800 mm with corner radii of 300 mm (see Fig 1).

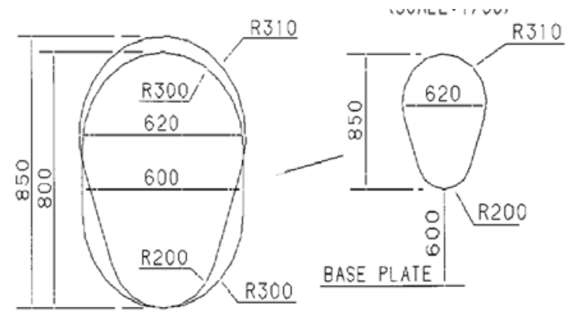

Figure 1: Alternative vertical opening

2. Technical provisions for means of access

2.1 Definitions

Ref. IMO Technical Provisions, 2 (Resolution MSC.158(78))

2.1.1 Rung

Rung means the step of vertical ladder or step on the vertical surface.

2.1.2 Tread

Tread means the step of inclined ladder, or step for the vertical access opening.

2.1.3 Flight of a ladder

Flight of an inclined ladder means the actual stringer length of an inclined ladder.

For vertical ladders, it is the distance between the platforms.

2.1.4 Stringer

Stringer means:

1) *the frame of a ladder; or*
2) *the stiffened horizontal plating structure fitted on side shell, transverse bulkheads and/or longitudinal bulkheads in the space. For the purpose of ballast tanks of less than 5 m width forming double side spaces, the horizontal plating structure is credited as a stringer and a longitudinal permanent means of access, if it provides a continuous passage of 600 mm or more in width past frames or stiffeners on the side shell or longitudinal bulkhead. Openings in stringer plating utilized as permanent means of access are to be arranged with guard rails or grid covers to provide safe passage on the stringer or safe access to each transverse web.*

2.1.5 Vertical ladder

Vertical ladder means a ladder of which the inclined angle is 70º and over up to 90º. Vertical ladder is to be not skewed by more than 2º.

2.1.6 Overhead obstructions

Overhead obstructions mean the deck or stringer structure including stiffeners above the means of access.

2.1.7 Distance below deck head

Distance below deck head means the distance below the plating.

2.1.8 Cross deck

Cross deck means the transverse area of main deck which is located inboard and between hatch coamings.

2.2 Permanent means of access

2.2.1

Ref. IMO Technical Provisions, 3.1 & 3.2 (Resolution MSC.158(78))

Structural members, except those in double bottom spaces, are to be provided with a permanent means of access to the extent as specified in [2.7] to [2.13].

Permanent means of access are, as far as possible, to be integral to the structure of the ships , thus ensuring that they are robust and at the same time contributing to the overall strength of the structure, of the ship.

2.2.2

Ref. IMO Technical Provisions, 3.3 (Resolution MSC.158(78)) and IACS UI SC191

Elevated passageways forming sections of a permanent means of access, where fitted, are to have a minimum clear width of 600 mm, except for going around vertical webs where the minimum clear width may be reduced to 450 mm, and to have guard rails over the open side of their entire length. For stand alone passageways guard rails are to be fitted on both sides of these structures.

Sloping structure providing part of the access and that are sloped by 5 or more degrees from horizontal plane when a ship is in upright position at even-keel, *is to be of a non-skid construction.*

Guard rails are to be 1000 mm in height and consist of a rail and intermediate bar 500 mm in height and of substantial construction. Stanchions are to be not more than 3 m apart.

2.2.3

Ref. IMO Technical Provisions, 3.4 (Resolution MSC.158(78))

Access to permanent means of access and vertical openings from the ship's bottom are to be provided by means of easily accessible passageways, ladders or treads. Treads are to be provided with lateral support for the foot. Where the rungs of ladders are fitted against a vertical surface, the distance from the centre of the rungs to the surface is to be at least 150 mm. Where vertical manholes are fitted higher than 600 mm above the walking level, access is to be facilitated by means of treads and hand grips with platform landings on both sides.

2.3 Construction of ladders

2.3.1 General

Ref. IMO Technical Provisions, 3.5 (Resolution MSC.158(78))

Permanent inclined ladders are to be inclined at an angle of less than 70º. There are to have no obstructions within 750 mm of the face of the inclined ladder, except that in way of an opening this clearance may be reduced to 600 mm. Resting platforms of adequate dimensions are normally to be provided at a maximum of 6 m vertical height. Ladders and handrails are to be constructed of steel or equivalent material of adequate strength and stiffness and securely attached to the tank structure by stays. The method of support and length of stay is to be such

that vibration is reduced to a practical minimum. In cargo holds, ladders are to be designed and arranged so that cargo handling difficulties are not increased and the risk of damage from cargo handling gear is minimized.

2.3.2 Inclined ladders

Ref. IMO Technical Provisions, 3.6 (Resolution MSC.158(78))

The width of inclined ladders between stringers is to be not less than 400 mm. The treads are to be equally spaced at a distance apart, measured vertically, of between 200 mm and 300 mm. When steel is used, the treads are to be formed of two square bars of not less than 22 mm by 22 mm in section, fitted to form a horizontal step with the edges pointing upward. The treads are to be carried through the side stringers and attached thereto by double continuous welding. All inclined ladders are to be provided with handrails of substantial construction on both sides, fitted at a convenient distance above the treads.

2.3.3 Vertical or spiral ladders

Ref. IMO Technical Provisions, 3.7 (Resolution MSC.158(78))

For vertical ladders or spiral ladders, the width and construction are to be in accordance with international or national standards.

2.4 Access through openings

2.4.1 Access through horizontal openings, hatches or manholes

Ref. IMO Technical Provisions, 3.10 (Resolution MSC.158(78))

For access through horizontal openings, hatches or manholes, the minimum clear opening is to be not less than 600 mm × 600 mm. When access to a cargo hold is arranged through the cargo hatch, the top of the ladder is to be placed as close as possible to the hatch coaming.

Access hatch coamings having a height greater than 900 mm are also to have steps on the outside in conjunction with the ladder.

2.4.2 Access through vertical openings, or manholes

Ref. IMO Technical Provisions, 3.11 (Resolution MSC.158(78))

For access through vertical openings, or manholes, in swash bulkheads, floors, girders and web frames providing passage through the length and breadth of the space, the minimum opening is to be not less than 600 mm × 800 mm at a height of not more than 600 mm from the passage unless gratings or other foot holds are provided.

2.5 Access ladders to cargo holds and other spaces

2.5.1 General

Ref. IMO Technical Provisions, 3.13.1 & 3.13.2 (Resolution MSC.158(78))

Access ladders to cargo holds and other spaces are to be:

a) where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is not more than 6 m, either a vertical ladder or an inclined ladder.

b) where the vertical distance between the upper surface of adjacent decks or between deck and the bottom of the cargo space is more than 6 m, an inclined ladder or series of inclined ladders at one end of the cargo hold, except the uppermost 2.5 m of a cargo space measured clear of overhead obstructions and the lowest 6 m may

have vertical ladders, provided that the vertical extent of the inclined ladder or ladders connecting the vertical ladders is not less than 2.5 m.

2.5.2

Ref. IMO Technical Provisions, 3.13.2 (Resolution MSC.158(78))

The second means of access at the other end of the cargo hold may be formed of a series of staggered vertical ladders, which have to comprise one or more ladder linking platforms spaced not more than 6 m apart vertically and displaced to one side of the ladder. Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder. The uppermost, entrance section, of the ladder directly exposed to a cargo hold is to be vertical for a distance of 2.5 m measured clear of overhead obstructions and connected to a ladder-linking platform.

2.5.3

Ref. IMO Technical Provisions, 3.13.3 (Resolution MSC.158(78))

A vertical ladder may be used as a means of access to topside tanks, where the vertical distance is 6 m or less between the deck and the longitudinal means of access in the tank or the stringer or the bottom of the space immediately below the entrance. The uppermost, entrance section from deck, of the vertical ladder of the tank is to be vertical for a distance of 2.5 m measured clear of the overhead obstructions and comprises a ladder linking platform unless landing on the longitudinal means of access, the stringer or the bottom within the vertical distance, it should be displaced to one side of a vertical ladder.

2.5.4

Ref. IMO Technical Provisions, 3.13.4 (Resolution MSC.158(78))

Unless allowed in [2.5.3], an inclined ladder or combination of ladders are to be used for access to a tank or a space where the vertical distance is greater than 6 m between the deck and a stringer immediately below the entrance, between stringers, or between the deck or a stringer and the bottom of the space immediately below the entrance.

2.5.5

Ref. IMO Technical Provisions, 3.13.5 (Resolution MSC.158(78))

In case of [2.5.4], the uppermost, entrance section from deck, of the ladder is to be vertical for a distance of 2.5 m clear of the overhead obstructions and connected to a landing platform and continued with an inclined ladder. The flights of inclined ladders are to be not more than 9 m in actual length and the vertical height is normally to be not more than 6 m. The lowermost section of the ladders may be vertical for a vertical distance of not less than 2.5 m.

2.5.6

Ref. IMO Technical Provisions, 3.13.6 (Resolution MSC.158(78))

In double side skin spaces of less than 2.5 m width, the access to the space may be by means of vertical ladders that comprises one or more ladder linking platforms spaced not more than 6 m apart vertically and displace to one side of the ladder.

Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder.

2.5.7

Ref. IMO Technical Provisions, 3.13.7 (Resolution MSC.158(78))

A spiral ladder is considered acceptable as an alternative for inclined ladders. In this regard, the uppermost 2.5 m can continue to be comprised of the spiral ladder and need not change over to vertical ladders.

2.6 Access ladders to tanks

2.6.1

Ref. IMO Technical Provisions, 3.14 (Resolution MSC.158(78))

The uppermost, entrance section from deck, of the vertical ladder providing access to a tank should be vertical for a distance of 2.5 m measured clear of the overhead obstructions and comprises a ladder linking platform. It should be displaced to one side of a vertical ladder. The vertical ladder can be between 1.6 m and 3 m below deck structure if it lands on a longitudinal or athwartship permanent means of access fitted within that range.

2.7 Access to underdeck structure of cargo holds

2.7.1

Ref. IMO Technical Provisions, Tab 2, 1.1 (Resolution MSC.158(78))

Permanent means of access are to be fitted to provide access to the overhead structure at both sides of the cross deck and in the vicinity of the centerline.

Each means of access is to be accessible from the cargo hold access or directly from the main deck and installed at a minimum of 1.6 m to a maximum of 3 m below the deck.

2.7.2

Ref. IMO Technical Provisions, Tab 2, 1.2 (Resolution MSC.158(78))

An athwartship permanent means of access fitted on the transverse bulkhead at a minimum 1.6 m to a maximum 3 m below the cross-deck head is accepted as equivalent to [2.7.1].

2.7.3

Ref. IMO Technical Provisions, Tab 2, 1.3 (Resolution MSC.158(78))

Access to the permanent means of access to overhead structure of the cross deck may also be via the upper stool.

2.7.4

Ref. IMO Technical Provisions, Tab 2, 1.4 (Resolution MSC.158(78)) and IACS UI SC191

Ships having transverse bulkheads with full upper stools, i.e. stools with a full extension between top side tanks and between hatch end beams, *with access from the main deck which allows monitoring of all framing and plates from inside, do not require permanent means of access of the cross deck.*

2.7.5

Ref. IMO Technical Provisions, Tab 2, 1.5 (Resolution MSC.158(78))

Alternatively, movable means of access may be utilized for access to the overhead structure of cross deck if its vertical distance is 17 m or less above the tank top.

2.8 Access to double side skin tanks of double side skin construction

RCN 1 to July 2010 version (effective from 1July 2012)

2.8.1

Ref. IMO Technical Provisions, Tab 2, 2.8 & Tab 1, 2.1 (Resolution MSC.158(78))

For double side spaces above the upper knuckle point of the bilge hopper sections, permanent means of access are to be provided in accordance with the following requirements:

a) where the vertical distance between horizontal uppermost stringer and deck head is 6 m or more, one continuous longitudinal permanent means of access is to be provided for the full length of the tank with a means to allow passing through transverse webs installed at a minimum of 1.6 m to a maximum of 3 m below the deck head with a vertical access ladder at each end of the tank;

b) continuous longitudinal permanent means of access, which are integrated in the structure, at a vertical distance not exceeding 6 m apart; and

c) plated stringers are to be, as far as possible, in alignment with horizontal girders of transverse bulkheads.

2.9 Access to vertical structures of cargo holds of single side skin construction

RCN 1 to July 2010 version (effective from 1July 2012)

2.9.1

Ref. IMO Technical Provisions, Tab 2, 1.6 (Resolution MSC.158(78))

Permanent means of vertical access are to be provided in all cargo holds and built into the structure to allow for an inspection of a minimum of 25 % of the total number of hold frames port and starboard equally distributed throughout the hold including at each end in way of transverse bulkheads. But in no circumstance is this arrangement to be less than 3 permanent means of vertical access fitted to each side (fore and aft ends of hold and mid-span).

Permanent means of vertical access fitted between two adjacent hold frames is counted for an access for the inspection of both hold frames. A means of portable access may be used to gain access over the sloping plating of lower hopper ballast tanks.

2.9.2

Ref. IMO Technical Provisions, Tab 2, 1.7 (Resolution MSC.158(78))

In addition, portable or movable means of access are to be utilized for access to the remaining hold frames up to their upper brackets and transverse bulkheads.

2.9.3

Ref. IMO Technical Provisions, Tab 2, 1.8 (Resolution MSC.158(78))

Portable or movable means of access may be utilized for access to hold frames up to their upper bracket in place of the permanent means required in [2.9.1]. These means of access are to be carried on board the ship and readily available for use.

2.9.4

Ref. IMO Technical Provisions, Tab 2, 1.9 (Resolution MSC.158(78))

The width of vertical ladders for access to hold frames is to be at least 300 mm, measured between stringers.

2.9.5

Ref. IMO Technical Provisions, Tab 2, 1.10 (Resolution MSC.158(78))

A single vertical ladder over 6 m in length is acceptable for the inspection of the hold side frames in a single skin construction.

2.10 Access to vertical structures of cargo holds of double side skin construction

RCN 1 to July 2010 version (effective from 1July 2012)

2.10.1

Ref. IMO Technical Provisions, Tab 2, 1.11 (Resolution MSC.158(78))

For double side skin construction no vertical ladders for the inspection of the cargo hold surfaces are required. Inspection of this structure should be provided from within the double hull space.

2.11 Access to top side ballast tanks

RCN 1 to July 2010 version (effective from 1July 2012)

2.11.1

Ref. IMO Technical Provisions, Tab 2, 2.1 (Resolution MSC.158(78))

For each topside tank of which the height is 6 m and over, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.6 m to a maximum of 3 m below deck with a vertical access ladder in the vicinity of each access to that tank.

2.11.2

Ref. IMO Technical Provisions, Tab 2, 2.2 (Resolution MSC.158(78))

If no access holes are provided through the transverse webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring.

2.11.3

Ref. IMO Technical Provisions, Tab 2, 2.3 (Resolution MSC.158(78))

Three permanent means of access, fitted at the end bay and middle bay of each tank, are to be provided spanning from tank base up to the intersection of the sloping plate with the hatch side girder. The existing longitudinal structure, if fitted on the sloping plate in the space may be used as part of this means of access.

2.11.4

Ref. IMO Technical Provisions, Tab 2, 2.4 (Resolution MSC.158(78))

For topside tanks of which the height is less than 6 m, alternative or a portable means may be utilized in lieu of the permanent means of access.

2.12 Access to bilge hopper ballast tanks

2.12.1

Ref. IMO Technical Provisions, Tab 2, 2.5 (Resolution MSC.158(78)) and IACS UI SC191

For each bilge hopper tank of which the height is 6 m and over, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.2 m below the top of the clear opening of the web ring with a vertical access ladder in the vicinity of each access to the tank.

An access ladder between the longitudinal continuous permanent means of access and the bottom of the space is to be provided at each end of the tank.

Alternatively, the longitudinal continuous permanent means of access can be located through the upper web plating above the clear opening of the web ring, at a minimum of 1.6 m below the deck head, when this arrangement facilitates more suitable inspection of identified structurally critical areas. An enlarged longitudinal frame, of at least 600 mm clear width *can be used for the purpose of the walkway.*

For double side skin bulk carriers the longitudinal continuous permanent means of access may be installed within 6 m from the knuckle point of the bilge, if used in combination with alternative methods to gain access to the knuckle point.

2.12.2

Ref. IMO Technical Provisions, Tab 2, 2.6 (to Resolution MSC.158(78))

If no access holes are provided through the transverse ring webs within 600 mm of the tank base and the web frame rings have a web height greater than 1 m in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring.

2.12.3

Ref. IMO Technical Provisions, Tab 2, 2.7 (Resolution MSC.158(78))

For bilge hopper tanks of which the height is less than 6 m, alternative or a portable means may be utilized in lieu of the permanent means of access. Such means of access are to be demonstrated that they can be deployed and made readily available in the areas where needed.

2.13 Access to fore peak tanks

2.13.1

Ref. IMO Technical Provisions, Tab 2, 2.9 (Resolution MSC.158(78))

For fore peak tanks with a depth of 6 m or more at the centreline of the collision bulkhead, a suitable means of access is to be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure.

2.13.2

Ref. IMO Technical Provisions, Tab 2, 2.9.1 (Resolution MSC.158(78))

Stringers of less than 6 m in vertical distance from the deck head or a stringer immediately above are considered to provide suitable access in combination with portable means of access.

2.13.3

Ref. IMO Technical Provisions, Tab 2, 2.9.2 (Resolution MSC.158(78))

In case the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is 6 m or more, alternative means of access are to be provided.

3. Shaft tunnels

3.1 General

3.1.1

Tunnels are to be large enough to ensure easy access to shafting.

3.1.2

Access to the tunnel is to be provided by a watertight door fitted on the aft bulkhead of the engine room in compliance with Ch 2, Sec 1, [6], and an escape trunk which can also act as watertight ventilator is to be fitted up to the subdivision deck, for tunnels greater than 7 m in length.

4. Access to steering gear compartment

4.1 General

4.1.1

The steering gear compartment is to be readily accessible and, as far as practicable, separated from machinery spaces.

4.1.2

Suitable arrangements to ensure working access to steering gear machinery and controls are to be provided.

These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage.

Chapter 3

Structural Design Principles

Section 1 – MATERIAL

1. General

1.1 Standard of material

1.1.1

The requirements in this Section are intended for ships of welded construction using steels having characteristics complying with the Society Rules for Materials.

1.1.2

Materials with different characteristics may be accepted, provided their specification (manufacture, chemical composition, mechanical properties, welding, etc.) is submitted to the Society for approval.

1.2 Testing of materials

1.2.1

Materials are to be tested in compliance with the applicable requirements of Society Rules for Materials.

1.3 Manufacturing processes

1.3.1

The requirements of this Section presume that welding and other cold or hot manufacturing processes are carried out in compliance with current sound working practice defined in IACS UR W and the applicable requirements of Society Rules for Materials. In particular:

- parent material and welding processes are to be within the limits stated for the specified type of material for which they are intended
- specific preheating may be required before welding
- welding or other cold or hot manufacturing processes may need to be followed by an adequate heat treatment.

2. Hull structural steel

2.1 General

2.1.1

Tab 1 gives the mechanical characteristics of steels currently used in the construction of ships.

Table 1: Mechanical properties of hull steels

Steel grades for plates with $t \leq 100$ mm	Minimum yield stress R_{eH} , in N/mm^2	Ultimate tensile strength R_m , in N/mm^2
A-B-D-E	235	400 – 520
*AH*32-*DH*32-*EH*32-*FH*32	315	440 – 570
*AH*36-*DH*36-*EH*36-*FH*36	355	490 – 630
*AH*40-*DH*40-*EH*40-*FH*40	390	510 – 660

2.1.2

Where higher strength steels are to be used for hull construction, the drawings showing the scope and locations of the used place together with the type and scantlings are to be submitted for the approval of the Society.

2.1.3

Higher strength steels other than those indicated in Tab 1 are considered by the Society on a case by case basis.

2.1.4

When steels with a minimum guaranteed yield stress R_{eH} other than 235 N/mm^2 are used on a ship, hull scantlings are to be determined by taking into account the material factor k defined in [2.2].

2.1.5

It is required to keep on board a plan indicating the steel types and grades adopted for the hull structures. Where steels other than those indicated in Tab 1 are used, their mechanical and chemical properties, as well as any workmanship requirements or recommendations, are to be available on board together with the above plan.

2.2 Material factor *k*

2.2.1

Unless otherwise specified, the material factor k of normal and higher strength steel for scantling purposes is to be taken as defined in Tab 2, as a function of the minimum yield stress R_{eH}.

For intermediate values of R_{eH}, k may be obtained by linear interpolation.

Steels with a yield stress greater than 390 N/mm^2 are considered by the Society on a case by case basis.

Table 2: Material factor *k*

Minimum yield stress R_{eH} , in N/mm^2	k
235	1.0
315	0.78
355	0.72
390	0.68

2.3 Grades of steel

2.3.1

Steel materials in the various strength members are not to be of lower grade than those corresponding to classes I, II and III, as given in Tab 3 for the material classes and grades given in Tab 4-1, while additional requirements for ships with length (L) exceeding 150m and 250m, BC-A and BC-B ships are given in Tab 4-2 to Tab 4-4.

For strength members not mentioned in Tab 4-1 to Tab 4-4, grade *A/AH* may be used.

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 3: Material grade requirements for classes I, II and III

Class	I		II		III	
As-built thickness (mm)	NSS	HSS	NSS	HSS	NSS	HSS
$t \leq 15$	*A*	*AH*	*A*	*AH*	*A*	*AH*
$15 < t \leq 20$	*A*	*AH*	*A*	*AH*	*B*	*AH*
$20 < t \leq 25$	*A*	*AH*	*B*	*AH*	*D*	*DH*
$25 < t \leq 30$	*A*	*AH*	*D*	*DH*	*D*	*DH*
$30 < t \leq 35$	*B*	*AH*	*D*	*DH*	*E*	*EH*
$35 < t \leq 40$	*B*	*AH*	*D*	*DH*	*E*	*EH*
$40 < t \leq 50$	*D*	*DH*	*E*	*EH*	*E*	*EH*
Notes : NSS : Normal strength steel HSS : Higher strength steel						

Table 4: (void)

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 4-1: Material Classes and Grades for ships in general

Structural member category	Material class/grade
SECONDARY: A1 Longitudinal bulkhead strakes, other than that belonging to the Primary category A2 Deck plating exposed to weather, other than that belonging to the Primary or Special category A3 Side plating	- Class I within 0.4*L* amidships - Grade *A/AH* outside 0.4*L* amidships
PRIMARY: B1 Bottom plating, including keel plate B2 Strength deck plating, excluding that belonging to the Special category B3 Continuous longitudinal members above strength deck, excluding hatch coamings. B4 Uppermost strake in longitudinal bulkhead B5 Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	- Class II within 0.4*L* amidships - Grade *A/AH* outside 0.4*L* amidships
SPECIAL: C1. Sheer strake at strength deck (1) C2 Stringer plate in strength deck (1) C3 Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships (1)	- Class III within 0.4*L* amidships - Class II outside 0.4*L* amidships - Class I outside 0.6*L* amidships
C5 Strength deck plating at corners of cargo hatch openings	- Class III within 0.6*L* amidships - Class II within rest of cargo region
C6 Bilge strake in ships with double bottom over the full breadth and length less than 150 m (1)	- Class II within 0.6*L* amidships - Class I outside 0.6*L* amidships
C7 Bilge strake in other ships (1)	- Class III within 0.4*L* amidships - Class II outside 0.4*L* amidships - Class I outside 0.6*L* amidships
C8 Longitudinal hatch coamings of length greater than 0.15*L* C9 End brackets and deck house transition of longitudinal cargo hatch coamings (2)	- Class III within 0.4*L* amidships - Class II outside 0.4*L* amidships - Class I outside 0.6*L* amidships - Not to be less than Grade *D/DH*
(1) Single strakes required to be of Class III within 0.4*L* amidships are to have breadths not less than 800+5*L* (mm), and need not be greater than 1800 (mm), unless limited by the geometry of the ship's design. (2) Applicable to bulk carriers having the longitudinal hatch coaming of length greater than 0.15*L*.	

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 4-2: Minimum material grades for ships with ship's length (*L*) exceeding 150m and single strength deck

Structural member category	Material Grade
Longitudinal strength members of strength deck plating	Grade *B/AH* within 0.4*L* amidships
Continuous longitudinal strength members above strength deck	Grade *B/AH* within 0.4*L* amidships
Single side strakes for ships without inner continuous longitudinal bulkheads between bottom and the strength deck	Grade *B/AH* within cargo region

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 4-3: Minimum Material Grades for ships with ship's length (*L*) exceeding 250m

Structural member category	Material Grade
Shear strake at strength deck (1)	Grade *E/EH* within 0.4*L* amidships
Stringer plate in strength deck (1)	Grade *E/EH* within 0.4*L* amidships
Bilge strake (1)	Grade *D/DH* within 0.4*L* amidships
(1) Single strakes required to be of Class III within 0.4*L* amidships are to have breadths not less than 800 + 5*L* (mm), and need not be greater than 1800 (mm), unless limited by the geometry of the ship's design	

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 4-4: Minimum material grades for BC-A and BC-B ships

Structural member category	Material Grade
Lower bracket of ordinary side frame(1), (2)	Grade *D/DH*
Side shell strakes included totally or partially between the two points located to 0.125 *l* above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate (2)	Grade *D/DH*
(1) The term "lower bracket" means webs of lower brackets and webs of the lower part of side frames up to the point 0.125 *l* above the intersection of side shell and bilge hopper sloping plate or inner bottom plate. (2) The span of the side frame, *l*, is defined as the distance between the supporting structure (See Ch. 3 Sec 6 Fig.19)	

RCN 2 to July 2008 version (effective from 1 July 2010)

2.3.2

Plating materials for stern frames, rudders, rudder horns and shaft brackets are in general not to be of lower grades than corresponding to class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) class III is to be applied.

2.3.3

Bedplates of seats for propulsion and auxiliary engines inserted in the inner bottom within 0.6*L* amidships are to be of class I. In other cases, the steel is to be at least of grade *A/AH*.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.3.4

(void)

RCN 2 to July 2008 version (effective from 1 July 2010)

2.3.5

The steel grade is to correspond to the as-built thickness.

2.3.6

Steel grades of plates or sections of as-built thickness greater than the limiting thicknesses in Tab 3 are considered by the Society on a case by case basis.

2.3.7

In specific cases, such as [2.3.8], with regard to stress distribution along the hull girder, the classes required within 0.4L amidships may be extended beyond that zone, on a case by case basis.

2.3.8

The material classes required for the strength deck plating, the sheerstrake and the upper strake of longitudinal bulkheads within 0.4L amidships are to be maintained for an adequate length across the poop front and at the ends of the bridge, where fitted.

2.3.9

Rolled products used for welded attachments of length greater than 0.15L on outside of hull plating, such as gutter bars, are to be of the same grade as that used for the hull plating in way.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.3.10

In the case of full penetration welded joints located in positions where high local stresses may occur perpendicular to the continuous plating, the Society may, on a case by case basis, require the use of rolled products having adequate ductility properties in the through thickness direction, such as to prevent the risk of lamellar tearing (Z type steel).

2.3.11

(void)

2.4 Structures exposed to low air temperature

2.4.1

The application of steels for ships designed to operate in area with low air temperatures is to comply with [2.4.2] to [2.4.6].

2.4.2

For ships intended to operate in areas with low air temperatures (below and including –20 °C), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D , to be taken as defined in [2.4.3].

2.4.3

The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation, where:

Mean : Statistical mean over observation period (at least 20 years).

Average : Average during one day and night.

Lowest : Lowest during year.

Fig 1 illustrates the temperature definition for Arctic waters.

For seasonally restricted service the lowest value within the period of operation applies.

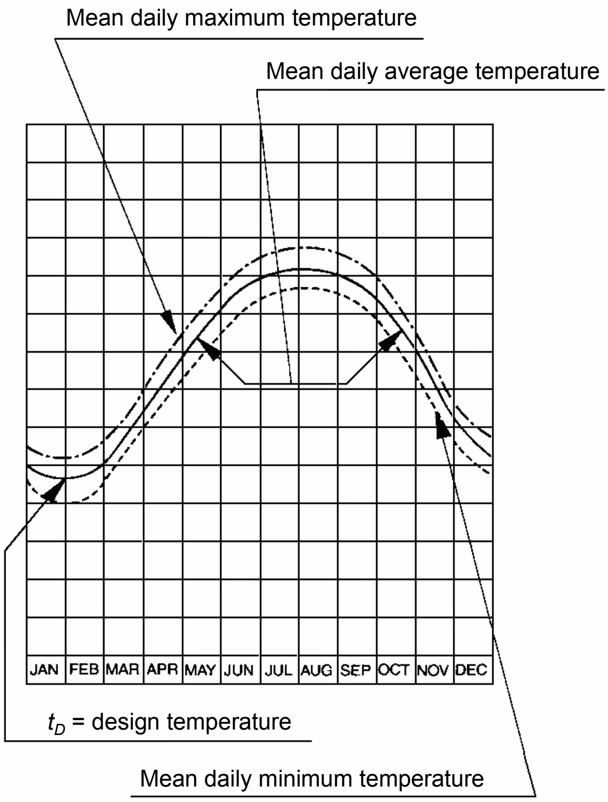

Figure 1: Commonly used definitions of temperatures

2.4.4

Materials in the various strength members above the lowest ballast water line (BWL) exposed to air are not to be of lower grades than those corresponding to classes I, II and III as given in Tab 5 depending on the categories of structural members (SECONDARY, PRIMARY and SPECIAL).

For non-exposed structures and structures below the lowest ballast water line, see [2.3]

2.4.5

The material grade requirements for hull members of each class depending on thickness and design temperature are defined in Tab 6, Tab 7 and Tab 8. For design temperatures $t_D < -55$ °C, materials are to be specially considered by the Society.

2.4.6

Single strakes required to be of class III or of grade *E /EH* and *FH* are to have breadths not less than the values, in m, given by the following formula, but need not to be greater than 1.8 m:

$b = 0.005L + 0.8$

Table 5: Application of material classes and grades - Structures exposed at low temperature

Structural member category	Material class	
	Within 0.4*L* amidship	**Outside 0.4*L* amidship**
SECONDARY		
Deck plating exposed to weather, in general	I	I
Side plating above BWL		
Transverse bulkheads above BWL		
PRIMARY		
Strength deck plating (1)	II	I
Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings		
Longitudinal bulkhead above BWL		
Top wing tank bulkhead above BWL		
SPECIAL		
Sheer strake at strength deck (2)	III	II
Stringer plate in strength deck (2)		
Deck strake at longitudinal bulkhead (3)		
Continuous longitudinal hatch coamings (4)		

Notes:

(1) Plating at corners of large hatch openings to be specially considered. Class III or grade *E/EH* to be applied in positions where high local stresses may occur.

(2) Not to be less than grade *E/EH* within 0.4*L* amidships in ships with length exceeding 250 m.

(3) In ships with a breadth exceeding 70 m at least three deck strakes to be class III.

(4) Not to be less than grade *D/DH*.

Table 6: Material grade requirements for class I at low temperature

3. Steels for forging and casting

3.1 General

3.1.1

Mechanical and chemical properties of steels for forging and casting to be used for structural members are to comply with the applicable requirements of the Society Rules for Materials.

3.1.2

Steels of structural members intended to be welded are to have mechanical and chemical properties deemed appropriate for this purpose by the Society on a case by case basis.

3.1.3

The steels used are to be tested in accordance with the applicable requirements of the Society Rules for Materials.

3.2 Steels for forging

3.2.1

Rolled bars may be accepted in lieu of forged products, after consideration by the Society on a case by case basis.

In such case, compliance with the applicable requirements of the Society Rules for Materials, relevant to the quality and testing of rolled parts accepted in lieu of forged parts, may be required.

3.3 Steels for casting

3.3.1

Cast parts intended for stems, sternframes, rudders, parts of steering gear and deck machinery in general may be made of C and C-Mn weldable steels, having specified minimum tensile strength R_m = 400 N/mm^2 or 440 N/mm^2, in accordance with the applicable requirements of the Society Rules for Materials.

3.3.2

The welding of cast parts to main plating contributing to hull strength members is considered by the Society on a case by case basis.

The Society may require additional properties and tests for such casting, in particular impact properties which are appropriate to those of the steel plating on which the cast parts are to be welded and non-destructive examinations.

3.3.3

Heavily stressed cast parts of steering gear, particularly those intended to form a welded assembly and tillers or rotors mounted without key, are to be subjected to surface and volumetric non-destructive examination to check their internal structure.

4. Aluminium alloy structures

4.1 General

4.1.1

The characteristics of aluminium alloys are to comply with the requirements of the Society Rules for Materials.

Series 5000 aluminium-magnesium alloys or series 6000 aluminium-magnesium-silicon alloys are to be used.

4.1.2

In the case of structures subjected to low service temperatures or intended for other specific applications, the alloys to be employed are to be agreed by the Society.

4.1.3

Unless otherwise agreed, the Young's modulus for aluminium alloys is equal to 70000 N/mm^2 and the Poisson's ratio equal to 0.33.

4.2 Extruded plating

4.2.1

Extrusions with built-in plating and stiffeners, referred to as extruded plating, may be used.

4.2.2
In general, the application is limited to decks, bulkheads, superstructures and deckhouses. Other uses may be permitted by the Society on a case by case basis.

4.2.3
Extruded plating is to be oriented so that the stiffeners are parallel to the direction of main stresses.

4.2.4
Connections between extruded plating and primary members are to be given special attention.

4.3 Mechanical properties of weld joints

4.3.1
Welding heat input lowers locally the mechanical strength of aluminium alloys hardened by work hardening (series 5000 other than condition O or H111) or by heat treatment (series 6000).

4.3.2
The as-welded properties of aluminium alloys of series 5000 are in general those of condition O or H111.
Higher mechanical characteristics may be taken into account, provided they are duly justified.

4.3.3
The as-welded properties of aluminium alloys of series 6000 are to be agreed by the Society.

4.4 Material factor *k*

4.4.1
The material factor *k* for aluminium alloys is to be obtained from the following formula:

$$k = \frac{235}{R'_{\lim}}$$

where:

$R'_{\lim}$: Minimum guaranteed yield stress of the parent metal in welded condition $R'_{p0.2}$, in N/mm^2, but not to be taken greater than 70% of the minimum guaranteed tensile strength of the parent metal in welded condition R'_m, in N/mm^2

$$R'_{p0.2} = \eta_1 R_{p0.2}$$

$$R'_m = \eta_2 R_m$$

$R_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of the parent metal in delivery condition

R_m : Minimum guaranteed tensile strength, in N/mm^2, of the parent metal in delivery condition

η_1 , η_2 : Specified in Tab 9.

4.4.2
In the case of welding of two different aluminium alloys, the material factor *k* to be considered for the scantlings is the greater material factor of the aluminium alloys of the assembly.

Table 9: Aluminium alloys for welded construction

Aluminium alloy	η_1	η_2
Alloys without work-hardening treatment (series 5000 in annealed condition O or annealed flattened condition H111)	1	1
Alloys hardened by work hardening (series 5000 other than condition O or H111)	$R'_{p0.2} / R_{p0.2}$	R'_m / R_m
Alloys hardened by heat treatment (series 6000) (1)	$R'_{p0.2} / R_{p0.2}$	0.6

Notes:

(1) : When no information is available, coefficient η_1 is to be taken equal to the metallurgical efficiency coefficient β defined in Tab 10.

$R'_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of material in welded condition

R'_m : Minimum guaranteed tensile strength, in N/mm^2, of material in welded condition

Table 10: Aluminium alloys - Metallurgical efficiency coefficient β

Aluminium alloy	Temper condition	Gross thickness, in mm	β
6005 A (Open sections)	T5 or T6	$t \leq 6$	0.45
		$t > 6$	0.40
6005 A (Closed sections)	T5 or T6	All	0.50
6061 (Sections)	T6	All	0.53
6082 (Sections)	T6	All	0.45

5. Other materials and products

5.1 General

5.1.1

Other materials and products such as parts made of iron castings, where allowed, products made of copper and copper alloys, rivets, anchors, chain cables, cranes, masts, derrick posts, derricks, accessories and wire ropes are to comply with the applicable requirements of the Society Rules for Materials.

5.1.2

The use of plastics or other special materials not covered by these Rules is to be considered by the Society on a case by case basis. In such cases, the requirements for the acceptance of the materials concerned are to be agreed by the Society.

5.1.3

Materials used in welding processes are to comply with the applicable requirements of the Society Rules for Materials.

5.2 Iron cast parts

5.2.1

As a rule, the use of grey iron, malleable iron or spheroidal graphite iron cast parts with combined ferritic/perlitic structure is allowed only to manufacture low stressed elements of secondary importance.

5.2.2

Ordinary iron cast parts may not be used for windows or sidescuttles; the use of high grade iron cast parts of a suitable type will be considered by the Society on a case by case basis.

Section 2 – NET SCANTLING APPROACH

Symbols

t_{as_built} : *As-built Thickness*: the actual thickness, in mm, provided at the newbuilding stage, including $t_{voluntary\_addition}$, if any.

t_C : *Corrosion Addition Thickness*: as defined in Ch 3, Sec 3, in mm.

$t_{gross\_offered}$: *Gross Thickness Offered*: the actual gross (full) thickness, in mm, provided at the newbuilding stage, excluding $t_{voluntary\_addition}$, the owner's extra margin for corrosion wastage, if any.

$t_{gross\_required}$: *Gross Thickness Required*: the gross (full) thickness, in mm, obtained by adding t_C to the Net Thickness Required.

$t_{net\_offered}$: *Net Thickness Offered*: the net thickness, in mm, obtained by subtracting t_C from the Gross Thickness Offered

$t_{net\_required}$: *Net Thickness Required*: the net thickness, in mm, as required by the Rules that satisfy all the structural strength requirements, rounded to the closest half millimetre.

$t_{voluntary\_addition}$: *Thickness for Voluntary Addition*: the thickness, in mm, voluntarily added as the owner's extra margin for corrosion wastage in addition to t_C.

1. General philosophy

1.1

1.1.1

Net Scantling Approach is to clearly specify the "net scantling" that is to be maintained right from the newbuilding stage throughout the ship's design life to satisfy the structural strength requirements. This approach clearly separates the net thickness from the thickness added for corrosion that is likely to occur during the ship-in-operation phase.

2. Application criteria

2.1 General

2.1.1

The scantlings obtained by applying the criteria specified in this Rule are net scantlings as specified in [3.1] to [3.3]; i.e. those which provide the strength characteristics required to sustain the loads, excluding any addition for corrosion and voluntarily added thickness such as the owner's extra margin, if any. The following gross offered scantlings are exceptions; i.e. they already include additions for corrosion but without voluntarily added values such as the owner's extra margin:

- scantlings of superstructures and deckhouses, according to Ch 9, Sec 4
- scantlings of rudder structures, according to Ch 10, Sec 1
- scantlings of massive pieces made of steel forgings, steel castings.

2.1.2

The required strength characteristics are:

- thickness, for plating including that which constitutes primary supporting members
- section modulus, shear area, moments of inertia and local thickness for ordinary stiffeners and, as the case may be, primary supporting members
- section modulus, moments of inertia and first moment for the hull girder.

2.1.3

The ship is to be built at least with the gross scantlings obtained by adding the corrosion additions, specified in Ch 3, Sec 3, to the net scantlings. The thickness for voluntary addition is to be added as an extra.

3. Net scantling approach

3.1 Net scantling definition

3.1.1 Required thickness

The gross thickness required, $t_{gross\_required}$, is not less than the gross thickness which is obtained by adding the corrosion addition t_C as defined in Ch 3, Sec 3 to net thickness required, as follows:

$$t_{gross\_required} = t_{net\_required} + t_C$$

3.1.2 Offered thickness

The gross thickness offered, $t_{gross\_offered}$, is the gross thickness provided at the newbuilding stage, which is obtained by deducting the thickness for voluntary addition from the as-built thickness, as follows:

$$t_{gross\_offered} = t_{as\_built} - t_{voluntary\_addition}$$

3.1.3 Net thickness for plate

Net thickness offered, $t_{net\_offered}$, is obtained by subtracting t_C from the gross thickness offered, as follows:

$$t_{net\_offered} = t_{gross\_offered} - t_C = t_{as\_built} - t_{voluntary\_addition} - t_C$$

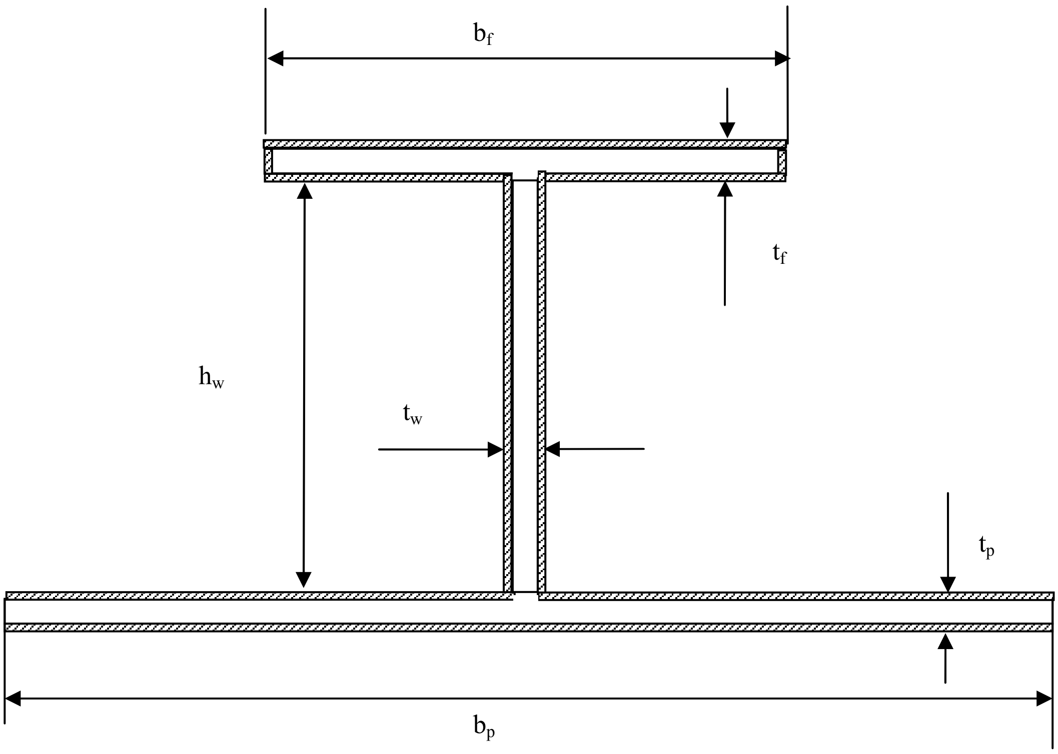
3.1.4 Net section modulus for stiffener

The net transverse section scantling is to be obtained by deducting t_C from the gross thickness offered of the elements which constitute the stiffener profile as shown in Fig 1.

For bulb profiles, an equivalent angle profile, as specified in Ch 3, Sec 6 [4.1.1], may be considered.

The net strength characteristics are to be calculated for the net transverse section.

In assessing the net strength characteristics of stiffeners reflecting the hull girder stress and stress due to local bending of the local structure such as double bottom structure, the section modulus of hull girder or rigidity of structure is obtained by deducting $0.5t_C$ from the gross thickness offered of the related elements.



Shadow area is corrosion addition.

For attached plate, the half of the considered corrosion addition specified in 3.2 is deducted from both sides of the attached plate.

Figure 1: Net scantling of stiffener

3.2 Considered net scantling

3.2.1 Yielding check of the hull girder

The net thickness of structural members to be considered for the yielding check of the hull girder, according to Ch 5, Sec 1, is to be obtained by deducting $0.5t_C$ from the gross thickness offered.

3.2.2 Global stress such as stress due to hull girder bending moment and shear force

The net thickness of structural members to be considered for stress due to hull girder bending moment and shear force according to Ch 5, Sec1, is to be obtained by deducting $0.5t_C$ from the gross thickness offered.

3.2.3 Buckling check of the hull girder

The net thickness of structural members to be considered for the buckling check, according to Ch 6, Sec 3, is to be obtained by deducting t_C from the gross thickness offered.

3.2.4 Ultimate strength check of the hull girder

The net thickness of structural members to be considered for the ultimate strength check of the hull girder, according to Ch 5, Sec 2, is to be obtained by deducting $0.5t_C$ from the gross thickness offered.

3.2.5 Direct strength analysis

The net thickness of plating which constitutes primary supporting members to be checked stresses according to Ch 7 is to be obtained by deducting $0.5t_C$ from the gross thickness offered.

The net thickness of plating members to be considered for the buckling check according to Ch 6, Sec 3, using the stresses obtained from direct strength analysis, is to be obtained by deducting t_C from the gross thickness offered.

3.2.6 Fatigue check

The net thickness of structural members to be checked for fatigue according to Ch 8 is to be obtained by deducting $0.5t_C$ from the gross thickness offered.

3.2.7 Check of primary supporting members for ships less than 150 m in length *L*

The net thickness of plating which constitutes primary supporting members for ships less than 150 m in length L, to be checked according to Ch.6, Sec.4, [2], is to be obtained by deducting t_c from the gross thickness.

3.3 Available information on structural drawings

3.3.1

The structural drawings are to indicate for each structural element the gross scantling and the renewal thickness as specified in Ch 13, Sec 2.

If thickness for voluntary addition is included in the as-built thicknesses, this is to be clearly mentioned and identified on the drawings.

Section 3 – CORROSION ADDITIONS

Symbols

t_C : Total corrosion addition, in mm, defined in [1.2]

t_{C1}, t_{C2} : Corrosion addition, in mm, on one side of the considered structural member, defined in Tab 1

$t_{reserve}$: Reserve thickness, in mm, defined in Ch 13, Sec 2 and taken equal to:

$$t_{reserve} = 0.5$$

1. Corrosion additions

1.1 General

1.1.1

The values of the corrosion additions specified in this section are to be applied in relation with the relevant protective coatings required by Sec 5.

For materials different from carbon steel, special consideration is to be given to the corrosion addition.

1.2 Corrosion addition determination

1.2.1 Corrosion additions for steel

The corrosion addition for each of the two sides of a structural member, t_{C1} or t_{C2}, is specified in Tab 1.

The total corrosion addition t_C, in mm, for both sides of the structural member is obtained by the following formula:

$$t_C = Roundup_{0.5}(t_{C1} + t_{C2}) + t_{reserve}$$

For an internal member within a given compartment, the total corrosion addition t_C is obtained from the following formula:

$$t_C = Roundup_{0.5}(2t_{C1}) + t_{reserve}$$

where t_{C1} is the value specified in Tab 1 for one side exposure to that compartment.

When a structural member is affected by more than one value of corrosion addition (e.g. a plate in a dry bulk cargo hold extending above the lower zone), the scantling criteria are generally to be applied considering the severest value of corrosion addition applicable to the member.

The corrosion addition of a longitudinal stiffener is determined according to the coordinate of the connection of the stiffener to the attached plating.

RCN 1 to July 2010 version (effective from 1July 2012)

In addition, the total corrosion addition t_C is not to be taken less than 2 mm, except for web and face plate of ordinary stiffeners.

1.2.2 Corrosion additions for aluminium alloys

For structural members made of aluminium alloys, the corrosion addition t_C is to be taken equal to 0.

</table>

Notes

(1) Dry bulk cargo hold includes holds, intended for the carriage of dry bulk cargoes, which may carry water ballast.

(2) The corrosion addition of a plating between water ballast and heated fuel oil tanks is to be increased by 0.7 mm.

(3) This is only applicable to ballast tanks with weather deck as the tank top.

(4) Upper part of the cargo holds corresponds to an area above the connection between the top side and the inner hull or side shell. If there is no top side, the upper part corresponds to the upper one third of the cargo hold height.

(5) Horizontal member means a member making an angle up to 20° as regard as a horizontal line.

(6) The corrosion addition on the outer shell plating in way of pipe tunnel is to be considered as water ballast tank.

(7) Outer side shell between normal ballast draught and scantling draught is to be increased by 0.5 mm.

RCN 1 to July 2008 version (effective from 1 July 2009)

Section 4 – LIMIT STATES

1. General

1.1 General principle

1.1.1

The structural strength assessments indicated in Tab 1 are covered by the requirements of the present Rules.

Table 1: Structural strength assessment

		Yielding check	Buckling check	Ultimate strength check	Fatigue check
Local Structures	Ordinary stiffeners	✓	✓	✓ (1)	✓ (2)
	Plating subjected to lateral pressure	✓	✓	✓ (3)	—
Primary supporting members		✓	✓	✓	✓ (2)
Hull girder		✓	✓ (4)	✓	—

Note: ✓ indicates that the structural assessment is to be carried out.

(1) The ultimate strength check of stiffeners is included in the buckling check of stiffeners.

(2) The fatigue check of stiffeners and primary supporting members is the fatigue check of connection details of these members.

(3) The ultimate strength check of plating is included in the yielding check formula of plating.

(4) The buckling check of stiffeners and plating taking part in hull girder strength is performed against stress due to hull girder bending moment and hull girder shear force.

1.1.2

Strength of hull structures in flooded condition is to be assessed.

1.2 Limit states

1.2.1 Serviceability limit state

Serviceability limit state, which concerns the normal use, includes:

- local damage which may reduce the working life of the structure or affect the efficiency or appearance of structural members
- unacceptable deformations which affect the efficient use and appearance of structural members or the functioning of equipment.

1.2.2 Ultimate limit state

Ultimate limit state, which corresponds to the maximum load-carrying capacity, or in some cases, the maximum applicable strain or deformation, includes:

- attainment of the maximum resistance capacity of sections, members or connections by rupture or excessive deformations

- instability of the whole structure or part of it.

1.2.3 Fatigue limit state
Fatigue limit state relate to the possibility of failure due to cyclic loads.

1.2.4 Accidental limit state
Accidental limit state considers the flooding of any one cargo hold without progression of the flooding to the other compartments and includes:

- the maximum load-carrying capacity of hull girder
- the maximum load-carrying capacity of double bottom structure
- the maximum load-carrying capacity of bulkhead structure

Accidental single failure of one structural member of any one cargo hold is considered in the assessment of the ultimate strength of the entire stiffened panel.

2. Strength criteria

2.1 Serviceability limit states

2.1.1 Hull girder
For the yielding check of the hull girder, the stress corresponds to a load at 10^{-8} probability level.

2.1.2 Plating
For the yielding check and buckling check of platings constituting a primary supporting member, the stress corresponds to a load at 10^{-8} probability level.

2.1.3 Ordinary stiffener
For the yielding check of an ordinary stiffener, the stress corresponds to a load at 10^{-8} probability level.

2.2 Ultimate limit states

2.2.1 Hull girder
The ultimate strength of the hull girder is to withstand the maximum vertical longitudinal bending moment obtained by multiplying the partial safety factor and the vertical longitudinal bending moment at 10^{-8} probability level.

2.2.2 Plating
The ultimate strength of the plating between ordinary stiffeners and primary supporting members is to withstand the load at 10^{-8} probability level.

2.2.3 Ordinary stiffener
The ultimate strength of the ordinary stiffener is to withstand the load at 10^{-8} probability level.

2.3 Fatigue limit state

2.3.1 Structural details

The fatigue life of representative structural details such as connections of ordinary stiffeners and primary supporting members is obtained from reference pressures at 10^{-4}.

2.4 Accidental limit state

2.4.1 Hull girder

Longitudinal strength of hull girder in cargo hold flooded condition is to be assessed in accordance with Ch 5, Sec 2.

2.4.2 Double bottom structure

Double bottom structure in cargo hold flooded condition is to be assessed in accordance with Ch 6, Sec 4.

2.4.3 Bulkhead structure

Bulkhead structure in cargo hold flooded condition is to be assessed in accordance with Ch 6, Sec 1, Sec 2 and Sec 3.

3. Strength check against impact loads

3.1 General

3.1.1

Structural response against impact loads such as forward bottom slamming, bow flare slamming and grab falling depends on the loaded area, magnitude of loads and structural grillage.

3.1.2

The ultimate strength of structural members that constitute the grillage, i.e. platings between ordinary stiffeners and primary supporting members and ordinary stiffeners with attached plating, is to withstand the maximum impact loads acting on them.

Section 5 – CORROSION PROTECTION

1. General

1.1 Structures to be protected

1.1.1

All seawater ballast tanks, cargo holds and ballast holds are to have a corrosion protective system fitted in accordance with [1.2], [1.3] and [1.4] respectively.

1.1.2

Void double side skin spaces in cargo length area for vessels having a length (L_{LL}) of not less than 150 m are to be coated in accordance with [1.2].

1.1.3

Corrosion protective coating is not required for internal surfaces of spaces intended for the carriage of fuel oil.

1.1.4

Narrow spaces are generally to be filled by an efficient protective product, particularly at the ends of the ship where inspections and maintenance are not easily practicable due to their inaccessibility.

1.2 Protection of seawater ballast tanks and void double side skin spaces

1.2.1

All dedicated seawater ballast tanks anywhere on the ship (excluding ballast hold) for vessels having a length (L) of not less than 90 m and void double side skin spaces in the cargo length area for vessels having a length (L_{LL}) of not less than 150 m are to have an efficient corrosion prevention system, such as hard protective coatings or equivalent, applied in accordance with the manufacturer's recommendation.

The coatings are to be of a light colour, i.e. a colour easily distinguishable from rust which facilitates inspection.

Where appropriate, sacrificial anodes, fitted in accordance with [2], may also be used.

1.2.2

For ships contracted for construction on or after 8 December 2006, the date of IMO adoption of the amended SOLAS regulation II-1/3-2, by which an IMO "Performance standard for protective coatings for ballast tanks and void spaces" will be made mandatory, the coatings of internal spaces subject to the amended SOLAS regulation are to satisfy the requirements of the IMO performance standard.

For ships contracted for construction on or after 1 July 2012, the IMO performance standard is to be applied as interpreted by IACS UI SC 223 and UI SC 227. In applying IACS UI SC 223, "Administration" is to be read to be the "Classification Society".

Consistent with IMO Resolution A.798(19) and IACS UI SC 122, the selection of the coating system, including coating selection, specification, and inspection plan, are to be agreed between the shipbuilder, coating system supplier and the owner, in consultation with the Society, prior to commencement of construction. The

specification for the coating system for these spaces is to be documented and this documentation is to be verified by the Society and is to be in full compliance with the coating performance standard.

The shipbuilder is to demonstrate that the selected coating system with associated surface preparation and application methods is compatible with the manufacturing processes and methods.

The shipbuilder is to demonstrate that the coating inspectors have proper qualification as required by the IMO standard.

The attending surveyor of the Society will not verify the application of the coatings but will review the reports of the coating inspectors to verify that the specified shipyard coating procedures have been followed.

RCN 1 to July 2010 version (effective from 1July 2012)

1.3 Protection of cargo hold spaces

1.3.1 Coating

It is the responsibility of the shipbuilder and of the owner to choose coatings suitable for the intended cargoes, in particular for the compatibility with the cargo.

1.3.2 Application

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of cargo holds (side and transverse bulkheads), excluding the inner bottom area and part of the hopper tank sloping plate and lower stool sloping plate, are to have an efficient protective coating, of an epoxy type or equivalent, applied in accordance with the manufacturer's recommendation.

The side and transverse bulkhead areas to be coated are specified in [1.3.3] and [1.3.4] respectively.

1.3.3 Side areas to be coated

The areas to be coated are the internal surfaces of:

- the inner side plating
- the internal surfaces of the topside tank sloping plates
- the internal surfaces of the hopper tank sloping plates for a distance of 300 mm below the frame end bracket for holds of single side skin construction or below the hopper tank upper end for holds of double side skin construction.

RCN 1 to July 2010 version (effective from 1July 2012)

These areas are shown in Fig 1.

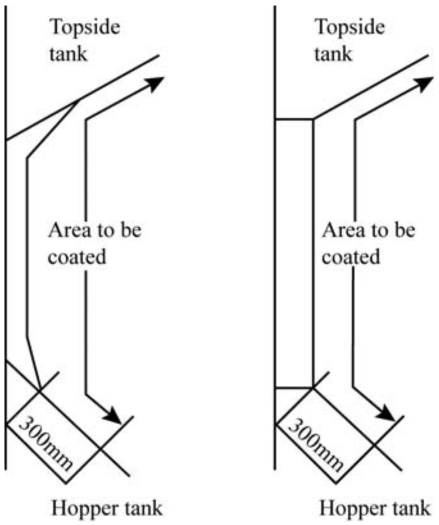

Figure 1: Side areas to be coated

1.3.4 Transverse bulkhead areas to be coated

The areas of transverse bulkheads to be coated are all the areas located above an horizontal level located at a distance of 300 mm below the frame end bracket for holds of single side skin construction or below the hopper tank upper end for holds of double side skin construction.

RCN 1 to July 2010 version (effective from 1July 2012)

1.4 Protection of ballast hold spaces

1.4.1 Application

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of ballast holds are to have an effective protective coating, of an epoxy type or equivalent, applied in accordance with the manufacturer's recommendation.

2. Sacrificial anodes

2.1 General

2.1.1

Anodes are to have steel cores and are to be fitted sufficiently rigid by the anode support designed so that they retain the anode even when it is wasted.

The steel inserts are to be attached to the structure by means of a continuous weld. Alternatively, they may be attached to separate supports by bolting, provided a minimum of two bolts with lock nuts are used. However, other mechanical means of clamping may be accepted.

2.1.2

The supports at each end of an anode may not be attached to separate items which are likely to move independently.

2.1.3

Where anode inserts or supports are welded to the structure, the welds are to be smoothly.

3. Protection of inner bottom by ceiling

3.1 General

3.1.1

Ceiling on the inner bottom, if any, is to comply with [3.2] and [3.3].

3.2 Arrangement

3.2.1

Planks forming ceiling over the bilges and on the inner bottom are to be easily removable to permit access for maintenance.

3.2.2

Where the double bottom is intended to carry fuel oil, ceiling on the inner bottom is to be separated from the plating by means of battens 30 mm high, in order to facilitate the drainage of oil leakages to the bilges.

3.2.3

Where the double bottom is intended to carry water, ceiling on the inner bottom may lie next to the plating, provided a suitable protective composition is applied beforehand.

3.2.4

The shipyard is to take care that the attachment of ceiling does not affect the tightness of the inner bottom.

3.3 Scantlings

3.3.1

The thickness of ceiling boards, when made of pine, is to be not less than 60 mm. Under cargo hatchways, the thickness of ceiling is to be increased by 15 mm.

Where the floor spacing is large, the thicknesses may be considered by the Society on a case by case basis.

Section 6 – STRUCTURAL ARRANGEMENT PRINCIPLES

Symbols

For symbols not defined in this Section, refer to the list defined in Ch 1, Sec 4.

b_h : Breadth, in m, of cargo hatch opening

ℓ_b : Length, in m, of the free edge of the end bracket

1. Application

If not specified otherwise, the requirements of this section apply to the hull structure except superstructures and deckhouses. For areas outside the cargo holds area, supplementary requirements are to be found in Ch. 9 Sec 1 to Ch. 9 Sec 3.

RCN 1 to July 2010 version (effective from 1July 2012)

2. General principles

2.1 Definition

2.1.1 Primary frame spacing

Primary frame spacing, in m, is defined as the distance between the primary supporting members.

2.1.2 Secondary frame spacing

Secondary frame spacing, in m, is defined as the distance between ordinary stiffeners.

2.2 Structural continuity

2.2.1 General

The reduction in scantling from the midship part to the end parts is to be effected as gradually as practicable.

Attention is to be paid to the structural continuity in way of changes in the framing system, at the connections of primary supporting members or ordinary stiffeners and in way of the ends of the fore and aft parts and machinery space and in way of the ends of superstructures.

2.2.2 Longitudinal members

Longitudinal members are to be so arranged as to maintain the continuity of strength.

Longitudinal members contributing to the hull girder longitudinal strength are to extend continuously for a sufficient distance towards the end of ship.

In particular, the continuity of the longitudinal bulkheads, including vertical and horizontal primary supporting members, extended over the cargo hold area is to be ensured beyond the cargo hold area. Scarfing brackets are a possible means.

2.2.3 Primary supporting members

Primary supporting members are to be arranged in such a way that they ensure adequate continuity of strength.

Abrupt changes in height or cross section are to be avoided.

2.2.4 Ordinary stiffeners

Ordinary stiffeners contributing to the hull girder longitudinal strength are generally to be continuous when crossing primary supporting members.

2.2.5 Platings

A change in plating thickness in as-built is not to exceed 50% of thicker plate thickness for load carrying direction. The butt weld preparation is to be in accordance with the requirements of Ch 11, Sec 2, [2.2].

2.2.6 Stress concentrations

Where stress concentration may occur in way of structural discontinuity, sufficient consideration is to be paid to reduce the stress concentration and adequate compensation and reinforcements are to be provided.

Openings are to be avoided, as far as practicable, in way of highly stressed areas.

Where openings are arranged, the shape of openings is to be such that the stress concentration remains within acceptable limits.

Openings are to be well rounded with smooth edges.

Weld joints are to be properly shifted from places where the stress may highly concentrate.

2.3 Connections with higher tensile steel

2.3.1 Connections with higher tensile steel

Where steels of different strengths are mixed in a hull structure, due consideration is to be given to the stress in the lower tensile steel adjacent to higher tensile steel.

Where stiffeners of lower tensile steel are supported by primary supporting members of higher tensile steel, due consideration is to be given to the stiffness of primary supporting members and scantlings to avoid excessive stress in the stiffeners due to the deformation of primary supporting members.

Where higher tensile steel is used at deck structures and bottom structure, longitudinal members not contributing to the hull girder longitudinal strength and welded to the strength deck or bottom plating and bilge strake, such as longitudinal hatch coamings, gutter bars, strengthening of deck openings, bilge keel, etc., are to be made of the same higher tensile steel. The same requirement is generally applicable for non continuous longitudinal stiffeners welded on the web of a primary member contributing to the hull girder longitudinal strength as hatch coamings, stringers and girders.

RCN 1 to July 2010 version (effective from 1July 2012)

3. Plating

3.1 Structural continuity of plating

3.1.1 Insert plate

Where a local increase in plating thickness is generally to be achieved to through insert plates, an insert plate is to be made of the materials of a quality (yield & grade) at least equal to that of the plates on which they are welded.

4. Ordinary stiffener

4.1 Profile of stiffeners

4.1.1 Stiffener profile with a bulb section

The properties of bulb profile sections are to be determined by exact calculations. If it is not possible, a bulb section may be taken as equivalent to a built-up section. The dimensions of the equivalent angle section are to be obtained, in mm, from the following formulae.

$$h_w = h'_w - \frac{h'_w}{9.2} + 2$$

$$b_f = \alpha\left(t'_w + \frac{h'_w}{6.7} - 2\right)$$

$$t_f = \frac{h'_w}{9.2} - 2$$

where:

h'_w , t'_w : Height and net thickness of a bulb section, in mm, as shown in Fig 1.

α : Coefficient equal to:

$$\alpha = 1.1 + \frac{(120 - h'_w)^2}{3000} \qquad \text{for } h'_w \le 120$$

$$\alpha = 1.0 \qquad \text{for } h'_w > 120$$

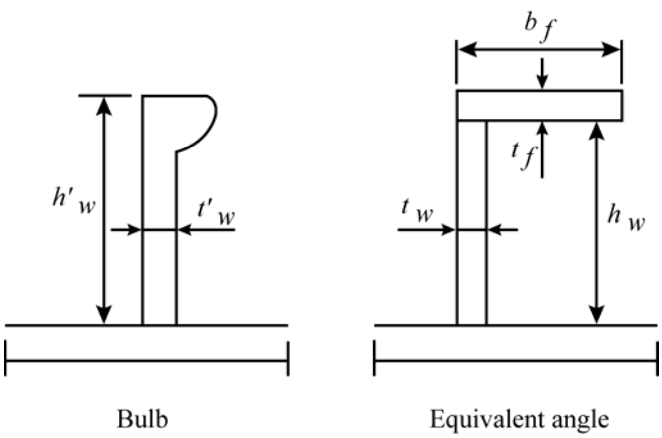

Figure 1: Dimensions of stiffeners

RCN 1 to July 2010 version (effective from 1July 2012)

4.2 Span of ordinary stiffeners

4.2.1 Ordinary stiffener

The span ℓ of ordinary stiffeners is to be measured as shown in Fig 2. For curved stiffeners, the span is measured along the chord.

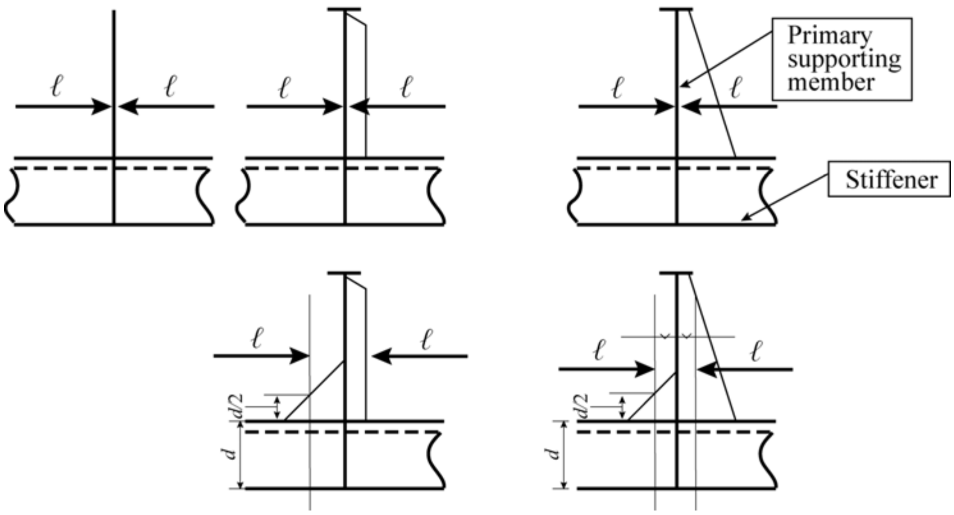

Figure 2: Span of ordinary stiffeners

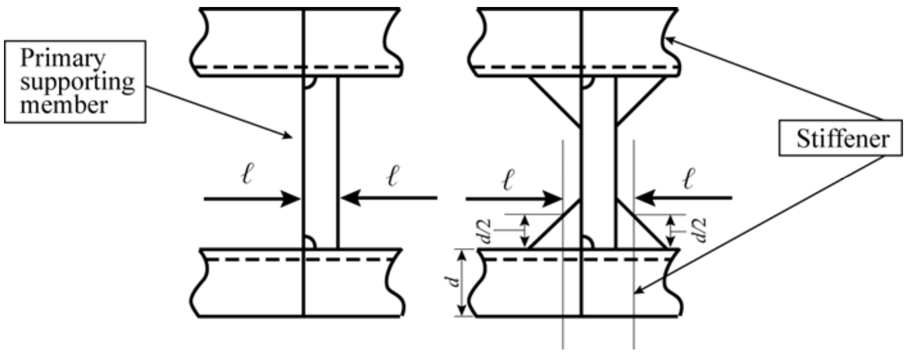

Figure 3: Span of ordinary stiffeners within a double hull

4.2.2 Ordinary stiffener within a double hull

The span ℓ of ordinary stiffeners fitted inside a double hull, i.e. when the web of the primary supporting members is connected with the inner hull and the outer shell acting as its flanges, is to be measured as shown in Fig 3.

4.2.3 Ordinary stiffeners supported by struts

The arrangement of ordinary stiffeners supported by struts is not allowed for ships over 120 m in length.

The span ℓ of ordinary stiffeners supported by one strut fitted at mid distance of the primary supporting members is to be taken as $0.7\ell_2$.

In case where two struts are fitted between primary supporting members, the span ℓ of ordinary stiffeners is to be taken as the greater of $1.4\ell_1$ and $0.7\ell_2$.

ℓ_1 and ℓ_2 are the spans defined in Figs 4 and 5.

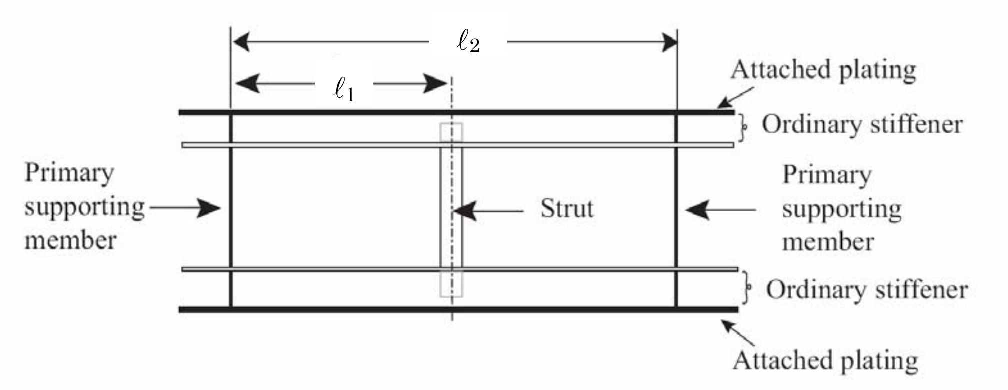

Figure 4: Span of ordinary stiffeners with one strut

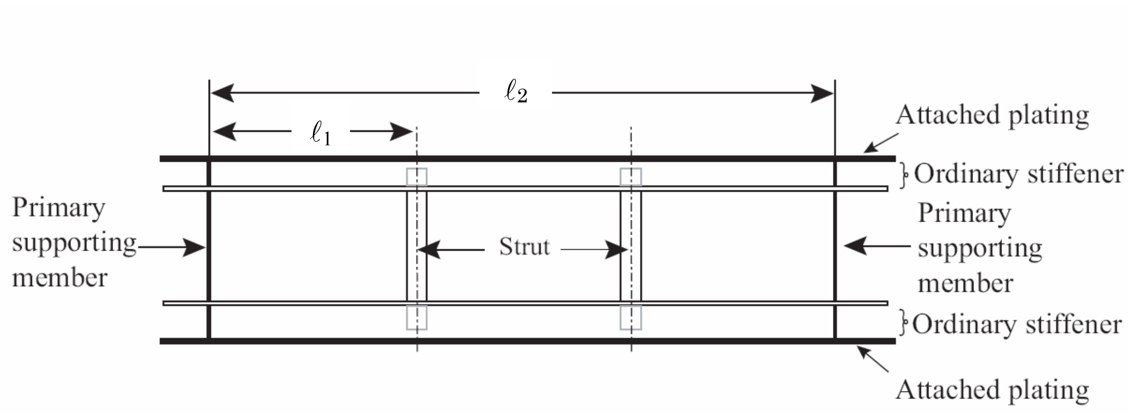

Figure 5: Span of ordinary stiffeners with two struts

4.3 Attached plating

4.3.1 Effective breadth for yielding check

The effective width b_p of the attached plating to be considered in the actual net section modulus for the yielding check of ordinary stiffeners is to be obtained, in m, from the following formulae:

- where the plating extends on both sides of the ordinary stiffener:

  $b_p = 0.2\ell$, or

  $b_p = s$

  whichever is lesser.

- where the plating extends on one side of the ordinary stiffener (i.e. ordinary stiffeners bounding openings):

  $b_p = 0.5s$

  $b_p = 0.1\ell$

  whichever is lesser.

4.3.2 Effective width for buckling check

The effective width of the attached plating of ordinary stiffeners for checking the buckling of ordinary stiffeners is defined in Ch 6, Sec 3, [5].

4.4 Geometric property of ordinary stiffeners

4.4.1 General

Geometric properties of stiffeners such as moment of inertia, section modulus, shear sectional area, slenderness ratio of web plating, etc., are to be calculated based on the net thickness as defined in Ch 3, Sec 2.

4.4.2 Stiffener not perpendicular to the attached plating

The actual stiffener's net section modulus is to be calculated about an axis parallel to the attached plating.

Where the stiffener is not perpendicular to the attached plating, the actual net section modulus can be obtained, in cm^3, from the following formula:

$$w = w_0 \sin\alpha$$

where:

w_0 : Actual net section modulus, in cm^3, of the stiffener assumed to be perpendicular to the attached plating

α : Angle, in degrees, between the stiffener web and the attached plating, as shown in Fig 6, but not to be taken less than 50.

The correction is to be applied when α is between 50 and 75 degrees.

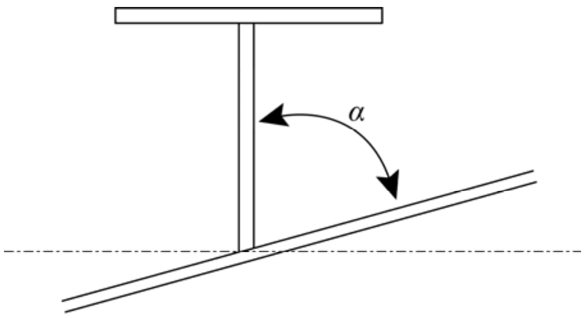

Figure 6: Angle between stiffener web and attached plating

Where the angle between the web plate of stiffener and the attached plating is less than 50 degrees, tripping bracket is to be fitted at suitable spacing. If the angle between the web plate of an unsymmetrical stiffener and the attached plating is less than 50 degrees, the face plate of the stiffener is to be fitted on the side of open bevel, as shown in Fig 7.

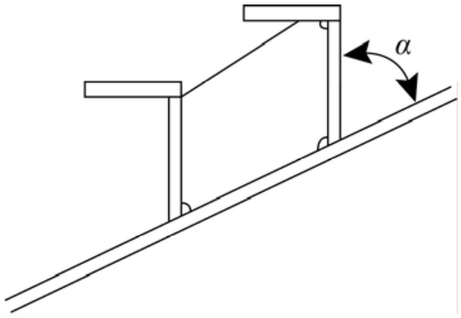

Figure 7: Orientation of stiffener when the angle is less than 50 degrees

4.5 End connections of ordinary stiffeners

4.5.1 General

Where ordinary stiffeners are to be continuous through primary supporting members, they are to be properly connected to the web plating so as to ensure proper transmission of loads. Some sample connections are shown in Fig 8 to Fig 11.

(a) (b)

Figure 8: (a) Connection without collar plate and (b) Connection with stiffener at side of longitudinal

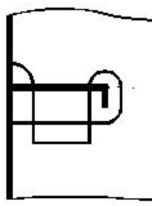

Figure 9: Connection with collar plate

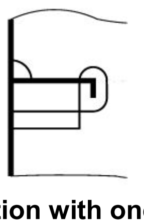

Figure 10: Connection with one large collar plate

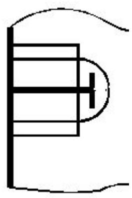

Figure 11: Connection with two large collar plates

4.5.2 Structural continuity of stiffeners

Where ordinary stiffeners are cut at primary supporting members, brackets are to be fitted to ensure structural continuity. In this case, the net section modulus and net sectional area of the brackets are to be not less than those of the ordinary stiffener.

The minimum net thickness of brackets is to be not less than that required for web plate of ordinary stiffeners.

The brackets are to be flanged or stiffened by a welded face plate where:

- the net thickness of the bracket, in mm, is less than $15\ell_b$, where ℓ_b is the length, in m, of the free edge of the end bracket or brackets; or
- the longer arm of the bracket is greater than 800 mm.

The net sectional area, in cm^2, of the flanged edge or faceplate is to be at least equal to $10\ell_b$.

4.5.3 End connections

End connection of stiffeners is to be sufficiently supported by the primary supporting members. Generally, a stiffener or a bracket to support the ordinary stiffener is to be provided.

Where slots for penetration of stiffeners are reinforced with collars, they are to be of the same materials as the primary supporting members.

Brackets or stiffeners to support the ordinary stiffeners are to be of sufficient sectional area and moment of inertia with respect to structural continuity, and are to have appropriate shape with respect to fatigue strength. If brackets or stiffeners to support the ordinary stiffeners are not fitted, or special slot configurations considering the fatigue strength are provided, fatigue strength assessment for slots are required by the Society.

5. Primary supporting members

5.1 General

5.1.1

Primary supporting members are to be arranged in such a way that they ensure adequate continuity of strength. Abrupt changes in height or in cross-section are to be avoided.

5.1.2

Where arrangements of primary supporting members are ensured adequate based on the results of FE analysis, fatigue assessment and ultimate strength assessment, primary supporting members are to be arranged in accordance with the result of such assessment.

5.2 Stiffening arrangement

5.2.1

Webs of primary supporting members are to be stiffened where the height, in mm, is greater than $100t$, where t is the net web thickness, in mm, of the primary supporting member.

In general, the web stiffeners of primary supporting members are to be spaced not more than $110t$.

The net thickness of web stiffeners and brackets, in mm, are not to be less than the value obtained from the following formula:

$t = 3 + 0.015\, L_2$

where:

L_2 : Rule length L, but to be taken not greater than 300 m

Additional stiffeners are to be fitted in way of end brackets, at the connection with cross ties, etc. of transverse primary supporting members where shearing stress and/or compressive stress is expected to be high. These parts are not to have holes. Cut outs for penetration of ordinary stiffeners in these parts are to be reinforced with collar plates.

Depth of stiffener of flat bar type is in general to be more than 1/12 of stiffener length. A smaller depth of stiffener may be accepted based on calculations showing compliance with Ch 6 Sec 2 [2.3.1], Ch 6 Sec 2 [4] and Ch 6 Sec 3 [4].

RCN 1 to July 2010 version (effective from 1July 2012)

5.2.2

Tripping brackets (see Fig 12) welded to the face plate are generally to be fitted:

- at every fourth spacing of ordinary stiffeners, without exceeding 4 m.
- at the toe of end brackets
- at rounded face plates
- in way of concentrated loads
- near the change of section.

Where the width of the symmetrical face plate is greater than 400 mm, backing brackets are to be fitted in way of the tripping brackets.

Where the face plate of the primary supporting member exceeds 180 mm on either side of the web, tripping bracket is to support the face plate as well.

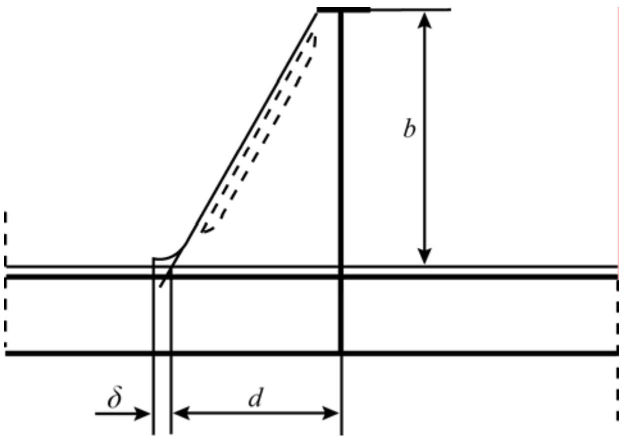

Figure 12: Primary supporting member: web stiffener in way of ordinary stiffener

5.2.3

The width of face plate of the primary supporting member except ring shape such as transverse ring in bilge hopper tanks and top side tank is to be not less than one tenth of the depth of the web, where tripping brackets are spaced as specified in [5.2.2].

5.2.4

The arm length of tripping brackets is to be not less than the greater of the following values, in m:

$$d = 0.38b$$

$$d = 0.85\sqrt{\frac{s_t}{t}}$$

where:

b : Height, in m, of tripping brackets, shown in Fig 12

s_t : Spacing, in m, of tripping brackets

t : Net thickness, in mm, of tripping brackets.

5.2.5

Tripping brackets with a net thickness, in mm, less than $10\ell_b$ are to be flanged or stiffened by a welded face plate.

The net sectional area, in cm^2, of the flanged edge or the face plate is to be not less than $7\ell_b$, where ℓ_b is the length, in m, of the free edge of the bracket.

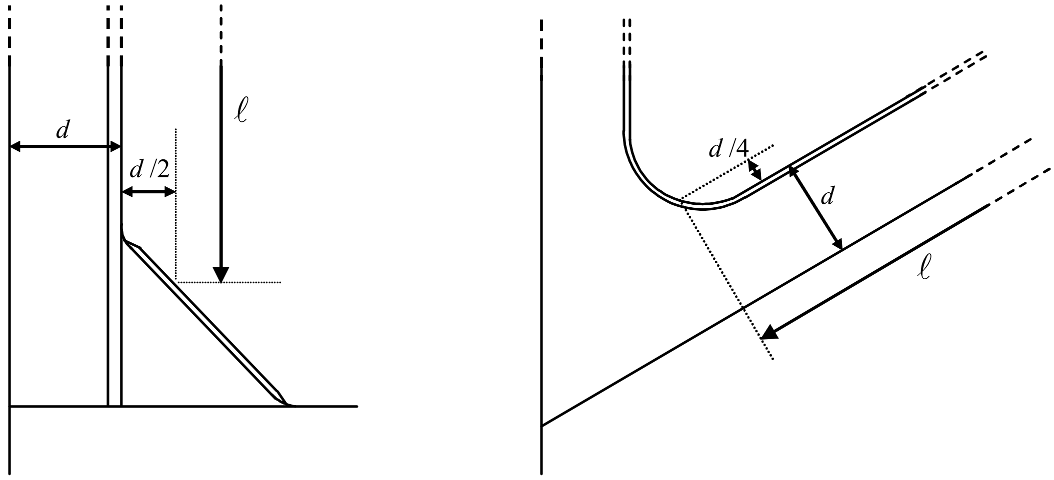
Where the height or breadth of tripping brackets is greater than 3 m, an additional stiffener is to be fitted parallel to the bracket free edge.

5.3 Span of primary supporting members

5.3.1 Definitions

The span ℓ, in m, of a primary supporting member without end bracket is to be taken as the length of the member between supports.

The span ℓ, in m, of a primary supporting member with end brackets is taken between points where the depth of the bracket is equal to half the depth of the primary supporting member as shown in Fig 13(a).
However, in case of curved brackets where the face plate of the member is continuous along the face of the bracket, as shown in Fig 13(b), the span is taken between points where the depth of the bracket is equal to one quarter the depth of the primary supporting member.



(a) **(b)**

Figure 13: Span of primary support member

5.4 Effective breadth of primary supporting member

5.4.1 General

The effective breadth b_p of the attached plating of a primary supporting member to be considered in the actual net section modulus for the yielding check is to be determined according to [4.3.1].

RCN 1 to July 2010 version (effective from 1July 2012)

5.5 Geometric properties

5.5.1 General

Geometric properties of primary supporting members such as moment of inertia, section modulus, shear sectional area, slenderness ratio of web plating, etc., are to be calculated based on the net thickness as specified in Ch 3, Sec 2.

5.6 Bracketed end connection

5.6.1 General

Where the ends of the primary supporting members are connected to bulkheads, inner bottom, etc., the end connections of all primary supporting members are to be balanced by effective supporting members on the opposite side of bulkheads, inner bottoms, etc..
Tripping brackets are to be provided on the web plate of the primary supporting members at the inner edge of end brackets and connection parts of the other primary supporting members and also at the proper intervals to support the primary supporting members effectively.

5.6.2 Dimensions of brackets

Arm length of bracket is generally not to be less than one-eighth of span length of the primary member, unless otherwise specified. Arm lengths of brackets at both ends are to be equal, as far as practicable.

The height of end brackets is to be not less than that of the primary supporting member. The net thickness of the end bracket web is not to be less than that of the web plate of the primary supporting member.

The scantlings of end brackets are to be such that the section modulus of the primary supporting member with end brackets is not less than that of the primary supporting member at mid-span point.

The width, in mm, of the face plate of end brackets is to be not less than $50(\ell_b+1)$.

Moreover, the net thickness of the face plate is to be not less than that of the bracket web.

Stiffening of end brackets is to be designed such that it provides adequate buckling web stability.

The following prescriptions are to be applied:

- where the length ℓ_b is greater than 1.5 m, the web of the bracket is to be stiffened
- the net sectional area, in cm^2, of web stiffeners is to be not less than 16.5ℓ, where ℓ is the span, in m, of the stiffener
- tripping flat bars are to be fitted to prevent lateral buckling of web stiffeners. Where the width of the symmetrical face plate is greater than 400 mm, additional backing brackets are to be fitted.

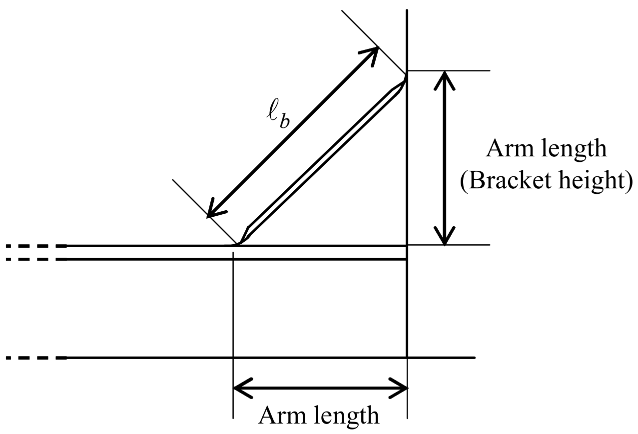


Figure 14: Dimension of brackets

5.7 Cut-outs and holes

5.7.1

Cut-outs for the passage of ordinary stiffeners are to be as small as possible and well rounded with smooth edges.

The depth of cut-outs is to be not greater than 50% of the depth of the primary supporting member.

5.7.2

Where openings such as lightening holes are cut in primary supporting members, they are to be equidistant from the face plate and corners of cut-outs and, in general, their height is to be not greater than 20% of the web height.

Where lightening holes with free edges are provided, the dimensions and locations of lightening holes are generally to be as shown in Fig 15.

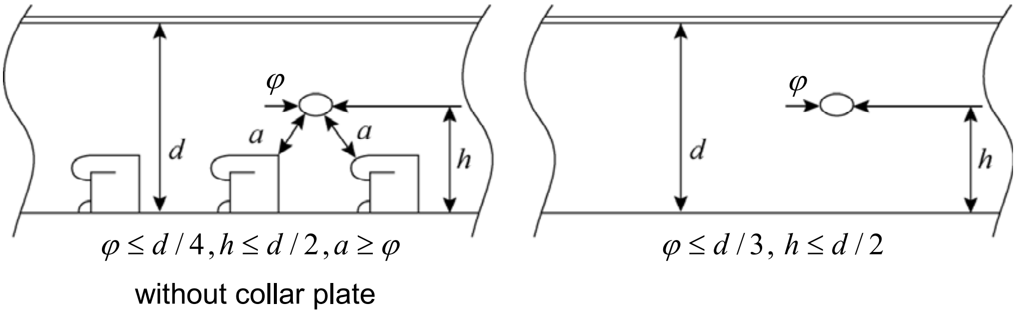

Figure 15: Location and dimensions of lightening holes

Where lightening holes are cut in the brackets, the distance from the circumference of the hole to the free flange of brackets is not to be less than the diameter of the lightening hole.

5.7.3

Openings are not be fitted in way of toes of end brackets.

5.7.4

At the mid-part within 0.5 times of the span of primary supporting members, the length of openings is to be not greater than the distance between adjacent openings.

At the ends of the span, the length of openings is to be not greater than 25% of the distance between adjacent openings.

5.7.5

In the case of large openings in the web of primary supporting members (e.g. where a pipe tunnel is fitted in the double bottom), the secondary stresses in primary supporting members are to be considered for the reinforcement of the openings.

This may be carried out by assigning an equivalent net shear sectional area to the primary supporting member obtained, in cm^2, according from the following formula:

$$A_{sh} = \frac{A_{sh1}}{1 + \dfrac{0.0032\ell^2 A_{sh1}}{I_1}} + \frac{A_{sh2}}{1 + \dfrac{0.0032\ell^2 A_{sh2}}{I_2}}$$

where (see Fig 16):

I_1, I_2 : Net moments of inertia, in cm^4, of deep webs (1) and (2), respectively, with attached plating around their neutral axes parallel to the plating

A_{sh1}, A_{sh2} : Net shear sectional areas, in cm^2, of deep webs (1) and (2), respectively, taking account of the web height reduction by the depth of the cut out for the passage of the ordinary stiffeners, if any

ℓ : Span, in cm, of deep webs (1) and (2).

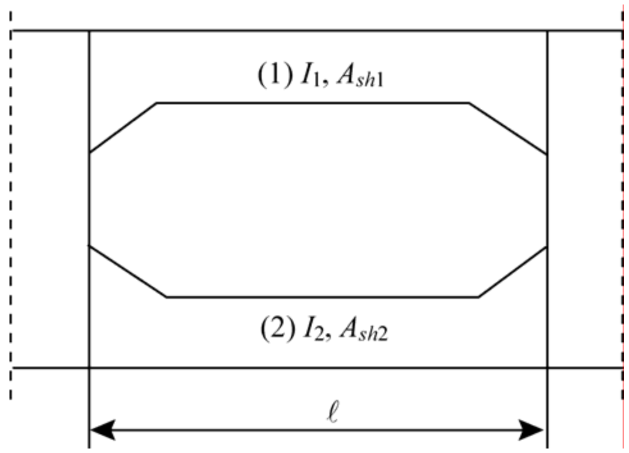

Figure 16: Large openings in the web of primary supporting members

6. Double bottom

6.1 General

6.1.1 Double bottom extend

Ref. SOLAS Ch. II-1, Part B, Reg. 12-1

A double bottom is to be fitted extending from the collision bulkhead to the afterpeak bulkhead.

6.1.2 Framing system

For ships greater than 120 m in length, the bottom, the double bottom and the sloped bulkheads of hopper tanks are to be of longitudinal system of frame arrangement at least within the cargo hold area. The spacing of the floors and bottom girders is not only governed by frame spaces but requirement in absolute value, in metres, is also indicated in [6.3.3] and [6.4.1].

6.1.3 Height of double bottom

Where a double bottom is required to be fitted the inner bottom shall be continued transversely in such a manner as to protect the bottom to the turn of the bilge.

Such protection will be deemed satisfactory if the inner bottom is not lower at any part than a plane parallel with the keel line and which is located not less than a vertical distance h measured from the keel line, as calculated by the formula:

$h = B/20$

However, in no case is the value of h to be less than 760 mm, and need not be taken as more than 2,000 mm.

Where the height of the double bottom varies, the variation is generally to be made gradually and over an adequate length; the knuckles of inner bottom plating are to be located in way of plate floors.

Where this is impossible, suitable longitudinal structures such as partial girders, longitudinal brackets etc., fitted across the knuckle are to be arranged.

RCN 1 to July 2010 version (effective from 1July 2012)

6.1.4 Dimensions of double bottom

The breadth of double bottom is taken as shown in Fig 17.

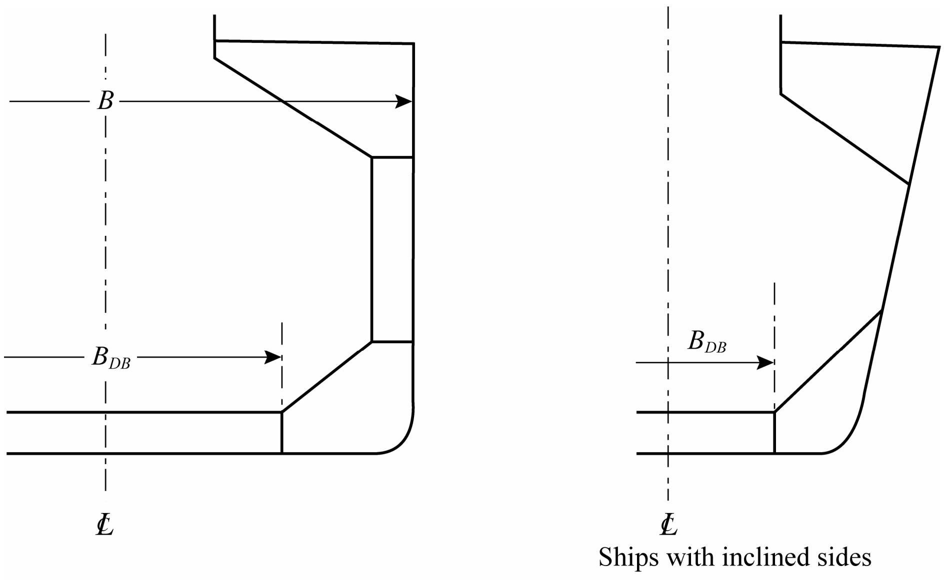

Figure 17: Breadth of double bottom

6.1.5 Docking

The bottom is to have sufficient strength to withstand the loads resulting from the dry-docking of the ship.

Where docking brackets are provided between solid floors and connecting the centreline girder to the bottom shell plating, the docking brackets are to be connected to the adjacent bottom longitudinals.

6.1.6 Continuity of strength

Where the framing system changes from longitudinal to transverse, special attention is to be paid to the continuity of strength by means of additional girders or floors. Where this variation occurs within $0.6L$ amidships, the inner bottom is generally to be maintained continuous by means of inclined plating.

Bottom and inner bottom longitudinal ordinary stiffeners are generally to be continuous through the floors.

The actual net thickness and the yield stress of the lower strake of the sloped bulkhead of hopper tanks, if any, are not to be less than these ones of the inner bottom with which the connection is made.

6.1.7 Reinforcement

The bottom is to be locally stiffened where concentrated loads are envisaged such as under the main engine and thrust seat.

Girders and floors are to be fitted under each line of pillars, toes of end brackets of bulkhead stiffeners and slant plate of lower stool of bulkhead. In case girders and floors are not fitted, suitable reinforcement is to be provided by means of additional primary supporting members or supporting brackets.

When solid ballast is fitted, it is to be securely positioned. If necessary, intermediate floors may be required for this purpose.

6.1.8 Manholes and lightening holes

Manholes and lightening holes are to be provided in floors and girders to ensure accessibility and ventilation as a rule.

The number of manholes in tank tops is to be kept to the minimum compatible with securing free ventilation and ready access to all parts of the double bottom.

Manholes may not be cut in the girders and floors below the heels of pillars.

6.1.9 Air holes and drain holes

Air and drain holes are to be provided in floors and girders.

Air holes are to be cut as near to the inner bottom and draining holes as near to the bottom shell as practicable.

Air holes and drain holes are to be designed to aid full ballast water and sediment removal to allow for effective ballast water exchange.

6.1.10 Drainage of tank top

Effective arrangements are to be provided for draining water from the tank top. Where wells are provided for the drainage, such wells are not to extend for more than one-half depth of the height of double bottom

6.1.11 Striking plate

Striking plates of adequate thickness or other equivalent arrangements are to be provided under sounding pipes to prevent the sounding rod from damaging the bottom plating.

6.1.12 Duct keel

Where a duct keel is arranged, the centre girder may be replaced by two girders generally spaced, no more than 3 m apart.

The structures in way of the floors are to ensure sufficient continuity of the latter.

6.2 Keel

6.2.1

The width of the keel is to be not less than the value obtained, in m, from the following formula:

$$b = 0.8 + L/200$$

6.3 Girders

6.3.1 Centre girder

The centre girder is to extend within the cargo hold area and is to extend forward and aft as far as practicable, and structural continuity thereof to be continuous within the full length of the ship.

Where double bottom compartments are used for the carriage of fuel oil, fresh water or ballast water, the centre girder is to be watertight, except for the case such as narrow tanks at the end parts or when other watertight girders are provided within $0.25B$ from the centreline, etc.

6.3.2 Side girders

The side girders are to extend within the parallel part of cargo hold area and are to extend forward and aft of cargo hold area as far as practicable.

6.3.3 Spacing

The spacing of adjacent girders is generally to be not greater than 4.6 m or 5 times the spacing of bottom or inner bottom ordinary stiffeners, whichever is the smaller. Greater spacing may be accepted depending on the result of the analysis carried out according to Ch 7.

6.4 Floors

6.4.1 Spacing

The spacing of floors is generally to be not greater than 3.5 m or 4 frame spaces as specified by the designer, whichever is the smaller. Greater spacing may be accepted depending on the result of the analysis carried out according to Ch 7.

6.4.2 Floors in way of transverse bulkheads

Where transverse bulkhead is provided with lower stool, solid floors are to be fitted in line with both sides of lower stool. Where transverse bulkhead is not provided with lower stool, solid floors are to be fitted in line with both flanges of the vertically corrugated transverse bulkhead or in line of plane transverse bulkhead.

RCN 1 to July 2008 version (effective from 1 July 2009)

6.4.3 Web stiffeners

Floors are to be provided with web stiffeners in way of longitudinal ordinary stiffeners. Where the web stiffeners are not provided, fatigue strength assessment for the cut out and connection of longitudinal stiffener is to be carried out.

6.5 Bilge strake and bilge keel

6.5.1 Bilge strake

Where some of the longitudinal stiffeners at the bilge part are omitted, longitudinal stiffeners are to be provided as near to the turns of bilge as practicable.

6.5.2 Bilge keel

Bilge keels are not be welded directly to the shell plating. An intermediate flat is required on the shell plating. The ends of the bilge keel are to be sniped as shown in Fig.18 or rounded with large radius. The ends are to be located in way of transverse bilge stiffeners inside the shell plating and the ends of intermediate flat are not to be located at the block joints.

The bilge keel and the intermediate flat are to be made of steel with the same yield stress as the one of the bilge strake. The bilge keel with a length greater than $0.15L$ is to be made with the same grade of steel as the one of bilge strake.

The net thickness of the intermediate flat is to be equal to that of the bilge strake. However, this thickness may generally not be greater than 15 mm.

Scallops in the bilge keels are to be avoided.

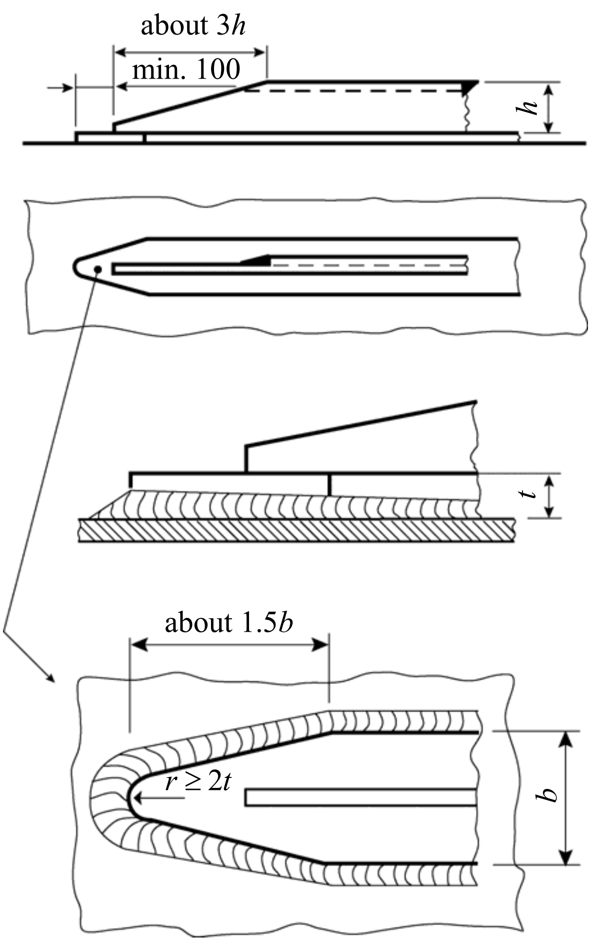

Figure 18: Example of bilge keel arrangement

7. Double Side structure in cargo hold area

RCN 1 to July 2010 version (effective from 1July 2012)

7.1 Application

7.1.1

The requirement of this article applies to longitudinally or transversely framed side structure.

The transversely framed side structures are built with transverse frames possibly supported by horizontal side girders.

The longitudinally framed side structures are built with longitudinal ordinary stiffeners supported by vertical primary supporting members.

The side within the hopper and topside tanks is, in general, to be longitudinally framed. It may be transversely framed when this is accepted for the double bottom and the deck according to [6.1.2] and [9.1.1], respectively.

7.2 Design principles

7.2.1

Where the double side space is void, the structural members bounding this space are to be structurally designed as a water ballast tank according to Ch 6. In such case the corresponding air pipe is considered as extending 0.76 m above the freeboard deck at side.

For corrosion addition, the space is still considered as void space.

7.3 Structural arrangement

7.3.1 General

Double side structures are to be thoroughly stiffened by providing web frames and side stringers within the double hull.

Continuity of the inner side structures, including stringers, is to be ensured within and beyond the cargo area. Scarfing brackets are a possible means.

7.3.2 Primary supporting member spacing

For transverse framing system, the spacing of transverse side primary supporting members is, in general, to be not greater than 3 frame spaces.

Greater spacing may be accepted depending on the results of the analysis carried out according to Ch 7 for the primary supporting members in the cargo holds.

The vertical distance between horizontal primary members of the double side is not to exceed 6 m, unless the appropriate structural members complying with the requirements for safe access are provided.

7.3.3 Primary supporting member fitting

Transverse side primary supporting members are to be fitted in line with web frames in topside and hopper tanks. However where it is not practicable for top side web frames, large brackets are to be fitted in the topside space in line with double side web frames

Transverse bulkheads in double side space are to be arranged in line with the cargo hold transverse bulkheads.

Vertical primary supporting members are to be fitted in way of hatch end beams.

Unless otherwise specified, horizontal side girders are to be fitted aft of the collision bulkhead up to $0.2L$ aft of the fore end, in line with fore peak girders.

7.3.4 Transverse ordinary stiffeners

The transverse ordinary stiffeners of the shell and the inner side are to be continuous or fitted with bracket end connections within the height of the double side. The transverse ordinary stiffeners are to be effectively connected to stringers. At their upper and lower ends, opposing shell and inner side transverse ordinary stiffeners and supporting stringer plates are to be connected by brackets.

7.3.5 Longitudinal ordinary stiffeners

The longitudinal side shell and inner side ordinary stiffeners, where fitted, are to be continuous within the length of the parallel part of cargo hold area and are to be fitted with brackets in way of transverse bulkheads aligned with cargo hold bulkheads. They are to be effectively connected to transverse web frames of the double side

structure. For the side longitudinal and ordinary stiffeners of inner skin out of parallel part of cargo hold area, special attention is to be paid for a structural continuity.

7.3.6 Sheer strake

The width of the sheer strake is to be not less than the value obtained, in m, from the following formula:

$$b = 0.715 + 0.425L / 100$$

The sheer strake may be either welded to the stringer plate or rounded.

If the shear strake is rounded, its radius, in mm, is to be not less than $17t_s$, where t_s is the net thickness, in mm, of the sheer strake.

The fillet weld at the connection of the welded sheer strake and deck plate may be either full penetration or deep penetration weld.

The upper edge of the welded sheer strake is to be rounded smooth and free of notches. Fixtures such as bulwarks, eye plates are not to be directly welded on the upper edge of sheer strake, except in fore and aft parts.

Longitudinal seam welds of rounded sheer strake are to be located outside the bent area at a distance not less than 5 times the maximum net thicknesses of the sheer strake.

The transition from a rounded sheer strake to an angled sheer strake associated with the arrangement of superstructures at the ends of the ship is to be carefully designed so as to avoid any discontinuities.

7.3.7 Plating connection

At the locations where the inner hull plating and the inner bottom plating are connected, attention is to be paid to the structural arrangement so as not to cause stress concentration.

Knuckles of the inner side are to be adequately stiffened by ordinary stiffeners or equivalent means, fitted in line with the knuckle.

The connections of hopper tank plating with inner hull and with inner bottom are to be supported by a primary supporting member.

7.4 Longitudinally framed double side

7.4.1 General

Adequate continuity of strength is to be ensured in way of breaks or changes in the width of the double side.

7.5 Transversely framed double side

7.5.1 General

Transverse frames of side and inner side may be connected by means of struts. Struts are generally to be connected to transverse frames by means of vertical brackets.

8. Single side structure in cargo hold area

RCN 1 to July 2010 version (effective from 1July 2012)

8.1 Application

8.1.1

This article applies to the single side structure with transverse framing.

If single side structure is supported by transverse or longitudinal primary supporting members, the requirements in [7] above apply to these primary supporting members as regarded to ones in double side skin.

8.2 General arrangement

8.2.1

Side frames are to be arranged at every frame space.

If air pipes are passing through the cargo hold, they are to be protected by appropriate measures to avoid a mechanical damage.

8.3 Side frames

8.3.1 General

Frames are to be built-up symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes.

The side frame flange is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature is not to be less than r, in mm, given by:

$$r = \frac{0.4 b_f^2}{t_f + t_C}$$

where:

t_C : Corrosion addition, in mm, specified in Ch 3, Sec 3

b_f and t_f : Flange width and net thickness of the curved flange, in mm. The end of the flange is to be sniped.

In ships less than 190 m in length, mild steel frames may be asymmetric and fitted with separate brackets. The face plate or flange of the bracket is to be sniped at both ends. Brackets are to be arranged with soft toes.

The dimensions of side frames are defined in Fig 19.

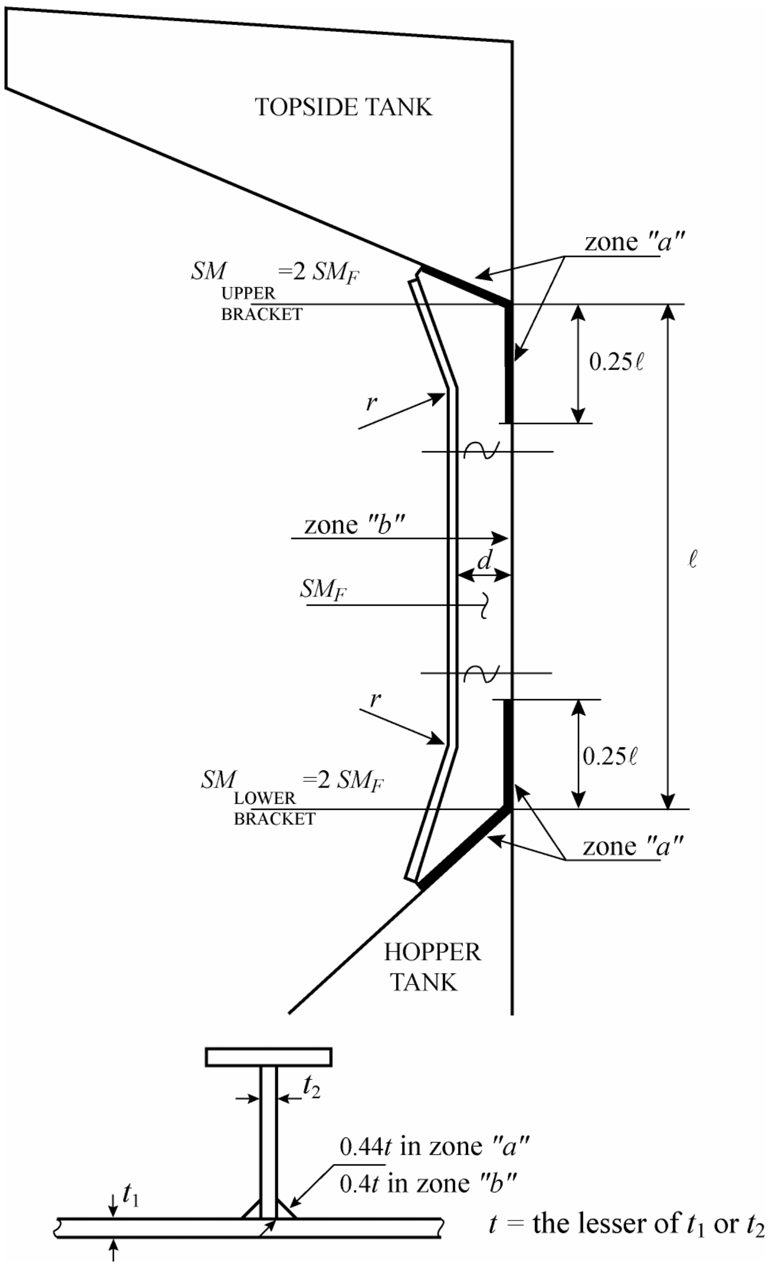

Figure 19: Dimensions of side frames

8.4 Upper and lower brackets

8.4.1

The face plates or flange of the brackets is to be sniped at both ends.

Brackets are to be arranged with soft toes.

The as-built thickness of the brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

8.4.2

The dimensions (in particular the height and length) of the lower brackets and upper brackets are to be not less than those shown in Fig 20.

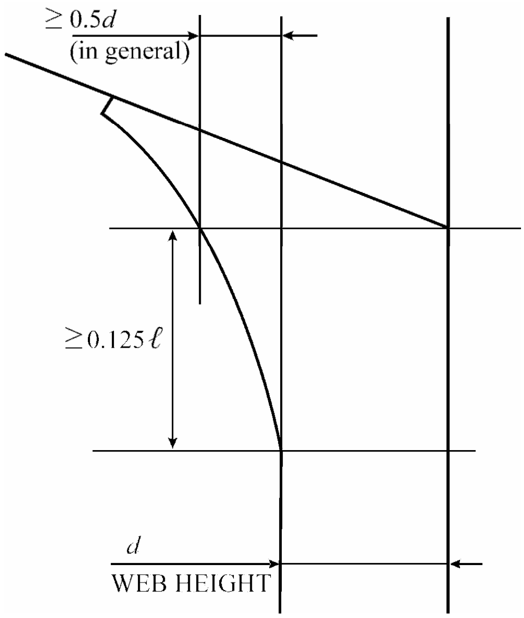

Figure 20: Dimensions of lower and upper brackets

8.5 Tripping brackets

8.5.1

In way of the foremost hold and in the holds of **BC-A** ships, side frames of asymmetrical section are to be fitted with tripping brackets at every two frames, as shown in Fig 21.

The as-built thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

Double continuous welding is to be adopted for the connections of tripping brackets with side shell frames and plating.

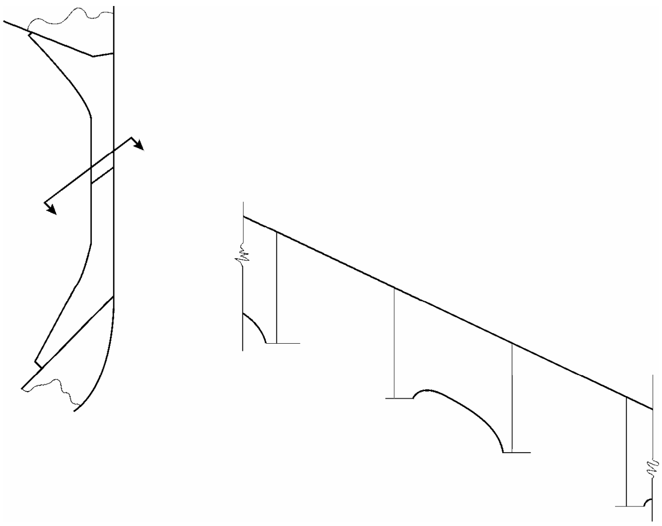

Figure 21: Tripping brackets to be fitted in way of foremost hold

8.6 Support structure

8.6.1

Structural continuity with the lower and upper end connections of side frames is to be ensured within hopper and topside tanks by connecting brackets as shown in Fig 22. The brackets are to be stiffened against buckling according to [5.6.2].

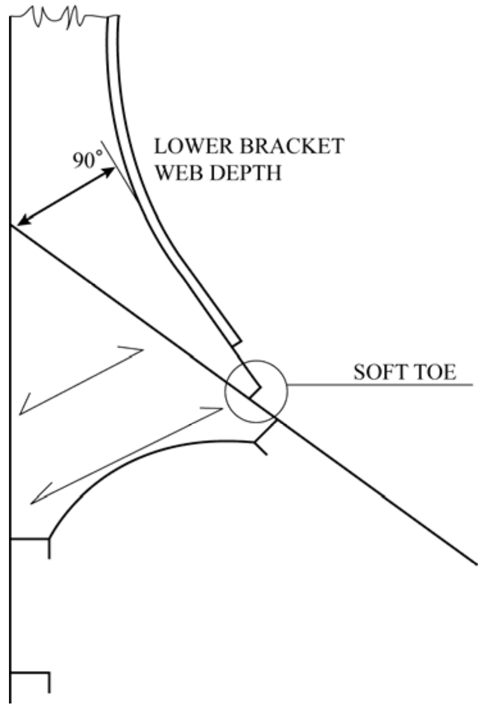

Figure 22: Example of support structure for lower end

9. Deck structure

9.1 Application

9.1.1

The deck outside the line of hatches and the topside tank sloping plates are to be longitudinally framed. Within the line of hatches, other arrangement than longitudinal framing may be considered provided that adequate structural continuity is ensured.

9.2 General arrangement

9.2.1

The spacing of web frames in topside tanks is generally to be not greater than 6 frame spaces.

Greater spacing may be accepted by the Society, on a case-by-case basis, depending on the results of the analysis carried out according to Ch 7.

9.2.2

The deck supporting structure is to be made of ordinary stiffeners longitudinally or transversely arranged, supported by primary supporting members.

9.2.3 Deck between hatches

Inside the line of openings, a transversely framed structure is to be generally adopted for the cross deck structures. Hatch end beams and cross deck beams are to be adequately supported by girders and extended outward to the second longitudinal from the hatch side girders towards the deck side. Where this is impracticable, intercostal stiffeners are to be fitted between the hatch side girder and the second longitudinal.

If the extension of beams outward to the second longitudinal is not achievable, structural checks of the structure are to be performed in compliance with the requirements in Ch.7 or by means deemed appropriate by the Society.

Smooth connection of the strength deck at side with the deck between hatches is to be ensured by a plate of intermediate thickness.

RCN 1 to July 2010 version (effective from 1July 2012)

9.2.4 Topside tank structures

Topside tank structures are to extend as far as possible within the machinery space and are to be adequately tapered.

Where a double side primary supporting member is fitted outside the plane of the topside tank web frame, a large bracket is to be fitted in line with.

9.2.5 Stringer plate

The width of the stringer plate is to be not less than the value obtained, in m, from the following formula:

$$b = 0.35 + 0.5L / 100$$

Rounded stringer plate, where adopted, are to have a radius complying with the requirements in [7.3.6].

9.2.6

Adequate continuity of strength by providing proper overlapping of structures and adequate scarphing members is to be ensured in way of:

- stepped strength deck
- changes in the framing system

9.2.7

Deck supporting structures under deck machinery, cranes, king post and equipment such as towing equipment, mooring equipment, etc., are to be adequately stiffened.

9.2.8

Pillars or other supporting structures are to be generally fitted under heavy concentrated loads.

9.2.9

A suitable stiffening arrangement is considered in way of the ends and corners of deckhouses and partial superstructures.

9.2.10 Connection of hatch end beams with deck structures

The connection of hatch end beams with deck structures is to be properly ensured by fitting inside the topside tanks additional web frames or brackets.

9.2.11 Construction of deck plating

Hatchways or other openings on decks are to have rounded corners, and compensation is to be suitably provided.

9.3 Longitudinally framed deck

9.3.1 General

Deck longitudinals within the parallel part of cargo hold area except within the line of hatch openings are to be continuous in way of deck transverses and transverse bulkheads. For the deck longitudinals out of parallel part of cargo hold area, other arrangements may be considered, provided adequate continuity of longitudinal strength is ensured.

Connections at ends of longitudinal stiffeners are to ensure a sufficient strength to bending and shear.

9.4 Transversely framed deck

9.4.1 General

Where the deck structure is transversely framed, deck beams or deck transverse stiffeners are to be fitted at each frame.

Transverse beams or deck transverse stiffeners are to be connected to side structure or frames by brackets.

9.5 Hatch supporting structures

9.5.1

Hatch side girders and hatch end beams of reinforced scantlings are to be fitted in way of cargo hold openings.

9.5.2

The connection of hatch end beams to web frames is to be ensured. Hatch end beams are to be aligned with transverse web frames in topside tanks.

(RCN 2, effective from 1 July 2008)

9.5.3

Clear of openings, adequate continuity of strength of longitudinal hatch coamings is to be ensured by under deck girders.

At hatchway corners, deck girders or their extension parts provided under deck in line with hatch coamings and hatch end beams are to be effectively connected so as to maintain the continuity in strength.

(RCN 2, effective from 1 July 2008)

9.5.4

For ships with holds designed for loading/discharging by grabs and having the additional class notation GRAB[X], wire rope grooving in way of cargo holds openings is to be prevented by fitting suitable protection such as half-round bar on the hatch side girders (i.e. upper portion of top side tank plates)/hatch end beams in cargo hold and upper portion of hatch coamings.

RCN 2 to July 2008 version (effective from 1 July 2010)

9.6 Openings in the strength deck

9.6.1 General

Openings in the strength deck are to be kept to a minimum and spaced as far as practicable from one another and from the breaks of effective superstructures. Openings are to be cut as far as practicable from hatchway corners, hatch side coamings and side shell platings.

9.6.2 Small opening location

Openings are generally to be cut outside the limits as shown in Fig 23 in dashed area, defined by:

- the bent area of a rounded sheer strake, if any, or the side shell
- $e = 0.25(B - b)$ from the edge of opening
- $c = 0.07\ell + 0.1b$ or $0.25b$, whichever is greater

where:

b : Width, in m, of the hatchway considered, measured in the transverse direction. (see Fig 23)

ℓ : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction. (see Fig 23).

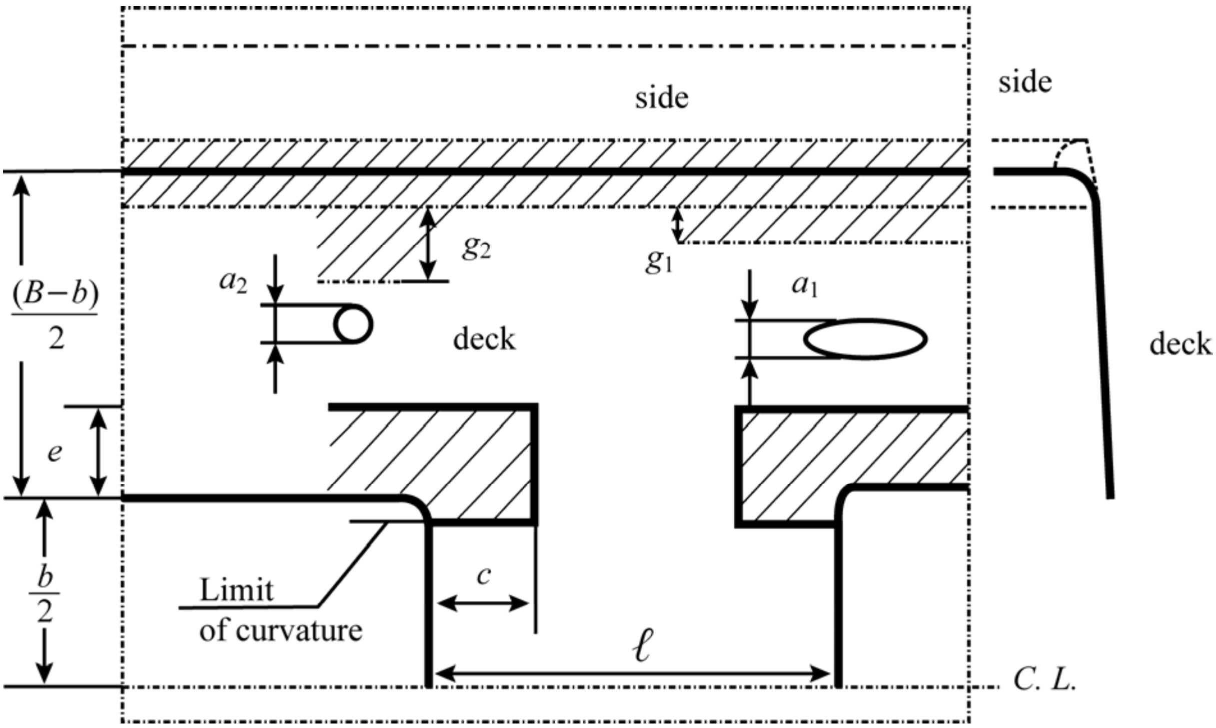

Figure 23: Position of openings in strength deck

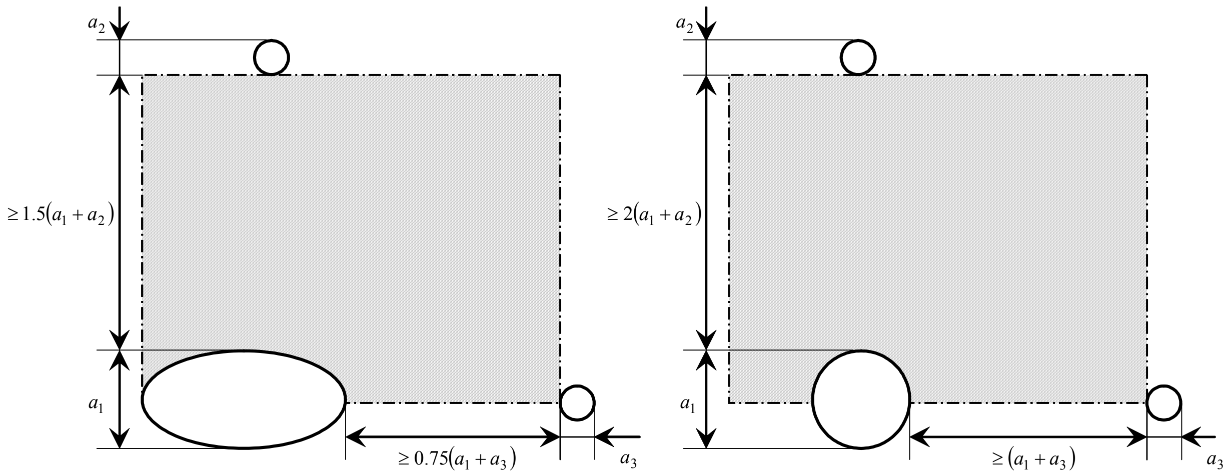

Figure 24: Elliptical and circular openings in strength deck

Moreover the transverse distance between these limits and openings or between openings together is not to be less than the followings:

- Transverse distance between the above limits and openings or between hatchways and openings as shown in Fig 23:
  - $g_2 = 2a_2$ for circular openings
  - $g_1 = a_1$ for elliptical openings
- Transverse distance between openings as shown in Fig 24:
  - $2(a_1 + a_2)$ for circular openings
  - $1.5(a_1 + a_2)$ for elliptical openings

  where

  a_1 : Transverse dimension of elliptical openings, or diameter of circular openings, as the case may be

  a_2 : Transverse dimension of elliptical openings, or diameter of circular openings, as the case may be

  a_3 : Longitudinal dimension of elliptical openings, or diameter of circular openings, as the case may be
- Longitudinal distance between openings is not to be less than the followings:
  - $(a_1 + a_3)$ for circular openings
  - $0.75(a_1 + a_3)$ for elliptical openings and for an elliptical opening in line with a circular one.

If the opening arrangements do not comply with these requirements, the longitudinal strength assessment in accordance with Ch 5 is to be carried out by subtracting such opening areas.

9.6.3 Corner of hatchways

For hatchways located within the cargo area, insert plates, whose thickness is to be determined according to the formula given after, are generally to be fitted in way of corners where the plating cut-out has a circular profile.

The radius of circular corners is to be not less than 5% of the hatch width, where a continuous longitudinal deck girder is fitted below the hatch coaming.

Corner radius, in the case of the arrangement of two or more hatchways athwartship, is considered by the Society on a case by case basis.

For hatchways located within the cargo area, insert plates are, in general, not required in way of corners where the plating cut-out has an elliptical or parabolic profile and the half axes of elliptical openings, or the half lengths of the parabolic arch, are not less than:

- 1/20 of the hatchway width or 600 mm, whichever is the lesser, in the transverse direction
- twice the transverse dimension, in the fore and aft direction.

Where insert plates are required, their net thickness is to be obtained, in mm, from the following formula:

$$t_{INS} = (0.8 + 0.4b / l)\, t$$

Corrigenda 2 to July 2012 version (effective from 1 July 2012)

without being taken less than t or greater than $1.6t$

where:

ℓ : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction (see Fig 23)

b : Width, in m, of the hatchway considered, measured in the transverse direction (see Fig 23)

t : Actual net thickness, in mm, of the deck at the side of the hatchways.

For the extreme corners of end hatchways, the thickness of insert plates is to be 60% greater than the actual thickness of the adjacent deck plating. A lower thickness may be accepted by the Society on the basis of calculations showing that stresses at hatch corners are lower than permissible values.

Where insert plates are required, the arrangement is shown in Fig 25, in which d_1, d_2, d_3 and d_4 are to be greater than the ordinary stiffener spacing.

For hatchways located outside the cargo area, a reduction in the thickness of the insert plates in way of corners may be considered by the Society on a case by case basis.

For ships having length L of 150 m or above, the corner radius, the thickness and the extent of insert plate may be determined by the results of a direct strength assessment according to Ch 7, Sec 2 and Sec 3, including buckling check and fatigue strength assessment of hatch corners according to Ch 8, Sec 5.

(RCN 2, effective from 1 July 2008)

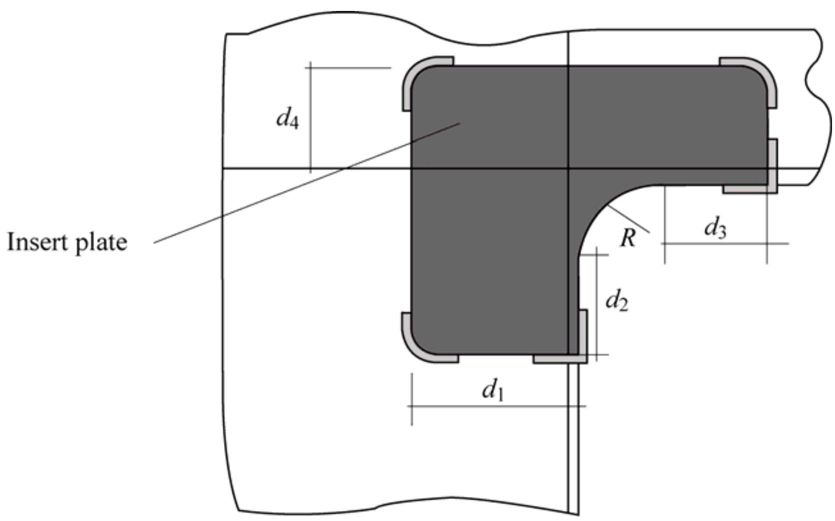

Figure 25: Hatch corner insert plate

10. Bulkhead structure

10.1 Application

10.1.1

The requirements of this article apply to longitudinal and transverse bulkhead structures which may be plane or corrugated.

10.1.2 Plane bulkheads

Plane bulkheads may be horizontally or vertically stiffened.

Horizontally framed bulkheads are made of horizontal ordinary stiffeners supported by vertical primary supporting members.

Vertically framed bulkheads are made of vertical ordinary stiffeners which may be supported by horizontal girders.

10.2 General

10.2.1

The web height of vertical primary supporting members of bulkheads may be gradually tapered from bottom to deck.

10.2.2

The net thickness of the after peak bulkhead plating in way of the stern tube is to be increased by at least 60% of other part of after peak bulkhead plating

10.3 Plane bulkheads

10.3.1 General

Where a bulkhead does not extend up to the uppermost continuous deck, suitable strengthening is to be provided in the extension of the bulkhead.

Bulkheads are to be stiffened in way of the deck girders.

The bulkhead stiffener webs of hopper and topside tank watertight bulkheads are required to be aligned with the webs of longitudinal stiffeners of sloping plates of inner hull.

A primary supporting member is to be provided in way of any vertical knuckle in longitudinal bulkheads. The distance between the knuckle and the primary supporting member is to be taken not greater than 70 mm. When the knuckle is not vertical, it is to be adequately stiffened by ordinary stiffeners or equivalent means, fitted in line with the knuckle.

Plate floors are to be fitted in the double bottom in line with the plate transverse bulkhead.

10.3.2 End connection of ordinary stiffeners

The crossing of ordinary stiffeners through a watertight bulkhead is to be watertight.

In general, end connections of ordinary stiffeners are to be bracketed. If bracketed end connections cannot be applied due to hull lines, etc., they are to be terminated on transverse headers between adjacent longitudinal or if

not possible, sniped ends may be accepted, provided the scantling of ordinary stiffeners and corresponding plating are modified accordingly.

10.3.3 Sniped end of ordinary stiffener

Sniped ends are not allowed on bulkheads subject to hydrostatic pressure. Where sniped ordinary stiffeners are fitted, the snipe angle is not to be greater than 30 degrees, and their ends are to be extended as far as practicable to the boundary of the bulkhead.

10.3.4 Bracketed ordinary stiffeners

Where bracketed ordinary stiffeners are fitted, the arm lengths of end brackets of ordinary stiffeners, as shown in Figs 26 and 27, are to be not less than the following values, in mm:

- for arm length a:
  - brackets of horizontal stiffeners and bottom bracket of vertical stiffeners:
    $a = 100\ell$
  - upper bracket of vertical stiffeners:
    $a = 80\ell$
- for arm length b, the greater of

  $b = 80\{(w + 20)/t\}^{0.5}$ and

  $b = \alpha p s \ell / t$

where:

ℓ : Span, in m, of the stiffener measured between supports

w : Net section modulus, in cm^3, of the stiffener

t : Net thickness, in mm, of the bracket

p : Design pressure, in kN/m^2, calculated at mid-span

α : Coefficient equal to:

$\alpha = 4.9$ for tank bulkheads

$\alpha = 3.6$ for watertight bulkheads.

The connection between the stiffener and the bracket is to be such that the net section modulus of the connection is not less than that of the stiffener.

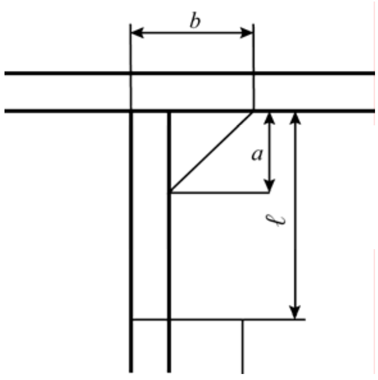

Figure 26: Bracket at upper end of ordinary stiffener on plane bulkhead

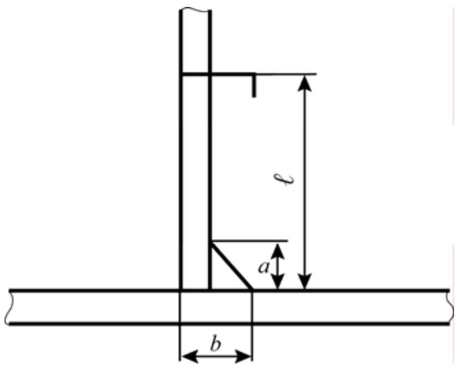

Figure 27: Bracket at lower end of ordinary stiffener on plane bulkhead

10.4 Corrugated bulkheads

10.4.1 General

For ships of 190 m of length L and above, the transverse vertically corrugated watertight bulkheads are to be fitted with a lower stool, and generally with an upper stool below deck. For ships less than 190 m in length L, corrugations may extend from inner bottom to deck provided the global strength of hull structures are satisfactorily proved for ships having ship length L of 150 m and above by DSA as required by Ch 7 of the Rules.

10.4.2 Construction

The main dimensions a, R, c, d, t, φ and s_C of corrugated bulkheads are defined in Fig 28.

The bending radius is not to be less than the following values, in mm:

$R = 3.0t$

where :

t : As-built thickness, in mm, of the corrugated plate.

The corrugation angle φ shown in Fig 28 is to be not less than 55°.

RCN 1 to July 2008 version (effective from 1 July 2009)

When welds in a direction parallel to the bend axis are provided in the zone of the bend, the welding procedures are to be submitted to the Society for approval.

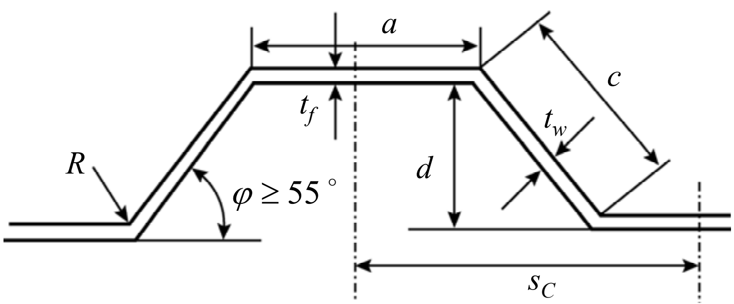

Figure 28: Dimensions of a corrugated bulkhead

10.4.3 Actual section modulus of corrugations

The net section modulus of a corrugation may be obtained, in cm^3, from the following formula:

$$w = \left[\frac{d(3at_f + ct_w)}{6} \right] 10^{-3}$$

where:

t_f, t_w : Net thickness of the plating of the corrugation, in mm, shown in Fig 28

d, a, c : Dimensions of the corrugation, in mm, shown in Fig 28.

Where the web continuity is not ensured at ends of the bulkhead, the net section modulus of a corrugation is to be obtained, in cm^3, from the following formula:

$$w = 0.5\, a\, t_f\, d \cdot 10^{-3}$$

10.4.4 Span of corrugations

The span ℓ_C of the corrugations is to be taken as the distance shown in Fig 29.

For the definition of ℓ_C, the internal end of the upper stool is not to be taken more than a distance from the deck at the centre line equal to:

- 3 times the depth of corrugation, in general
- 2 times the depth of corrugation, for rectangular stool

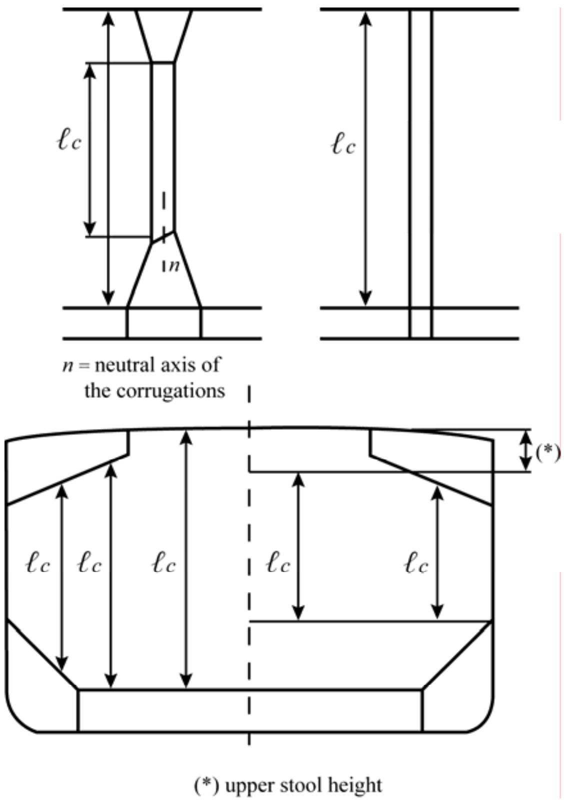

Figure 29: Span of the corrugations

10.4.5 Structural arrangements

The strength continuity of corrugated bulkheads is to be ensured at the ends of corrugations.

Where corrugated bulkheads are cut in way of primary supporting members, attention is to be paid to ensure correct alignment of corrugations on each side of the primary member.

Where vertically corrugated transverse bulkheads or longitudinal bulkheads are welded on the inner bottom plate, floors or girders are to be fitted in way of flanges of corrugations, respectively.

In general, the first vertical corrugation connected to the boundary structures is to have a width not smaller than typical width of corrugation flange. *RCN 1 to July 2008 version (effective from 1 July 2009)*

10.4.6 Bulkhead stools

Plate diaphragms or web frames are to be fitted in bottom stools in way of the double bottom longitudinal girders or plate floors, as the case may be.

Brackets or deep webs are to be fitted to connect the upper stool to the deck transverse or hatch end beams, as the case may be. *RCN 1 to July 2008 version (effective from 1 July 2009)*

10.4.7 Lower stool

The lower stool, when fitted, is to have a height in general not less than 3 times the depth of the corrugations. The ends of stool side ordinary stiffeners, when fitted in a vertical plane, are to be attached to brackets at the upper and lower ends of the stool.

The distance d from the edge of the stool top plate to the surface of the corrugation flange is to be in accordance with Fig 30.

The stool bottom is to be installed in line with double bottom floors or girders as the case may be, and is to have a width not less than 2.5 times the mean depth of the corrugation.

The stool is to be fitted with diaphragms in line with the longitudinal double bottom girders or floors as the case may be, for effective support of the corrugated bulkhead. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided.

Where corrugations are cut at the lower stool, corrugated bulkhead plating is to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or deep penetration welds. The supporting floors are to be connected to the inner bottom by either full penetration or deep penetration weld.

RCN 1 to July 2008 version (effective from 1 July 2009)

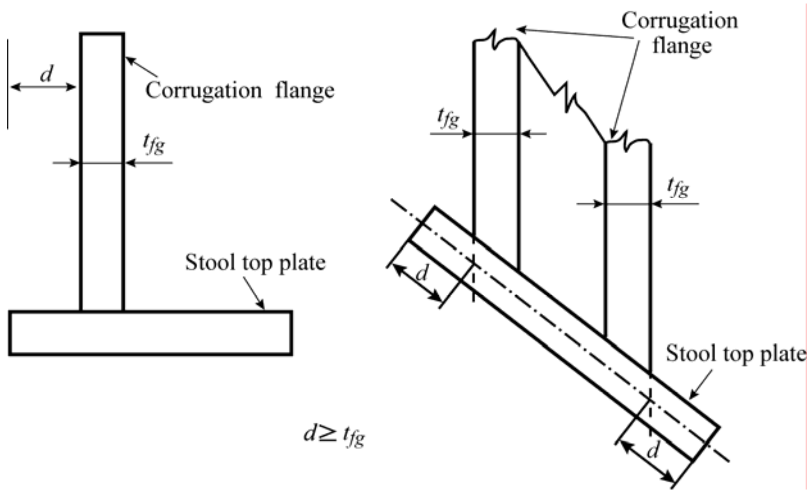

Figure 30: Permitted distance, *d*, from the edge of the stool top plate to the surface of the corrugation flange

10.4.8 Upper stool

The upper stool, when fitted, is to have a height in general between two and three times the depth of corrugations. Rectangular stools are to have a height in general equal to twice the depth of corrugations, measured from the deck level and at the hatch side girder.

The upper stool of transverse bulkhead is to be properly supported by deck girders or deep brackets between the adjacent hatch end beams.

The width of the upper stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non-rectangular stools is to have a width not less than twice the depth of corrugations.

The ends of stool side ordinary stiffeners when fitted in a vertical plane, are to be attached to brackets at the upper and lower end of the stool.

The stool is to be fitted with diaphragms in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders or transverse deck primary supporting members as the case may be, for effective support of the corrugated bulkhead.

Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

RCN 1 to July 2008 version (effective from 1 July 2009)

10.4.9 Alignment

At deck, if no upper stool is fitted, two transverse or longitudinal reinforced beams as the case may be, are to be fitted in line with the corrugation flanges.

At bottom, if no lower stool is fitted, the corrugation flanges are to be in line with the supporting floors or girders.

The weld of corrugations and floors or girders to the inner bottom plating are to be full penetration ones.

The cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors or girders are to be connected to each other by suitably designed shear plates.

Stool side plating is to be aligned with the corrugation flanges. Lower stool side vertical stiffeners and their brackets in the stool are to be aligned with the inner bottom structures as longitudinals or similar, to provide appropriate load transmission between these stiffening members.

Lower stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top plate.

RCN 1 to July 2008 version (effective from 1 July 2009)

10.4.10 Effective width of the compression flange

The effective width of the corrugation flange in compression to be considered for the strength check of the bulkhead is to be obtained, in m, from the following formula:

$$b_{ef} = C_E a$$

where:

C_E : Coefficient to be taken equal to:

$$C_E = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \qquad \text{for } \beta > 1.25$$

$$C_E = 1.0 \qquad \text{for } \beta \le 1.25$$

β : Coefficient to be taken equal to:

$$\beta = 10^3 \frac{a}{t_f} \sqrt{\frac{R_{eH}}{E}}$$

a : Width, in m, of the corrugation flange (see Fig 28)

t_f : Net flange thickness, in mm.

10.4.11 Effective shedder plates

Effective shedder plates are those which:

- are not knuckled
- are welded to the corrugations and the lower stool top plate according to Ch 11
- are fitted with a minimum slope of 45°, their lower edge being in line with the lower stool side plating
- have thickness not less than 75% of that required for the corrugation flanges
- have material properties not less than those required for the flanges.

10.4.12 Effective gusset plate

Effective gusset plates are those which:

- are in combination with shedder plates having thickness, material properties and welded connections as requested for shedder plates in [10.4.11],
- have a height not less than half of the flange width,
- are fitted in line with the lower stool side plating,
- are welded to the lower stool top plate, corrugations and shedder plates according to Ch 11,
- have thickness and material properties not less than those required for the flanges.

10.5 Non-tight bulkheads

10.5.1 Non-tight bulkheads not acting as pillars

Non-tight bulkheads not acting as pillars are to be provided with bulkhead stiffeners with a maximum spacing equal to:

- 0.9 m, for transverse bulkheads
- two frame spacings, with a maximum of 1.5 m, for longitudinal bulkheads.

The net thickness of bulkhead stiffener, in mm, is not to be less than the value obtained from the following formula:

$t = 3 + 0.015\, L_2$

where:

L_2 : Rule length L, but to be taken not greater than 300 m

The depth of bulkhead stiffener of flat bar type is in general not to be less than 1/12 of stiffener length. A smaller depth of stiffener may be accepted based on calculations showing compliance with Ch 6 Sec 2 [2.3.1], Ch 6 Sec 2 [4] and Ch 6 Sec 3 [4].

RCN 1 to July 2010 version (effective from 1July 2012)

10.5.2 Non-tight bulkheads acting as pillars

Non-tight bulkheads acting as pillars are to be provided with bulkhead stiffeners with a maximum spacing equal to:

- two frame spacings, when the frame spacing does not exceed 0.75 m,
- one frame spacing, when the frame spacing is greater than 0.75 m.

Each vertical stiffener, in association with a width of plating equal to 35 times the plating net thickness or 1/12 of stiffener length, whichever is the smaller, is to comply with the applicable requirements in Ch 6, Sec 2, for the load being supported.

In the case of non-tight bulkheads supporting longitudinally framed decks, vertical girders are to be provided in way of deck transverse.

10.6 Watertight bulkheads of trunks and tunnels

10.6.1

Ref. SOLAS Ch. II-1, Part B, Reg. 19.1

Watertight trunks, tunnels, duct keels and ventilators are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing openings in them, are to be to the satisfaction of the Society.

11. Pillars

11.1 General

11.1.1

Pillars are to be fitted, as far as practicable, in the same vertical line. If not possible, effective means are to be provided for transmitting their loads to the supports below.

11.1.2

Pillars are to be provided in line with the double bottom girder or as close thereto as practicable, and the structure above and under the pillars is to be of sufficient strength to provide effective distribution of the load. Where pillars connected to the inner bottom are not located in way of the intersection of floors and girders, partial floors or girders or equivalent structures suitable to support the pillars are to be arranged.

11.1.3

Pillars provided in tanks are to be of solid or open section type. Pillars located in spaces intended for products which may produce explosive gases are to be of open section type.

11.1.4 Connections

Heads and heels of pillars are to be secured by thick doubling plates and brackets as necessary. Where the pillars are likely to be subjected to tensile loads such as those in tanks, the head and heel of pillars are to be efficiently secured to withstand the tensile loads and the doubling plates replaced by insert plate.

In general, the net thickness of doubling plates is to be not less than 1.5 times the net thickness of the pillar.

Pillars are to be attached at their heads and heels by continuous welding.

Chapter 4

Design Loads

Appendix 2 Standard Loading Conditions for Direct Strength Analysis

Appendix 3 Standard Loading Conditions for Fatigue Assessment

Section 1 – GENERAL

1. General

1.1

1.1.1

The equivalent design wave (EDW) method is used to set the design loads which include lateral loads normal to plating and hull girder loads in still water and in waves.

1.1.2

External hydrostatic pressure and internal static pressure due to cargo and ballast are considered as lateral loads in still water. External hydrodynamic pressure and internal inertial pressure due to cargo and ballast are considered as lateral loads in waves.

1.1.3

Still water vertical shear force and bending moment, wave-induced vertical shear force and bending moment and wave-induced horizontal bending moment are considered as the hull girder loads.

1.1.4

The stresses due to the lateral loads in waves and the hull girder loads in waves are to be combined using load combination factors determined for each equivalent design wave.

Section 2 – SHIP MOTIONS AND ACCELERATIONS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

a_0 : Acceleration parameter, taken equal to:

$$a_0 = f_p\left(1.58 - 0.47C_B\right)\left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right)$$

T_R : Roll period, in s, defined in [2.1.1]

θ : Single roll amplitude, in deg, defined in [2.1.1]

T_P : Pitch period, in s, defined in [2.2.1]

Φ : Single pitch amplitude, in deg, defined in [2.2.1]

f_p : Coefficient corresponding to the probability level, taken equal to:

$f_p = 1.0$ for strength assessments corresponding to the probability level of 10^{-8}

$f_p = 0.5$ for strength assessments corresponding to the probability level of 10^{-4}

1. General

1.1

1.1.1

Ship motions and accelerations are assumed to be periodic. The motion amplitudes, defined by the formulae in this Section, are half of the crest to trough amplitudes.

1.1.2

As an alternative to the formulae in this Section, the Society may accept the values of ship motions and accelerations derived from direct calculations or obtained from model tests, when justified on the basis of the ship's characteristics and intended service. In general, the values of ship motions and accelerations to be determined are those which can be reached with a probability level of 10^{-8} or 10^{-4}. In any case, the model tests or the calculations, including the assumed sea scatter diagrams and spectra, are to be submitted to the Society for approval.

2. Ship absolute motions and accelerations

2.1 Roll

2.1.1

The roll period T_R, in s, and the single roll amplitude θ, in deg, are given by:

$$T_R = \frac{2.3k_r}{\sqrt{GM}}$$

$$\theta = \frac{9000\left(1.25 - 0.025T_R\right)f_p k_b}{\left(B + 75\right)\pi}$$

where:

k_b : Coefficient taken equal to:

$k_b = 1.2$ for ships without bilge keel

$k_b = 1.0$ for ships with bilge keel

k_r : Roll radius of gyration, in m, in the considered loading condition. When k_r is not known, the values indicated in Tab 1 may be assumed.

GM : Metacentric height, in m, in the considered loading condition. When GM is not known, the values indicated in Tab 1 may be assumed.

Table 1: Values of k_r and GM *RCN 1 to July 2008 version (effective from 1 July 2009)*

Loading condition		k_r	GM
Full load condition	Alternate or homogeneous loading	$0.35B$	$0.12B$
	Steel coil loading	$0.42B$	$0.24B$
Normal ballast condition		$0.45B$	$0.33B$
Heavy ballast condition		$0.40B$	$0.25B$

2.2 Pitch

2.2.1

The pitch period T_P, in s, and the single pitch amplitude Φ, in deg, are given by:

$$T_P = \sqrt{\frac{2\pi\lambda}{g}}$$

$$\Phi = f_p \frac{960}{L} \sqrt[4]{\frac{V}{C_B}}$$

where:

$$\lambda = 0.6\left(1 + \frac{T_{LC}}{T_S}\right)L$$

2.3 Heave

2.3.1

The vertical acceleration due to heave, in m/s^2, is given by:

$$a_{heave} = a_0 g$$

2.4 Sway

2.4.1

The transverse acceleration due to sway, in m/s^2, is given by:

$$a_{sway} = 0.3 a_0 g$$

2.5 Surge

2.5.1

The longitudinal acceleration due to surge, in m/s^2, is given by:

$a_{surge} = 0.2 a_0 g$

3. Ship relative accelerations

3.1 General

3.1.1

At any point, the accelerations in X, Y and Z directions are the acceleration components which result from the ship absolute motions and accelerations defined in [2.1] to [2.5].

3.2 Accelerations

3.2.1

The reference values of the longitudinal, transverse and vertical accelerations at any point are obtained from the following formulae:

- In longitudinal direction:

  $a_X = C_{XG} g \sin \Phi + C_{XS} a_{surge} + C_{XP} a_{pitch\,x}$

- In transverse direction:

  $a_Y = C_{YG} g \sin \theta + C_{YS} a_{sway} + C_{YR} a_{roll\,y}$

- In vertical direction:

  $a_Z = C_{ZH} a_{heave} + C_{ZR} a_{roll\,z} + C_{ZP} a_{pitch\,z}$

where:

C_{XG}, C_{XS}, C_{XP}, C_{YG}, C_{YS}, C_{YR}, C_{ZH}, C_{ZR} and C_{ZP} : Load combination factors defined in Ch 4, Sec 4, [2.2]

$a_{pitch\,x}$: Longitudinal acceleration due to pitch, in m/s^2

$$a_{pitch\,x} = \Phi \frac{\pi}{180} \left(\frac{2\pi}{T_P} \right)^2 R$$

$a_{roll\,y}$: Transverse acceleration due to roll, in m/s^2

$$a_{roll\,y} = \theta \frac{\pi}{180} \left(\frac{2\pi}{T_R} \right)^2 R$$

$a_{roll\,z}$: Vertical acceleration due to roll, in m/s^2

$$a_{roll\,z} = \theta \frac{\pi}{180} \left(\frac{2\pi}{T_R} \right)^2 y$$

$a_{pitch\,z}$: Vertical acceleration due to pitch, in m/s^2

$$a_{pitch\,z} = \Phi \frac{\pi}{180} \left(\frac{2\pi}{T_P} \right)^2 \left| (x - 0.45L) \right|$$

where $\left| (x - 0.45L) \right|$ is to be taken not less than $0.2L$

R = $z - \min\left(\frac{D}{4} + \frac{T_{LC}}{2}, \frac{D}{2} \right)$

x, y, z : X, Y and Z co-ordinates, in m, of any point considered with respect to the reference co-ordinate system defined in Ch 1, Sec 4

Section 3 – HULL GIRDER LOADS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

x : X co-ordinate, in m, of the calculation point with respect to the reference co-ordinate system

f_p : Coefficient corresponding to the probability, defined in Ch 4, Sec 2.

1. General

1.1 Sign conventions of bending moments and shear forces

1.1.1

Absolute values are to be taken for bending moments and shear forces introduced in this Section. The sign of bending moments and shear forces is to be considered according to Sec 4, Tab 3. The sign conventions of vertical bending moments, horizontal bending moments and shear forces at any ship transverse section are as shown in Fig 1, namely:

- the vertical bending moments M_{SW} and M_{WV} are positive when they induce tensile stresses in the strength deck (hogging bending moment) and are negative in the opposite case (sagging bending moment)
- the horizontal bending moment M_{WH} is positive when it induces tensile stresses in the starboard and is negative in the opposite case.
- the vertical shear forces Q_{SW}, Q_{WV} are positive in the case of downward resulting forces preceding and upward resulting forces following the ship transverse section under consideration, and is negative in the opposite case.

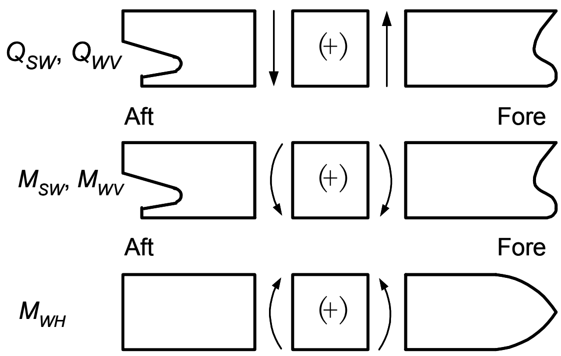

Figure 1: Sign conventions for shear forces Q_{SW}, Q_{WV} and bending moments M_{SW}, M_{WV} and M_{WH}

2. Still water loads

2.1 General

2.1.1

In general the vertical still water bending moment and the shear force of the individual loading condition is to be applied. The shipbuilder has to submit for each of the loading condition defined in Ch 4, Sec 7 a longitudinal strength calculation.

The values of still water vertical bending moment and shear force are to be treated as the upper limits with respect to hull girder strength.

In general, the design cargo and ballast loading conditions, based on amount of bunker, fresh water and stores at departure and arrival, are to be considered for the M_{SW} and Q_{SW} calculations. Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting any ballast tank are to be submitted and where approved included in the loading manual for guidance.

2.1.2 Partially filled ballast tanks in ballast loading conditions

Ballast loading conditions involving partially filled peak and/or other ballast tanks at departure, arrival or during intermediate conditions are not permitted to be used as design conditions unless:

- design stress limits are satisfied for all filling levels between empty and full, and
- for **BC-A** and **BC-B** ships, longitudinal strength of hull girder in flooded condition according to Ch 5, Sec 1, [2.1.3] is complied with for all filling levels between empty and full.

To demonstrate compliance with all filling levels between empty and full, it will be acceptable if, in each condition at departure, arrival, and where required by [2.1.1], any intermediate condition, the tanks intended to be partially filled are assumed to be:

- empty
- full
- partially filled at intended level

Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated.

(RCN 2, effective from 1 July 2008)

2.1.3 Partially filled ballast tanks in cargo loading conditions

In cargo loading conditions, the requirement in [2.1.2] applies to the peak tanks only.

2.1.4 Sequential ballast water exchange

Requirements of [2.1.2] and [2.1.3] are not applicable to ballast water exchange using the sequential method.

(RCN 2, effective from 1 July 2008)

2.2 Still water bending moment

2.2.1

The design still water bending moments $M_{SW,H}$ and $M_{SW,S}$ at any hull transverse section are the maximum still water bending moments calculated, in hogging and sagging conditions, respectively, at that hull transverse section for the loading conditions, as defined in [2.1.1]. Greater values may be considered if defined by the Designer.

2.2.2

If the design still water bending moments are not defined, at a preliminary design stage, at any hull transverse section, the longitudinal distributions shown in Fig 2 may be considered.

In Fig 2, M_{SW} is the design still water bending moment amidships, in hogging or sagging conditions, whose values are to be taken not less than those obtained, in kN.m, from the following formulae:

- hogging conditions:

$$M_{SW,H} = 175CL^2B(C_B + 0.7)10^{-3} - M_{WV,H}$$

- sagging conditions:

$$M_{SW,S} = 175CL^2B(C_B + 0.7)10^{-3} - M_{WV,S}$$

where $M_{WV,H}$ and $M_{WV,S}$ are the vertical wave bending moments, in kN.m, defined in [3.1].

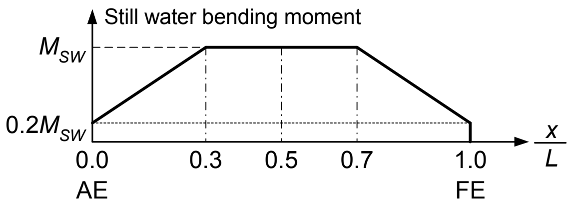

Figure 2: Preliminary still water bending moment distribution

2.3 Still water shear force

2.3.1

The design still water shear force Q_{SW} at any hull transverse section is the maximum positive or negative shear force calculated, at that hull transverse section, for the loading conditions, as defined in [2.1.1]. Greater values may be considered if defined by the Designer.

2.4 Still water bending moment and still water shear force in flooded condition

2.4.1

The still water bending moments $M_{SW,F}$, in hogging and sagging conditions, and the still water shear force $Q_{SW,F}$, in flooded condition are to be determined for the flooding scenario considering each cargo hold individually flooded up to the equilibrium waterline.

This means that double side spaces may not be considered flooded, and the cargo holds may not be considered completely flooded, but only up to the equilibrium waterline.

2.4.2

To calculate the weight of ingressed water, the following assumptions are to be made:

a) The permeability of empty cargo spaces and volume left in loaded cargo spaces above any cargo is to be taken as 0.95.

b) Appropriate permeabilities and bulk densities are to be used for any cargo carried. For iron ore, a minimum permeability of 0.3 with a corresponding bulk density of 3.0 t/m^3 is to be used. For cement, a minimum permeability of 0.3 with a corresponding bulk density of 1.3 t/m^3 is to be used. In this respect, "permeability" for solid bulk cargo means the ratio of the floodable volume between the particles, granules or any larger pieces of the cargo, to the gross volume of the bulk cargo.

For packed cargo conditions (such as steel mill products), the actual density of the cargo should be used with a permeability of zero.

2.4.3

To quantify the effects of ingressed water on the hull girder still water bending moments and still water shear forces, specific calculations are to be carried out. The loading conditions on which the design of the ship has been based are to be considered and, for each of them, the cargo holds are to be considered as being individually flooded up to the equilibrium waterline. The still water bending moments and still water shear forces are therefore to be calculated for any combination of considered loading conditions and flooded cargo holds.

3. Wave loads

3.1 Vertical wave bending moments

3.1.1 Intact condition

The vertical wave bending moments in intact condition at any hull transverse section are obtained, in kN.m, from the following formulae:

- hogging conditions:

$$M_{WV,H} = 190 F_M f_p C L^2 B C_B 10^{-3}$$

- sagging conditions:

$$M_{WV,S} = 110 F_M f_p C L^2 B (C_B + 0.7) 10^{-3}$$

where:

F_M : Distribution factor defined in Tab 1 (see also Fig 3).

Table 1: Distribution factor F_M

Hull transverse section location	Distribution factor F_M
$0 \le x < 0.4L$	$2.5\frac{x}{L}$
$0.4L \le x \le 0.65L$	1.0
$0.65L < x \le L$	$2.86\left(1-\frac{x}{L}\right)$

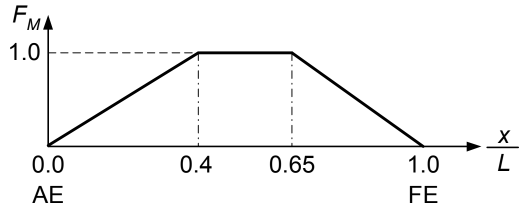

Figure 3: Distribution factor F_M

3.1.2 Flooded condition

The vertical wave bending moments in flooded condition at any hull transverse section are obtained, in kN.m, from the following formula:

$$M_{WV,F} = 0.8 M_{WV}$$

where M_{WV} is defined in [3.1.1].

3.1.3 Harbour condition

The vertical wave bending moments in harbour condition at any hull transverse section are obtained, in kN.m, from the following formula:

$$M_{WV,P} = 0.4 M_{WV}$$

where M_{WV} is defined in [3.1.1].

3.2 Vertical wave shear force

3.2.1 Intact condition

The vertical wave shear force in intact condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_{WV} = 30 F_Q f_p CLB(C_B + 0.7)10^{-2}$$

where:

F_Q : Distribution factor defined in Tab 2 for positive and negative shear forces (see also Fig 4).

Table 2: Distribution factor F_Q

Hull transverse section location	Distribution factor F_Q	
	Positive wave shear force	Negative wave shear force
$0 \le x < 0.2L$	$4.6A\dfrac{x}{L}$	$4.6\dfrac{x}{L}$
$0.2L \le x \le 0.3L$	$0.92A$	0.92
$0.3L < x < 0.4L$	$(9.2A-7)\left(0.4-\dfrac{x}{L}\right)+0.7$	$2.2\left(0.4-\dfrac{x}{L}\right)+0.7$
$0.4L \le x \le 0.6L$	0.7	0.7
$0.6L < x < 0.7L$	$3\left(\dfrac{x}{L}-0.6\right)+0.7$	$(10A-7)\left(\dfrac{x}{L}-0.6\right)+0.7$
$0.7L \le x \le 0.85L$	1	A
$0.85L < x \le L$	$6.67\left(1-\dfrac{x}{L}\right)$	$6.67A\left(1-\dfrac{x}{L}\right)$
Note : $A = \dfrac{190C_B}{110(C_B+0.7)}$		

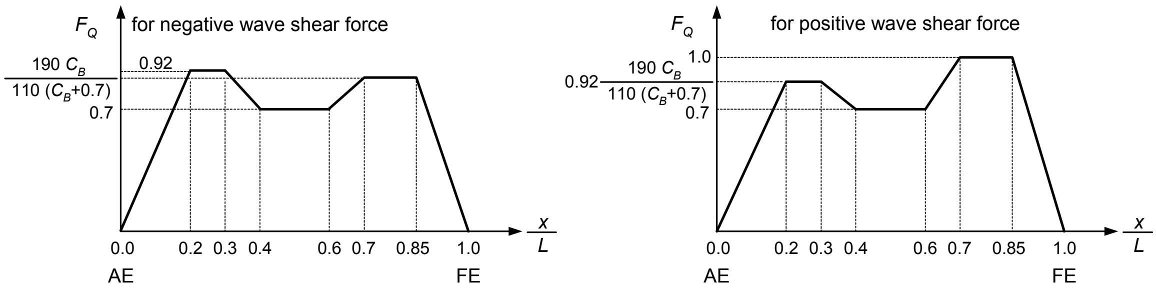

Figure 4: Distribution factor F_Q

3.2.2 Flooded condition

The vertical wave shear force in flooded condition at any hull transverse section are obtained, in kN, from the following formula:

$$Q_{WV,F} = 0.8Q_{WV}$$

where Q_{WV} is defined in [3.2.1].

3.2.3 Harbour condition

The vertical wave shear force in harbour condition at any hull transverse section are obtained, in kN, from the following formula:

$$Q_{WV,P} = 0.4Q_{WV}$$

where Q_{WV} is defined in [3.2.1].

3.3 Horizontal wave bending moment

3.3.1

The horizontal wave bending moment at any hull transverse section, in kN.m, is given by:

$$M_{WH} = (0.3 + \frac{L}{2000}) F_M f_p C L^2 T_{LC} C_B$$

where F_M is the distribution factor defined in [3.1.1].

3.4 Wave torsional moment

3.4.1

The wave torsional moment at any hull transverse section, in kN.m, is given by:

$$M_{WT} = f_p (|M_{WT1}| + |M_{WT2}|)$$

where:

$$M_{WT1} = 0.4 \cdot C \sqrt{\frac{L}{T}} \cdot B^2 D \cdot C_B \cdot F_{T1}$$

$$M_{WT2} = 0.22 C L B^2 C_B \cdot F_{T2}$$

$F_{T1,} F_{T2}$: Distribution factors, defined as follows:

$$F_{T1} = \sin\left(\frac{2\pi x}{L}\right)$$

$$F_{T2} = \sin^2\left(\frac{\pi x}{L}\right)$$

Section 4 – LOAD CASES

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

a_{surge}, $a_{pitch\,x}$, a_{sway}, $a_{roll\,y}$, a_{heave}, $a_{roll\,z}$, $a_{pitch\,z}$: Components of accelerations, defined in Ch 4, Sec 2.

1. General

1.1 Application

1.1.1

The load cases described in this section are those to be used for:

- the local strength analysis of plating and ordinary stiffeners and primary supporting members according to the applicable requirements of Ch 6, Sec 1, Ch 6, Sec 2 and Ch 6, Sec 4 respectively,
- the direct strength analysis of structural members, according to the applicable requirements of Ch 7,
- the fatigue check of structural details, according to the applicable requirements of Ch 8.

1.1.2

For the local strength analysis and for the direct strength analysis, the load cases are the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2 described in [2].

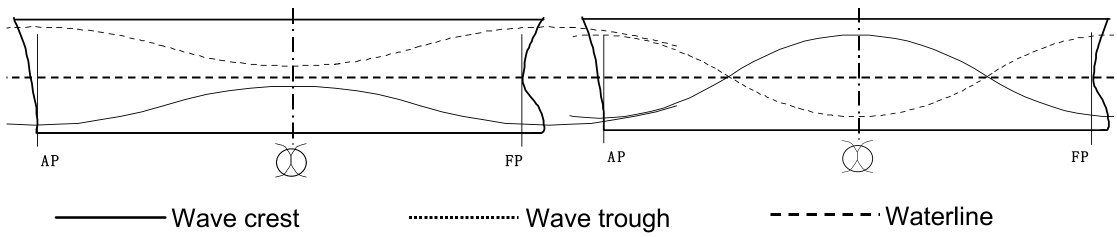
1.2 Equivalent design wave

1.2.1

Regular waves that generate response values equivalent to the long-term response values of the load components considered being predominant to the structural members are set as Equivalent Design Waves (EDWs). They consist of:

- regular waves when the vertical wave bending moment becomes maximum in head sea (EDW “H”)
- regular waves when the vertical wave bending moment becomes maximum in following sea (EDW “F”)
- regular waves when the roll motion becomes maximum (EDW “R”)
- regular waves when the hydrodynamic pressure at the waterline becomes maximum (EDW “P”)

The definitions of wave crest and wave trough in the EDW “H” and EDW “F” are given in Fig 1. The definitions of weather side down and weather side up for the EDW “R” and EDW “P” are given in Fig 2.



(a) for EDW “H” (b) for EDW ”F”

Figure 1: Definition of wave crest and wave trough for EDWs “H” and “F”

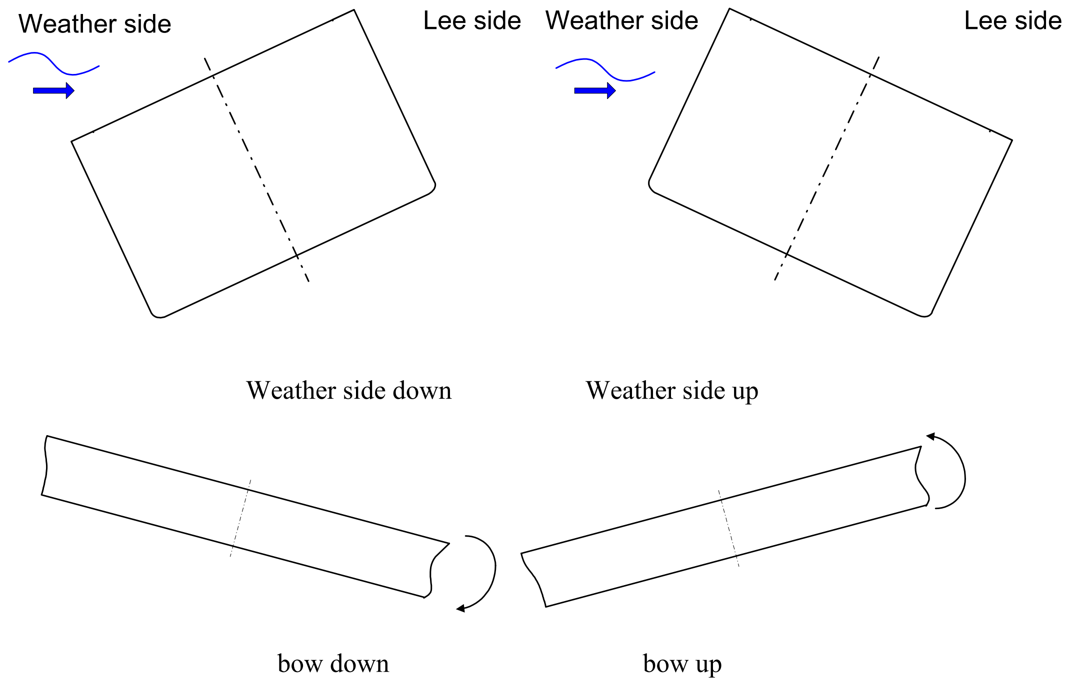


Figure 2: Definitions of ship motion

2. Load cases

2.1 General

2.1.1

The load cases corresponding to the Equivalent Design Waves (EDWs) are defined in Tab 1. The corresponding hull girder loads and motions of the ship are indicated in Tab 2. If the ship structure or the ship loading condition is not symmetrical with respect to the centreline plane of ship, the load cases (R1, R2, P1 and P2) corresponding to the beam conditions in which the encounter wave comes from the starboard (in this case the starboard is the weather side), should be also included in the structural strength assessment.

Table 1: Definition of load cases

Load case	H1	H2	F1	F2	R1	R2	P1	P2
EDW	"H"		"F"		"R"		"P"	
Heading	Head		Follow		Beam (Port: weather side)		Beam (Port: weather side)	
Effect	Max. Bending Moment		Max. Bending Moment		Max. Roll		Max. Ext. Pressure	
	Sagging	Hogging	Sagging	Hogging	(+)	(-)	(+)	(-)

Table 2: Reference hull girder loads and motions of ship

</table>

2.2 Load combination factors

2.2.1

The hull girder loads and the acceleration components to be considered in each load case H1, H2, F1, F2, R1, R2, P1 and P2 are to be obtained by multiplying the reference value of each component by the relevant load combination factor LCF defined in Tab 3.

2.2.2

The still water vertical bending moment is to be added to the hull girder loads in waves, calculated with load combination factors.

2.2.3

The internal loads are the sum of static pressures or forces induced by the weights carried, including those carried on decks, and of inertial pressures or forces induced by the accelerations on these weights and calculated with load combination factors.

Table 3: Load combination factors LCF

	LCF	H1	H2	F1	F2	R1	R2	P1	P2
M_{WV}	C_{WV}	-1	1	-1	1	0	0	$0.4-\dfrac{T_{LC}}{T_S}$	$\dfrac{T_{LC}}{T_S}-0.4$
Q_{WV}	C_{QW} (1)	-1	1	-1	1	0	0	$0.4-\dfrac{T_{LC}}{T_S}$	$\dfrac{T_{LC}}{T_S}-0.4$
M_{WH}	C_{WH}	0	0	0	0	$1.2-\dfrac{T_{LC}}{T_S}$	$\dfrac{T_{LC}}{T_S}-1.2$	0	0
a_{surge}	C_{XS}	-0.8	0.8	0	0	0	0	0	0
$a_{pitch\ x}$	C_{XP}	1	-1	0	0	0	0	0	0
$g\sin\Phi$	C_{XG}	1	-1	0	0	0	0	0	0
a_{sway}	C_{YS}	0	0	0	0	0	0	1	-1
$a_{roll\ y}$	C_{YR}	0	0	0	0	1	-1	0.3	-0.3
$g\sin\theta$	C_{YG}	0	0	0	0	1	-1	0.3	-0.3
a_{heave}	C_{ZH}	$0.6\dfrac{T_{LC}}{T_S}$	$-0.6\dfrac{T_{LC}}{T_S}$	0	0	$\dfrac{\sqrt{L}}{40}$	$-\dfrac{\sqrt{L}}{40}$	1	-1
$a_{roll\ z}$	C_{ZR}	0	0	0	0	1	-1	0.3	-0.3
$a_{pitch\ z}$	C_{ZP}	1	-1	0	0	0	0	0	0

(1) The LCF for C_{QW} is only used for the aft part of midship section. The inverse value of it should be used for the forward part of the midship section.

Section 5 – EXTERNAL PRESSURES

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

L_2 : Rule length L, but to be taken not greater than 300 m

C : Wave coefficient, as defined in Ch 1, Sec 4, [2.3.1]

λ : Wave length, in m, corresponding to the load case, defined in [1.3.1], [1.4.1], and [1.5.1]

f_p : Coefficient corresponding to the probability, defined in Ch 4, Sec 2

T_{LCi} : Draught in the considered cross section, in m, in the considered loading condition

B_i : Moulded breadth at the waterline, in m, in the considered cross section

x, y, z : X, Y and Z co-ordinates, in m, of the load point with respect to the reference co-ordinate system defined in Ch 1, sec 4.

1. External sea pressures on side shell and bottom

1.1 General

1.1.1

The total pressure p at any point of the hull, in kN/m^2, to be obtained from the following formula is not to be negative:

$$p = p_S + p_W$$

Where:

p_S : Hydrostatic pressure defined in [1.2]

p_W : Wave pressure equal to the hydrodynamic pressure defined in [1.3], [1.4] or [1.5], as the case may be, and corrected according to [1.6]

1.2 Hydrostatic pressure

1.2.1

The hydrostatic pressure p_S at any point of the hull, in kN/m^2, corresponding to the draught in still water is obtained, for each loading condition, from the formulae in Tab 1 (see also Fig 1).

Table 1: Hydrostatic pressure p_S

Location	Hydrostatic pressure, p_S, in kN/m^2
Points at and below the waterline ($z \le T_{LCi}$)	$\rho g(T_{LCi} - z)$
Points above the waterline ($z > T_{LCi}$)	0

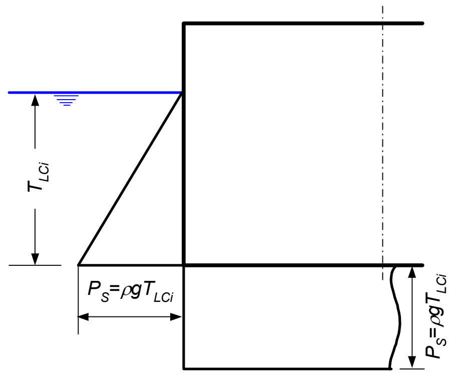

Figure 6: Hydrostatic pressure p_S

1.3 Hydrodynamic pressures for load cases H1, H2, F1 and F2

1.3.1

The hydrodynamic pressures p_H and p_F, for load cases H1, H2, F1 and F2, at any point of the hull below the waterline are to be obtained, in kN/m^2, from Tab 2.

The distribution of pressure p_{F2} is schematically given in Fig 2.

Table 2: Hydrodynamic pressures for load cases H1, H2, F1 and F2

Load case	Hydrodynamic pressure, in kN/m^2
H1	$p_{H1} = - k_\ell \, k_p \, p_{HF}$
H2	$p_{H2} = k_\ell \, k_p \, p_{HF}$
F1	$p_{F1} = - p_{HF}$
F2	$p_{F2} = p_{HF}$

where:

$$p_{HF} = 3 f_p f_{nl} C \sqrt{\frac{L+\lambda-125}{L}} \left(\frac{z}{T_{LCi}} + \frac{|2y|}{B_i} + 1 \right); \quad \text{with } \frac{|2y|}{B_i} \le 1.0 \text{ and } z \text{ is to be taken not greater than } T_{LCi}$$

f_{nl} : Coefficient considering nonlinear effect, taken equal to:

$f_{nl} = 0.9$ for the probability level of 10^{-8}

$f_{nl} = 1.0$ for the probability level of 10^{-4}

k_ℓ : Amplitude coefficient in the longitudinal direction of the ship, taken equal to:

$$k_\ell = 1 + \frac{12}{C_B} \left(1 - \sqrt{\frac{|2y|}{B}} \right) \left| \frac{x}{L} - 0.5 \right|^3 \qquad \text{for } 0.0 \le x/L \le 0.5$$

$$k_\ell = 1 + \frac{6}{C_B} \left(3 - \frac{|4y|}{B} \right) \left| \frac{x}{L} - 0.5 \right|^3 \qquad \text{for } 0.5 \le x/L \le 1.0$$

k_p : Phase coefficient in the longitudinal direction of the ship, taken equal to:

$$k_p = \left(1.25 - \frac{T_{LC}}{T_S} \right) \cos\left(\frac{2\pi |x - 0.5L|}{L} \right) - \frac{T_{LC}}{T_S} + 0.25$$, for local strength analysis in conditions other than full load condition, for direct strength analysis and for fatigue strength assessments

$k_p = -1.0$, for local strength analysis in full load condition

λ : Wave length, in m, taken equal to:

$$\lambda = 0.6\left(1+\frac{T_{LC}}{T_S}\right)L$$ for load cases H1 and H2

$$\lambda = 0.6\left(1+\frac{2}{3}\frac{T_{LC}}{T_S}\right)L$$ for load cases F1 and F2

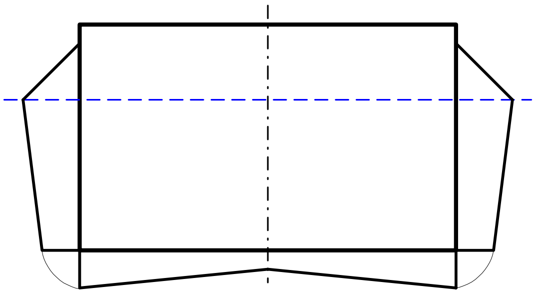

Figure 7: Distribution of hydrodynamic pressure p_{F2} at midship

1.4 Hydrodynamic pressures for load cases R1 and R2

1.4.1

The hydrodynamic pressures p_R, for load cases R1 and R2, at any point of the hull below the waterline are to be obtained, in kN/m^2, from the following formulae. The distribution of pressure p_{R1} is schematically given in Fig 3.

$$p_{R1} = f_{nl}\left(10y\sin\theta + 0.88 f_p C\sqrt{\frac{L+\lambda-125}{L}}\left(\frac{|2y|}{B}+1\right)\right)$$

$$p_{R2} = -p_{R1}$$

where:

f_{nl} : Coefficient considering nonlinear effect, taken equal to:

$f_{nl} = 0.8$ for the probability level of 10^{-8}

$f_{nl} = 1.0$ for the probability level of 10^{-4}

$$\lambda = \frac{g}{2\pi}T_R^2$$

y : Y co-ordinate of the load point, in m, taken positive on the portside.

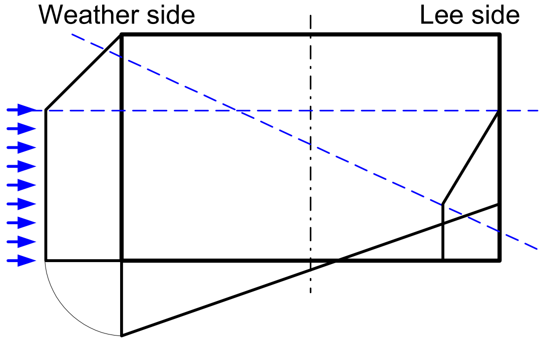

Figure 8: Distribution of hydrodynamic pressure p_{R1} at midship

1.5 Hydrodynamic pressures for load cases P1 and P2

1.5.1

The hydrodynamic pressures p_P, for the load cases P1 and P2, at any point of the hull below the waterline are to be obtained, in kN/m^2, from Tab 3. The distribution of pressure p_{P1} is schematically given in Fig 4.

Table 3: Hydrodynamic pressures for load cases P1 and P2

Load case	Hydrodynamic pressure, in kN/m^2	
	weather side	lee side
P1	$p_{P1} = p_P$	$p_{P1} = p_P/3$
P2	$p_{P2} = -\,p_P$	$p_{P2} = -\,p_P/3$

where:

$$p_P = 4.5 f_p f_{nl} C \sqrt{\frac{L+\lambda-125}{L}}\left(2\frac{|z|}{T_{LCi}} + 3\frac{|2y|}{B}\right)$$

f_{nl} : Coefficient considering nonlinear effect, taken equal to:

$f_{nl} = 0.65$ for the probability level of 10^{-8}

$f_{nl} = 1.0$ for the probability level of 10^{-4}

$$\lambda = \left(0.2 + 0.4\frac{T_{LC}}{T_S}\right)L$$

y : Y co-ordinate of the load point, in m, as defined in [1.4.1]

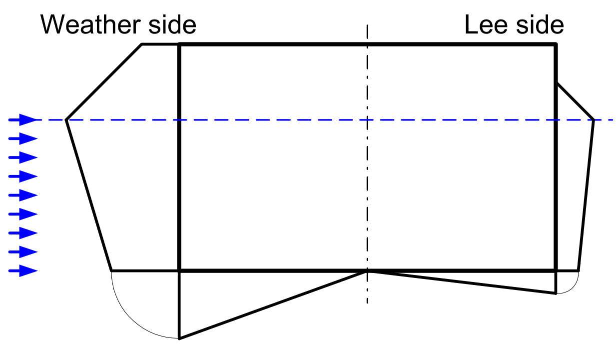

Figure 9: Distribution of hydrodynamic pressure p_{P1} at midship

1.6 Correction to hydrodynamic pressures

1.6.1

For the positive hydrodynamic pressure at the waterline (in load cases H1, H2, F2, R1, R2 and P1), the hydrodynamic pressure $P_{W,C}$ at the side above waterline is given (see Fig 5), in kN/m^2, by:

- $p_{W,C} = p_{W,WL} + \rho g (T_{LCi} - z)$ for $T_{LCi} \le z \le h_W + T_{LCi}$
- $p_{W,C} = 0$ for $z \ge h_W + T_{LCi}$

where:

$p_{W,WL}$: positive hydrodynamic pressure at the waterline for the considered load case

$$h_W = \frac{p_{W,WL}}{\rho g}$$

1.6.2

For the negative hydrodynamic pressure at the waterline (in load cases H1, H2, F1, R1, R2, and P2), the hydrodynamic pressure $P_{W,C}$, under the waterline is given (see Fig 5), in kN/m², by:

$p_{W,C} = p_W$, without being taken less than $\rho g(z-T_{LCi})$

where

p_W : Negative hydrodynamic pressure under the waterline for the considered load case

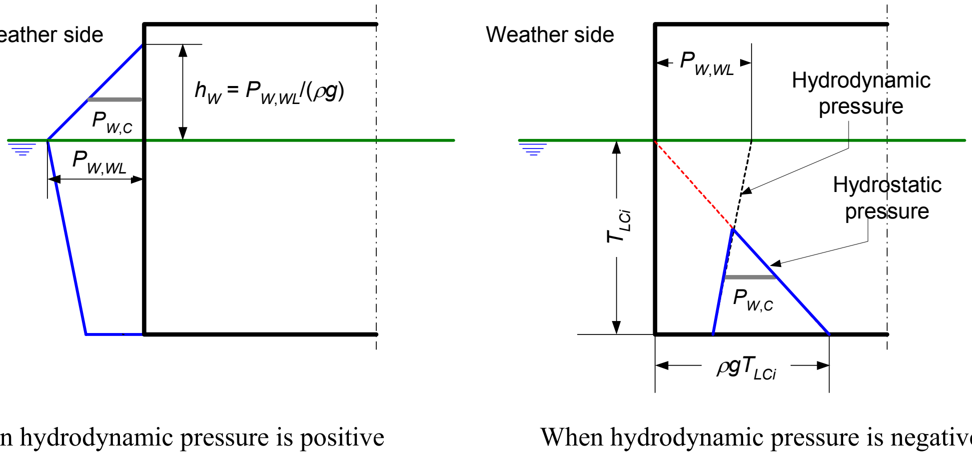

Figure 10: Correction to hydrodynamic pressure

2. External pressures on exposed decks

2.1 General

2.1.1

The external pressures on exposed decks are to be applied for the local scantling check of the structures on exposed deck but not applied for fatigue strength assessment.

RCN 1 to July 2008 version (effective from 1 July 2009)

If a breakwater is fitted on the exposed deck, no reduction in the external pressures defined in [2.2] and [2.3] is allowed for the area of the exposed deck located aft of the breakwater.

2.2 Load cases H1, H2, F1 and F2

2.2.1

The external pressure p_D, for load cases H1, H2, F1 and F2, at any point of an exposed deck is to be obtained, in kN/m², from the following formula:

$$p_D = \varphi p_W$$

where:

p_W : Pressure obtained from the formulae in Tab 4

φ : Coefficient defined in Tab 5.

Table 4: Pressures on exposed decks for H1, H2, F1 and F2

Location	Pressure p_W, in kN/m^2	
	$L_{LL} \geq 100$ m	$L_{LL} < 100$ m
$0 \leq x_{LL}/L_{LL} \leq 0.75$	34.3	$14.9 + 0.195\, L_{LL}$
$0.75 < x_{LL}/L_{LL} < 1$	$34.3 + (14.8 + a(L_{LL} - 100))\left(4\dfrac{x_{LL}}{L_{LL}} - 3\right)$	$12.2 + \dfrac{L_{LL}}{9}\left(5\dfrac{x_{LL}}{L_{LL}} - 2\right) + 3.6\dfrac{x_{LL}}{L_{LL}}$

where:

a : Coefficient taken equal to:
$a = 0.0726$ for Type B freeboard ships
$a = 0.356$ for Type B-60 or Type B-100 freeboard ships.

x_{LL}: X coordinate of the load point measured from the aft end of the freeboard length L_{LL}.

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 5: Coefficient for pressure on exposed decks

Exposed deck location	φ
Freeboard deck	1.00
Superstructure deck, including forecastle deck	0.75
1st tier of deckhouse	0.56
2nd tier of deckhouse	0.42
3rd tier of deckhouse	0.32
4th tier of deckhouse	0.25
5th tier of deckhouse	0.20
6th tier of deckhouse	0.15
7th tier of deckhouse and above	0.10

RCN 2 to July 2008 version (effective from 1 July 2010)

2.3 Load cases R1, R2, P1 and P2

2.3.1

The external pressure p_D, for load cases R1, R2, P1 and P2, at any point of an exposed deck is to be obtained, in kN/m^2, from the following formula:

$$p_D = 0.4\,\varphi p_W$$

where:

p_W : Hydrodynamic pressure at side of the exposed deck for the load cases P1, P2 , R1 and R2, in kN/m^2, can be determined by [1.6] at the z co-ordinate. p_W is to be taken greater one of the hydrodynamic pressures $p_{W,C}$ at both sides of the exposed deck (portside and starboard), and is not to be taken less than zero.

φ : Coefficient defined in Tab 5.

2.4 Load carried on exposed deck

2.4.1 Pressure due to distributed load

If a distributed load is carried on an exposed deck, the static pressure p_S corresponding to this load is to be defined by the Designer and, in general, is not to be taken less than 10 kN/m^2.

The total pressure p due to this load is to be considered not simultaneously to the pressures defined in [2.2] and [2.3]. It is to be taken equal, in kN/m^2, to the greater value obtained from the following formulae:

$$p = p_S + p_W$$

$$p = p_D$$

where:

p_S : Static pressure due to the distributed load carried, if any

p_W : Dynamic pressure due to the distributed load carried, in kN/m^2, taken equal to:

$$p_W = \frac{a_Z}{g} p_S$$

a_Z : Vertical acceleration at the centre of gravity of the distributed load carried for the load case considered, in m/s^2, obtained by the formulae defined in Ch 4, Sec 2, [3.2]

p_D : Pressure for the exposed deck, for the load case considered, as defined in [2.2.1] and [2.3.1].

2.4.2 Concentrated forces due to unit load

If a unit load is carried on an exposed deck, the static and dynamic forces due to the unit load carried are considered.

The total force F due to this load is to be considered not simultaneously to the pressures defined in [2.2] and [2.3]. It is to be taken, in kN, equal to value obtained from the following formula:

$$F = F_S + F_W$$

where:

F_S : Static force due to the unit load carried, in kN, taken equal to:

$$F_S = m_U g$$

F_W : Dynamic force due to unit load carried, in kN, taken equal to:

$$F_W = m_U a_Z$$

m_U : Mass of the unit load carried, in t

a_Z : Vertical acceleration at the centre of gravity of the unit load carried for the load case considered, in m/s^2, obtained by the formulae defined in Ch 4, Sec 2, [3.2].

3. External pressures on superstructure and deckhouses

3.1 Exposed decks

3.1.1

External pressures on exposed decks of superstructures and deckhouses are to be obtained according to [2].

3.2 Exposed wheel house tops

3.2.1

The lateral pressure for exposed wheel house tops, in kN/m^2, is not to be taken less than:

$$p = 12.5$$

3.3 Sides of superstructures

3.3.1

The lateral pressure for sides of superstructures, in kN/m^2, is to be obtained from the following formula:

$$p_{SI} = 2.1 C f_p c_F \left(C_B + 0.7\right) \frac{20}{10 + z - T}$$

f_p : Probability factor, taken equal to:

$f_p = 1.0$ for plate panels

$f_p = 0.75$ for ordinary stiffeners and primary supporting members

c_F : Distribution factor according to Tab 6.

Table 6: Distribution factor c_F

Location	c_F
$0 \le \frac{x}{L} < 0.2$	$1.0 + \frac{5}{C_B}\left(0.2 - \frac{x}{L}\right)$, without taking x/L less than 0.1
$\frac{x}{L} \ge 0.2$	1.0

3.4 End bulkheads of superstructure and deckhouse walls

3.4.1

The lateral pressure, in kN/m^2, for determining the scantlings is to be obtained from the greater of the following formulae:

$$p_A = nc\left[bC - (z - T)\right]$$

$$p_A = p_{A\min}$$

where:

n : Coefficient defined in Tab 7, depending on the tier level.

The lowest tier is normally that tier which is directly situated above the uppermost continuous deck to which the depth D is to be measured. However, where the actual distance ($D - T$) exceeds the minimum non-corrected tabular freeboard according to ILLC as amended by at least one standard superstructure height as defined in Ch 1, Sec 4, [3.18.1], this tier may be defined as the 2nd tier and the tier above as the 3rd tier

c : Coefficient taken equal to:

$$c = 0.3 + 0.7 \frac{b_1}{B_1}$$

For exposed parts of machinery casings, c is not to be taken less than 1.0

b_1 : Breadth of deckhouse at the position considered

B_1 : Actual maximum breadth of ship on the exposed weather deck at the position considered.

b_1 / B_1 is not to be taken less than 0.25

b : Coefficient defined in Tab 8

x : X co-ordinate, in m, of the calculation point for the bulkhead considered. When determining sides of a deckhouse, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding $0.15L$ each, and x is to be taken as the X co-ordinate of the centre of each part considered.

z : Z co-ordinate, in m, of the midpoint of stiffener span, or to the middle of the plate field

ℓ : Span, in m, to be taken as the superstructure height or deckhouse height respectively, and not less than 2.0 m

$p_{A\min}$: Minimum lateral pressure, in kN/m^2, defined in Tab 9.

Table 7: Coefficient *n*

Type of bulkhead	Location	*n*
Unprotected front	Lowest tier	$20+\frac{L_2}{12}$
	Second tier	$10+\frac{L_2}{12}$
	Third tier and above	$5+\frac{L_2}{15}$
Protected front	All tiers	$5+\frac{L_2}{15}$
Sides	All tiers	$5+\frac{L_2}{15}$
Aft end	Abaft amidships	$7+\frac{L_2}{100}-8\frac{x}{L_2}$
	Forward of amidships	$5+\frac{L_2}{100}-4\frac{x}{L_2}$

Table 8: Coefficient *b*

Location of bulkhead	*b*
$\frac{x}{L}<0.45$	$1.0+\left(\frac{\frac{x}{L}-0.45}{C_B+0.2}\right)^2$
$\frac{x}{L}\geq 0.45$	$1.0+1.5\left(\frac{\frac{x}{L}-0.45}{C_B+0.2}\right)^2$
Where: C_B : Block coefficient with $0.6\leq C_B\leq 0.8$. When determining scantlings of aft ends forward of amidships, C_B need not be taken less than 0.8.	

Table 9: Minimum lateral pressure p_{Amin}

	p_{Amin}, in kN/m^2	
L	**Lowest tier of unprotected fronts**	**Elsewhere (1)**
$90 < L \le 250$	$25 + \dfrac{L}{10}$	$12.5 + \dfrac{L}{20}$
$L > 250$	50	25
(1) For the 4th tier and above, $p_{A\min}$ is to be taken equal to 12.5 kN/m^2.		

4. Pressure in bow area

4.1 Bow flare area pressure

4.1.1

The bow pressure, in kN/m^2, to be considered for the reinforcement of the bow flare area is to be obtained from the following formula:

$$p_{FB} = K\left(p_S + p_W\right)$$

where:

p_S, p_W : Hydrostatic pressure and maximum hydrodynamic pressures among load cases H, F, R and P at considered point of the hull in normal ballast condition. Minimum ballast draught in ballast condition T_B defined in Ch 1, Sec 4, [2.1.1] is to be considered as T_{LCi} for the calculation of hydrostatic pressure and hydrodynamic pressures.

RCN 1 to July 2010 version (effective from 1July 2012)

K : Coefficient taken equal to:

$$K = \frac{c_{FL}\left(0.2V + 0.6\sqrt{L}\right)^2}{42C\left(C_B + 0.7\right)\left(1 + \dfrac{20}{C_B}\left(\dfrac{x}{L} - 0.7\right)^2\right)}\left(10 + z - T_B\right) \text{ to be taken not less than 1.0}$$

c_{FL} : Coefficient taken equal to:

$c_{FL} = 0.8$ in general

$c_{FL} = \dfrac{0.4}{1.2 - 1.09\sin\alpha}$ where the flare angle α is greater than 40°

Where, the flare angle α at the load calculation point is to be measured in plane of the frame between a vertical line and the tangent to the side shell plating. (see Fig 7)

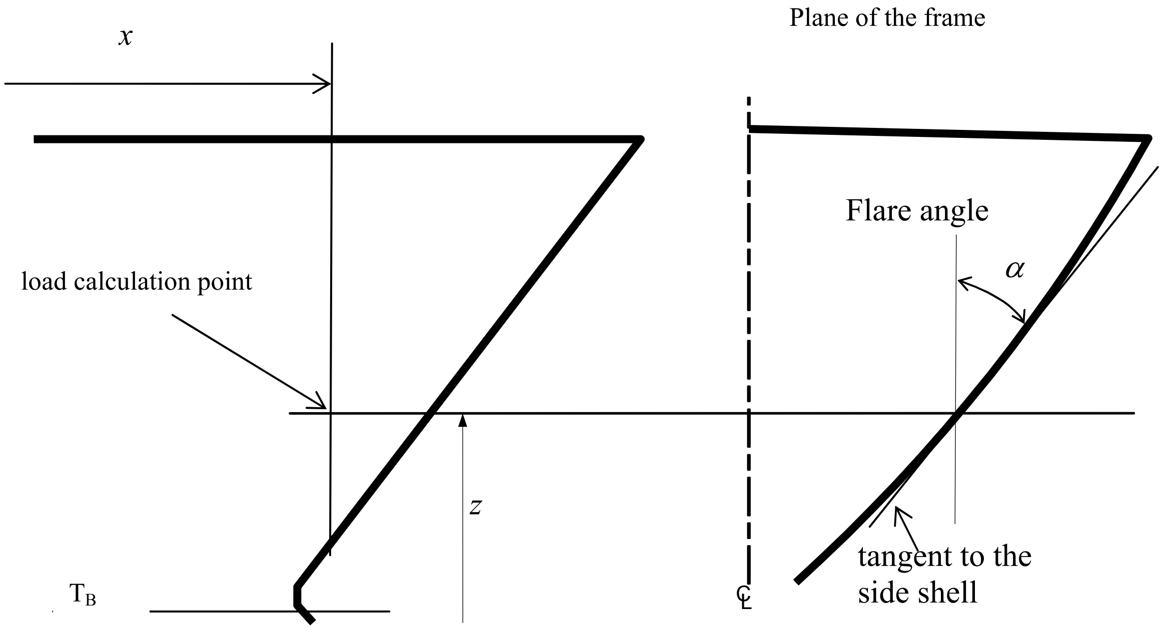

Figure 7: The definition of the flare angle

4.2 Design bottom slamming pressure

4.2.1

The bottom slamming pressure, in kN/m², to be considered for the reinforcement of the flat bottom forward is to be obtained from the following formula:

- $p_{SL} = 162 c_1 c_{SL} \sqrt{L}$ for $L \le 150$m
- $p_{SL} = 1984 c_1 c_{SL} (1.3 - 0.002L)$ for $L > 150$m

where:

c_1 : Coefficient taken equal to:

$$c_1 = 3.6 - 6.5 \left(\frac{T_{BFP}}{L} \right)^{0.2}$$, to be taken not greater than 1.0

T_{BFP} : Smallest design ballast draught, in m, defined at forward perpendicular for normal ballast conditions. Where the sequential method for ballast water exchange is intended to be applied, T_{BFP} is to be considered for the sequence of exchange.

c_{SL} : Distribution factor taken equal to(see Fig 6):

$$c_{SL} = 0 \qquad \text{for } \frac{x}{L} \le 0.5$$

$$c_{SL} = \frac{\frac{x}{L} - 0.5}{c_2} \qquad \text{for } 0.5 < \frac{x}{L} \le 0.5 + c_2$$

$c_{SL} = 1.0$ for $0.5 + c_2 < \dfrac{x}{L} \le 0.65 + c_2$

$c_{SL} = 0.5\left(1 + \dfrac{1 - \dfrac{x}{L}}{0.35 - c_2}\right)$ for $\dfrac{x}{L} > 0.65 + c_2$

c_2 : Coefficient taken equal to:

$c_2 = 0.33C_B + \dfrac{L}{2500}$, to be taken not greater than 0.35.

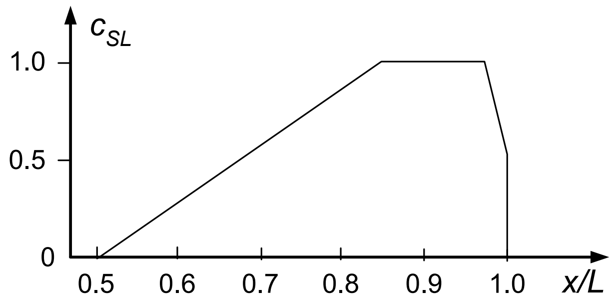

Figure 6: Distribution factor c_{SL}

4.2.2

It is the Master's responsibility to observe, among others, the weather conditions and the draught at forward perpendicular during water ballast exchange operations, in particular when the forward draught during these operations is less than T_{BFP}.

The above requirement and the draught T_{BFP} is to be clearly indicated in the operating manuals.

5. External pressures on hatch covers

5.1 General

5.1.1

If a specific load is carried on a hatch cover, the pressure is to be obtained according to [2.4].

5.2 Wave pressure

5.2.1

The pressure at any point of the hatch cover is to be obtained according to [2.2.1], considering φ equal to 1.0.

However, when the hatchway is located at least one superstructure standard height, as defined in Ch 1, Sec 4, [3.18], higher than the freeboard deck, the pressure p_W may be taken equal to 34.3 kN/m^2.

Section 6 – INTERNAL PRESSURES AND FORCES

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

ρ_C : Density of the dry bulk cargo, in t/m^3, taken equal to:

- the value given in Tab 1 for ships having a length L of 150 m and above
- the maximum density from the loading manual for ships having a length L less than 150 m

Table 1: Density of dry bulk cargo

Type of loading	Density	
	BC-A, BC-B	**BC-C**
Cargo hold loaded up to the upper deck	max(M_H/V_H, 1.0)	1.0
Cargo hold not loaded up to the upper deck	3.0 **(1)**	-
(1) Except otherwise specified by the designer.		

ρ_L : Density of internal liquid, in t/m^3, taken equal to 1.025 when internal liquid is ballast water

M_H : The actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught, in t

V_H : Volume, in m^3, of cargo hold excluding the volume enclosed by hatch coaming

K_C : Coefficient taken equal to:

$K_C = \cos^2\alpha + (1 - \sin\psi)\sin^2\alpha$ for inner bottom, hopper tank, transverse and longitudinal bulkheads, lower stool, vertical upper stool, inner side and side shell:

$K_C = 0$ for top side tank, upper deck and sloped upper stool:

α : Angle, in deg, between panel considered and the horizontal plane

ψ : Assumed angle of repose, in deg, of bulk cargo (considered drained and removed); in the absence of more precise evaluation, the following values may be taken:

$\psi = 30°$ in general

$\psi = 35°$ for iron ore

$\psi = 25°$ for cement

h_C : Vertical distance, in m, from the inner bottom to the upper surface of bulk cargo, as defined in [1.1.1] or [1.1.2]

h_{DB} : Height, in m, of the double bottom in the centreline

h_{LS} : Mean height, in m, of the lower stool, measured from the inner bottom

z_{TOP} : Z co-ordinate, in m, of the top of the tank, in upright condition

z_{BO} : Z co-ordinate, in m, of the top of the overflow pipe

a_X : Longitudinal acceleration at the centre of gravity of the hold or tank considered, in m/s^2, obtained by the formulae defined in Ch 4, Sec 2, [3.2]

a_Y : Transverse acceleration at the centre of gravity of the hold or tank considered, in m/s^2, obtained by the formulae defined in Ch 4, Sec 2, [3.2]

a_Z : Vertical acceleration at the centre of gravity of the hold or tank considered, in m/s^2, obtained by the formulae defined in Ch 4, Sec 2, [3.2]

B_H : Mean breadth of the cargo hold, in m

b_{IB} : Breadth of inner bottom, in m, as defined on Fig 2

D_1 : Distance, in m, from the base line to the freeboard deck at side amidships

s_C : Spacing of corrugations, in m; see Ch 3, Sec 6, Fig 28

x, y, z : X, Y and Z co-ordinates, in m, of the load point with respect to the reference co-ordinate system defined in Ch 1, Sec 4. y is to be taken positive on the weather side

x_G, y_G, z_G : X, Y and Z co-ordinates, in m, of the centre of gravity of the hold or tank considered with respect to the reference co-ordinate system defined in Ch 1, Sec 4

d_{AP} : Distance from the top of air pipe to the top of compartment, in m, taken equal to:

$d_{AP} = z_{BO} - z_{TOP}$

1. Lateral pressure due to dry bulk cargo

1.1 Dry bulk cargo upper surface

1.1.1

When the dry bulk cargo density is such that the cargo hold is loaded to the top of hatch coaming, the upper surface of the dry bulk cargo is an equivalent horizontal surface to be determined in considering the same loaded cargo volume in the considered hold bounded by the side shell or inner hull, as the case may be.

For holds of cylindrical shape, the equivalent horizontal surface of the dry bulk cargo may be taken at a distance h_C, in m, above the inner bottom obtained from the following formula (see Fig 1):

$$h_C = h_{HPU} + h_0$$

where:

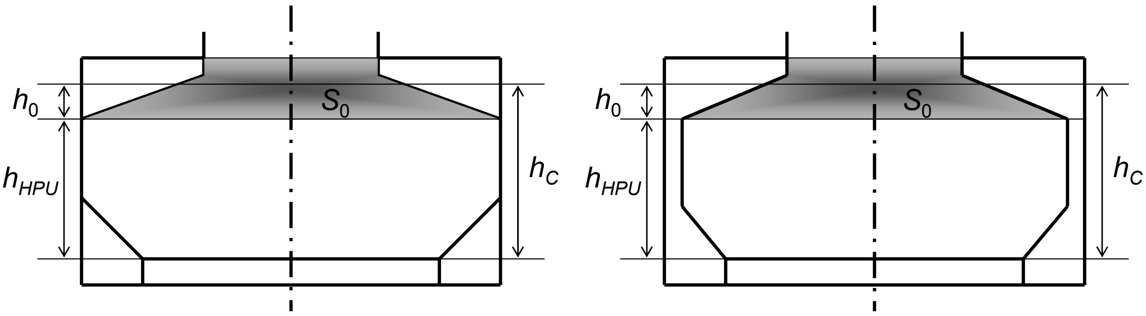
$$h_0 = \frac{S_A}{B_H}$$

$$S_A = S_0 + \frac{V_{HC}}{\ell_H}$$

h_{HPU} : Vertical distance, in m, between inner bottom and lower intersection of top side tank and side shell or inner side, as the case may be, as defined in Fig 1

S_0 : Shaded area, in m^2, above the lower intersection of top side tank and side shell or inner side, as the case may be, and up to the upper deck level, as defined in Fig 1

V_{HC} : Volume, in m^3, enclosed by the hatch coaming.



Single side bulk carrier Double side bulk carrier

Figure 1: Definitions of h_C, h_0, h_{HPU} and S_0

1.1.2

When the dry bulk cargo density is such that the cargo hold is not loaded up to the upper deck, the upper surface of the dry bulk cargo is considered as having a plane surface of width $B_H/2$ in the centreline and inclined parts with an angle equal to half the angle of repose ($\psi/2$) at sides, and is to be determined in considering the same loaded cargo volume in the considered hold, taken equal to M / ρ_C.

For holds of cylindrical shape, the upper surface of the dry bulk cargo may be taken at a distance h_C, in m, above the inner bottom obtained from the following formula (see Fig 2):

$$h_C = h_{HPL} + h_1 + h_2$$

where:

h_{HPL} : Vertical distance, in m, between inner bottom and upper intersection of hopper tank and inner side, as defined in Fig 2. h_{HPL} is to be taken equal to 0 if there is no hopper tank.

h_1 : Vertical distance, in m, obtained from the following formula, see Fig 2.

$$h_1 = \frac{M}{\rho_C \cdot B_H \ell_H} - \frac{B_H + b_{IB}}{2B_H} h_{HPL} - \frac{3}{16} B_H \tan\frac{\psi}{2} + \frac{V_{TS}}{B_H \ell_H}$$

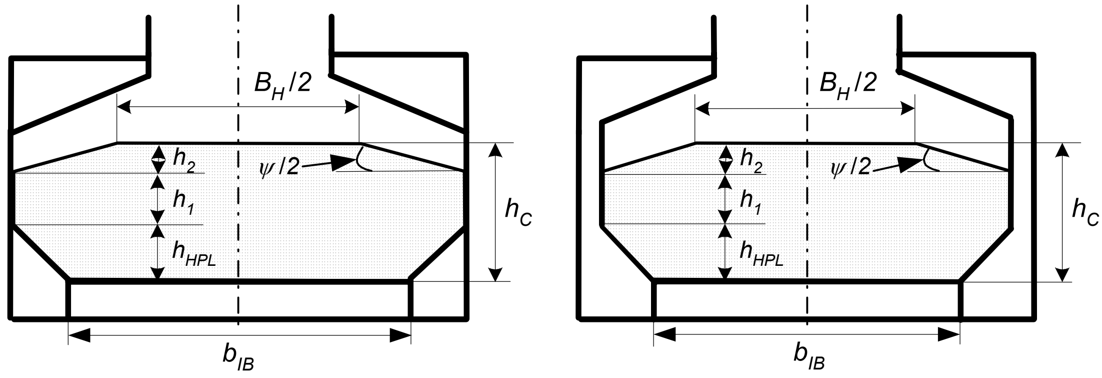
M : Mass, in t, of the bulk cargo to be considered, as defined in Ch 4 Sec 7

V_{TS} : Total volume, in m^3, of transverse stools at bottom of transverse bulkheads within the concerned cargo hold length ℓ_H. This volume excludes the part of hopper tank passing through the transverse bulkhead.

h_2 : Bulk cargo upper surface, in m, depending on y, given by:

$$h_2 = \frac{B_H}{4}\tan\frac{\psi}{2}\text{, if } 0 \le |y| \le \frac{B_H}{4}$$

$$h_2 = \left(\frac{B_H}{2} - |y|\right)\tan\frac{\psi}{2}\text{, if } \frac{B_H}{4} \le |y| \le \frac{B_H}{2}$$



Single side bulk carrier Double side bulk carrier

Figure 2: Definitions of h_C, h_1, h_2 and h_{HPL}

For holds of non-cylindrical shape, and in case of prescriptive rule requirements, the upper surface of the bulk cargo may be taken at the upper deck level with a density of dry bulk cargo equal to M/V_H.

1.2 Dry bulk cargo pressure in still water

1.2.1

The dry bulk cargo pressure in still water p_{CS}, in kN/m^2, is given by:

$$p_{CS} = \rho_C g K_C \left(h_C + h_{DB} - z\right)$$

1.3 Inertial pressure due to dry bulk cargo

1.3.1

The inertial pressure induced by dry bulk cargo p_{CW}, in kN/m^2, for each load case is given by the following formulae.

- for load case H: $p_{CW} = \rho_C \left[0.25 a_X \left(x - x_G\right) + K_C\, a_Z \left(h_C + h_{DB} - z\right)\right]$
- for load case F: $p_{CW} = 0$
- for load cases R and P: $p_{CW} = \rho_C \left[0.25 a_Y \left(y - y_G\right) + K_C\, a_Z \left(h_C + h_{DB} - z\right)\right]$

$(x\text{-}x_G)$ is to be taken as $0.25\ell_H$ in the load case H1 or $-0.25\ell_H$ in the load case H2 for local strength by Ch 6 and fatigue check for longitudinal stiffeners by Ch 8.

The total pressure ($p_{CS} + p_{CW}$) is not to be negative.

1.4 Shear load due to dry bulk cargo

1.4.1

In order to evaluate the total force in the vertical direction, shear load due to dry bulk cargo acting along sloping plates in way of bilge hopper tank and lower stool is to be considered.

The shear load due to dry bulk cargo acting along the sloping members in still water $p_{CS\text{-}S}$ (positive down to inner bottom plating), in kN/m^2, is given by:

$$p_{CS-S} = \rho_C g \frac{(1-K_C)(h_C + h_{DB} - z)}{\tan\alpha}$$

The shear load due to dry bulk cargo acting along the sloping members in waves p_{CW-S} (positive down to inner bottom plating), in kN/m^2, is given by:

- for load cases H, R and P: $p_{CW-S} = \rho_C a_Z \dfrac{(1-K_C)(h_C + h_{DB} - z)}{\tan\alpha}$
- for load case F: $p_{CW-S} = 0$

1.4.2

In order to evaluate the total force in the longitudinal and transverse directions, shear load due to dry bulk cargo in way of inner bottom plating is to be considered.

The shear load due to dry bulk cargo in the longitudinal direction in waves p_{CW-S} (positive forward), in kN/m^2, is given by:

- for load case H: $p_{CW-S} = 0.75\rho_C a_X h_C$
- for load cases F, R and P: $p_{CW-S} = 0$

The shear load due to dry bulk cargo in the transverse direction in waves p_{CW-S} (positive weather side), in kN/m^2, is given by:

- for load cases R and P: $p_{CW-S} = 0.75\rho_C a_Y h_C$
- for load cases H and F: $p_{CW-S} = 0$

2. Lateral pressure due to liquid

2.1 Pressure due to liquid in still water

2.1.1

The liquid pressure in still water p_{BS}, in kN/m^2, is given by the greater of the following values:

$$p_{BS} = \rho_L g(z_{TOP} - z + 0.5d_{AP})$$

$$p_{BS} = \rho_L g(z_{TOP} - z) + 100P_{PV}$$

where:

P_{PV} : Setting pressure, in bar, of safety valves to be considered if any

For local strength assessments, the static pressure p_{BS} is to be taken not less than 25 kN/m^2.

2.1.2

When checking ballast water exchange operations by means of the flow through method, the static pressure p_{BS} for local strength assessments and direct strength analysis by Ch 7 is to be not less than:

$$p_{BS} = \rho_L g(z_{TOP} - z + d_{AP}) + 25$$

Additional calculation may be required where piping or pumping arrangements may lead to a higher pressure.

2.1.3

For fatigue strength assessment, the liquid pressure in still water p_{BS}, in kN/m², is given by the following formula.

$$p_{BS} = \rho_L g(z_{TOP} - z)$$

If the p_{BS} is negative, p_{BS} is to be taken equal to 0.

Where the considered load point is located in the fuel oil, other oils or fresh water tanks, liquids are assumed to be fulfilled up to the half height of the tanks and z_{TOP} is taken to the Z coordinate of the liquid surface at the upright condition.

RCN 1 to July 2008 version (effective from 1 July 2009)

2.2 Inertial pressure due to liquid

2.2.1

The inertial pressure due to liquid p_{BW}, in kN/m^2, for each load case is given as follows. When checking ballast water exchange operations by means of the flow through method, the inertial pressure due to ballast water is not to be considered for local strength assessments and direct strength analysis.

- for load case H: $p_{BW} = \rho_L \left[a_Z (z_{TOP} - z) + a_X (x - x_B)\right]$

  $(x\text{-}x_B)$ is to be taken as $0.75\ell_H$ in the load case H1 or $-0.75\ell_H$ in the load case H2 for local strength by Ch 6 and fatigue check for longitudinal stiffeners by Ch 8
- for load case F: $p_{BW} = 0$
- for load cases R and P: $p_{BW} = \rho_L \left[a_Z (z_B - z) + a_Y (y - y_B)\right]$

where:

x_B : X co-ordinate, in m, of the aft end of the tank when the bow side is downward, or of the fore end of the tank when the bow side is upward, as defined in Fig 3

y_B : Y co-ordinate, in m, of the tank top located at the most lee side when the weather side is downward, or of the most weather side when the weather side is upward, as defined in Fig 3

z_B : Z co-ordinate of the following point:

- for completely filled spaces: the tank top
- for ballast hold: the top of the hatch coaming

The reference point B is defined as the upper most point after rotation by the angle φ between the vertical axis and the global acceleration vector $\vec{A}_G$ shown in Fig 3. φ is obtained from the following formulae:

- load cases H1 and H2:

$$\varphi = \tan^{-1}\left(\frac{|a_X|}{g\cos\Phi + a_Z}\right)$$

- load cases R1(P1) and R2(P2):

$$\varphi = \tan^{-1}\left(\frac{|a_Y|}{g\cos\theta + a_Z}\right)$$

where:

θ : Single roll amplitude, in deg, defined in Ch4, Sec 2, [2.1.1]

Φ : Single pitch amplitude, in deg, defined in Ch4, Sec 2, [2.2.1]

The total pressure $(p_{BS} + p_{BW})$ is not to be negative.

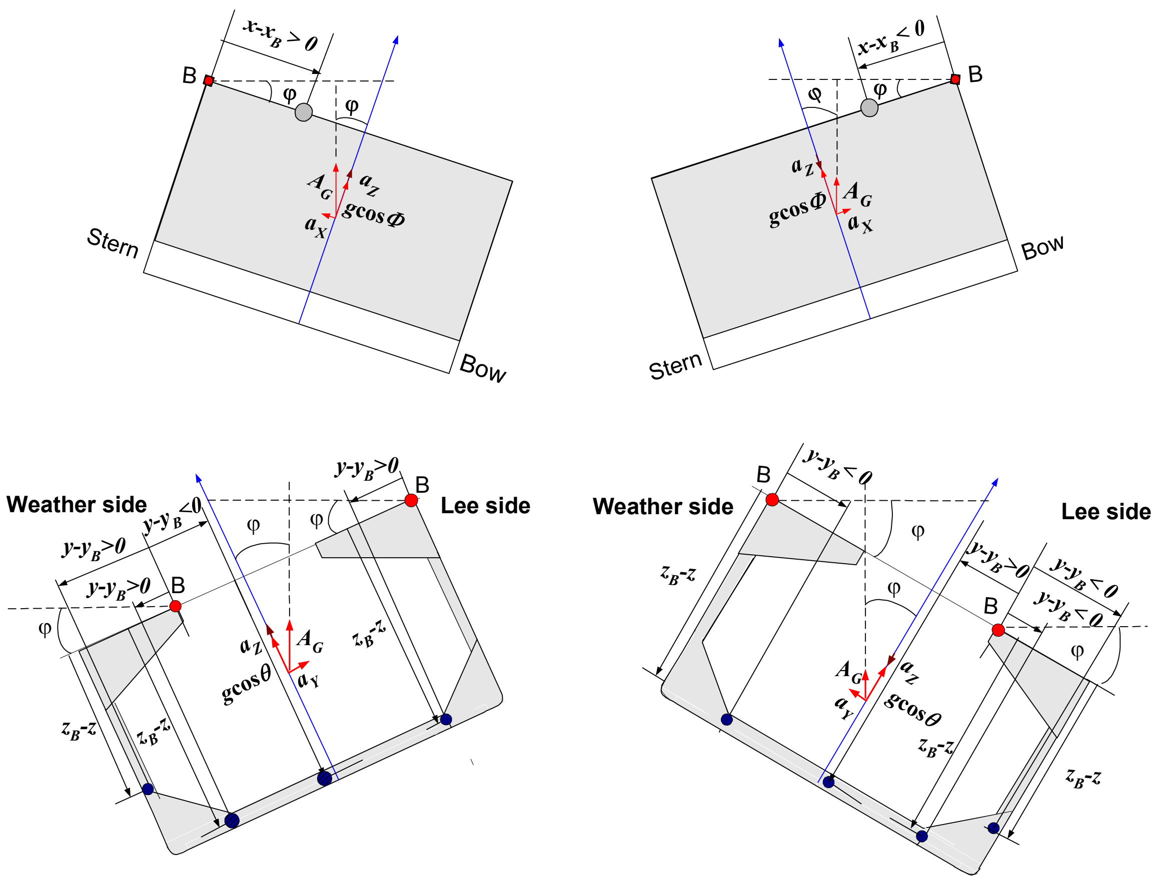


Figure 3: Definition of x_B and y_B

3. Lateral pressures and forces in flooded condition

3.1 Application

3.1.1

The lateral pressures to be considered in flooded condition are indicated in:

- [3.2] in general cases
- [3.3] for the particular case of transverse corrugated bulkheads
- [3.4] for the particular case of double bottom

3.2 General

3.2.1

The pressure p_F to be considered as acting on plating (excluding bottom and side shell plating) which constitute boundaries of compartments not intended to carry liquids is to be obtained, in kN/m^2, from the following formula:

$$p_F = \rho g\left(1 + 0.6\frac{a_Z}{g}\right)(z_F - z)\text{, without being less than } gd_0$$

where:

z_F : Z co-ordinate, in m, of the freeboard deck at side in way of the transverse section considered. Where the results of damage stability calculations are available, the deepest equilibrium waterline may be considered in lieu of the freeboard deck; in this case, the Society may require transient conditions to be taken into account

d_0 : Distance, in m, to be taken equal to:

$d_0 = 0.02L$ for $90 \text{ m} \leq L < 120$ m

$d_0 = 2.4$ for $L \geq 120$ m

3.3 Transverse vertically corrugated watertight bulkheads

3.3.1 Application

Each cargo hold is to be considered individually flooded.

3.3.2 General

The loads to be considered as acting on each bulkhead are those given by the combination of those induced by cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under examination. In any case, the pressure due to the flooding water alone is to be considered.

The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of each bulkhead, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions
- non-homogeneous loading conditions,

considering the individual flooding of both loaded and empty holds.

For the purpose of this item, homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, does not exceed 1.20, to be corrected for different cargo densities.

Non-homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not be considered according to these requirements.

The specified design load limits for the cargo holds are to be represented by loading conditions defined by the Designer in the loading manual.

For the purpose of this item, holds carrying packed cargoes are to be considered as empty.

Unless the ship is intended to carry, in non-homogeneous conditions, only iron ore or cargo having bulk density equal to or greater than 1.78 t/m^3, the maximum mass of cargo which may be carried in the hold is also to be considered to fill that hold up to the upper deck level at centreline.

3.3.3 Flooding level

The flooding level z_F is the distance, in m, measured vertically from the base line with the ship in the upright position, and equal to:

- in general:
  - D_1 for the foremost transverse corrugated bulkhead
  - $0.9D_1$ for other bulkheads;

where the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions, the following values may be assumed:

  - $0.95D_1$ for the foremost transverse corrugated bulkhead
  - $0.85D_1$ for other bulkheads
- for ships less than 50000 t deadweight with type B freeboard:
  - $0.95D_1$ for the foremost transverse corrugated bulkhead
  - $0.85D_1$ for other bulkheads;

where the ship is to carry cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions, the following values may be assumed:

  - $0.9D_1$ for the foremost transverse corrugated bulkhead
  - $0.8D_1$ for other bulkheads.

3.3.4 Pressures and forces on a corrugation in non-flooded bulk cargo loaded holds

At each point of the bulkhead, the pressure is to be obtained, in kN/m^2, from the following formula:

$$p_B = \rho_C g(h_C + h_{DB} - z)\tan^2\left(45 - \frac{\psi}{2}\right)$$

The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_B = \rho_C g s_C \frac{(h_C - h_{LS})^2}{2}\tan^2\left(45 - \frac{\psi}{2}\right)$$

3.3.5 Pressures and forces on a corrugation in flooded bulk cargo loaded holds

Two cases are to be considered, depending on the values of z_F and h_C (see [3.3.3] and [1.1]):

- First case, when $z_F \geq h_C + h_{DB}$

  At each point of the bulkhead located at a distance between z_F and $h_C + h_{DB}$ from the base line, the pressure, in kN/m^2, is to be obtained from the following formula:

  $p_{B,F} = \rho\, g\, (z_F - z)$

  At each point of the bulkhead located at a distance lower than $h_C + h_{DB}$ from the base line, the pressure, in kN/m^2, is to be obtained from the following formula:

  $$p_{B,F} = \rho g(z_F - z) + [\rho_C - \rho(1 - perm)]g(h_C + h_{DB} - z)\tan^2\left(45 - \frac{\psi}{2}\right)$$

  where *perm* is the permeability of cargo, to be taken as 0.3 for iron ore, coal cargoes and cement.

  The force acting on a corrugation is to be obtained, in kN, from the following formula:

  $$F_{B,F} = s_C\left[\rho g\frac{(z_F - h_C - h_{DB})^2}{2} + \frac{\rho g(z_F - h_C - h_{DB}) + (p_{B,F})_{LE}}{2}(h_C - h_{LS})\right]$$

  where $(p_{B,F})_{LE}$ is the pressure $p_{B,F}$, in kN/m^2, calculated at the lower edge of the corrugation.

- Second case, when $z_F < h_C + h_{DB}$

  At each point of the bulkhead located at a distance between z_F and $h_C + h_{DB}$ from the base line, the pressure is to be obtained, in kN/m^2, from the following formula:

  $$p_{B,F} = \rho_C g(h_C + h_{DB} - z)\tan^2\left(45 - \frac{\psi}{2}\right)$$

  At each point of the bulkhead located at a distance lower than z_F from the base line, the pressure is to be obtained, in kN/m^2, from the following formula:

$$p_{B,F} = \rho g(z_F - z) + \left[\rho_C(h_C + h_{DB} - z) - \rho(1 - perm)(z_F - z)\right]g \tan^2\left(45 - \frac{\psi}{2}\right)$$

where *perm* is the permeability of cargo, to be taken as 0.3 for iron ore, coal cargoes and cement.

The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_{B,F} = s_C\left[\rho_C g\frac{(h_C + h_{DB} - z_F)^2}{2}\tan^2\left(45 - \frac{\psi}{2}\right)\right] + s_C\left[\frac{\rho_C g(h_C + h_{DB} - z_F)\tan^2\left(45 - \frac{\psi}{2}\right) + (p_{B,F})_{LE}}{2}(z_F - h_{DB} - h_{LS})\right]$$

where $(p_{B,F})_{LE}$ is the pressure $p_{B,F}$, in kN/m^2, calculated at the lower edge of the corrugation.

3.3.6 Pressures and forces on a corrugation in flooded empty holds

At each point of the bulkhead, the still water pressure induced by the flooding to be considered is to be obtained, in kN/m^2, from the following formula:

$$p_F = \rho\, g\, (z_F - z)$$

The force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F_F = s_C \rho g \frac{(z_F - h_{DB} - h_{LS})^2}{2}$$

3.3.7 Resultant pressures and forces

Resultant pressures and forces to be calculated for homogeneous and non-homogeneous loading conditions are to be obtained according to the following formulae:

- Homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure to be considered for the scantlings of the bulkhead is to be obtained, in kN/m^2, from the following formula:

$$p = p_{B,F} - 0.8 p_B$$

The resultant force acting on a corrugation is to be obtained, in kN, from the following formula:

$$F = F_{B,F} - 0.8\, F_B$$

where:

p_B : Pressure in the non-flooded holds, in kN/m^2, to be obtained as specified in [3.3.4]

$p_{B,F}$: Pressure in the flooded holds, in kN/m^2, to be obtained as specified in [3.3.5]

$F_{B,F}$: Force acting on a corrugation in the flooded holds, in kN, to be obtained as specified in [3.3.5].

F_B : Force acting on a corrugation in non-flooded holds, in kN, to be obtained as specified in [3.3.4].

- Non-homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure to be considered for the scantlings of the bulkhead is to be obtained, in kN/m^2, by the following formula:

$$p = p_{B,F}$$

The resultant force acting on a corrugation is to be obtained, in kN, by the following formula:

$$F = F_{B,F}$$

where:

$p_{B,F}$: Pressure in the flooded holds kN/m^2, to be obtained as specified in [3.3.5]

$F_{B,F}$: Force acting on a corrugation in the flooded holds kN/m^2, to be obtained as specified in [3.3.5].

3.4 Double bottom

3.4.1 Application

Each cargo hold is to be considered individually flooded.

3.4.2 General

The loads to be considered as acting on the double bottom are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of the hold which the double bottom belongs to.

The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions
- non-homogeneous loading conditions
- packed cargo conditions (such as in the case of steel mill products).

For each loading condition, the maximum dry bulk cargo density to be carried is to be considered in calculating the allowable hold loading.

3.4.3 Flooding level

The flooding level z_F is the distance, in m, measured vertically from the base line with the ship in the upright position, and equal to:

- for ships less than 50000 t deadweight with type B freeboard:
  - $0.95D_1$ for the foremost hold
  - $0.85D_1$ for other holds;
- for other ships:
  - D_1 for the foremost hold
  - $0.9D_1$ for other holds;

4. Testing lateral pressure

4.1 Still water pressures

4.1.1

The total pressure to be considered as acting on plates and stiffeners subject to tank testing is obtained, in kN/m^2, from the following formula:

$$p_{ST} = 10(z_{ST} - z)$$

where:

z_{ST} : Testing load height, in m, as defined in Tab 2.

Table 2: Testing load height

Compartment or structure to be tested	Testing load height, in m
Double bottom tanks	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{ml}$
Hopper side tanks, topside tanks, double side tanks, fore and after peaks used as tank, cofferdams	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{TOP} + 2.4$
Tank bulkheads, deep tanks, fuel oil bunkers	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{TOP} + 2.4$ $z_{ST} = z_{TOP} + 10p_{PV}$
Ballast hold	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_h + 0.9$
Fore and aft peak not used as tank	The greater of the following: $z_{ST} = z_F$ $z_{ST} = z_{ml}$
Watertight doors below freeboard deck	$z_{ST} = z_{fd}$
Chain locker (if aft of collision bulkhead)	$z_{ST} = z_{TOP}$
Independent tanks	The greater of the following: $z_{ST} = z_{TOP} + d_{AP}$ $z_{ST} = z_{TOP} + 0.9$
Ballast ducts	Testing load height corresponding to ballast pump maximum pressure

where:

z_{ml} : Z co-ordinate, in m, of the bulkhead deck at side.

z_h : Z co-ordinate, in m, of the top of hatch coaming.

z_F : As defined in [3.2.1].

z_{fd} : Z co-ordinate, in m, of the freeboard deck.

p_{PV} : Setting pressure, in bar, of safety valves.

RCN 1 to July 2010 version (effective from 1July 2012)

Section 7 – LOADING CONDITIONS

Symbols

M_H : The actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught, in t

M_{Full} : The cargo mass in a cargo hold corresponding to cargo with virtual density (homogenous mass / hold cubic capacity, minimum 1.0 t/m^3) filled to the top of the hatch coaming, in t.

$$M_{Full} = V_{Full} \cdot \max(M_H / V_H, 1.0)$$

M_{Full} is in no case to be less than M_H

M_{HD} : The maximum cargo mass allowed to be carried in a cargo hold according to design loading condition(s) with specified holds empty at maximum draught, in t

V_{Full} : Volume, in m^3, of the cargo hold including the volume enclosed by the hatch coaming

V_H : Volume, in m^3, defined in Ch 4, Sec 6

T_{HB} : Deepest ballast draught, in m.

1. Application

1.1 Ships having a length *L* less than 150 m

1.1.1

The severest loading conditions from the loading manual, midship section drawing or otherwise specified by the Designer are to be considered for the longitudinal strength according to Ch 5, Sec 1 and for the local strength check of plating, ordinary stiffeners and primary supporting members according to Ch 6.

1.2 Ships having a length *L* of 150 m and above

1.2.1

The requirements in [2] to [4] are applicable to ships having a length *L* of 150 m and above.

1.2.2

These requirements are not intended to prevent any other loading conditions to be included in the loading manual for which calculations are to be submitted. It is not intended to replace in any way the required loading manual/instrument.

1.2.3

The maximum loading condition draught is to be taken as the moulded summer load line draught.

1.2.4

The loading conditions listed in [2] are to be applied for the check of longitudinal strength as required by Ch 5, Sec 1, the check of local strength by Ch 6, the direct strength analysis by Ch 7, for capacity and disposition of ballast tanks and stability purposes. The loading conditions listed in [3] are to be applied for the check of local strength. The loading conditions listed in [4] are to be applied for direct strength analysis.

1.2.5
In operation, a bulk carrier may be loaded differently from the design loading conditions specified in the loading manual, provided longitudinal and local strength as defined in the loading manual and onboard loading instrument and applicable stability requirements are not exceeded.

2. General

2.1 Design loading conditions - General

2.1.1
For the determination of the maximum cargo mass in cargo holds, the condition corresponding to the ship being loaded at maximum draught with 50% of consumables is to be considered.

2.1.2 BC-C
Homogeneous cargo loaded condition where the cargo density corresponds to all cargo holds, including hatchways, being 100% full at maximum draught with all ballast tanks empty.

2.1.3 BC-B
As required for **BC-C**, plus:

Homogeneous cargo loaded condition with cargo density 3.0 t/m^3, and the same filling ratio (cargo mass/hold cubic capacity) in all cargo holds at maximum draught with all ballast tanks empty.

In cases where the cargo density applied for this design loading condition is less than 3.0 t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated with the additional service feature **{maximum cargo density *x.y* t/m^3}**.

2.1.4 BC-A
As required for **BC-B**, plus:

At least one cargo loaded condition with specified holds empty, with cargo density 3.0 t/m^3, and the same filling ratio (cargo mass/hold cubic capacity) in all loaded cargo holds at maximum draught with all ballast tanks empty.

The combination of specified empty holds is to be indicated with the additional service feature **{holds *a*, *b*, ... may be empty}**.

In such cases where the design cargo density applied is less than 3.0 t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated within the additional service feature **{holds *a*, *b*, ... may be empty with maximum cargo density *x.y* t/m^3}**.

2.2 Applicable ballast conditions

2.2.1 Ballast tank capacity and disposition
All bulk carriers are to have ballast tanks of sufficient capacity and so disposed to at least fulfill the following requirements.

Normal ballast condition

Normal ballast condition is a ballast (no cargo) condition where:

- the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in Ch 4, Sec 3 are to be complied with
- any cargo hold or holds adapted for the carriage of water ballast at sea are to be empty
- the propeller is to be fully immersed, and
- the trim is to be by the stern and is not to exceed $0.015L_{BP}$.

In the assessment of the propeller immersion and trim, the draughts at the forward and after perpendiculars may be used.

Heavy ballast condition

Heavy ballast condition is a ballast (no cargo) condition where:

- the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in Ch 4, Sec 3 are to be complied with
- at least one cargo hold adapted for carriage of water ballast at sea is to be full
- the propeller immersion I/D is to be at least 60 %, where:
  I = Distance from propeller centerline to the waterline
  D = Propeller diameter
- the trim is to be by the stern and is not to exceed $0.015L_{BP}$
- the moulded forward draught in the heavy ballast condition is not to be less than the smaller of $0.03L_{BP}$ or 8 m.

2.2.2 Strength requirements

All bulk carriers are to meet the following strength requirements:

Normal ballast condition:

- the structures of bottom forward are to be strengthened in accordance with the Rules against slamming for the condition of [2.2.1] for normal ballast condition at the lightest forward draught,
- the longitudinal strength requirements according to Ch 4, Sec 3 are to be met for the condition of [2.2.1] for normal ballast condition, and
- in addition, the longitudinal strength requirements according to Ch 4, Sec 3 are to be met with all ballast tanks 100% full.

Heavy ballast condition:

- the longitudinal strength requirements according to Ch 4, Sec 3 are to be met for the condition of [2.2.1] for heavy ballast condition
- in addition, the longitudinal strength requirements according to Ch 4, Sec 3 are to be met with all ballast tanks 100% full and one cargo hold adapted and designated for the carriage of water ballast at sea, where provided, 100% full, and

- where more than one hold is adapted and designated for the carriage of water ballast at sea, it will not be required that two or more holds be assumed 100% full simultaneously in the longitudinal strength assessment, unless such conditions are expected in the heavy ballast condition. Unless each hold is individually investigated, the designated heavy ballast hold and any/all restrictions for the use of other ballast hold(s) are to be indicated in the loading manual.

2.3 Departure and arrival conditions

2.3.1

Unless otherwise specified, each of the design loading conditions defined in [2.1] and [2.2] is to be investigated for the arrival and departure conditions as defined as follows:

- Departure condition : with bunker tanks not less than 95% full and other consumables 100%
- Arrival condition : with 10% of consumables

3. Design loading conditions for local strength

3.1 Definitions

3.1.1

The maximum allowable or minimum required cargo mass in a cargo hold, or in two adjacently loaded holds, is related to the net load on the double bottom. The net load on the double bottom is a function of draft, cargo mass in the cargo hold, as well as the mass of fuel oil and ballast water contained in double bottom tanks.

3.2 Applicable general conditions

3.2.1

Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.

3.2.2

Any cargo hold is to be capable of carrying minimum 50% of M_H, with all double bottom tanks in way of the cargo hold being empty, at maximum draught.

3.2.3

Any cargo hold is to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at the deepest ballast draught.

3.3 Additional conditions applicable except when additional service feature {no MP} is assigned

3.3.1

Any cargo hold is to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of maximum draught.

3.3.2

Any cargo hold is to be capable of being empty with all double bottom tanks in way of the cargo hold being empty, at 83% of maximum draught.

3.3.3

Any two adjacent cargo holds are to be capable of carrying M_{Full} with fuel oil tanks in double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of the maximum draught. This requirement to the mass of cargo and fuel oil in double bottom tanks in way of the cargo hold applies also to the condition where the adjacent hold is filled with ballast, if applicable.

3.3.4

Any two adjacent cargo holds are to be capable of being empty, with all double bottom tanks in way of the cargo hold being empty, at 75% of maximum draught.

3.4 Additional conditions applicable for BC-A only

3.4.1

Cargo holds, which are intended to be empty at maximum draught, are to be capable of being empty with all double bottom tanks in way of the cargo hold also being empty.

3.4.2

Cargo holds, which are intended to be loaded with high density cargo, are to be capable of carrying M_{HD} plus 10% of M_H, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty in way of the cargo hold, at maximum draught.
In operation the maximum allowable cargo mass shall be limited to M_{HD}.

3.4.3

Any two adjacent cargo holds which according to a design loading condition may be loaded with the next holds being empty, are to be capable of carrying 10% of M_H in each hold in addition to the maximum cargo load according to that design loading condition, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at maximum draught.
In operation the maximum allowable mass shall be limited to the maximum cargo load according to the design loading conditions.

3.5 Additional conditions applicable for ballast hold(s) only

3.5.1

Cargo holds, which are designed as ballast water holds, are to be capable of being 100% full of ballast water including hatchways, with all double bottom tanks in way of the cargo hold being 100% full, at any heavy ballast draught. For ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty.

3.6 Additional conditions applicable during loading and unloading in harbour only

3.6.1

Any single cargo hold is to be capable of holding the maximum allowable seagoing mass at 67% of maximum draught, in harbour condition.

3.6.2

Any two adjacent cargo holds are to be capable of carrying M_{Full}, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of maximum draught, in harbour condition.

3.6.3

At reduced draught during loading and unloading in harbour, the maximum allowable mass in a cargo hold may be increased by 15% of the maximum mass allowed at the maximum draught in sea-going condition, but shall not exceed the mass allowed at maximum draught in the sea-going condition. The minimum required mass may be reduced by the same amount.

3.7 Hold mass curves

3.7.1

Based on the design loading criteria for local strength, as given in [3.2] to [3.6] except [3.5.1], hold mass curves are to be included in the loading manual and the loading instrument, showing maximum allowable and minimum required mass as a function of draught in sea-going condition as well as during loading and unloading in harbour. Hold mass curves are to be calculated according to Ch 4, App 1.

3.7.2

At other draughts than those specified in the design loading conditions, the maximum allowable and minimum required mass is to be adjusted for the change in buoyancy acting on the bottom. Change in buoyancy is to be calculated using water plane area at each draught.

Hold mass curves for each single hold, as well as for any two adjacent holds, are to be included in the loading manual and the loading instrument.

4. Design loading conditions for direct strength analysis

4.1 Loading patterns

4.1.1

The loading patterns applicable to types of bulk carriers with various service feature notations are summarized in Tab 1, which are to be considered in direct strength analysis in accordance with [2] and [3].

Table 1: Applicable loading patterns according to additional service features

No.	Loading pattern	Ref.	BC-			BC-, (no MP)		
			A	B	C	A	B	C
1	Full load in homogeneous condition	3.2.1	x	x	x	x	x	x
2	Slack load	3.2.2	x	x	x	x	x	x
3	Deepest ballast	3.2.3	x	x	x	x	x	x
4	Multiport -1	3.3.1	x	x	x			
5	Multiport -2	3.3.2	x	x	x			
6	Multiport -3	3.3.3	x	x	x			
7	Multiport -4	3.3.4	x	x	x			
8	Alternate load	3.4.1&.2	x			x		
9	Alternate block load	3.4.3	x			x		
10	Heavy ballast	3.5.1	x	x	x	x	x	x
11	Harbour condition -1	3.6.1				x	x	x
12	Harbour condition -2	3.6.2				x	x	x

4.1.2

Other loading conditions from the loading manual, which are not covered in Tab 1, if any, are also to be considered.

4.2 Still water bending moment and shear force

4.2.1

Load cases defined in Sec 4 are to be considered for each loading pattern given in Tab 1. The still water vertical bending moment provided in Tab 2 and the still water vertical shear force provided in Tab 3 are to be used for each combination of loading pattern and load case.

4.2.2

If one loading condition in the loading manual has a still water vertical bending moment more severe than the value in Tab 2 for the corresponding loading pattern, the value in Tab 2 for this loading pattern is to be replaced with the value from the loading manual.

4.3 Application

4.3.1

The minimum required loading conditions for direct strength analysis, including vertical shear force analysis, are defined in Ch 4, App 2.

4.3.2

The standard loading conditions for fatigue assessment are defined in Ch 4, App 3.

Table 2: Vertical still water bending moment

		Loading pattern				
		Full load in homogeneous condition	**Slack load**	**Multiport**	**Heavy ballast (Ballast hold)**	**Harbour condition**

Section 8 - LOADING MANUAL AND LOADING INSTRUMENT

1. General

1.1 All ships

1.1.1

An approved loading manual is to be supplied on board for all ships.

In addition, an approved loading instrument is to be supplied for all ships.

The loading instrument is ship specific onboard equipment and the results of the calculations are only applicable to the ship for which it has been approved.

An approved loading instrument may not replace an approved loading manual.

1.2 Ships equal to or greater than 150 m in length *L*

1.2.1

BC-A, **BC-B**, and **BC-C** ships are to be provided with an approved loading manual and an approved computer-based loading instrument, in accordance with the applicable requirements of this Section.

A guidance for loading and unloading sequences is given in [5].

2. Loading manual

2.1 Definitions

2.1.1 All ships

A loading manual is a document which describes:

- the loading conditions on which the design of the ship has been based, including permissible limits of still water bending moment and shear force. The conditions specified in the ballast water exchanging procedure and dry docking procedure are to be included in the loading manual.
- the results of the calculations of still water bending moments and shear forces
- the allowable local loading for the structure (hatch covers, decks, double bottom, etc.).

2.1.2 Ships equal to or greater than 150 m in length *L*

In addition to [2.1.1], for **BC-A**, **BC-B** and **BC-C** ships, the loading manual is also to describe:

- envelope results and permissible limits of still water bending moments and shear forces in the hold flooded condition according to Ch 5, Sec 1
- the cargo hold(s) or combination of cargo holds that might be empty at full draught. If no cargo hold is allowed to be empty at full draught, this is to be clearly stated in the loading manual
- maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of the draught at mid-hold position

- maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions
- maximum allowable tank top loading together with specification of the nature of the cargo for cargoes other than bulk cargoes
- maximum allowable load on deck and hatch covers. If the ship is not approved to carry load on deck or hatch covers, this is to be clearly stated in the loading manual
- maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

2.2 Conditions of approval

2.2.1 All ships

The approved loading manual is to be based on the final data of the ship. The manual is to include the design (cargo and ballast) loading conditions, subdivided into departure and arrival conditions as appropriate, upon which the approval of the hull scantlings is based.

In the case of modifications resulting in changes to the main data of the ship, a new approved loading manual is to be issued.

2.2.2 Ships equal to or greater than 150 m in length *L*

In addition to [2.2.1], for **BC-A**, **BC-B** and **BC-C** ships, the following loading conditions, subdivided into departure and arrival conditions as appropriate, are also to be included in the loading manual:

- homogeneous light and heavy cargo loading conditions at maximum draught
- alternate light and heavy cargo loading conditions at maximum draught, where applicable
- ballast conditions. For ships having ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty
- short voyage conditions where the ship is to be loaded to maximum draught but with limited amount of bunkers
- multiple port loading / unloading conditions
- deck cargo conditions, where applicable
- typical loading sequences where the ship is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions are also to be included. The typical loading / unloading sequences are also to be developed to not exceed applicable strength limitations. The typical loading sequences are also to be developed paying due attention to loading rate and the deballasting capability. Tab 1 contains, as guidance only, an example of a Loading Sequence Summary Form
- typical sequences for change of ballast at sea, where applicable.

2.3 Language

2.3.1

The loading manual is to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

3. Loading instrument

3.1 Definitions

3.1.1 All ships

A loading instrument is an instrument which is either analog or digital and by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces, in any load or ballast condition, do not exceed the specified permissible values.

3.1.2 Ships equal to or greater than 150 m in length *L*

For **BC-A**, **BC-B** and **BC-C** ships, the loading instrument is an approved digital system as defined in [3.1.1]. In addition to [3.1.1], it is also to ascertain as applicable that:

- the mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position
- the mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds
- the still water bending moment and shear forces in the hold flooded conditions

do not exceed the specified permissible values.

3.2 Conditions of approval

3.2.1 All ships

The loading instrument is subject to approval, which is to include:

- verification of type approval, if any
- verification that the final data of the ship have been used
- acceptance of number and position of all read-out points
- acceptance of relevant limits for read-out points
- checking of proper installation and operation of the instrument on board, under agreed test conditions, and that a copy of the operation manual is available.

3.2.2 Ships equal to or greater than 150 m in length *L*

In addition, for **BC-A**, **BC-B** and **BC-C** ships, the approval is also to include, as applicable:

- acceptance of hull girder bending moment limits for all read-out points
- acceptance of hull girder shear force limits for all read-out points
- acceptance of limits for the mass of cargo and double bottom contents of each hold as a function of draught
- acceptance of limits for the mass of cargo and double bottom contents in any two adjacent holds as a function of draught.

3.2.3
In the case of modifications implying changes in the main data of the ship, the loading instrument is to be modified accordingly and approved.

3.2.4
An operational manual is always to be provided for the loading instrument.

The operation manual and the instrument output are to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

3.2.5
The operation of the loading instrument is to be verified upon installation under the agreed test conditions. It is to be checked that the agreed test conditions and the operation manual for the instrument are available on board.

4. Annual and class renewal survey

4.1 General

4.1.1
At each annual and class renewal survey, it is to be checked that the approved loading manual is available on board.

4.1.2
The loading instrument is to be checked for accuracy at regular intervals by the ship's Master by applying test loading conditions.

4.1.3
At each class renewal survey this checking is to be done in the presence of the Surveyor.

5. Guidance for loading/unloading sequences

5.1 General

5.1.1
The typical loading/unloading sequences shall be developed paying due attention to the loading/unloading rate, the ballasting/deballasting capacity and the applicable strength limitations.

5.1.2
The shipbuilder will be required to prepare and submit for approval typical loading and unloading sequences.

5.1.3
The typical loading sequences as relevant should include:

- alternate light and heavy cargo load condition
- homogeneous light and heavy cargo load condition
- short voyage condition where the ship is loaded to maximum draught but with limited bunkers
- multiple port loading/unloading condition

- deck cargo condition
- block loading.

5.1.4
The loading/unloading sequences may be port specific or typical.

5.1.5
The sequence is to be built up step by step from commencement of cargo loading to reaching full deadweight capacity. Each time the loading equipment changes position to a new hold defines a step. Each step is to be documented and submitted to the Society. In addition to longitudinal strength, the local strength of each hold is to be considered.

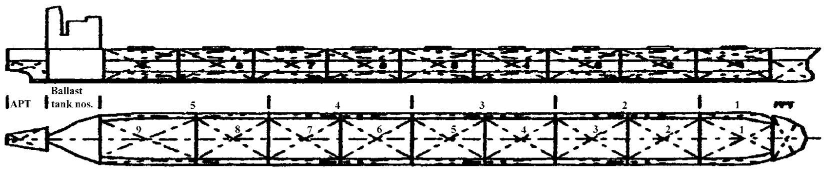
5.1.6
For each loading condition a summary of all steps is to be included. This summary is to highlight the essential information for each step such as:

- how much cargo is filled in each hold during the different steps,
- how much ballast is discharged from each ballast tank during the different steps,
- the maximum still water bending moment and shear at the end of each step,
- the ship's trim and draught at the end of each step.

Table 1: Guidance on Typical Loading Sequence Summary Form

LOADING/UNLOADING SEQUENCE SUMMARY FORM

Vessel name	Voyage No.	Condition	Yard	Id. Number



Port (specific or typical) :	Condition at commencement of loading/discharging	
Total mass of cargo to be loaded/discharged :	Condition at end of loading/discharging	
Dock water density (t/m3) :	Maximum Loading/discharging rate :	Average Loading/discharging rate :

Appendix 1 – HOLD MASS CURVES

Symbols

h : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline, in m.

h_a : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the aft cargo hold in a block loading, in m.

h_f : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the fore cargo hold in a block loading, in m.

M_H : As defined in Ch 4, Sec 7

M_{Full} : As defined in Ch 4, Sec 7

M_{HD} : As defined in Ch 4, Sec 7

M_D : The maximum cargo mass given for each cargo hold, in t

M_{BLK} : The maximum cargo mass in a cargo hold according to the block loading condition in the loading manual, in t

T_{HB} : As defined in Ch 4, Sec 7

T_i : Draught in loading condition No. i, at mid-hold position of cargo hold length ℓ_H , in m

V_H : As defined in Ch 4, Sec 6

V_f and V_a: Volume of the forward and after cargo hold excluding volume of the hatchway part, in m^3.

$T_{\min}$: $0.75T_S$ or draught in ballast conditions with the two adjacent cargo holds empty, whichever is greater, in m.

Σ : The sum of masses of two adjacent cargo holds

RCN 2 to July 2008 version (effective from 1 July 2010)

1. General

1.1 Application

1.1.1

The requirements of this Appendix apply to ships of 150 m in length L and above.

1.1.2

This Appendix describes the procedure to be used for determination of:

- the maximum and minimum mass of cargo in each cargo hold as a function of the draught at mid-hold position of cargo hold
- the maximum and minimum mass of cargo in any two adjacent holds as a function of the mean draught in way of these holds.

1.1.3

Results of these calculations are to be included in the reviewed loading manual which has also to indicate the maximum permissible mass of cargo at scantling draught in each hold or in any two adjacent holds, as obtained from the design review.

1.1.4

The following notice on referring to the maximum permissible and the minimum required mass of cargo is to be described in loading manual.

Where ship engages in a service to carry such hot coils or heavy cargoes that have some adverse effect on the local strength of the double bottom and that the loading is not described as cargo in loading manual, the maximum permissible and the minimum required mass of cargo are to be considered specially.

2. Maximum and minimum masses of cargo in each hold

2.1 Maximum permissible mass and minimum required masses of single cargo hold in seagoing condition

2.1.1 General

The cargo mass curves of single cargo hold in seagoing condition are defined in [2.1.2] to [2.1.5]. However if the ship structure is checked for more severe loading conditions than the ones considered in Ch 4, Sec 7, [3.7.1], the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.1.2 BC-A ship not having {No MP} assigned

- For loaded holds

  The maximum permissible mass ($W_{\max}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

  $$W_{\max}(T_i) = M_{HD} + 0.1M_H - 1.025V_H \frac{(T_S - T_i)}{h}$$

  However, $W_{\max}(T_i)$ is no case to be greater than $M_{HD.}$

  The minimum required cargo mass ($W_{\min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

  $W_{\min}(T_i) = 0$ for $T_i \le 0.83T_S$

  $W_{\min}(T_i) = 1.025V_H \dfrac{(T_i - 0.83T_S)}{h}$ for $T_S \ge T_i > 0.83T_S$

- For empty holds which can be empty at the maximum draught

  The maximum permissible mass ($W_{\min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

  $W_{\max}(T_i) = M_{Full}$ for $T_S \ge T_i \ge 0.67T_S$

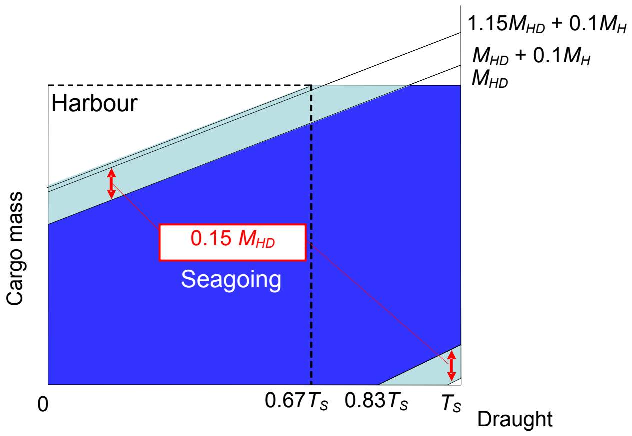
  $W_{\max}(T_i) = M_{Full} - 1.025V_H \dfrac{(0.67T_S - T_i)}{h}$ for $T_i < 0.67T_S$

The minimum required mass ($W_{\min}(T_i)$) is obtained, in t, by the following formula:

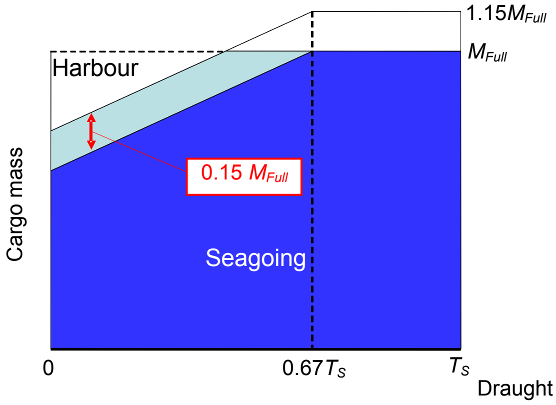
$W_{\min}(T_i) = 0$ for $T_i \le T_S$

Examples for mass curve of loaded cargo hold and cargo hold which can be empty at the maximum draught for **BC-A** ships not having {No MP} assigned are shown in Fig 1.

RCN 2 to July 2008 version (effective from 1 July 2010)



(a) Loaded hold



b) Cargo hold which can be empty at the maximum draught

Figure 1: Example of mass curve for BC-A ships not having {No MP} assigned

RCN 2 to July 2008 version (effective from 1 July 2010)

2.1.3 BC-A ship having {No MP} assigned

- For loaded holds

The maximum permissible mass ($W_{\max}(T_i)$) at various draughts (T_i) is the same specified in [2.1.2].

The minimum required mass ($W_{\min}(T_i)$) is obtained, in t, by the following formulae:

$W_{\min}(T_i) = 0$ for $T_i \le T_{HB}$

$W_{\min}(T_i) = 1.025 V_H \dfrac{(T_i - T_{HB})}{h}$ for $T_S \ge T_i > T_{HB}$ or

$W_{\min}(T_i) = 0.5 M_H - 1.025 V_H \dfrac{(T_S - T_i)}{h} \ge 0$ for $T_S \ge T_i$

- For empty hold which can be empty at the maximum draught

The maximum permissible mass ($W_{\max}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

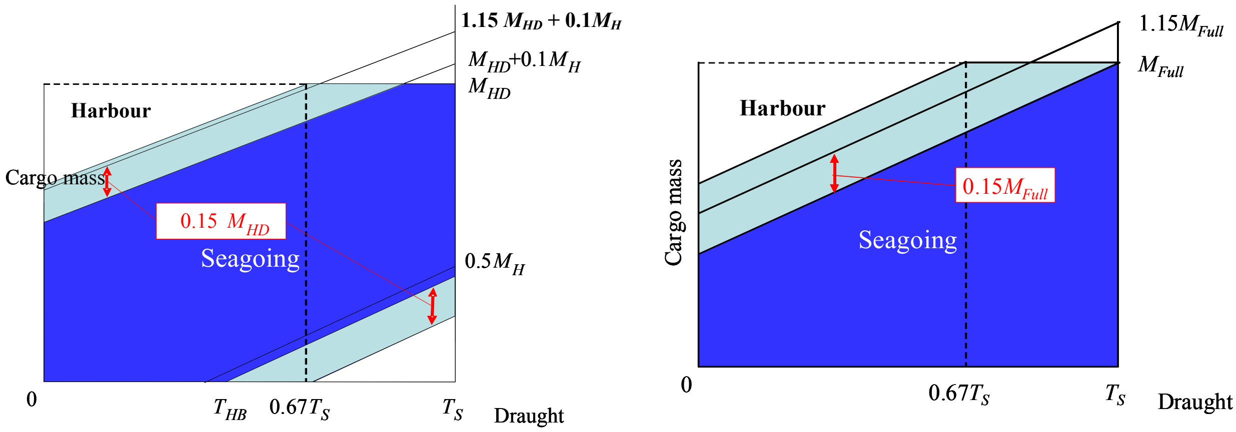
$$W_{\max}(T_i) = M_{Full} - 1.025 V_H \frac{(T_S - T_i)}{h}$$

The minimum required cargo mass ($W_{\min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$W_{\min}(T_i) = 0$ for $T_i \le T_S$

Examples for mass curve of cargo hold for **BC-A** ships, having {No MP} assigned are shown in Fig 2.

RCN 2 to July 2008 version (effective from 1 July 2010)



(a) Loaded hold (b) Cargo hold which can be empty at the maximum draught

Figure 2: Example of mass curve for BC-A ships having {No MP} assigned

RCN 2 to July 2008 version (effective from 1 July 2010)

2.1.4 BC-B and BC-C ships not having {No MP} assigned

The maximum permissible mass ($W_{\max}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{\max}(T_i) = M_{Full} \qquad \text{for } T_S \geq T_i \geq 0.67T_S$$

$$W_{\max}(T_i) = M_{Full} - 1.025V_H \frac{(0.67T_S - T_i)}{h} \qquad \text{for } T_i < 0.67T_S$$

The minimum required cargo mass ($W_{\min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{\min}(T_i) = 0 \qquad \text{for } T_i \leq 0.83T_S$$

$$W_{\min}(T_i) = 1.025V_H \frac{(T_i - 0.83T_S)}{h} \qquad \text{for } T_S \geq T_i > 0.83T_S$$

Example for mass curve of cargo hold for BC-B and BC-C ships is shown in Fig. 3.

RCN 2 to July 2008 version (effective from 1 July 2010)

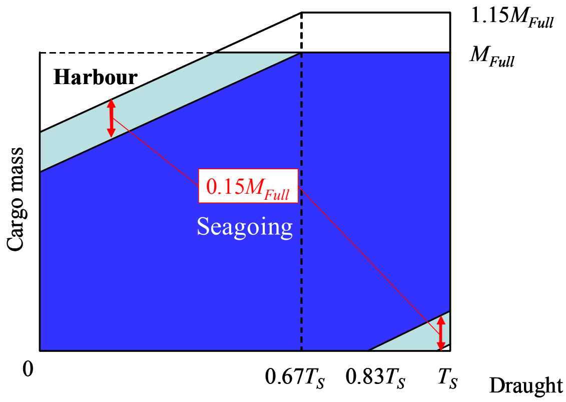


Figure 3: Example of mass curve for BC-B and BC-C ships not having {No MP} assigned

RCN 2 to July 2008 version (effective from 1 July 2010)

2.1.5 BC-B and BC-C ships having {No MP} assigned

The maximum permissible mass ($W_{\max}(T_i)$) at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\max}(T_i) = M_{Full} - 1.025V_H \frac{(T_S - T_i)}{h}$$

The minimum required cargo mass ($W_{\min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$W_{\min}(T_i) = 0$ for $T_i \le T_{HB}$

$W_{\min}(T_i) = 1.025V_H \frac{(T_i - T_{HB})}{h}$ for $T_S \ge T_i > T_{HB}$ or

$W_{\min}(T_i) = 0.5M_H - 1.025V_H \frac{(T_S - T_i)}{h}$ for $T_S \ge T_i$

$W_{\min}(T_i) \ge 0.0$

Example for mass curve of cargo hold for **BC-B** or **BC-C** ships with {No MP} is shown in Fig 4.

RCN 2 to July 2008 version (effective from 1 July 2010)

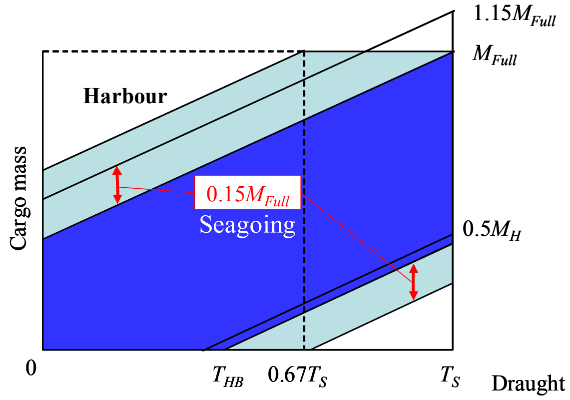

Figure 4: Example of mass curve for BC-B and BC-C ships having {No MP} assigned

RCN 2 to July 2008 version (effective from 1 July 2010)

2.2 Maximum permissible mass and minimum required masses of single cargo hold in harbour condition

2.2.1 General

The cargo mass curves of single cargo hold in harbour condition are defined in [2.2.2]. However if the ship structure is checked for more severe loading conditions than ones considered in Ch 4, Sec 7, [3.7.1], the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.2.2 All ships

The maximum permissible cargo mass and the minimum required cargo mass corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15% of the maximum permissible mass at the maximum draught for the cargo hold in seagoing condition. However, maximum permissible mass is in no case to be greater than the maximum permissible cargo mass at designed maximum load draught for each cargo hold.

2.2.3 BC-A ship not having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in [2.1.2]:

For loaded hold

$W_{max}(T_i) = M_{HD}$ for $T_i \geq 0.67T_S$

$W_{max}(T_i) = M_{HD} + 0.1M_H - 1.025V_H \dfrac{0.67T_S - T_i}{h}$ for $T_i < 0.67T_S$

RCN 2 to July 2008 version (effective from 1 July 2010)

2.2.4 BC-A ship having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in [2.1.3]:

For empty hold which can be empty at the maximum draught

$W_{max}(T_i) = M_{Full}$ for $T_S \geq T_i \geq 0.67T_S$

$W_{max}(T_i) = M_{Full} - 1.025V_H \dfrac{(0.67T_S - T_i)}{h}$ for $T_i < 0.67T_S$

RCN 2 to July 2008 version (effective from 1 July 2010)

2.2.5 BC-B and BC-C ships having {No MP} assigned

The maximum permissible mass $W_{max}(T_i)$ at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in [2.2.2]:

$W_{max}(T_i) = M_{Full}$ for $T_S \geq T_i \geq 0.67T_S$

$W_{max}(T_i) = M_{Full} - 1.025V_H \dfrac{(0.67T_S - T_i)}{h}$ for $T_i < 0.67T_S$

RCN 2 to July 2008 version (effective from 1 July 2010)

3. Maximum and minimum masses of cargo of two adjacent holds

3.1 Maximum permissible mass and minimum required masses of two adjacent holds in seagoing condition

3.1.1 General

The cargo mass curves of two adjacent cargo holds in seagoing condition are defined in [3.1.2] and [3.1.3]. However if the ship structure is checked for more severe loading conditions than ones considered in Ch 4, Sec 7, [3.7.1], the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.2 BC-A ships with "Block loading" and not having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts (T_i) is obtained, in t, by the greater of the following formulae:

$$W_{max}(T_i) = \sum (M_{BLK} + 0.1M_H) - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_s - T_i) \qquad \text{or}$$

$$W_{max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_s - T_i)$$

However, $W_{max}(T_i)$ is no case to be greater than $\sum M_{BLK}$.

The minimum required cargo mass ($W_{min}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae:

$$W_{\min}(T_i) = 0 \qquad \text{for} \quad T_i \le 0.75T_S$$

$$W_{\min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - 0.75T_S) \qquad \text{for} \quad T_S \ge T_i > 0.75T_S$$

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.2 bis BC-A ships with "Block loading" and having {No MP} assigned

The maximum permissible mass $W_{\max}(T_i)$ at various draughts T_i is obtained, in t, by the following formula:

$$W_{\max}(T_i) = \sum(M_{BLK} + 0.1M_H) - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_s - T_i)$$

However, $W_{\max}(T_i)$ is no case to be greater than $\sum M_{BLK}$.

The minimum required cargo mass $W_{\min}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\min}(T_i) = 0 \qquad \text{for} \quad T_i \le T_{HB}$$

$$W_{\min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - T_{HB}) \qquad \text{for} \quad T_S \ge T_i > T_{HB}$$

Examples for mass curve of cargo hold for BC-A with block loading ships are shown in Fig 5.

RCN 2 to July 2008 version (effective from 1 July 2010)

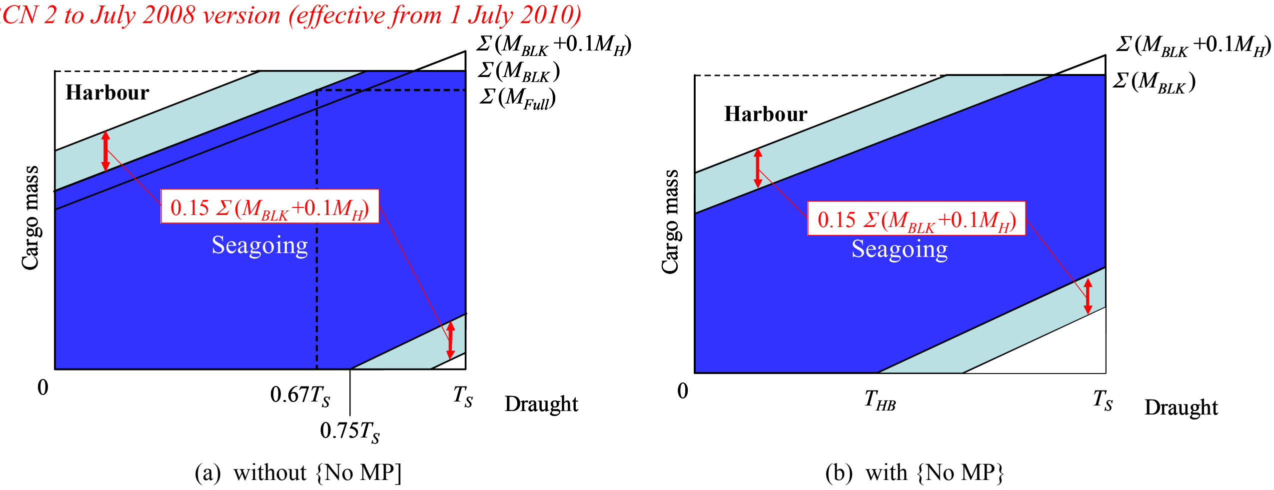

Figure 5: Example of mass curve for BC-A ships with "Block loading"

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.3 (void)

(void)

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.4 BC-A ships without "Block loading" and BC-B, BC-C ships, not having {No MP} assigned

The maximum permissible mass $W_{\max}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\max}(T_i) = \sum M_{Full} \qquad \text{for} \quad T_S \ge T_i \ge 0.67T_S$$

$$W_{\max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_S - T_i) \qquad \text{for} \quad T_i < 0.67T_S$$

The minimum required cargo mass $W_{\min}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\min}(T_i) = 0 \qquad \text{for} \quad T_i \le 0.75T_S$$

$$W_{\min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - 0.75T_S) \qquad \text{for} \quad T_S \ge T_i > 0.75T_S$$

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.5 BC-A ships without "Block loading" and BC-B, BC-C ships, having {No MP} assigned

The maximum permissible mass $W_{max}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_S - T_i) \qquad \text{for} \quad T_i < T_S$$

The minimum required cargo mass $W_{min}(T_i)$ at various draughts T_i is obtained, in t, by the following formulae:

$$W_{\min}(T_i) = 0 \qquad \text{for} \quad T_i \le T_{HB}$$

$$W_{\min}(T_i) = 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(T_i - T_{HB}) \qquad \text{for} \quad T_S \ge T_i > T_{HB}$$

Examples for mass curve of cargo hold for **BC-A** without block loading and **BC-B** or **BC-C** are shown in Fig 6.

RCN 2 to July 2008 version (effective from 1 July 2010)

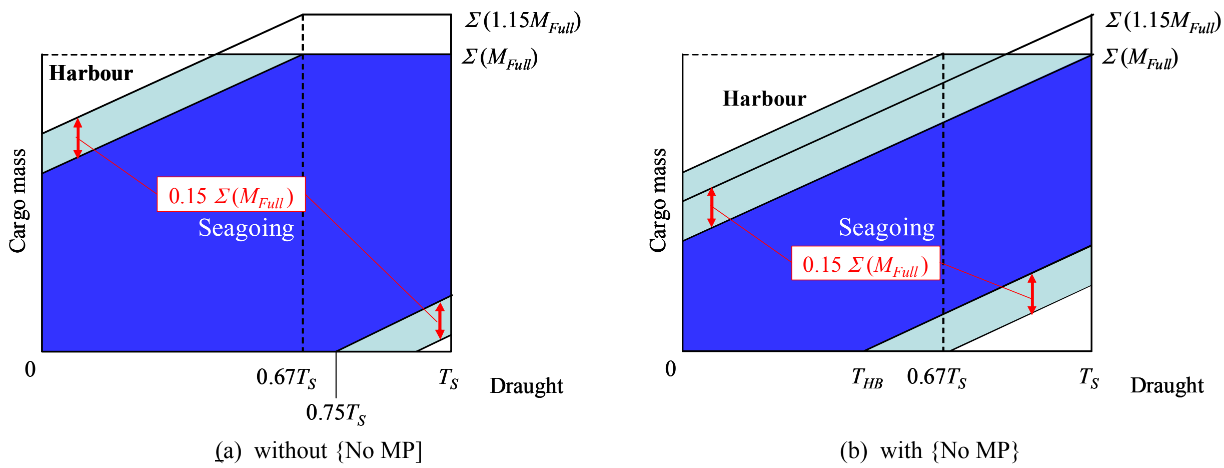

Figure 6: Example of mass curve for BC A-ship without block loading and BC-B or BC-C ships

RCN 2 to July 2008 version (effective from 1 July 2010)

3.2 Maximum permissible mass and minimum required masses of two adjacent cargo holds in harbour condition

3.2.1 General

The cargo mass curves of two adjacent cargo holds in harbour condition are defined in [3.2.2]. However if the ship structure is checked for more severe loading conditions than ones considered in Ch 4, Sec 7, [3.7.1], the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.2.2 All ships

The maximum permissible cargo mass and minimum required cargo mass corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15% of the maximum permissible mass at the maximum draught for the cargo hold in seagoing condition. However, maximum permissible mass is in no case to be greater than the maximum permissible cargo mass at designed maximum load draught for each cargo hold.

3.2.3 BC-A ships with “Block loading” and having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in [3.1.2 bis]:

$$W_{\max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_S - T_i)$$

$$W_{\max}(T_i) \le \sum M_{BLK}$$

RCN 2 to July 2008 version (effective from 1 July 2010)

3.2.4 BC-A ships without “Block loading” and BC-B, BC-C ships, having {No MP} assigned

The maximum permissible mass ($W_{max}(T_i)$) at various draughts T_i in harbour condition is also to be checked by the following formulae in addition to the requirements in [3.1.5]:

$$W_{\max}(T_i) = \sum M_{Full} \qquad \text{for} \quad T_S \ge T_i \ge 0.67T_S$$

$$W_{\max}(T_i) = \sum M_{Full} - 1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)(0.67T_S - T_i) \qquad \text{for} \quad T_i < 0.67T_S$$

RCN 2 to July 2008 version (effective from 1 July 2010)

Appendix 2 – STANDARD LOADING CONDITION FOR DIRECT STRENGTH ANALYSIS

Table 1: Bending moment analysis applicable to empty hold in alternate condition of BC-A (mid-hold is empty hold)

No.	Description [a]	Draught	Loading Pattern	Aft	Mid	Fore	Load Case (Design Wave) / Still water vertical bending moment [b]				Remarks (see below)
1	Full Load ([2.1.3])	T_S	M_H M_H M_H				P1 / $0.5M_{SW,S}$				1), 2)
2	Full Load ([3.2.1])	T_S	M_{Full} M_{Full} M_{Full}				P1 / $0.5M_{SW,S}$				1), 3)
3	Slack Load ([3.2.2])	T_S	50%M_H M_{Full} M_{Full}				P1 / 0				3)

7	Multi Port -3 ([3.3.3])	$0.67T_S$	M_{Full} M_{Full}				H1 / $M_{SW,S}$				3), 6)

No.	Description [a)]	Draught	Loading Pattern	Aft	Mid	Fore	Load Case (Design Wave) Still water vertical bending moment [b)]				Remarks (see below)
8	Multi Port -4 ([3.3.4])	$0.75T_S$					F2 $M_{SW,H}$	P1 $M_{SW,S}$			3), 6)
9	Multi Port -4 ([3.3.4])	$0.75T_S$					F2 $M_{SW,H}$	P1 $M_{SW,S}$			3), 6)
10	Alternate Load ([3.4.1])	T_S					F2 $M_{SW,H}$	P1 0			2)
11	Alt-Block Load ([3.4.3])	T_S					H1 $M_{SW,S}$	F2 $M_{SW,H}$	P1 $M_{SW,S}$		2), 8), 9), 10)
12	Alt-Block Load ([3.4.3])	T_S					H1 $M_{SW,S}$	F2 $M_{SW,H}$	P1 $M_{SW,S}$		2), 8), 9), 10)
13	Heavy Ballast ([3.5.1])	$T_{HB}(min)$					H1 $M_{SW,S}$	R1 0	R1 $M_{SW,S}$		11),12)
14	Heavy Ballast	$T_{HB}(min)$					R1 0	R1 $M_{SW,S}$			11), 12), 13)
15	Harbour Condition -2 ([3.6.2])	$0.67T_S$					--- $M_{SW,P,H}$	--- $M_{SW,P,S}$			3), 14), 15)

No.	Description a)	Draught	Loading Pattern	Aft Mid Fore	Load Case (Design Wave) Still water vertical bending moment b)				Remarks (see below)
16	Harbour Condition -2 ([3.6.2])	$0.67T_S$			---	---			3), 14), 15)
					$M_{SW,P,H}$	$M_{SW,P,S}$			

a) Referred paragraph number corresponds to loading pattern prescribed in Ch 4, Sec 7.
b) $M_{SW,H}$, $M_{SW,S}$: Allowable still water vertical bending moment for seagoing condition, hogging or sagging respectively
$M_{SW,P,H}$, $M_{SW,P,S}$: Allowable still water vertical bending moment for harbour condition, hogging or sagging respectively

Remarks
1) Single loading pattern in M_{Full} with cargo density of 3.0 t/m^3 can be analyzed in lieu of these two loading patterns.
2) Cargo density 3.0 t/m^3 is to be used for calculation of dry cargo pressure in principle.
3) M_H/V_H or 1.0 t/m^3, whichever is greater, is to be used as cargo density for calculation of dry cargo pressure.
4) In case of no ballast hold, normal ballast condition with assuming $M_{SW,S} = 0$ is to be analyzed.
5) Position of ballast hold is to be adjusted as appropriate.
6) This condition is not required when {**no MP**} notation is assigned.
7) For vertical shear force analysis, maximum shear force ($Q_{SW} + Q_{WV}$) with reduced vertical bending moment ($0.8M_{SW} + 0.65C_{WV}M_{WV}$) is to be considered.
8) This condition is only required when such a condition is prepared in the loading manual.
9) "M_{BLK}" is maximum cargo mass according to the design loading condition in the loading manual.
10) Actual still water vertical bending moment, as given in the loading manual, may be used in stead of design value.
11) This condition is to be considered for the empty hold which is assigned as ballast hold if any.
12) Minimum draught among heavy ballast conditions is to be used in principle.
13) This condition is not required when such a condition is explicitly prohibited in the loading manual.
14) This condition is to be analyzed when {**no MP**} notation is assigned.
15) External sea pressures and internal pressures can be considered as static.

Appendix 3 - STANDARD LOADING CONDITION FOR FATIGUE ASSESSMENT

Table 1: Fatigue Assessment applicable to empty hold in alternate condition of BC-A (mid-hold is empty hold)

No.	Description	Draught [a)]	Loading pattern / Aft / Mid / Fore	Load case (Design wave)				Still water vertical bending moment [b)]	Remarks (see below)
1	Full Load	T		H1	F1	R1	P1	$M_{S,(1)}$	1)
				H2	F2	R2	P2		
2	Alternate Load	T		H1	F1	R1	P1	$M_{S,(2)}$	2)
				H2	F2	R2	P2		
3	Normal Ballast	T_{NB}		H1	F1	R1	P1	$M_{S,(3)}$	
				H2	F2	R2	P2		
4	Heavy Ballast	T_{HB}		H1	F1	R1	P1	$M_{S,(4)}$	3)
				H2	F2	R2	P2		
				H1	F1	R1	P1	$M_{S,(4)}$	4)
				H2	F2	R2	P2		

a) T : Moulded draught, T_{NB} : Draught at normal ballast condition, T_{HB} : Draught at heavy ballast condition

b) $M_{S,(1)}$, $M_{S,(2)}$, $M_{S,(3)}$, $M_{S,(4)}$: Still water vertical bending moment as defined in [3.2.2] of Ch 8, Sec 3

Remarks

1) M_H/V_H is to be used as cargo density for calculation of dry cargo pressure.
2) Cargo density 3.0 t/m^3 is to be used for calculation of dry cargo pressure in principle.
3) This condition is to be applied only for the empty hold which is not assigned as ballast hold. Position of ballast hold is to be adjusted as appropriate.
4) This condition is to be applied only for the empty hold which is assigned as ballast hold.

Table 2: Fatigue Assessment applicable to loaded hold in alternate condition of BC-A (mid-hold is loaded hold)

No.	Description	Draught [a)]	Loading pattern / Aft Mid Fore	Load case (Design wave)				Still water vertical bending moment [b)]	Remarks (see below)

b) $M_{S,(1)}$, $M_{S,(2)}$, $M_{S,(3)}$, $M_{S,(4)}$: Still water vertical bending moment as defined in [3.2.2] of Ch 8, Sec 3

Remarks
1) M_H/V_H is to be used as cargo density for calculation of dry cargo pressure.
2) This condition is to be applied only for the mid-hold which is not assigned as ballast hold. Position of ballast hold is to be adjusted as appropriate.
3) This condition is to be applied only for the mid-hold which is assigned as ballast hold.

Chapter 5

Hull Girder Strength

Section 1 - YIELDING CHECK

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

M_{SW} : Design still water bending moment in intact condition, in kN.m, at the hull transverse section considered, defined in Ch 4, Sec 3, [2.2]:

$M_{SW} = M_{SW,H}$ in hogging conditions

$M_{SW} = M_{SW,S}$ in sagging conditions

M_{WV} : Vertical wave bending moment in intact condition, in kN.m, at the hull transverse section considered, defined in Ch 4, Sec 3, [3.1]

$M_{SW,F}$: Still water bending moment, in kN.m, in flooded conditions, at the hull transverse section under consideration, to be calculated according to Ch 4, Sec 3

$M_{WV,F}$: Vertical wave bending moment, in kN.m, in flooded conditions, at the hull transverse section under consideration, , to be calculated according to Ch 4, Sec 3

$M_{WV,P}$: Vertical wave bending moment, in kN.m, in harbour conditions, at the hull transverse section under consideration, to be calculated according to Ch 4, Sec 3

M_{WH} : Horizontal wave bending moment, in kN.m, at the hull transverse section considered, defined in Ch 4, Sec 3, [3.3]

Q_{SW} : Design still water shear force in intact condition, in kN, at the hull transverse section considered, defined in Ch 4, Sec 3, [2.3]

Q_{WV} : Vertical wave shear force in intact condition, in kN, at the hull transverse section considered, defined in Ch 4, Sec 3, [3.2]

$Q_{SW,F}$: Still water shear force, in kN, in flooded conditions, at the hull transverse section under consideration, to be calculated according to Ch 4, Sec 3

$Q_{WV,F}$: Vertical wave shear force, in kN, in flooded conditions, at the hull transverse section under consideration, to be calculated according to Ch 4, Sec 3

$Q_{WV,P}$: Vertical wave shear force, in kN, in harbour conditions, at the hull transverse section under consideration, to be calculated according to Ch 4, Sec 3

k : Material factor, as defined in Ch 1, Sec 4, [2.2.1]

x : X co-ordinate, in m, of the calculation point with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4]

z : Z co-ordinate, in m, of the calculation point with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4]

N : Z co-ordinate, in m, of the centre of gravity of the hull transverse section defined in [1.2], with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4]

V_D : Vertical distance, in m, defined in [1.4.2]

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to [1.5]

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to [1.5]

S : Net first moment, in m^3, of the hull transverse section, to be calculated according to [1.6]

Z_A : Net section modulus, in m^3, at any point of the hull transverse section, to be calculated according [1.4.1]

Z_{AB}, Z_{AD} : Net section moduli, in m^3, at bottom and deck, respectively, to be calculated according to [1.4.2]

C : Wave parameter defined in Ch 1, Sec 4, [2.3.1]

$\sigma_{1,ALL}$: Allowable normal stress, in N/mm^2, defined in [3.1.1]

$\tau_{1,ALL}$: Allowable shear stress, in N/mm^2, defined in [3.2.1]

ρ : Sea water density, taken equal to 1.025 t/m^3.

1. Strength characteristics of the hull girder transverse sections

1.1 General

1.1.1

This Article specifies the criteria for calculating the hull girder strength characteristics to be used for the checks in [2] to [5], in association with the hull girder loads specified in Ch 4, Sec 3.

1.2 Hull girder transverse sections

1.2.1 General

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder longitudinal strength, i.e. all continuous longitudinal members below and including the strength deck defined in [1.3], taking into account the requirements in [1.2.2] to [1.2.9].

These members are to be considered as having (see also Ch 3, Sec 2) net offered scantlings based on gross offered thickness reduced by $0.5t_C$, when the hull girder strength characteristics are used for:

- the hull girder yielding check according to [2] to [5]
- the ultimate strength check in Ch 5, Sec 2
- the calculation of the hull girder stresses for the strength checks of plating, ordinary stiffeners and primary supporting members according to Ch 6.

1.2.2 Continuous trunks and continuous longitudinal hatch coamings

Continuous trunks and continuous longitudinal hatch coamings may be included in the hull girder transverse sections, provided they are effectively supported by longitudinal bulkheads or primary supporting members.

1.2.3 Longitudinal ordinary stiffeners or girders welded above the strength deck

Longitudinal ordinary stiffeners or girders welded above the strength deck (including the deck of any trunk fitted as specified in [1.2.2]) are to be included in the hull girder transverse sections.

1.2.4 Longitudinal girders between hatchways, supported by longitudinal bulkheads

Where longitudinal girders, effectively supported by longitudinal bulkheads, are fitted between hatchways, the sectional area of these longitudinal girders are to be included in the hull girder transverse.

1.2.5 Longitudinal bulkheads with vertical corrugations

Longitudinal bulkheads with vertical corrugations are not to be included in the hull girder transverse sections.

1.2.6 Members in materials other than steel

Where a member contributing to the longitudinal strength is made in material other than steel with a Young's modulus E equal to 2.06 10^5 N/mm^2, the steel equivalent sectional area that may be included in the hull girder transverse sections is obtained, in m^2, from the following formula:

$$A_{SE} = \frac{E}{2.06 \cdot 10^5} A_M$$

where:

A_M : Sectional area, in m^2, of the member under consideration.

1.2.7 Large openings

Large openings are:

- elliptical openings exceeding 2.5 m in length or 1.2 m in breadth
- circular openings exceeding 0.9 m in diameter.

Large openings and scallops, where scallop welding is applied, are always to be deducted from the sectional areas included in the hull girder transverse sections.

1.2.8 Small openings

Smaller openings than those in [1.2.7] in one transverse section in the strength deck or bottom area need not be deducted from the sectional areas included in the hull girder transverse sections, provided that:

$$\Sigma b_S \le 0.06(B - \Sigma b)$$

where:

Σb_S : Total breadth of small openings, in m, in the strength deck or bottom area at the transverse section considered, determined as indicated in Fig 1

Σb : Total breadth of large openings, in m, at the transverse section considered, determined as indicated in Fig 1.

Where the total breadth of small openings Σb_S does not fulfil the above criteria, only the excess of breadth is to be deducted from the sectional areas included in the hull girder transverse sections.

1.2.9 Lightening holes, draining holes and single scallops

Lightening holes, draining holes and single scallops in longitudinals need not be deducted if their height is less than $0.25 h_w$, without being greater than 75 mm, where h_w is the web height, in mm.

Otherwise, the excess is to be deducted from the sectional area or compensated.

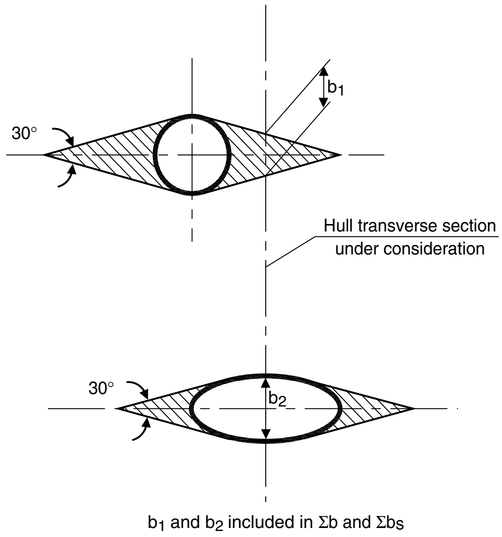

Figure 1: Calculation of Σb and Σb_S

1.3 Strength deck

1.3.1

The strength deck is, in general, the uppermost continuous deck.

In the case of a superstructure or deckhouses contributing to the longitudinal strength, the strength deck is the deck of the superstructure or the deck of the uppermost deckhouse.

1.3.2

A superstructure extending at least 0.15L within 0.4L amidships may generally be considered as contributing to the longitudinal strength.

For other superstructures and for deckhouses, their contribution to the longitudinal strength is to be assessed on a case by case basis, to evaluate their percentage of participation to the longitudinal strength.

1.4 Section modulus

1.4.1

The section modulus at any point of a hull transverse section is obtained, in m^3, from the following formula:

$$Z_A = \frac{I_Y}{|z - N|}$$

1.4.2

The section moduli at bottom and at deck are obtained, in m^3, from the following formulae:

- at bottom:

$$Z_{AB} = \frac{I_Y}{N}$$

- at deck:

  $$Z_{AD} = \frac{I_Y}{V_D}$$

  where:

  V_D : Vertical distance, in m, taken equal to:

  - in general:

    $$V_D = z_D - N$$

    where:

    z_D : Z co-ordinate, in m, of strength deck at side, defined in [1.3], with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4]

  - if continuous trunks or hatch coamings are taken into account in the calculation of I_Y, as specified in [1.2.2]:

    $$V_D = (z_T - N)\left(0.9 + 0.2\frac{y_T}{B}\right) \geq z_D - N$$

    where:

    y_T, z_T : Y and Z co-ordinates, in m, of the top of continuous trunk or hatch coaming with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4]; y_T and z_T are to be measured for the point which maximises the value of V_D

  - if longitudinal ordinary stiffeners or girders welded above the strength deck are taken into account in the calculation of I_Y, as specified in [1.2.3], V_D is to be obtained from the formula given above for continuous trunks and hatch coamings. In this case, y_T and z_T are the Y and Z co-ordinates, in m, of the top of the longitudinal stiffeners or girders with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4].

1.5 Moments of inertia

1.5.1

The moments of inertia I_Y and I_Z, in m^4, are those, calculated about the horizontal and vertical neutral axes, respectively, of the hull transverse sections defined in [1.2].

1.6 First moment

1.6.1

The first moment S, in m^3, at a level z above the baseline is that, calculated with respect to the horizontal neutral axis, of the portion of the hull transverse sections defined in [1.2] located above the z level.

2. Hull girder stresses

2.1 Normal stresses

2.1.1 General

The normal stresses in a member made in material other than steel with a Young's modulus E equal to 2.06 10^5 N/mm^{2,} included in the hull girder transverse sections as specified in [1.2.6], are obtained from the following formula:

$$\sigma_1 = \frac{E}{2.06 \cdot 10^5} \sigma_{1S}$$

where:

σ_{1S} : Normal stress, in N/mm^2, in the member under consideration, calculated according to [2.1.2] and [2.1.3] considering this member as having the steel equivalent sectional area A_{SE} defined in [1.2.6].

2.1.2 Normal stresses induced by vertical bending moments

The normal stresses induced by vertical bending moments are obtained, in N/mm^2, from the following formulae:

- at any point of the hull transverse section, located below z_{VD} , where $z_{VD} = V_D + N$:

$$\sigma_1 = \frac{M_{SW} + M_{WV}}{Z_A} 10^{-3}$$

- at bottom:

$$\sigma_1 = \frac{M_{SW} + M_{WV}}{Z_{AB}} 10^{-3}$$

- at deck:

$$\sigma_1 = \frac{M_{SW} + M_{WV}}{Z_{AD}} 10^{-3}$$

2.1.3 Normal stresses in flooded conditions of BC-A or BC-B ships

This requirement applies to **BC-A** or **BC-B** ships, in addition to [2.1.2].

The normal stresses, in the flooded conditions specified in Ch 4, Sec 3, are to be obtained at any point, in N/mm^2, from the following formula:

$$\sigma_1 = \frac{M_{SW,F} + M_{WV,F}}{Z_A} 10^{-3}$$

2.2 Shear stresses

2.2.1 General

The shear stresses induced by vertical shear forces Q_{SW} and Q_{WV} in intact condition and, for **BC-A** and **BC-B** ships by vertical shear forces $Q_{SW,F}$ and $Q_{WV,F}$ in flooded condition are normally to be obtained through direct analyses.

When they are combined, vertical shear forces Q_{SW} and Q_{WV} in intact condition are to be taken with the same sign. The same is to be applied also for combination of vertical shear forces $Q_{SW,F}$ and $Q_{WV,F}$ in flooded condition.

The shear force correction ΔQ_C is to be taken into account, in accordance with [2.2.2]. The shear force correction need not to be considered at the fore end of foremost hold and aft end of aftermost hold.

As an alternative to this procedure, the shear stresses induced by the vertical shear forces Q_{SW} and Q_{WV} in intact condition and, for **BC-A** and **BC-B** ships by the vertical shear forces $Q_{SW,F}$ and $Q_{WV,F}$ in flooded condition may be obtained through the simplified procedure in [2.2.2] and [2.2.3] respectively.

2.2.2 Simplified calculation of shear stresses induced by vertical shear forces

The shear stresses induced by the vertical shear forces in the calculation point are obtained, in N/mm^2, from the following formula:

$$\tau_1 = \left(Q_{SW} + Q_{WV} - \varepsilon \Delta Q_C\right)\frac{S}{I_Y t}\delta$$

where:

t : Minimum net thickness, in mm, of side and inner side plating, as applicable according to Tab 1

δ : Shear distribution coefficient defined in Tab 1

$\varepsilon = \mathrm{sgn}\left(Q_{SW}\right)$

ΔQ_C : Shear force correction (see Fig 2) at the section considered. The shear force correction is to be considered independently forward and aft of the transverse bulkhead for the hold considered. The shear force correction takes into account, when applicable, the portion of loads transmitted by the double bottom girders to the transverse bulkheads:

RCN 1 to July 2008 version (effective from 1 July 2009)

- for ships with any non-homogeneous loading conditions, such as alternate hold loading conditions and heavy ballast conditions carrying ballast in hold(s):

$$\Delta Q_C = \alpha\left|\frac{M}{B_H \ell_H} - \rho T_{LC,mh}\right| \text{ for each non-homogenous loading condition}$$

RCN 1 to July 2008 version (effective from 1July 2009)

- for other ships and homogenous loading conditions: *RCN 1 to July 2008 version (effective from 1 July 2009)*

  $\Delta Q_C = 0$

$\varphi = 1.38 + 1.55\frac{\ell_0}{b_0}$, to be taken not greater than 3.7

$$\alpha = g\frac{\ell_0 b_0}{2 + \varphi\frac{\ell_0}{b_0}}$$

ℓ_0, b_0 : Length and breadth, respectively, in m, of the flat portion of the double bottom in way of the hold considered; b_0 is to be measured on the hull transverse section at the middle of the hold

ℓ_H : Length, in m, of the hold considered, measured between the middle of the transverse corrugated bulkheads depth

B_H : Ship's breadth, in m, measured at the level of inner bottom on the hull transverse section at the middle of the hold considered

M : Mass, in t, in the considered section.

- Adjacent cargo hold is loaded in a non homogenous loading condition for the condition under consideration

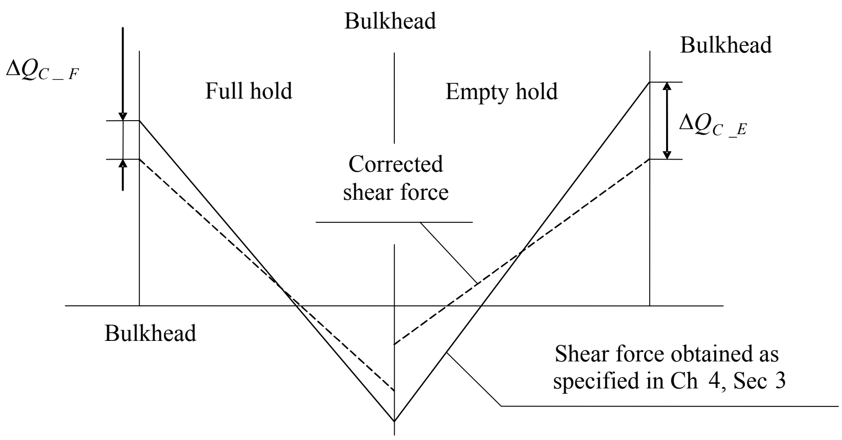
  M is to include the total mass in the hold and the mass of water ballast in double bottom tank, bounded by side girders in way of hopper tank plating or longitudinal bulkhead.

- Other cases

  M is the total mass in the hold.

  RCN 1 to July 2008 version (effective from 1July 2009)

$T_{LC,mh}$: Draught, in m, measured vertically on the hull transverse section at the middle of the hold considered, from the moulded baseline to the waterline in the loading condition considered.



ΔQ_{C_F} : shear force correction for the hull load
ΔQ_{C_E} : shear force correction for the empty hold

RCN 1 to July 2008 version (effective from 1 July 2009)

Figure 2: Shear force correction ΔQ_C

Table 1: Shear stresses induced by vertical shear forces

Ship typology	Location	*t*, in mm	δ
Single side skin construction	Sides	t_S	0,5
Double side skin construction	Sides	t_S	$0.5(1-\phi)$
	Inner sides	t_{IS}	0.5ϕ

where:

t_S, t_{IS} : Minimum net thicknesses, in mm, of side and inner side, respectively

t_{SM}, t_{ISM} : Mean net thicknesses, in mm, over all the strakes of side and inner side , respectively. They are calculated as $\Sigma(\ell_i\, t_i) / \Sigma\ell_i$, where ℓ_i and t_i are the length, in m, and the net thickness, in mm, of the i[th] strake of side and inner side.

ϕ : Coefficient taken equal to: $\phi = 0.275 + 0.25\dfrac{t_{ISM}}{t_{SM}}$

RCN 1 to July 2010 version (effective from 1July 2012)

2.2.3 Shear stresses in flooded conditions of BC-A or BC-B ships

This requirement applies to **BC-A** or **BC-B** ships, in addition to [2.2.1] and [2.2.2].

The shear stresses, in the flooded conditions specified in Ch 4, Sec 3, are to be obtained at the calculation point, in N/mm², from the following formula:

$$\tau_1 = \left(Q_{SW,F} + Q_{WV,F} - \varepsilon \Delta Q_C\right)\frac{S}{I_Y t}\delta$$

$$\varepsilon = \operatorname{sgn}(Q_{SW,F})$$

ΔQ_C : Shear force correction, to be calculated according to [2.2.2], where the mass of the ingressed water is to be added to M, and where the draught $T_{LC,mh}$ is to be measured up to the equilibrium waterline.

RCN 1 to July 2008 version (effective from 1 July 2009)

t : Net thickness, in mm, of the side plating.

3. Checking criteria

3.1 Normal stresses

3.1.1

It is to be checked that the normal stresses σ_1 calculated according to [2.1.2] and, when applicable, [2.1.3] are in compliance with the following formula:

$$\sigma_1 \le \sigma_{1,ALL}$$

where:

$\sigma_{1,ALL}$: Allowable normal stress, in N/mm², obtained from the following formulae:

$$\sigma_{1,ALL} = \frac{130}{k} \quad \text{for} \quad \frac{x}{L} \le 0.1$$

$$\sigma_{1,ALL} = \frac{190}{k} - \frac{1500}{k}\left(\frac{x}{L} - 0.3\right)^2 \quad \text{for} \quad 0.1 < \frac{x}{L} < 0.3$$

$$\sigma_{1,ALL} = \frac{190}{k} \quad \text{for} \quad 0.3 \le \frac{x}{L} \le 0.7$$

$$\sigma_{1,ALL} = \frac{190}{k} - \frac{1500}{k}\left(\frac{x}{L} - 0.7\right)^2 \quad \text{for} \quad 0.7 < \frac{x}{L} < 0.9$$

$$\sigma_{1,ALL} = \frac{130}{k} \quad \text{for} \quad \frac{x}{L} \ge 0.9$$

3.2 Shear stresses

3.2.1

It is to be checked that the shear stresses τ_1 calculated according to [2.2.1] or [2.2.2] and, when applicable, [2.2.3] are in compliance with the following formula:

$$\tau_1 \le \tau_{1,ALL}$$

where:

$\tau_{1,ALL}$: Allowable shear stress, in N/mm²:

$$\tau_{1,ALL} = 120/k$$

4. Section modulus and moment of inertia

4.1 General

4.1.1

The requirements in [4.2] to [4.5] provide the minimum hull net girder section modulus, complying with the checking criteria indicated in [3], and the midship net section moment of inertia required to ensure sufficient hull girder rigidity.

4.1.2

The k material factors are to be defined with respect to the materials used for the bottom and deck members contributing to the longitudinal strength according to [1]. When material factors for higher strength steels are used, the requirements in [4.5] apply.

4.2 Section modulus within 0.4*L* amidships

4.2.1

The net section moduli Z_{AB} and Z_{AD} at the midship section are to be not less than the value obtained, in m^3, from the following formula:

- $Z_{R,MIN} = 0.9CL^2 B\left(C_B + 0.7\right)k\,10^{-6}$

4.2.2

In addition, the net section moduli Z_{AB} and Z_{AD} within 0.4L amidships are to be not less than the value obtained, in m^3, from the following formula:

- $Z_R = \dfrac{M_{SW}+M_{WV}}{\sigma_{1,ALL}} 10^{-3}$
- in addition, for **BC-A** and **BC-B** ships:

  $Z_R = \dfrac{M_{SW,F}+M_{WV,F}}{\sigma_{1,ALL}} 10^{-3}$

4.2.3

Where the total breadth Σb_S of small openings, as defined in [1.2.8], is deducted from the sectional areas included in the hull girder transverse sections, the values $Z_{R,MIN}$ and Z_R defined in [4.2.1] or [4.2.2] may be reduced by 3%.

4.2.4

Scantlings of members contributing to the longitudinal strength (see [1]), based on the section modulus requirement in [4.2.1], are to be maintained within 0.4L amidships.

4.3 Section modulus outside 0.4*L* amidships

4.3.1

The net section moduli Z_{AB} and Z_{AD} outside 0.4L amidships are to be not less than the value obtained, in m^3, from the following formula:

- $Z_R = \frac{M_{SW}+M_{WV}}{\sigma_{1,ALL}}10^{-3}$
- in addition, for **BC-A** and **BC-B** ships:

  $Z_R = \frac{M_{SW,F}+M_{WV,F}}{\sigma_{1,ALL}}10^{-3}$

4.3.2

Scantlings of members contributing to the hull girder longitudinal strength (see [1]) may be gradually reduced, outside 0.4*L* amidships, to the minimum required for local strength purposes at fore and aft parts, as specified in Ch 9, Sec 1 or Ch 9, Sec 2, respectively.

4.4 Midship section moment of inertia

4.4.1

The net midship section moment of inertia about its horizontal neutral axis is to be not less than the value obtained, in m^4, from the following formula:

$$I_{YR} = 3Z'_{R,MIN}L \cdot 10^{-2}$$

where $Z'_{R,MIN}$ is the required net midship section modulus $Z_{R,MIN}$, in m^3, calculated as specified in [4.2.1] but assuming $k = 1$.

4.5 Extent of higher strength steel

4.5.1

When a material factor for higher strength steel is used in calculating the required section modulus at bottom or deck according to [4.2] or [4.3], the relevant higher strength steel is to be adopted for all members contributing to the longitudinal strength (see [1]), at least up to a vertical distance, in m, obtained from the following formulae:

- above the baseline (for section modulus at bottom):

  $V_{HB} = \frac{\sigma_{1B} - k\sigma_{1,ALL}}{\sigma_{1B} + \sigma_{1D}} z_D$

- below a horizontal line located at a distance V_D (see [1.4.2]) above the neutral axis of the hull transverse section (for section modulus at deck):

  $V_{HD} = \frac{\sigma_{1D} - k\sigma_{1,ALL}}{\sigma_{1B} + \sigma_{1D}} \left(N + V_D\right)$

where:

σ_{1B}, σ_{1D} : Normal stresses, in N/mm^2, at bottom and deck, respectively, calculated according to [2.1]

z_D : Z co-ordinate, in m, of the strength deck defined in [1.3], with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4]

4.5.2

The higher strength steel is to extend in length at least throughout 0.4*L* amidships where it is required for strength purposes according to the provision of the present Rules.

5. Permissible still water bending moment and shear force

5.1 Permissible still water bending moment and shear force in intact condition

5.1.1 Permissible still water bending moment

The permissible still water bending moment at any hull transverse section in intact condition, in hogging or sagging conditions, is the value M_{SW} considered in the hull girder section modulus calculation according to [4.2] and [4.3].

In the case of structural discontinuities in the hull transverse sections, the distribution of permissible still water bending moments is considered on a case by case basis.

5.1.2 Permissible still water shear force - Direct calculation

Where the shear stresses are obtained through calculation analyses according to [2.2.1], the permissible positive or negative still water shear force in intact condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_P = \varepsilon |Q_T| - Q_{WV}$$

where:

$$\varepsilon = \mathrm{sgn}(Q_{SW})$$

Q_T : Shear force, in kN, which produces a shear stress $\tau = 120/k$ N/mm^2 in the most stressed point of the hull net transverse section, taking into account the shear force correction ΔQ_C in accordance with [2.2.2].

A lower value of the permissible still water shear force may be considered, if requested by the Shipbuilder.

5.1.3 Permissible still water shear force - Simplified calculation

Where the shear stresses are obtained through the simplified procedure in [2.2.2], the permissible positive or negative still water shear force in intact condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_P = \varepsilon \left(\frac{120}{k\delta} \frac{I_Y t}{S} + \Delta Q_C \right) - Q_{WV}$$

where:

$$\varepsilon = \mathrm{sgn}(Q_{SW})$$

δ : Shear distribution coefficient defined in Tab 1

t : Minimum net thickness, in mm, of side and inner side plating, as applicable according to Tab 1

ΔQ_C : Shear force corrections defined in [2.2.2], to be considered independently forward and aft of the transverse bulkhead.

RCN 1to July 2008 version (effective from 1 July 2009)

A lower value of the permissible still water shear force may be considered, if requested by the Shipbuilder.

5.2 Permissible still water bending moment and shear force in harbour conditions

5.2.1 Permissible still water bending moment

The permissible still water bending moment at any hull transverse section in harbour conditions, in hogging or sagging conditions, is obtained, in kN.m, from the following formula:

$$M_{P,P} = M_{SW} + M_{WV} - M_{WV,P}$$

A lower value of the permissible still water bending moment in harbour conditions may be considered, if requested by the Shipbuilder.

5.2.2 Permissible still water shear force

The permissible positive or negative still water shear force at any hull transverse section, in harbour conditions, is obtained, in kN, from the following formula:

$$Q_{P,P} = \varepsilon Q_P + Q_{WV} - Q_{WV,P}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW})$

Q_P : Permissible still water shear force during navigation, in kN, to be calculated according to [5.1.3].

A lower value of the permissible still water shear force in harbour conditions may be considered, if requested by the Shipbuilder.

5.3 Permissible still water bending moment and shear force in flooded condition

5.3.1 Permissible still water bending moment

The permissible still water bending moment at any hull transverse section in flooded condition, in hogging or sagging conditions, is the value $M_{SW,F}$ considered in the hull girder section modulus calculation according to [4.2] and [4.3].

In the case of structural discontinuities in the hull transverse sections, the distribution of permissible still water bending moments is considered on a case by case basis.

5.3.2 Permissible still water shear force - Direct calculation

Where the shear stresses are obtained through calculation analyses according to [2.2.1], the permissible positive or negative still water shear force in flooded condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_{P,F} = \varepsilon |Q_T| - Q_{WV,F}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW,F})$

Q_T : Shear force, in kN, which produces a shear stress $\tau = 120/k$ N/mm^2 in the most stressed point of the hull net transverse section, taking into account the shear force correction ΔQ_C in accordance with [2.2.2].

5.3.3 Permissible still water shear force - Simplified calculation

Where the shear stresses are obtained through the simplified procedure in [2.2.2], the permissible positive or negative still water shear force in flooded condition at any hull transverse section is obtained, in kN, from the following formula:

$$Q_{P,F} = \varepsilon\left(\frac{120}{k\delta}\frac{I_Y t}{S} + \Delta Q_C\right) - Q_{WV,F}$$

where:

$\varepsilon = \mathrm{sgn}(Q_{SW})$

δ : Shear distribution coefficient defined in Tab 1

t : Minimum net thickness, in mm, of side and inner side plating, as applicable according to Tab 1

ΔQ_C : Shear force correction, to be calculated according to [2.2.2], where the mass M is to include the mass of the ingressed water in the hold considered and the draught T_{LC} is to be measured up to the equilibrium waterline.

Section 2 - ULTIMATE STRENGTH CHECK

1. Application

1.1 General

1.1.1

The requirements of this Section apply to ships equal to or greater than 150 m in length L.

2. Hull girder ultimate strength check

2.1 Hull girder loads

2.1.1 Bending moment

The bending moment M in sagging and hogging conditions, to be considered in the ultimate strength check of the hull girder, is to be obtained, in kN.m, in intact, flooded and harbour conditions, from the following formula:

$M = M_{SW} + \gamma_W M_{WV}$

where:

M_{SW}, $M_{SW,F}$, $M_{SW,P}$: Design still water bending moment, in kN.m, in sagging and hogging conditions at the hull transverse section considered, to be calculated respectively in intact (M_{SW}), flooded ($M_{SW,F}$) and harbour ($M_{SW,P}$) conditions

M_{WV}, $M_{WV,F}$, $M_{WV,P}$: Vertical wave bending moment, in kN.m, in sagging and hogging conditions at the hull transverse section considered, defined in Ch 4, Sec 3, respectively in intact (M_{WV}), flooded ($M_{WV,F}$) and harbour ($M_{WV,P}$) conditions

γ_W : Safety factor on wave hull girder bending moments, taken equal to:

$\gamma_W = 1.20$

2.2 Hull girder bending moment

2.2.1 Curve *M*- χ

The ultimate bending moment capacities of a hull girder transverse section, in hogging and sagging conditions, are defined as the maximum values of the curve of bending moment capacity M versus the curvature χ of the transverse section considered (see Fig 1).

The curvature χ is positive for hogging condition and negative for sagging condition.

The curve M-χ is to be obtained through an incremental-iterative procedure, according to the criteria specified in App 1.

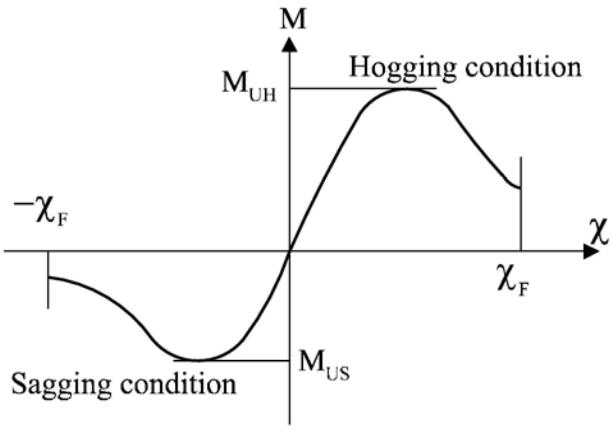


Figure 1: Curve bending moment capacity *M* versus curvature χ

2.2.2 Hull girder transverse sections

The hull girder transverse sections are constituted by the elements contributing to the hull girder longitudinal strength, considered with their net offered scantlings according to Ch 3, Sec 2, [3.2.4].

2.3 Checking criteria

2.3.1

It is to be checked that the hull girder ultimate bending capacity at any hull transverse section is in compliance with the following formula:

$$M \leq \frac{M_U}{\gamma_R}$$

where:

M_U : Ultimate bending moment capacity of the hull transverse section considered, calculated with net offered scantlings based on gross offered thickness reduced by 0.5 t_C, in kN.m:

$M_U = M_{UH}$ in hogging conditions

$M_U = M_{US}$ in sagging conditions

M_{UH} : Ultimate bending moment capacity in hogging conditions, in kN.m, defined in [2.2.1]

M_{US} : Ultimate bending moment capacity in sagging conditions, in kN.m, defined in [2.2.1]

M : Bending moment, in kN.m, defined in [2.1.1] for the ship in intact, flooded and harbour conditions

γ_R : Safety factor taken equal to 1.10

Appendix 1 - HULL GIRDER ULTIMATE STRENGTH

Symbols

For symbols not defined in this Appendix, refer to Ch 1, Sec 4.

I_Y : Moment of inertia, in m^4, of the hull transverse section around its horizontal neutral axis, to be calculated according to Ch 5, Sec 1, [1.5.1]

Z_{AB}, Z_{AD} : Section moduli, in m^3, at bottom and deck, respectively, defined in Ch 5, Sec 1, [1.4.2].

R_{eHs} : Minimum yield stress, in N/mm², of the material of the considered stiffener.

R_{eHp} : Minimum yield stress, in N/mm², of the material of the considered plate.

A_s : Net sectional area, in cm², of stiffener, without attached plating

A_p : Net sectional area, in cm², of attached plating

1. Hull girder ultimate strength check

1.1 Introduction

1.1.1

This Appendix provides the criteria for obtaining the curve M-χ and the ultimate longitudinal bending moment capacity M_U that are to be calculated according to the simplified incremental-iterative approach, as specified in [2.1].

2. Criteria for the calculation of the curve *M*-χ

2.1 Simplified method based on a incremental-iterative approach

2.1.1 Procedure

The curve M-χ is to be obtained by means of an incremental-iterative approach, summarised in the flow chart in Fig 1.

In this approach, the ultimate hull girder bending moment capacity M_U is defined as the peak value of the curve with vertical bending moment M versus the curvature χ of the ship cross section as shown in Fig 1**.** The curve is to be obtained through an incremental-iterative approach.

Each step of the incremental procedure is represented by the calculation of the bending moment M_i which acts on the hull transverse section as the effect of an imposed curvature χ_i.

For each step, the value χ_i is to be obtained by summing an increment of curvature $\Delta\chi$ to the value relevant to the previous step χ_{i-1}.This increment of curvature corresponds to an increment of the rotation angle of the hull girder transverse section around its horizontal neutral axis.

This rotation increment induces axial strains ε in each hull structural element, whose value depends on the position of the element. In hogging condition, the structural elements above the neutral axis are lengthened, while the elements below the neutral axis are shortened. Vice-versa in sagging condition.

The stress σ induced in each structural element by the strain ε is to be obtained from the load-end shortening curve σ-ε of the element, which takes into account the behaviour of the element in the non-linear elasto-plastic domain.

The distribution of the stresses induced in all the elements composing the hull transverse section determines, for each step, a variation of the neutral axis position, since the relationship σ-ε is non-linear. The new position of the neutral axis relevant to the step considered is to be obtained by means of an iterative process, imposing the equilibrium among the stresses acting in all the hull elements.

Once the position of the neutral axis is known and the relevant stress distribution in the section structural elements is obtained, the bending moment of the section M_i around the new position of the neutral axis, which corresponds to the curvature χ_i imposed in the step considered, is to be obtained by summing the contribution given by each element stress.

The main steps of the incremental-iterative approach described above are summarised as follows (see also Fig 1):

Step 1 Divide the transverse section of hull into stiffened plate elements.

Step 2 Define stress-strain relationships for all elements as shown in Tab 1

Step 3 Initialize curvature χ_1 and neutral axis for the first incremental step with the value of incremental curvature (curvature that induces a stress equal to 1% of yield strength in strength deck) as:

$$\chi_1 = \Delta\chi = \frac{0.01\dfrac{R_{eH}}{E}}{z_D - N}$$

where:

z_D : Z co-ordinate, in m, of strength deck at side, with respect to reference co-ordinate defined in Ch 1, Sec 4, [4]

Step 4 Calculate for each element the corresponding strain $\varepsilon_i = \chi\,(z_i - z_{NA})$ and the corresponding stress σ_i

RCN 1 to July 2008 version (effective from 1 July 2009)

Step 5 Determine the neutral axis z_{NA_cur} at each incremental step by establishing force equilibrium over the whole transverse section as:

$\Sigma A_i\ \sigma_i = \Sigma A_j\ \sigma_j$ (i-th element is under compression, j-th element under tension)

Step 6 Calculate the corresponding moment by summing the contributions of all elements as:

$$M_U = \sum \sigma_{Ui} A_i \left|\left(z_i - z_{NA\_cur}\right)\right|$$

Step 7 Compare the moment in the current incremental step with the moment in the previous incremental step. If the slope in M-χ relationship is less than a negative fixed value, terminate the process and define the peak value of M_U. Otherwise, increase the curvature by the amount of $\Delta\chi$ and go to **Step 4**.

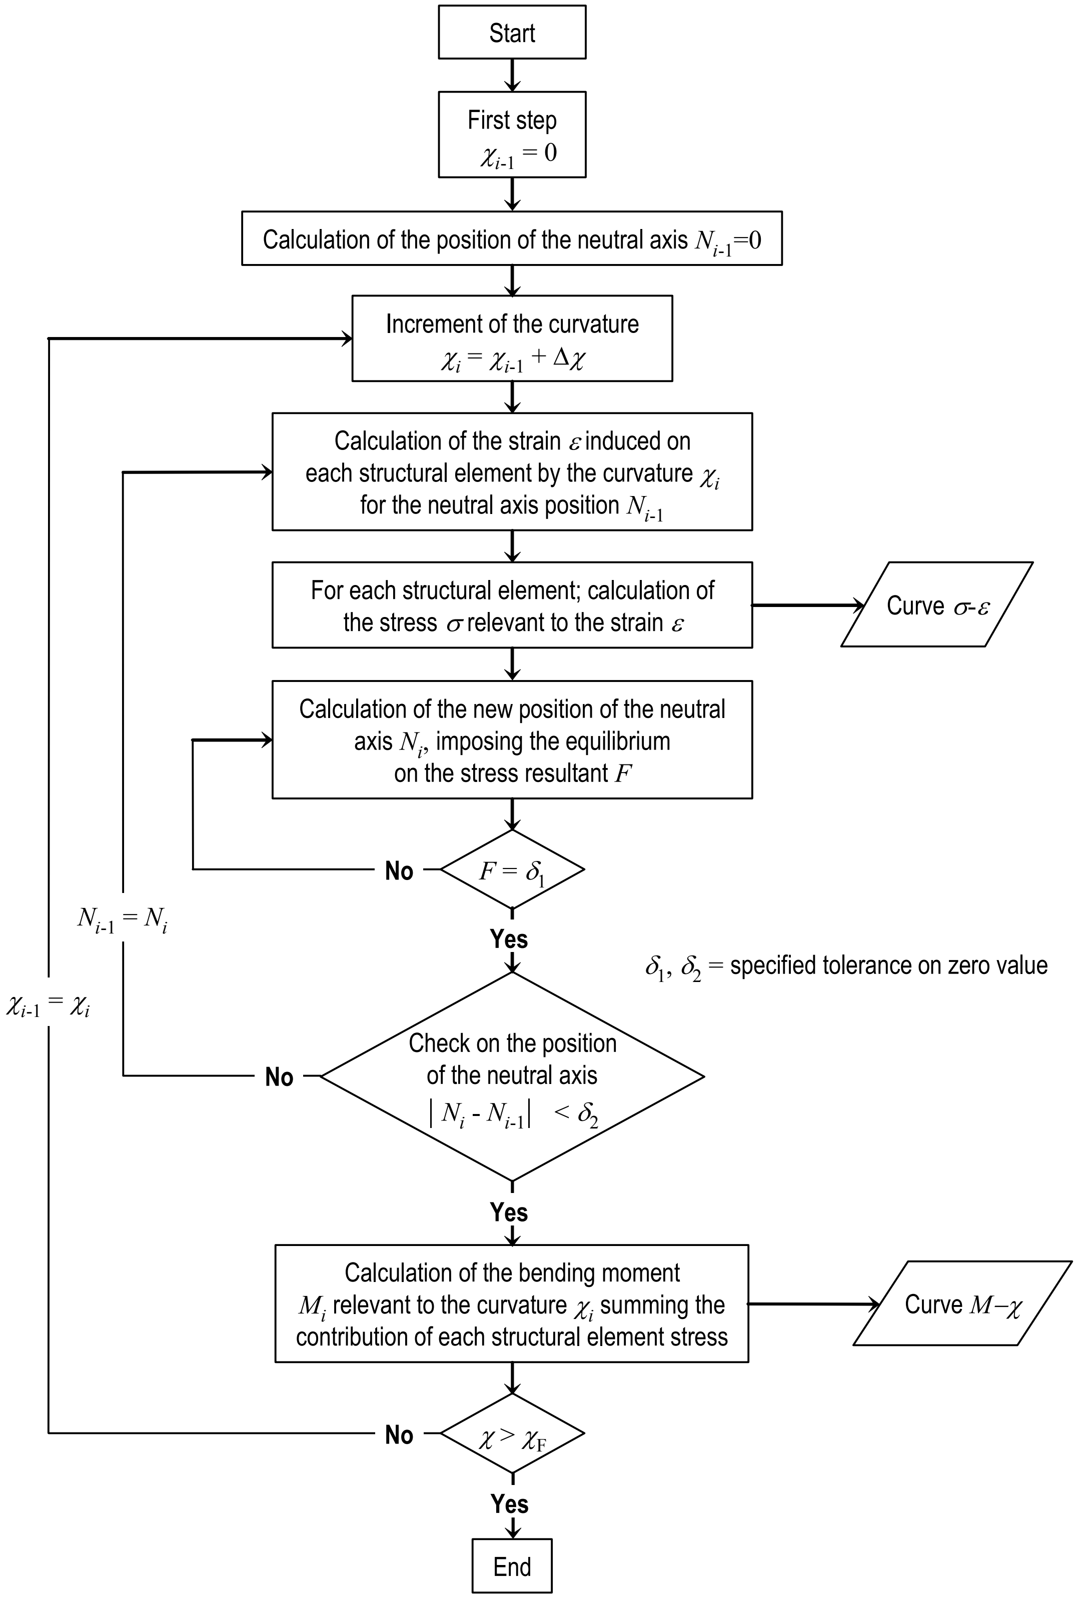

Figure 1: Flow chart of the procedure for the evaluation of the curve *M*-χ

2.1.2 Assumption

In applying the procedure described in [2.1.1], the following assumptions are generally to be made:

- the ultimate strength is calculated at hull transverse sections between two adjacent transverse webs.

- the hull girder transverse section remains plane during each curvature increment.
- the hull material has an elasto-plastic behaviour.
- the hull girder transverse section is divided into a set of elements, which are considered to act independently.

  These elements are:
  – transversely framed plating panels and/or ordinary stiffeners with attached plating, whose structural behaviour is described in [2.2.1]
  – hard corners, constituted by plating crossing, whose structural behaviour is described in [2.2.2].
- according to the iterative procedure, the bending moment M_i acting on the transverse section at each curvature value χ_i is obtained by summing the contribution given by the stress σ acting on each element. The stress σ, corresponding to the element strain ε, is to be obtained for each curvature increment from the non-linear load-end shortening curves σ- ε - of the element.

  These curves are to be calculated, for the failure mechanisms of the element, from the formulae specified in [2.2]. The stress σ is selected as the lowest among the values obtained from each of the considered load-end shortening curves σ- ε.
- The procedure is to be repeated until the value of the imposed curvature reaches the value χ_F, in m^{-1}, in hogging and sagging condition, obtained from the following formula:

  $$\chi_F = \pm 0.003 \frac{M_Y}{EI_Y}$$

  where:

  M_Y : the lesser of the values M_{Y1} and M_{Y2}, in kN.m:

  $M_{Y1} = 10^3\, R_{eH}\, Z_{AB}$

  $M_{Y2} = 10^3\, R_{eH}\, Z_{AD}$

If the value χ_F is not sufficient to evaluate the peaks of the curve M-χ, the procedure is to be repeated until the value of the imposed curvature permits the calculation of the maximum bending moments of the curve.

2.1.3 Modeling of the hull girder cross section

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder ultimate strength.

Sniped stiffeners are also to be modeled imaginarily, taking account that they doesn't contribute to the hull girder strength.

The structural members are categorized into an ordinary stiffener element, a stiffened plate element or a hard corner element.

The plate panel including web plate of girder or side stringer is idealized into either a stiffened plate element, an attached plate of an ordinary stiffener element or a hard corner element.

The plate panel is categorized into the following two kinds:

- longitudinally stiffened panel of which the longer side is in the longitudinal direction, and
- transversely stiffened panel of which the longer side is in the perpendicular direction to the longitudinal direction.

- Hard corner element

  Hard corner elements are sturdier elements composing the hull girder transverse section, which collapse mainly according to an elasto-plastic mode of failure (material yielding); they are generally constituted by two plates not lying in the same plane.

  The extent of a hard corner element from the point of intersection of the plates is taken equal to $20t_p$ on transversely stiffened panel and to $0.5s$ on a longitudinally stiffened panel. (see Fig 6)

  where:

  t_p : Gross offered thickness of the plate, in mm

  s : Spacing of the adjacent longitudinal stiffener, in m

  Bilge, sheer strake-deck stringer elements, girder-deck connections and face plate-web connections on large girders are typical hard corners.

- Ordinary stiffener element

  The ordinary stiffener constitutes an ordinary stiffener element together with the attached plate.

  The attached plate width is in principle:

  - equal to the mean spacing of the ordinary stiffener when the panels on both sides of the stiffener are longitudinally stiffened, or

  - equal to the width of the longitudinally stiffened panel when the panel on one side of the stiffener is longitudinally stiffened and the other panel is of the transversely stiffened. (See Fig.6)

- Stiffened plate element

  The plate between ordinary stiffener elements, between an ordinary stiffener element and a hard corner element or between hard corner elements is to be treated as a stiffened plate element. (See Fig. 6)

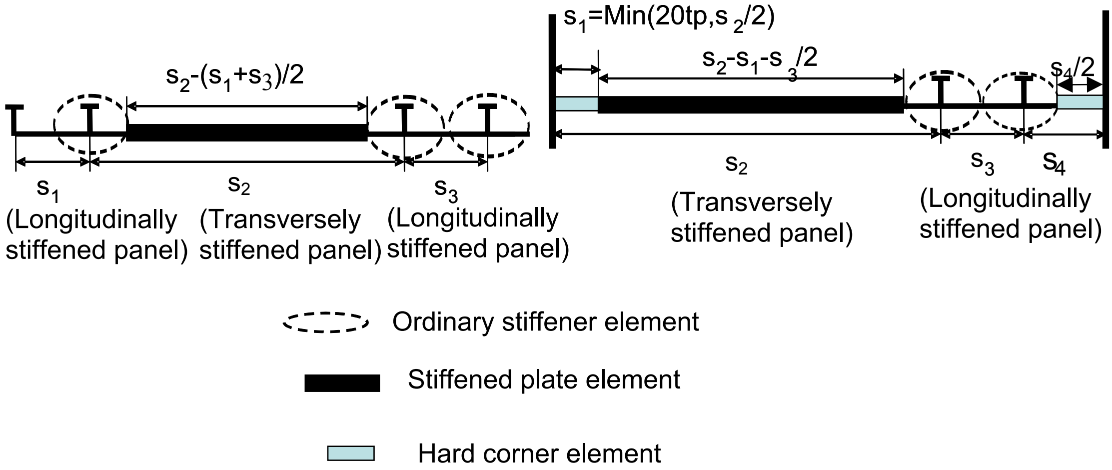

Figure 6: Extension of the breadth of the attached plating and hard corner element

The typical examples of modeling of hull girder section are illustrated in Figs 7 and 8.

Notwithstanding the foregoing principle these figures are to be applied to the modeling in the vicinity of upper deck, sheer strake and hatch side girder.

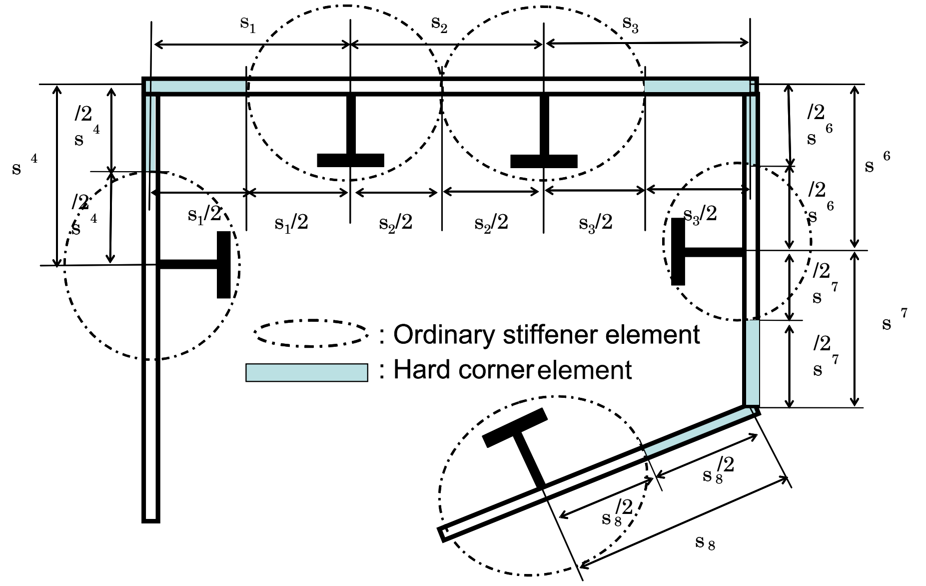

Figure 7: Extension of the breadth of the attached plating and hard corner element

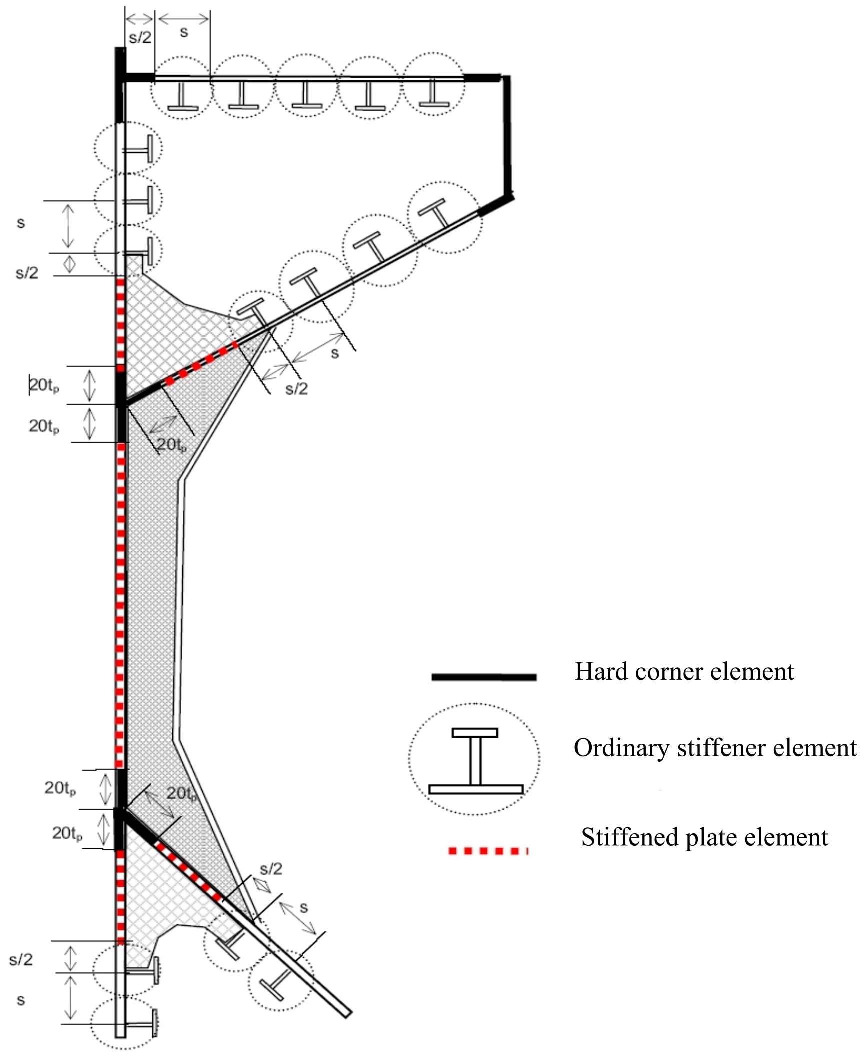

Figure 8: Examples of the configuration of stiffened plate elements, ordinary stiffener elements and hard corner elements on a hull section

(Note)

(1) In case of the knuckle point as shown in Fig 9, the plating area adjacent to knuckles in the plating with an angle greater than 30 degrees is defined as a hard corner. The extent of one side of the corner is taken equal to $20t_p$ on transversely framed panels and to $0.5s$ on longitudinally framed panels from the knuckle point.

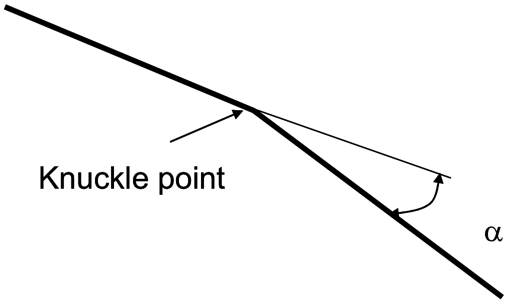

Figure 9: The case of plating with knuckle point

(2) Where the plate members are stiffened by non-continuous longitudinal stiffeners, the non-continuous stiffeners are considered only as dividing a plate into various elementary plate panels.

(3) Where the opening is provided in the stiffened plate element, the openings are to be considered in accordance with Ch 5, Sec 1, [1.2.7], [1.2.8] and [1.2.9].

(4) Where attached plating is made of steels having different thicknesses and/or yield stresses, an average thickness and/or average yield stress obtained from the following formula are to be used for the calculation.

$$t = \frac{t_1 s_1 + t_2 s_2}{s}, \qquad R_{eHp} = \frac{R_{eHp1} t_1 s_1 + R_{eHp2} t_2 s_2}{ts}$$

Where,

R_{eHp1}, R_{eHp2}, t_1, t_2, s_1, s_2 and s are shown in Fig 10.

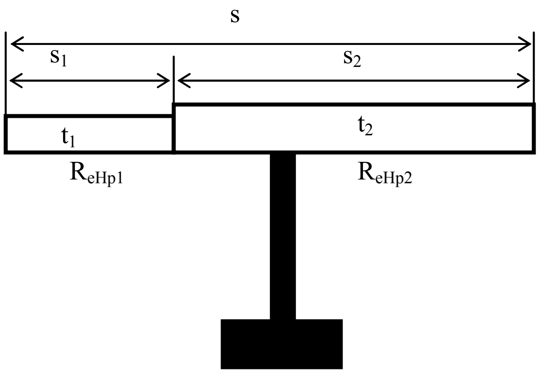

Figure 10: Element with different thickness and yield strength

RCN 1 to July 2008 version (effective from 1 July 2009)

2.2 Load-end shortening curves σ-ε

2.2.1 Stiffened plate element and ordinary stiffener element

Stiffened plate element and ordinary stiffener element composing the hull girder transverse sections may collapse following one of the modes of failure specified in Tab 1.

- Where the plate members are stiffened by non-continuous longitudinal stiffeners, the stress of the element is to be obtained in accordance with [2.2.3] to [2.2.7], taking into account the non-continuous longitudinal stiffener.

  In calculating the total forces for checking the hull girder ultimate strength, the area of non-continuous longitudinal stiffener is to be assumed as zero.
- Where the opening is provided in the stiffened plate element, the considered area of the stiffened plate element is to be obtained by deducting the opening area from the plating in calculating the total forces for checking the hull girder ultimate strength. The consideration of the opening is in accordance with the requirement in Ch 5, Sec 1, [1.2.7] to [1.2.9].
- For stiffened plate element, the effective breadth of plate for the load shortening portion of the stress-strain curve is to be taken as full plate breadth, i.e. to the intersection of other plate or longitudinal stiffener – not from the end of the hard corner element nor from the attached plating of ordinary stiffener element, if any. In calculating the total forces for checking the hull girder ultimate strength, the area of the stiffened plate element is to be taken between the hard corner element and the ordinary stiffener element or between the hard corner elements, as applicable.

RCN 1 to July 2008 version (effective from 1 July 2009)

Table 1: Modes of failure of stiffened plate element and ordinary stiffener element

Element	Mode of failure	Curve σ–ε defined in
Lengthened stiffened plate element or ordinary stiffener element	Elasto-plastic collapse	[2.2.3]
Shortened ordinary stiffener element	Beam column buckling Torsional buckling Web local buckling of flanged profiles Web local buckling of flat bars	[2.2.4] [2.2.5] [2.2.6] [2.2.7]
Shortened stiffened plate element	Plate buckling	[2.2.8]

RCN 1 to July 2008 version (effective from 1 July 2009)

2.2.2 Hard corner element

The relevant load-end shortening curve σ-ε is to be obtained for lengthened and shortened hard corners according to [2.2.3].

RCN 1 to July 2008 version (effective from 1 July 2009)

2.2.3 Elasto-plastic collapse of structural elements

The equation describing the load-end shortening curve σ-ε for the elasto-plastic collapse of structural elements composing the hull girder transverse section is to be obtained from the following formula, valid for both positive (shortening) and negative (lengthening) strains (see Fig 2):

$\sigma = \Phi R_{eHA}$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

R_{eHA} : Equivalent minimum yield stress, in N/mm², of the considered element, obtained by the following formula

$$R_{eHA} = \frac{R_{eHp} A_p + R_{eHs} A_s}{A_p + A_s}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

Φ : Edge function, equal to:

$\Phi = -1$ for $\varepsilon < -1$

$\Phi = \varepsilon$ for $-1 \leq \varepsilon \leq 1$

$\Phi = 1$ for $\varepsilon > 1$

ε : Relative strain, equal to:

$$\varepsilon = \frac{\varepsilon_E}{\varepsilon_Y}$$

ε_E : Element strain

ε_Y : Strain at yield stress in the element, equal to:

$$\varepsilon_Y = \frac{R_{eHA}}{E}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

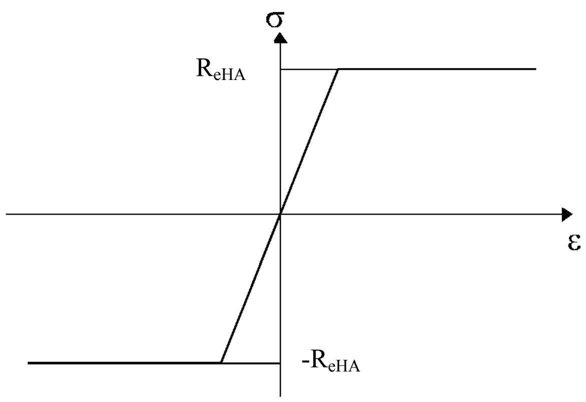

Figure 2: Load-end curve σ-ε for elasto plastic collapse

RCN 1 to July 2008 version (effective from 1 July 2009)

2.2.4 Beam column buckling

The equation describing the load-end shortening curve σ_{CR1}-ε for the beam column buckling of ordinary stiffeners composing the hull girder transverse section is to be obtained from the following formula (see Fig 3):

$$\sigma_{CR1} = \Phi \sigma_{C1} \frac{A_s + A_{pE}}{A_s + A_p}$$

RCN 1 to July 2008 version (effective from 1July 2009)

where:

Φ : Edge function defined in [2.2.3]

σ_{C1} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C1} = \frac{\sigma_{E1}}{\varepsilon} \qquad \text{for } \sigma_{E1} \le \frac{R_{eHB}}{2}\varepsilon$$

$$\sigma_{C1} = R_{eHB}\left(1 - \frac{R_{eHB}\,\varepsilon}{4\,\sigma_{E1}}\right) \qquad \text{for } \sigma_{E1} > \frac{R_{eHB}}{2}\varepsilon$$

R_{eHB} : Equivalent minimum yield stress, in N/mm², of the considered element, obtained by the following formula

$$R_{eHB} = \frac{R_{eHp}A_{pE1}l_{pE} + R_{eHs}A_s l_{sE}}{A_{pE1}l_{pE} + A_s l_{sE}}$$

A_{pEl} : Effective area, in cm², equal to

$A_{pEl} = 10 b_{E1} t_p$

l_{pE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plate of width b_{el} to the bottom of the attached plate

l_{sE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plating of width b_{El} to the top of the stiffener

RCN 1 to July 2008 version (effective from 1 July 2009)

ε : Relative strain defined in [2.2.3]

σ_{E1} : Euler column buckling stress, in N/mm^2, equal to:

$$\sigma_{E1} = \pi^2 E \frac{I_E}{A_E l^2} 10^{-4}$$

I_E : Net moment of inertia of ordinary stiffeners, in cm^4, with attached shell plating of width b_{E1}

b_{E1} : Effective width, in m, of the attached shell plating, equal to:

$$b_{E1} = \frac{s}{\beta_E} \qquad \text{for } \beta_E > 1.0$$

$$b_{E1} = s \qquad \text{for } \beta_E \le 1.0$$

$\beta_E = 10^3 \frac{s}{t_p}\sqrt{\frac{\varepsilon R_{eHp}}{E}}$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

A_{pE} : Net sectional area, in cm^2, of attached shell plating of width b_E, equal to:

$A_{pE} = 10 b_E t_p$

b_E : Effective width, in m, of the attached shell plating, equal to:

$$b_E = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right)s \qquad \text{for } \beta_E > 1.25$$

$$b_E = s \qquad \text{for } \beta_E \le 1.25$$

(RCN 1, effective from 1 April 2008)

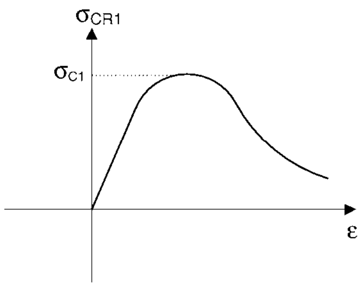

Figure 3: Load-end shortening curve σ_{CR1}-ε for beam column buckling

2.2.5 Torsional buckling

The equation describing the load-end shortening curve σ_{CR2}-ε for the flexural-torsional buckling of ordinary stiffeners composing the hull girder transverse section is to be obtained according to the following formula (see Fig 4).

$$\sigma_{CR2} = \Phi \frac{A_S \sigma_{C2} + A_p \sigma_{CP}}{A_S + A_p}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

Φ : Edge function defined in [2.2.3]

σ_{C2} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C2} = \frac{\sigma_{E2}}{\varepsilon} \qquad \text{for } \sigma_{E2} \le \frac{R_{eHs}}{2}\varepsilon$$

$$\sigma_{C2} = R_{eHs}\left(1 - \frac{R_{eHs}\,\varepsilon}{4\sigma_{E2}}\right) \qquad \text{for } \sigma_{E2} > \frac{R_{eHs}}{2}\varepsilon$$

RCN 1 to July 2008 version (effective from 1 July 2009)

σ_{E2} : Euler torsional buckling stress, in N/mm^2, defined in Ch 6, Sec 3, [4.3]

ε : Relative strain defined in [2.2.3]

σ_{CP} : Buckling stress of the attached plating, in N/mm^2, equal to:

$$\sigma_{CP} = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right) R_{eHp} \qquad \text{for } \beta_E > 1.25$$

$$\sigma_{CP} = R_{eHp} \qquad \text{for } \beta_E \le 1.25$$

RCN 1 to July 2008 version (effective from 1 July 2009)

β_E : Coefficient defined in [2.2.4]

(RCN 1, effective from 1 April 2008)

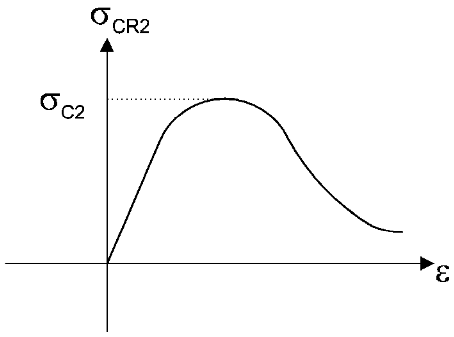

Figure 4: Load-end shortening curve σ_{CR2}-ε for flexural-torsional buckling

2.2.6 Web local buckling of ordinary stiffeners made of flanged profiles

The equation describing the load-end shortening curve σ_{CR3}-ε for the web local buckling of flanged ordinary stiffeners composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR3} = \Phi \frac{10^3 b_E t_p R_{eHp} + (h_{we} t_w + b_f t_f) R_{eHs}}{10^3 s t_p + h_w t_w + b_f t_f}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where

Φ : Edge function defined in [2.2.3]

b_E : Effective width, in m, of the attached shell plating, defined in [2.2.4]

h_{we} : Effective height, in mm, of the web, equal to:

$$h_{we} = \left(\frac{2.25}{\beta_w} - \frac{1.25}{\beta_w^2} \right) h_w \qquad \text{for } \beta_w > 1.25$$

$$h_{we} = h_w \qquad \text{for } \beta_w \le 1.25$$

$$\beta_w = \frac{h_w}{t_w} \sqrt{\frac{\varepsilon R_{eHs}}{E}}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

ε : Relative strain defined in [2.2.3]

2.2.7 Web local buckling of ordinary stiffeners made of flat bars

The equation describing the load-end shortening curve σ_{CR4}-ε for the web local buckling of flat bar ordinary stiffeners composing the hull girder transverse section is to be obtained from the following formula (see Fig 5):

$$\sigma_{CR4} = \Phi \frac{A_P \sigma_{CP} + A_s \sigma_{C4}}{A_p + A_s}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

Φ : Edge function defined in [2.2.3]

σ_{CP} : Buckling stress of the attached plating, in N/mm^2, defined in [2.2.5]

σ_{C4} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C4} = \frac{\sigma_{E4}}{\varepsilon} \qquad \text{for } \sigma_{E4} \le \frac{R_{eHs}}{2}\varepsilon$$

$$\sigma_{C4} = R_{eHs}\left(1 - \frac{R_{eHs}\,\varepsilon}{4\sigma_{E4}}\right) \qquad \text{for } \sigma_{E4} > \frac{R_{eHs}}{2}\varepsilon$$

RCN 1 to July 2008 version (effective from 1 July 2009)

σ_{E4} : Local Euler buckling stress, in N/mm^2, equal to:

$$\sigma_{E4} = 160000\left(\frac{t_w}{h_w}\right)^2$$

ε : Relative strain defined in [2.2.3].

(RCN 1, effective from 1 April 2008)

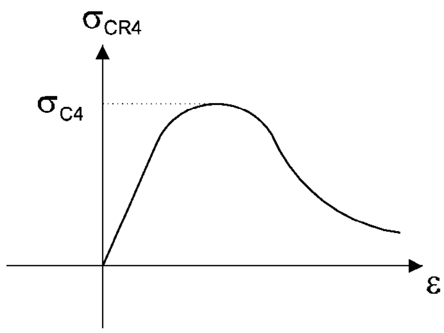

Figure 5: Load-end shortening curve σ_{CR4}-ε for web local buckling

2.2.8 Plate buckling

The equation describing the load-end shortening curve σ_{CR5}-ε for the buckling of transversely stiffened panels composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR5} = \min\begin{cases} R_{eHp}\,\Phi \\ \Phi R_{eHp}\left[\dfrac{s}{\ell}\left(\dfrac{2.25}{\beta_E} - \dfrac{1.25}{\beta_E^2}\right) + 0.1\left(1 - \dfrac{s}{\ell}\right)\left(1 + \dfrac{1}{\beta_E^2}\right)^2\right] \end{cases}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

Φ : Edge function defined in [2.2.3].

$$\beta_E = 10^3\,\frac{s}{t_p}\sqrt{\frac{\varepsilon R_{eHp}}{E}}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

s : plate breadth, in m, taken as the spacing between the ordinary stiffeners.

ℓ : longer side of the plate, in m.

(RCN 1, effective from 1 April 2008)

Chapter 6

Hull Scantlings

Section 1 - PLATING

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to Ch 5, Sec 1, [1.5], on gross offered thickness reduced by $0.5t_C$ for all structural members

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to Ch 5, Sec 1, [1.5], on gross offered thickness reduced by $0.5t_C$ for all structural members

N : Z co-ordinate with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4], in m, of the centre of gravity of the hull net transverse section, defined in Ch 5, Sec 1, [1.2], considering gross offered thickness reduced by $0.5t_C$ for all structural members

t : Net thickness, in mm, of a plate panel.

p_S, p_W : Still water and wave pressure, in kN/m^2, in intact conditions, defined in [3.1.2]

p_F : Pressure, in kN/m^2, in flooded conditions, defined in [3.1.3]

p_T : Pressure, in kN/m^2, in testing conditions, defined in [3.1.4]

σ_X : Normal stress, in N/mm^2, defined in [3.1.5]

ℓ : Length, in m, of the longer side of the elementary plate panel, measured along the chord

s : Length, in m, of the shorter side of the elementary plate panel, measured along the chord at mid-span of ℓ

c_a : Coefficient of aspect ratio of the plate panel, equal to:

$$c_a = 1.21\sqrt{1 + 0.33\left(\frac{s}{\ell}\right)^2} - 0.69\frac{s}{\ell}$$, to be taken not greater than 1.0

c_r : Coefficient of curvature of the panel, equal to:

$$c_r = 1 - 0.5\frac{s}{r}$$, to be taken not less than 0.4

r : Radius of curvature, in m.

1. General

1.1 Application

1.1.1

The requirements of this Section apply for the strength check of plating subjected to lateral pressure and, for plating contributing to the longitudinal strength, to in-plane hull girder normal stress.

In addition, the buckling check of platings and stiffened panels is to be carried out according to Ch 6, Sec 3.

1.2 Net thicknesses

1.2.1

As specified in Ch 3, Sec 2, all thicknesses referred to in this Section are net, i.e. they do not include any corrosion addition.

The gross thicknesses are obtained as specified in Ch 3, Sec 2, [3].

1.2.2

The net thickness, in mm, of each plating is given by the greatest of the net thicknesses calculated for each load calculation point, as defined in [1.5.1], representative of the considered plating (see Tab 1). The geometry to be considered is that of the elementary plate panel related to the load calculation point.

1.3 Pressure combination

1.3.1 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering independently the following cases:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

1.3.2 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

1.4 Elementary plate panel

1.4.1

The elementary plate panel (EPP) is the smallest unstiffened part of plating between stiffeners.

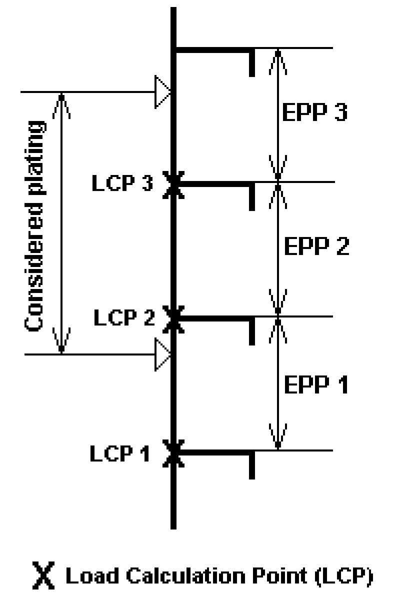
1.5 Load calculation point

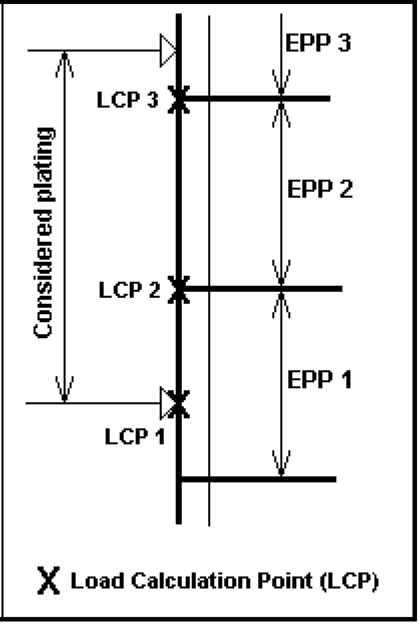
1.5.1

Unless otherwise specified, lateral pressure and hull girder stresses are to be calculated:

- for longitudinal framing, at the lower edge of the elementary plate panel (see Tab 1) or, in the case of horizontal plating, at the point of minimum y-value among those of the elementary plate panel considered, as the case may be
- for transverse framing, at the lower edge of the elementary plate panel or at the lower edge of the strake (see Tab 1) or, in the case of horizontal plating, at the point of minimum y-value among those of the elementary plate panel considered, as the case may be.

Table 1: Load calculation points

Longitudinally stiffened plating	Transversely stiffened plating
	




2. General requirements

2.1 Corrugated bulkhead

2.1.1

Unless otherwise specified, the net plating thickness of a corrugated bulkhead is to be not less than that obtained for a plate panel with s equal to the greater of a and c, where a and c are defined in Fig 1.

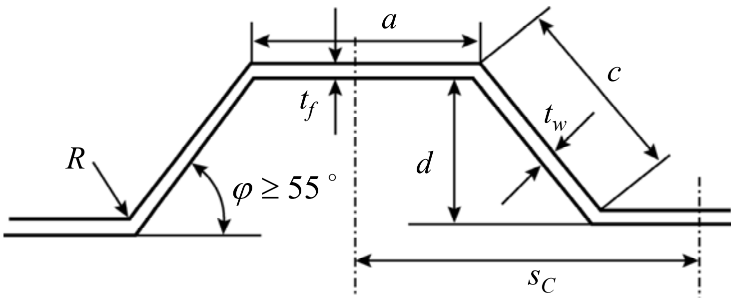


Figure 1: Corrugated bulkhead

2.2 Minimum net thicknesses

2.2.1

The net thickness of plating is to be not less than the values given in Tab 2.

In addition, in the cargo area, the net thickness of side shell plating, from the normal ballast draught to $0.25T_S$ (minimum 2.2 m) above T_S, is to be not less than the value obtained, in mm, from the following formula:

$$t = 28(s + 0.7)\frac{(BT_S)^{0.25}}{\sqrt{R_{eH}}}$$

Table 2: Minimum net thickness of plating

Plating	Minimum net thickness, in mm
Keel	$7.5 + 0.03L$
Bottom, inner bottom	$5.5 + 0.03L$
Weather strength deck and trunk deck, if any	$4.5 + 0.02L$
Side shell, bilge	$0.85L^{1/2}$
Inner side, hopper sloping plate and topside sloping plate	$0.7L^{1/2}$
Transverse and longitudinal watertight bulkheads	$0.6L^{1/2}$
Wash bulkheads	6.5
Accommodation deck	5.0

2.3 Bilge plating

2.3.1

The net thickness of the longitudinally framed bilge plating, in mm, is to be not less than the value obtained from [3.2].

2.3.2

The net thickness of the transversely framed bilge plating, in mm, is to be not less than the value obtained from the following formula:

$$t = 0.76\left[\left(p_S + p_W\right)s_b\right]^{0.4} R^{0.6} k^{0.5}$$

where :

R : Bilge radius, in m

s_b : Spacing of floors or transverse bilge brackets, in m.

2.3.3

The net thickness of the bilge plating is to be not less than the actual net thicknesses of the adjacent 2 m width bottom or side plating, whichever is the greater.

2.4 Keel plating

2.4.1

The net thickness of the keel plating is to be not less than the actual net thicknesses of the adjacent 2 m width bottom plating.

2.5 Sheerstrake

2.5.1 Welded sheerstrake

The net thickness of a welded sheerstrake is to be not less than the actual net thicknesses of the adjacent 2 m width side plating, taking into account higher strength steel corrections if needed.

2.5.2 Rounded sheerstrake

The net thickness of a rounded sheerstrake is to be not less than the actual net thickness of the adjacent deck plating.

2.5.3 Net thickness of the sheerstrake in way of breaks of effective superstructures

The net thickness of the sheerstrake is to be increased in way of breaks of effective superstructures occurring within 0.5*L* amidships, over a length of about one sixth of the ship's breadth on each side of the superstructure end.

This increase in net thickness is not to be less than 40% of the net thickness of sheerstrake, but need not exceed 4.5 mm.

Where the breaks of superstructures occur outside 0.5*L* amidships, the increase in net thickness may be reduced to 30%, but need not exceed 2.5 mm.

2.5.4 Net thickness of the sheerstrake in way of breaks of non-effective superstructures

The net thickness of the sheerstrake is to be increased in way of breaks of non-effective superstructures occurring within 0.6*L* amidships, over a length of about one sixth of the ship's breadth on each side of the superstructure end.

This increase in net thickness is to be equal to 15%, but need not exceed 4.5 mm.

2.6 Stringer plate

2.6.1 General

The net thickness of the stringer plate is to be not less than the actual net thickness of the adjacent deck plating.

2.6.2 Net thickness of the stringer plate in way of breaks of long superstructures

The net thickness of the stringer plate is to be increased in way of breaks of long superstructures occurring within 0.5*L* amidships, over a length of about one sixth of the ship's breadth on each side of the superstructure end.

This increase in net thickness is not to be less than 40% of the net thickness of stringer plate, but need not exceed 4.5 mm.

Where the breaks of superstructures occur outside 0.5*L* amidships, the increase in net thickness may be reduced to 30%, but need not exceed 2.5 mm.

2.6.3 Net thickness of the stringer plate in way of breaks of short superstructures

The net thickness of the stringer plate is to be increased in way of breaks of short superstructures occurring within 0.6*L* amidships, over a length of about one sixth of the ship breadth on each side of the superstructure end.

This increase in net thickness is to be equal to 15%, but need not exceed 4.5 mm.

2.7 Inner bottom loaded by steel coils on a wooden support

2.7.1 General

The net thickness of inner bottom, bilge hopper sloping plate and inner hull for ships intended to carry steel coils is to comply with [2.7.2] to [2.7.4].

The provision is determined by assuming Fig 2 as the standard means of securing steel coils.

RCN 1 to July 2008 version (effective from 1 July 2009)

(Insert Fig 2- Inner bottom loaded by steel coils)

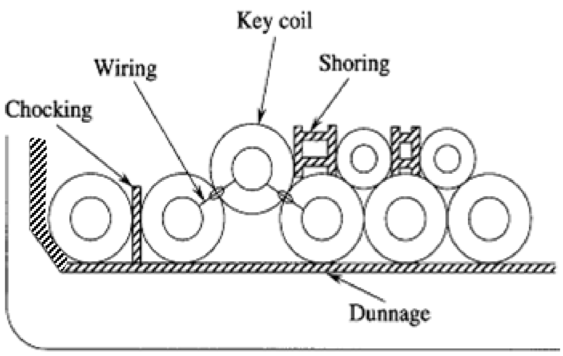

Figure 2: Inner bottom loaded by steel coils

2.7.1 bis1 Accelerations

In order to calculate the accelerations, the following coordinates are to be used for the centre of gravity.

$x_{G-sc} = 0.75\,\ell_H$ forward of aft bulkhead, where the hold of which the mid position is located forward from 0,45L from A.E.

$x_{G-sc} = 0.75\,\ell_H$ afterward of fore bulkhead, where the hold of which the mid position is located afterward from 0,45L from A.E.

$$y_{G-sc} = \varepsilon \frac{B_h}{4}$$

$$z_{G-sc} = h_{DB} + \left\{1 + (n_1 - 1)\frac{\sqrt{3}}{2}\right\}\frac{d_{sc}}{2}$$

where:

ε : 1.0 when a port side structural member is considered, or -1.0 when a starboard side structural member is considered.

B_h : breadth in m, at the mid of the hold, of the cargo hold at the level of connection of bilge hopper plate with side shell or inner hull

d_{sc} : diameter of steel coils, in m

h_{DB} : height of inner bottom, in m

ℓ_H : Cargo hold length, in m

Vertical acceleration a_Z, in m/s², are to be calculated by the formulae defined in Ch 4, Sec 2, [3.2] and tangential acceleration a_R due to roll, in m/s², is to be calculated by the following formula.

$$a_R = \theta \frac{\pi}{180}\left(\frac{2\pi}{T_R}\right)^2 \sqrt{y_{G\_SC}{}^2 + R^2}$$

where:

θ, T_R and R: as defined in Ch 4, Sec 2, [3.2].

RCN 1 to July 2008 version (effective from 1 July 2009)

2.7.2 Inner bottom plating

The net thickness of plating of longitudinally framed inner bottom is to be not less than the value obtained, in mm, from the following formula:

$$t = K_1\sqrt{\frac{\{g(\cos(C_{ZP}\Phi)\cos(C_{ZR}\theta)) + a_z\}F}{\lambda_P R_Y}}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

K_1 : Coefficient taken equal to:

$$K_1 = \sqrt{\frac{1.7s\ell K_2 - 0.73s^2K_2^2 - (\ell - \ell')^2}{2\ell'(2s + 2\ell K_2)}}$$

a_z : Vertical acceleration, in m/s², defined in [2.7.1 bis1]

Φ : Single pitch amplitude, in deg, defined in Ch 4, Sec 2, [2.2]

θ : Single roll amplitude, in deg, defined in Ch 4, Sec 2, [2.1]

C_{ZP}, C_{ZR} : Load combination factor defined in Ch 4, Sec 4, [2.2]

RCN 1 to July 2008 version (effective from 1 July 2009)

F : Force, in kg, taken equal to:

$$F = K_S\frac{Wn_1n_2}{n_3} \qquad \text{for } n_2 \le 10 \text{ and } n_3 \le 5$$

$$F = K_S n_1 W\frac{l}{l_S} \qquad \text{for } n_2 > 10 \text{ or } n_3 > 5$$

RCN 1 to July 2008 version (effective from 1 July 2009)

λ_P : Coefficient defined in Tab 6

K_S : Coefficient taken equal to:

$K_S = 1.4$ when steel coils are lined up in one tier with a key coil

$K_S = 1.0$ in other cases

W : Mass of one steel coil, in kg

n_1 : Number of tiers of steel coils

n_2 : Number of load points per elementary plate panel (See Figs.3 and 4)

When $n_3 \le 5$, n_2 can be obtained from Tab 3 according to the values of n_3 and ℓ / ℓ_S

RCN 1 to July 2008 version (effective from 1 July 2009)

n_3 : Number of dunnages supporting one steel coil

ℓ_S : Length of a steel coil, in m

K_2 : Coefficient taken equal to:

$$K_2 = -\frac{s}{\ell} + \sqrt{\left(\frac{s}{\ell}\right)^2 + 1.37\left(\frac{\ell}{s}\right)^2\left(1 - \frac{\ell'}{\ell}\right)^2 + 2.33}$$

ℓ' : Distance, in m, between outermost load points per elementary plate panel in ship length (See Figs.3 and 4). When $n_2 \leq 10$ and $n_3 \leq 5$, ℓ' can be obtained from Tab 4 according to the values of ℓ, ℓ_s, n_2 and n_3. When $n_2 > 10$ or $n_3 > 5$, ℓ' is to be taken equal to ℓ.

RCN 1 to July 2008 version (effective from 1 July 2009)

2.7.3 Bilge hopper sloping plate and inner hull plate *RCN 1 to July 2008 version (effective from 1 July 2009)*

The net thickness of plating of longitudinally framed bilge hopper sloping plate and inner hull is to be not less than the value obtained, in mm, from the following formula:

$$t = K_1\sqrt{\frac{a_{hopper}F'}{\lambda_P R y}}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

K_1 : Coefficient defined in [2.7.2]

θ_h : Angle, in deg, between inner bottom plate and bilge hopper sloping plate or inner hull plate

RCN 1 to July 2008 version (effective from 1 July 2009)

$$a_{hopper} = -C_{YR}a_R\sin\left(\tan^{-1}\left|\frac{y_{G\_SC}}{R}\right| - \theta_h\right) + g\cos(\theta_h - C_{YG}\theta)\cos(C_{XG}\Phi) + C_{YS}a_{sway}\sin\theta_h$$

RCN 1 to July 2008 version (effective from 1 July 2009)

a_R : tangential acceleration defined in [2.7.1 bis1].

a_{sway} : Transverse acceleration due to sway, in m/s², defined in Ch 4, Sec 2, [2.4]

C_{XG}, C_{YS}, C_{YR}, C_{YG} : Load combination factors defined in Ch 4, Sec 4, [2.2]

y_{G}_sc : Centre of gravity in transverse direction, in m, defined in [2.7.1 bis1]

R : Coefficient defined in Ch 4, Sec 2, [3.2.1]

F' : Force, in kg, taken equal to:

$$F' = \frac{Wn_2C_k}{n_3} \quad \text{for } n_2 \leq 10 \text{ and } n_3 \leq 5$$

$$F' = C_kW\frac{l}{l_s} \quad \text{for } n_2 > 10 \text{ or } n_3 > 5$$

RCN 1 to July 2008 version (effective from 1 July 2009)

λ_P : Coefficient defined in Tab 6

W, n_2, n_3, Φ and θ : As defined in [2.7.2]

C_k : Coefficient taken equal to:

$C_k = 3.2$ when steel coils are lined up two or more tier, or when steel coils are lined up one tier and key coil is located second or third from bilge hopper sloping plate or inner hull plate

$C_k = 2.0$ for other cases

RCN 1 to July 2008 version (effective from 1 July 2009)

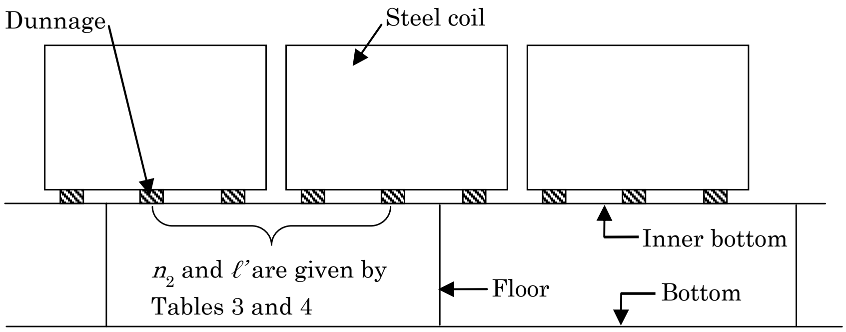

Figure 3: Loading condition of steel coils (example of n_2 = 4, n_3 = 3)

3. Strength check of plating subjected to lateral pressure

3.1 Load model

3.1.1 General

The still water and wave lateral pressures induced by the sea and the various types of cargoes and ballast in intact conditions are to be considered, depending on the location of the plating under consideration and the type of the compartments adjacent to it.

The plating which constitutes the boundary of compartments not intended to carry liquid (excluding bottom and side shell plating) is to be subjected to lateral pressure in flooded conditions.

The wave lateral pressures and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in Ch 4, Sec 4.

3.1.2 Lateral pressure in intact conditions

The lateral pressure in intact conditions is constituted by still water pressure and wave pressure.

Still water pressure p_S includes:

- the hydrostatic pressure, defined in Ch 4, Sec 5, [1]
- the still water internal pressure, defined in Ch 4, Sec 6 for the various types of cargoes and for ballast.

Wave pressure p_W includes for each load case H1, H2, F1, F2, R1, R2, P1 and P2:

- the hydrodynamic pressure, defined in Ch 4, Sec 5, [1]
- the inertial pressure, defined in Ch 4, Sec 6 for the various types of cargoes and for ballast.

3.1.3 Lateral pressure in flooded conditions

The lateral pressure in flooded conditions p_F is defined in Ch 4, Sec 6, [3.2.1].

3.1.4 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating
- $p_T = p_{ST}$ otherwise,

where:

p_{ST} : Testing pressure defined in Ch 4, Sec 6, [4]

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in Ch 4, Sec 5, [1] for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat
- if the testing is not carried out afloat: $p_S = 0$

3.1.5 Normal stresses

The normal stress to be considered for the strength check of plating contributing to the hull girder longitudinal strength is the maximum value of σ_X between sagging and hogging conditions, when applicable, obtained, in N/mm^2, from the following formula:

$$\sigma_X = \left[C_{SW} \left| \frac{M_{SW}}{I_Y} \right| (z-N) + C_{WV} \left| \frac{M_{WV}}{I_Y} \right| (z-N) - C_{WH} \left| \frac{M_{WH}}{I_Z} \right| y \right] 10^{-3}$$

where:

M_{SW} : Permissible still water bending moments, in kN.m, in hogging or sagging as the case may be

M_{WV} : Vertical wave bending moment, in kN.m, in hogging or sagging as the case may be, as defined in Ch 4, Sec 3

M_{WH} : Horizontal wave bending moment, in kN.m, as defined in Ch 4, Sec 3

C_{SW} : Combination factor for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and defined in Tab 5

C_{WV}, C_{WH} : Combination factors defined in Ch 4, Sec 4, [2.2] for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and given in Tab 5.

Table 5: Combination factors C_{SW}, C_{WV} and C_{WH}

LC	Hogging			Sagging		
	C_{SW}	C_{WV}	C_{WH}	C_{SW}	C_{WV}	C_{WH}
H1	Not Applicable			-1	-1	0
H2	1	1	0	Not Applicable		
F1	Not Applicable			-1	-1	0
F2	1	1	0	Not Applicable		
R1	1	0	$1.2-\dfrac{T_{LC}}{T_S}$	-1	0	$1.2-\dfrac{T_{LC}}{T_S}$
R2	1	0	$\dfrac{T_{LC}}{T_S}-1.2$	-1	0	$\dfrac{T_{LC}}{T_S}-1.2$
P1	1	$0.4-\dfrac{T_{LC}}{T_S}$	0	-1	$0.4-\dfrac{T_{LC}}{T_S}$	0
P2	1	$\dfrac{T_{LC}}{T_S}-0.4$	0	-1	$\dfrac{T_{LC}}{T_S}-0.4$	0

3.2 Plating thickness

3.2.1 Intact conditions

The net thickness of laterally loaded plate panels is to be not less than the value obtained, in mm, from the following formula:

$$t = 15.8 c_a c_r s \sqrt{\frac{p_S + p_W}{\lambda_P R_Y}}$$

where:

λ_P : Coefficient defined in Tab 6

Table 6: Coefficient λ_P

Plating		Coefficient λ_P
Contributing to the hull girder longitudinal strength	Longitudinally framed plating	$0.95-0.45\left\|\dfrac{\sigma_X}{R_Y}\right\|$, without being taken greater than 0.9
	Transversely framed plating	$0.95-0.90\left\|\dfrac{\sigma_X}{R_Y}\right\|$, without being taken greater than 0.9
Not contributing to the hull girder longitudinal strength		0.9

3.2.2 Net thickness under flooded conditions excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds

The plating which constitutes the boundary of compartments not intended to carry liquids (excluding bottom plating and side shell plating), and excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds is to be checked in flooded conditions. To this end, its net thickness is to be not less than the value obtained, in mm, from the following formula:

$$t = 15.8 c_a c_r s \sqrt{\frac{p_F}{\alpha \lambda_P R_Y}}$$

where:

λ_P : Coefficient defined in Tab 6, determined by considering σ_X in flooded condition

α : Coefficient taken equal to:

α = 0.95 for the plating of collision bulkhead

α = 1.15 for the plating of other watertight boundaries of compartments.

3.2.3 Net thickness of corrugation of transverse vertically corrugated watertight bulkheads separating cargo holds for flooded conditions

The net plate thickness t, in mm, of transverse vertically corrugated watertight bulkheads separating cargo holds is to be not less than that obtained from the following formula:

$$t = 14.9 s \sqrt{\frac{1.05 p}{R_{eH}}}$$

p : pressure p_F or resultant pressure p, in kN/m^2, as defined in Ch 4, Sec 6 [3.3.6] and [3.3.7], respectively

RCN 1 to July 2010 version (effective from 1July 2012)

s : plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is greater

RCN 1 to July 2008 version (effective from 1 July 2009)

For built-up corrugation bulkheads, when the thicknesses of the flange and web are different:

- the net thickness of the narrower plating is to be not less than that obtained, in mm, from the following formula:

  $$t_N = 14.9 s \sqrt{\frac{1.05 p}{R_{eH}}}$$

  s : plate width, in m, of the narrower plating.

  RCN 1 to July 2008 version (effective from 1 July 2009)

- the net thickness of the wider plating is not to be less than the greater of those obtained, in mm, from the following formulae:

  $$t_W = 14.9 s \sqrt{\frac{1.05 p}{R_{eH}}}$$

  $$t_W = \sqrt{\frac{462 s^2 p}{R_{eH}} - t_{NP}^2}$$

where:

t_{NP} : Actual net thickness of the narrower plating, in mm, to be not taken greater than:

$$t_{NP} = 14.9 s \sqrt{\frac{1.05 p}{R_{eH}}}$$

s : plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is greater.

The net thickness of the lower part of corrugations is to be maintained for a distance from the inner bottom (if no lower stool is fitted) or the top of the lower stool not less than $0.15\ell_C$, where ℓ_C is the span of the corrugations, in m, to be obtained according to Ch 3, Sec 6, [10.4.4]. The net thickness is also to comply with the requirements in [3.2.1], Sec 2, [3.6.1 & 3.6.2], and Sec 3, [6].

The net thickness of the middle part of corrugations is to be maintained for a distance from the deck (if no upper stool is fitted) or the bottom of the upper stool not greater than $0.3\ \ell_C$. The net thickness is also to comply with the requirements in [3.2.1] and Sec 2, [3.6.1 & 3.6.2].

RCN 1 to July 2008 version (effective from 1 July 2009)

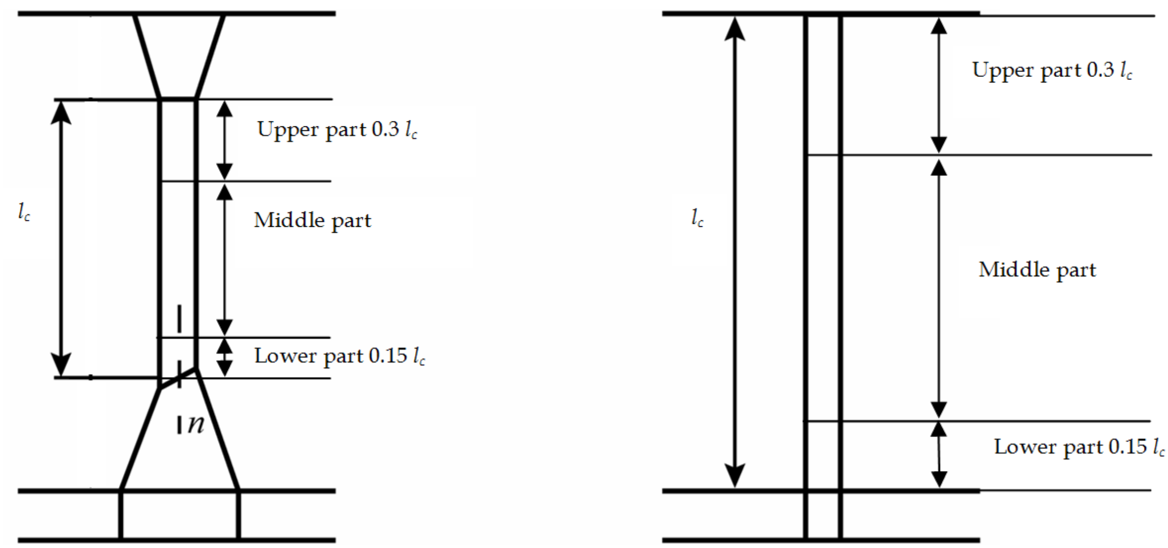

Figure 5: Parts of Corrugation

RCN 1 to July 2008 version (effective from 1 July 2009)

3.2.3 bis1 Net thickness of lower stool and upper stool

The net thickness and material of the stool top plate of lower stool are to be not less those for the corrugated bulkhead plating above required by [3.2.3].

The net thickness and material of the upper portion of vertical or sloping stool side plating of lower stool within the depth equal to the corrugation flange width from the stool top are to be not less than the flange plate at the lower end of the corrugation required by [3.2.3], as applicable, whichever is the greater.

The net thickness and material of the stool bottom plate of upper stool are to be the same as those of the bulkhead plating required by [3.2.3], as applicable, whichever is the greater.

The net thickness of the lower portion of stool side plating is to not be less than 80% of the upper part of the bulkhead plating required by [3.2.3], as applicable, whichever is the greater, where the same material is used.

The net thickness of lower stool and upper stool are to be not less than those required by [3.2.1], [3.2.2] and [3.2.4].

RCN 1 to July 2008 version (effective from 1 July 2009)

3.2.3 bis 2 Net thickness of supporting floors of corrugated bulkhead

The net thickness and material of the supporting floors and pipe tunnel beams of corrugated bulkhead, when no stool is fitted, are to be not less than those of the corrugation flanges required by [3.2.3].

When a lower stool is fitted, the net thickness of supporting floors are to be not less than that of the stool side plating required by the first sentence of [3.2.2].

RCN 1 to July 2008 version (effective from 1 July 2009)

3.2.4 Testing Conditions

The plating of compartments or structures as defined in Ch 4, Sec 6, [4] is to be checked in testing conditions. To this end, its net thickness is to be not less than the value obtained, in mm, from the following formula:

$$t = 15.8 c_a c_r s \sqrt{\frac{p_T}{1.05 R_Y}}$$

Section 2 - ORDINARY STIFFENERS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

L_2 : Rule length L, but to be taken not greater than 300 m

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to Ch 5, Sec 1, [1.5], on gross offered thickness reduced by $0.5t_C$ for all structural members

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to Ch 5, Sec 1, [1.5], on gross offered thickness reduced by $0.5t_C$ for all structural members

N : Z co-ordinate with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4], in m, of the centre of gravity of the hull net transverse section defined in Ch 5, Sec 1, [1.2], considering gross offered thickness reduced by $0.5t_C$ for all structural members

p_S, p_W : Still water and wave pressure, in kN/m^2, in intact conditions, defined in [3.1.2]

p_F : Pressure, in kN/m^2, in flooded conditions, defined in [3.1.3]

p_T : Pressure, in kN/m^2, in testing conditions, defined in [3.1.4]

σ_X : Normal stress, in N/mm^2, defined in [3.1.5]

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners, measured along the chord between the supporting members, see Ch 3, Sec 6, [4.2]

h_w : Web height, in mm

t_w : Net web thickness, in mm

b_f : Face plate width, in mm

t_f : Net face plate thickness, in mm

b_p : Width, in m, of the plating attached to the stiffener, for the yielding check, defined in Ch 3, Sec 6, [4.3]

w : Net section modulus, in cm^3, of the stiffener, with an attached plating of width b_p, to be calculated as specified in Ch 3, Sec 6, [4.4]

A_{sh} : Net shear sectional area, in cm^2, of the stiffener, to be calculated as specified in Ch 3, Sec 6, [4.4]

m : Coefficient taken equal to:

$m = 10$ for vertical stiffeners

$m = 12$ for other stiffeners

τ_a : Allowable shear stress, in N/mm^2, taken equal to:

$$\tau_a = \frac{R_Y}{\sqrt{3}}$$

1. General

1.1 Application

1.1.1

The requirements of this Section apply for the yielding check of ordinary stiffeners subjected to lateral pressure and, for ordinary stiffeners contributing to the hull girder longitudinal strength, to hull girder normal stresses.

The yielding check is also to be carried out for ordinary stiffeners subjected to specific loads, such as concentrated loads.

In addition, the buckling check of ordinary stiffeners is to be carried out according to Ch 6, Sec 3.

1.2 Net scantlings

1.2.1

As specified in Ch 3, Sec 2, all scantlings referred to in this Section are net, i.e. they do not include any corrosion addition.

The gross scantlings are obtained as specified in Ch 3, Sec 2, [3].

1.3 Pressure combination

1.3.1 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering independently the following cases:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

1.3.2 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

1.4 Load calculation point

1.4.1 Horizontal stiffeners

Unless otherwise specified, lateral pressure and hull girder stress, if any, are to be calculated at mid-span of the ordinary stiffener considered.

1.4.2 Vertical stiffeners

The lateral pressure p is to be calculated as the maximum between the value obtained at mid-span and the value obtained from the following formula:

- $p = \dfrac{p_U + p_L}{2}$, when the upper end of the vertical stiffener is below the lowest zero pressure level
- $p = \dfrac{\ell_1}{\ell}\dfrac{p_L}{2}$, when the upper end of the vertical stiffener is at or above the lowest zero pressure level (see Fig 1)

where:

ℓ_1 : Distance, in m, between the lower end of vertical stiffener and the lowest zero pressure level

p_U, p_L : Lateral pressures at the upper and lower end of the vertical stiffener span ℓ, respectively.

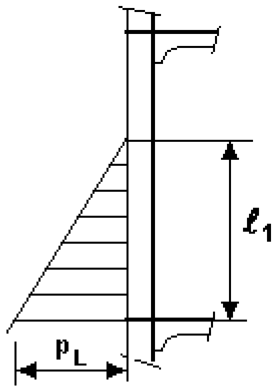

Figure 1: Definition of pressure for vertical stiffeners

2. General requirements

2.1 (void) *RCN 1 to July 2008 version (effective from 1 July 2009)*

2.1.1

(void) *RCN 1 to July 2008 version (effective from 1 July 2009)*

Figure 2: (void) *RCN 1 to July 2008 version (effective from 1 July 2009)*

2.2 Net thickness of web of ordinary stiffeners

2.2.1 Minimum net thickness of webs of ordinary stiffeners other than side frames of single side bulk carriers

The net thickness of the web of ordinary stiffeners, in mm, is to be not less than the greater of:

- $t = 3.0 + 0.015L_2$
- 40% of the net required thickness of the attached plating, to be determined according to Ch.6, Sec.1.

RCN 1 to July 2008 version (effective from 1 July 2009)

2.2.2 Minimum net thickness of side frames of single side bulk carriers *RCN 1 to July 2008 version (effective from 1 July 2009)*

The net thickness of side frame webs within the cargo area, in mm, is to be not less than the value obtained from the following formula:

$t_{MIN} = 0.75\alpha(7 + 0.03L)$

where:

α : Coefficient taken equal to:

$\alpha = 1.15$ for the frame webs in way of the foremost hold

$\alpha = 1.00$ for the frame webs in way of other holds.

2.2.3 Maximum net thickness of web of ordinary stiffener

The net thickness of the web of ordinary stiffeners, in mm, is to be less than 2 times the net offered thickness of the attached plating. *RCN 1 to July 2008 version (effective from 1 July 2009)*

2.3 Net dimensions of ordinary stiffeners

2.3.1 Flat bar

The net dimensions of a flat bar ordinary stiffener (see Fig 3) are to comply with the following requirement:

$$\frac{h_w}{t_w} \le 20\sqrt{k}$$

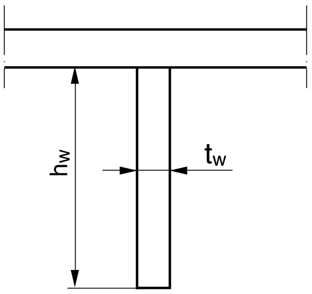

Figure 3: Net dimensions of a flat bar

2.3.2 T-section

The net dimensions of a T-section ordinary stiffener (see Fig 4) are to comply with the following requirements:

$$\frac{h_w}{t_w} \le 65\sqrt{k}$$

$$\frac{b_f}{t_f} \le 33\sqrt{k}$$

$$b_f t_f \ge \frac{h_w t_w}{6}$$

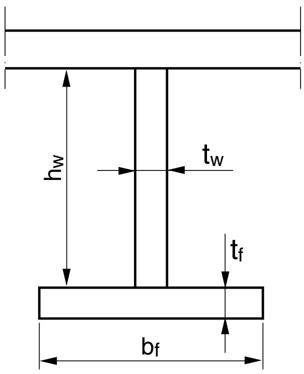

Figure 4: Net dimensions of a T-section

2.3.3 Angle

The net dimensions of an angle ordinary stiffener (see Fig 5) are to comply with the following requirements:

$$\frac{h_w}{t_w} \le 55\sqrt{k}$$

$$\frac{b_f}{t_f} \le 16.5\sqrt{k}$$

$$b_f t_f \ge \frac{h_w t_w}{6}$$

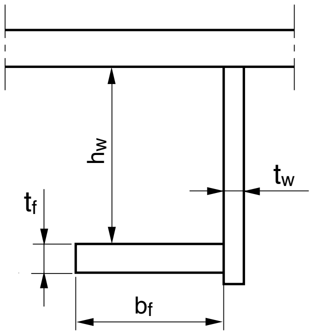

Figure 5: Net dimensions of an angle

2.4 Struts connecting ordinary stiffeners

2.4.1

The net sectional area A_{SR}, in cm^2, and the net moment of inertia I_{SR} about the main axes, in cm^4, of struts connecting ordinary stiffeners are to be not less than the values obtained from the following formulae:

$$A_{SR} = \frac{p_{SR} s\ell}{20}$$

$$I_{SR} = \frac{0.75 s\ell (p_{SR1} + p_{SR2}) A_{ASR}\ \ell_{SR}^2}{47.2 A_{ASR} - s\ell (p_{SR1} + p_{SR2})}$$

where:

p_{SR} : Pressure to be taken equal to the greater of the values obtained, in kN/m^2, from the following formulae:

$$p_{SR} = 0.5(p_{SR1} + p_{SR2})$$

$$p_{SR} = p_{SR3}$$

p_{SR1} : External pressure in way of the strut, in kN/m^2, acting on one side, outside the compartment in which the strut is located

p_{SR2} : External pressure in way of the strut, in kN/m^2, acting on the opposite side, outside the compartment in which the strut is located

p_{SR3} : Internal pressure at mid-span of the strut, in kN/m^2, in the compartment in which the strut is located

ℓ : Span, in m, of ordinary stiffeners connected by the strut (see Ch 3, Sec 6, [4.2.3])

ℓ_{SR} : Length, in m, of the strut

A_{ASR} : Actual net sectional area, in cm^2, of the strut.

2.5 Ordinary stiffeners of inner bottom loaded by steel coils on a wooden support

2.5.1 General

The requirements of this sub-article apply to the ordinary stiffeners located on inner bottom plate, bilge hopper sloping plate and inner hull plate when loaded by steel coils on a wooden support (dunnage), as indicated in Fig 2 of Ch 6, Sec 1.

RCN 1 to July 2008 version (effective from 1 July 2009)

2.5.2 Ordinary stiffeners located on inner bottom plating

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners located on inner bottom plating are to be not less than the values obtained from the following formulae:

$$w = K_3 \frac{\left[g \cdot \cos(C_{ZP}\Phi) \cdot \cos(C_{ZR}\theta) + a_Z\right] \cdot F}{8.\lambda_S R_Y}$$

$$A_{SH} = \frac{5\left[g \cdot \cos(C_{ZP}\Phi) \cdot \cos(C_{ZR}\theta)) + a_Z\right] \cdot F}{\tau_a \sin\phi} 10^{-3}$$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

where:

K_3 : Coefficient defined in Tab 1. When n_2 is greater than 10, K_3 is to be taken equal to $2\,\ell / 3$

a_Z : Vertical acceleration, in m/s^2, defined in Ch 6, Sec1, [2.7.1 bis1]

Φ : Single pitch amplitude, in deg, defined in Ch 4, Sec 2, [2.2]

θ : Single roll amplitude, in deg, defined in Ch 4, Sec 2, [2.1]

C_{ZP}, C_{ZR}: Load combination factor defined in Ch 4, Sec 4, [2.2]

F : Force, in kg, defined in Ch 6, Sec 1, [2.7.2]

λ_S : Coefficient defined in Tab 3

ϕ : Angle, in deg, defined in [3.2.3].

RCN 1 to July 2008 version (effective from 1 July 2009)

2.5.3 Ordinary stiffeners located on bilge hopper sloping plate or inner hull plate

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners located on bilge hopper sloping plate and inner hull plate are to be not less than the values obtained from the following formulae:

$$w = K_3 \frac{a_{hopper} F'}{8\lambda_S R_Y}$$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

$$A_{sh} = \frac{5 a_{hopper} F'}{\tau_a \sin\phi} 10^{-3}$$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

where:

K_3 : Coefficient defined in Tab 1. When n_2>10, K_3 is taken equal to $2\ell/3$.

θ_h : Angle, in deg, between inner bottom plate and bilge hopper sloping plate or inner hull plate

a_{hopper} : Acceleration, in m/s², defined in Ch 6, Sec 1, [2.7.4]

F' : Force, in kg, defined in Ch 6, Sec 1, [2.7.3]

λ_S : Coefficient defined in Tab 3

ϕ : Angle, in deg, defined in [3.2.3]

ℓ' : Distance, in m, between outermost load points per elementary plate panel in ship length

RCN 1 to July 2008 version (effective from 1 July 2009)

Table 1: Coefficient K_3

n_2	1	2	3	4	5	6	7	8	9	10
K_3	ℓ	$\ell-\frac{\ell'^2}{\ell}$	$\ell-\frac{2\ell'^2}{3\ell}$	$\ell-\frac{5\ell'^2}{9\ell}$	$\ell-\frac{\ell'^2}{2\ell}$	$\ell-\frac{7\ell'^2}{15\ell}$	$\ell-\frac{4\ell'^2}{9\ell}$	$\ell-\frac{3\ell'^2}{7\ell}$	$\ell-\frac{5\ell'^2}{12\ell}$	$\ell-\frac{11\ell'^2}{27\ell}$

2.5.4

(void) *RCN 1 to July 2008 version (effective from 1 July 2009)*

2.6 Deck ordinary stiffeners in way of launching appliances used for survival craft or rescue boat

2.6.1

The scantlings of deck ordinary stiffeners are to be determined by direct calculations.

2.6.2

The loads exerted by launching appliance are to correspond to the Safe Working Load of the launching appliance.

2.6.3

The combined stress, in N/mm², is not to exceed the smaller of:

$$\frac{100}{235}R_{eH} \text{ and } \frac{54}{235}R_m$$

where R_m is the ultimate tensile strength of the stiffener material, in N/mm².

3. Yielding check

3.1 Load model

3.1.1 General

The still water and wave lateral loads induced by the sea and the various types of cargoes and ballast in intact conditions are to be considered, depending on the location of the ordinary stiffener under consideration and the type of the compartments adjacent to it.

Ordinary stiffeners located on plating which constitutes the boundary of compartments not intended to carry liquids (excluding those on bottom and side shell plating) are to be subjected to the lateral pressure in flooded conditions.

The wave lateral loads and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in Ch 4, Sec 4.

3.1.2 Lateral pressure in intact conditions

The lateral pressure in intact conditions is constituted by still water pressure and wave pressure.

Still water pressure p_S includes:

- the hydrostatic pressure, defined in Ch 4, Sec 5, [1]
- the still water internal pressure, defined in Ch 4, Sec 6 for the various types of cargoes and for ballast.

Wave pressure p_W includes for each load case H1, H2, F1, F2, R1, R2, P1 and P2:

- the hydrodynamic pressure, defined in Ch 4, Sec 5, [1]
- the inertial pressure, defined in Ch 4, Sec 6 for the various types of cargoes and for ballast.

3.1.3 Lateral pressure in flooded conditions

The lateral pressure in flooded conditions p_F is defined in Ch 4, Sec 6, [3.2.1].

3.1.4 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating
- $p_T = p_{ST}$ otherwise,

where:

p_{ST} : Testing pressure defined in Ch 4, Sec 6, [4]

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in Ch 4, Sec 5, [1] for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat
- if the testing is not carried out afloat: $p_S = 0$

3.1.5 Normal stresses

The normal stress to be considered for the strength check of ordinary stiffeners contributing to the hull girder longitudinal strength is the maximum value of σ_X between sagging and hogging conditions, when applicable, obtained , in N/mm^2, from the following formula:

$$\sigma_X = \left[C_{SW} \left| \frac{M_{SW}}{I_Y} \right| (z - N) + C_{WV} \left| \frac{M_{WV}}{I_Y} \right| (z - N) - C_{WH} \left| \frac{M_{WH}}{I_Z} \right| y \right] 10^{-3}$$

where:

M_{SW} : Permissible still water bending moments, in kN.m, in hogging or sagging as the case may be

M_{WV} : Vertical wave bending moment, in kN.m, in hogging or sagging as the case may be, as defined in Ch 4, Sec 3

M_{WH} : Horizontal wave bending moment, in kN.m, as defined in Ch 4, Sec 3

C_{SW} : Combination factor for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and defined in Tab 2

C_{WV}, C_{WH} : Combination factors defined in Ch 4, Sec 4, [2.2] for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and given in Tab 2.

Table 2: Combination factors C_{SW}, C_{WV} and C_{WH}

LC	Hogging			Sagging		
	C_{SW}	C_{WV}	C_{WH}	C_{SW}	C_{WV}	C_{WH}
H1	Not Applicable			-1	-1	0
H2	1	1	0	Not Applicable		
F1	Not Applicable			-1	-1	0
F2	1	1	0	Not Applicable		
R1	1	0	$1.2-\frac{T_{LC}}{T_S}$	-1	0	$1.2-\frac{T_{LC}}{T_S}$
R2	1	0	$\frac{T_{LC}}{T_S}-1.2$	-1	0	$\frac{T_{LC}}{T_S}-1.2$
P1	1	$0.4-\frac{T_{LC}}{T_S}$	0	-1	$0.4-\frac{T_{LC}}{T_S}$	0
P2	1	$\frac{T_{LC}}{T_S}-0.4$	0	-1	$\frac{T_{LC}}{T_S}-0.4$	0

3.2 Strength criteria for single span ordinary stiffeners other than side frames of single side bulk carriers

3.2.1 Boundary conditions

The requirements of this sub-article apply to ordinary stiffeners considered as clamped at both ends.

For other boundary conditions, the yielding check is to be considered on a case by case basis.

3.2.2 Groups of equal ordinary stiffeners

Where a group of equal ordinary stiffeners is fitted, it is acceptable that the minimum net section modulus in [3.2.3] to [3.2.7] is calculated as the average of the values required for all the stiffeners of the same group, but this average is to be taken not less than 90% of the maximum required value.

The same applies for the minimum net shear sectional area.

3.2.3 Net section modulus and net shear sectional area of single span ordinary stiffeners under intact conditions

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners subjected to lateral pressure are to be not less than the values obtained from the following formulae:

$$w=\frac{(p_S+p_W)s\ell^2}{m\lambda_S R_Y}10^3$$

$$A_{sh}=\frac{5(p_S+p_W)s\ell}{\tau_a \sin\phi}$$

where:

λ_S : Coefficient defined in Tab 3.

ϕ : Angle, in deg, between the stiffener web and the shell plate, measured at the middle of the stiffener span; the correction is to be applied when ϕ is less than 75 deg.

Table 3: Coefficient λ_S

Ordinary stiffener	Coefficient λ_S
Longitudinal stiffener ccontributing to the hull girder longitudinal strength	$1.2\left(1.0-0.85\left\|\frac{\sigma_X}{R_Y}\right\|\right)$, without being taken greater than 0.9
Other stiffeners	0.9

3.2.4 Net section modulus of corrugated bulkhead of ballast hold for ships having a length *L* less than 150m

The net section modulus w, in cm³, of corrugated bulkhead of ballast hold for ships having a length L less than 150m subjected to lateral pressure are to be not less than the values obtained from the following formula:

$$w = K\frac{(p_S + p_W)s_C\ell^2}{m\lambda_S R_Y}10^3$$

where:

K : Coefficient given in Tab 4 and 5, according to the type of end connection. When $d_H < 2.5d_0$, both section modulus per half pitch of corrugated bulkhead and section modulus of lower stool at inner bottom are to be calculated.

s_C : Half pitch length, in m, of the corrugation, defined in Ch 3, Sec 6, Fig 28

ℓ : Length, in m, between the supports, as indicated in Fig 6

λ_S : Coefficient defined in Tab 3.

The effective width of the corrugation flange in compression is to be considered according to Ch 3, Sec 6, [10.4.10] when the net section modulus of corrugated bulkhead is calculated.

RCN 1 to July 2008 version (effective from 1 July 2009)

Table 4: Values of *K*, in case $d_H \geq 2.5d_0$

Upper end support		
Supported by girders	Welded directly to deck	Welded to stool efficiently supported by ship structure
1.25	1.00	0.83

RCN 1 to July 2008 version (effective from 1 July 2009)

Table 5: Values of *K*, in case $d_H < 2.5d_0$

Section modulus of	Upper end support		
	Supported by girders	Connected to deck	Connected to stool
Corrugated bulkhead	0.83	0.71	0.65
Stool at bottom	0.83	1.25	1.13

RCN 1 to July 2008 version (effective from 1 July 2009)

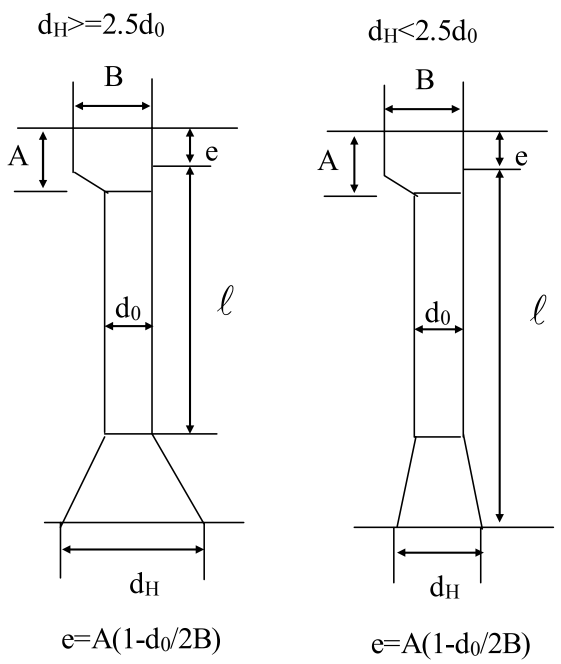

Figure 6: Measurement of ℓ

3.2.5 Net section modulus and net shear sectional area of single span ordinary stiffeners under flooded conditions excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners excluding corrugations of transverse vertically corrugated bulkhead separating cargo holds subjected to flooding are to be not less than the values obtained from the following formulae:

$$w = \frac{p_F s \ell^2}{16 \alpha \lambda_S R_Y} 10^3$$

$$A_{sh} = \frac{5 p_F s \ell}{\alpha \tau_a \sin\phi}$$

where:

λ_s, ϕ : Coefficient and angle defined in [3.2.3], λ_s being determined by considering σ_X in flooded condition.

α : Coefficient taken equal to:

α = 0.95 for the ordinary stiffeners of collision bulkhead,

α = 1.15 for the ordinary stiffeners of other watertight boundaries of compartments.

without taken $\alpha\lambda_S$ greater than 1.0

3.2.6

(void) *RCN 1 to July 2008 version (effective from 1 July2009)*

3.2.7 Net section modulus and net shear sectional area of single span ordinary stiffeners under testing conditions

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of single span ordinary stiffeners subjected to testing are to be not less than the values obtained from the following formulae:

$$w = \frac{p_T s \ell^2}{1.05 m R_Y} 10^3$$

$$A_{sh} = \frac{5 p_T s \ell}{1.05 \tau_a \sin\phi}$$

where:

ϕ : Angle, in deg, defined in [3.2.3].

3.3 Strength criteria for side frames of single side bulk carriers

3.3.1 Net section modulus and net shear sectional area of side frames

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side frames subjected to lateral pressure are to be not less, in the mid-span area, than the values obtained from the following formulae:

$$w = 1.125 \alpha_m \frac{(p_S + p_W) s \ell^2}{m \lambda_S R_Y} 10^3$$

$$A_{sh} = 1.1 \alpha_S \frac{5 (p_S + p_W) s \ell}{\tau_a \sin\phi} \left(\frac{\ell - 2\ell_B}{\ell} \right)$$

where:

α_m : Coefficient taken equal to:

$\alpha_m = 0.42$ for **BC-A** ships

$\alpha_m = 0.36$ for other ships

λ_S : Coefficient taken equal to 0.9

ℓ : Side frame span, in m, defined in Ch 3, Sec 6, Fig 19, to be taken not less than 0.25D

α_S : Coefficient taken equal to:

$\alpha_S = 1.1$ for side frames of holds specified to be empty in **BC-A** ships

$\alpha_S = 1.0$ for other side frames

ℓ_B : Lower bracket length, in m, defined in Fig 7

p_s, p_w : Still water and wave pressures, in kN/m², in intact conditions calculated as defined in [1.3] and [1.4.2]. *RCN 1 to July 2008 version (effective from 1 July 2009)*

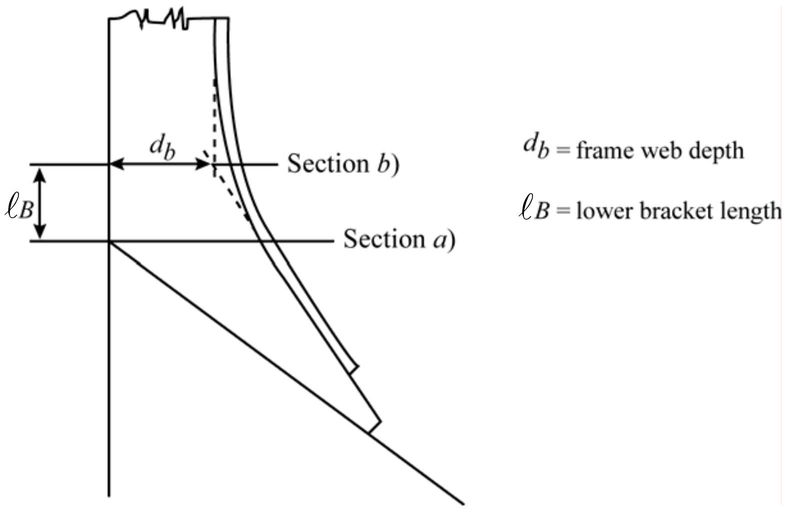

Figure 7: Side frame lower bracket length

In addition, for side frames of holds intended to carry ballast water in heavy ballast condition, the net section modulus w, in cm^3, and the net shear sectional area A_{sh} , in cm^2, all along the span are to be in accordance with [3.2.3], ℓ being the span of the side frame as defined in Ch.3, Sec.6, [4.2], with consideration to brackets at ends. *RCN 1 to July 2008 version (effective from 1 July 2009)*

3.3.2 Supplementary strength requirements

In addition to [3.3.1], the net moment of inertia, in cm^4, of the 3 side frames located immediately abaft the collision bulkhead is to be not less than the value obtained from the following formula:

$$I = 0.18\frac{(p_S + p_W)\ell^4}{n}$$

where:

ℓ : Side frame span, in m

n : Number of frames from the bulkhead to the frame in question, taken equal to 1, 2 or 3

As an alternative, supporting structures, such as horizontal stringers, are to be fitted between the collision bulkhead and a side frame which is in line with transverse webs fitted in both the topside tank and hopper tank, maintaining the continuity of forepeak stringers within the foremost hold.

3.3.3 Lower bracket of side frame

At the level of lower bracket as shown in Ch 3, Sec 6, Fig 19, the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is to be not less than twice the net section modulus w required for the frame mid-span area obtained from [3.3.1].

In addition, for holds intended to carry ballast water in heavy ballast condition, the net section modulus w, in cm^3, at the level of lower bracket is to be not less than twice the greater of the net section moduli obtained from [3.3.1] and [3.2.3]. *RCN 1 to July 2008 version (effective from 1 July2009)*

The net thickness t_{LB} of the frame lower bracket, in mm, is to be not less than the net thickness of the side frame web plus 1.5 mm.

Moreover, the net thickness t_{LB} of the frame lower bracket is to comply with the following formula:

- for symmetrically flanged frames: $\dfrac{h_{LB}}{t_{LB}} \le 87\sqrt{k}$
- for asymmetrically flanged frames : $\dfrac{h_{LB}}{t_{LB}} \le 73\sqrt{k}$

The web depth h_{LB} of lower bracket may be measured from the intersection between the sloped bulkhead of the hopper tank and the side shell plate, perpendicularly to the face plate of the lower bracket (see Ch 3, Sec 6, Fig 22).

For the 3 side frames located immediately abaft the collision bulkhead, whose scantlings are increased according to [3.3.2], when t_{LB} is greater than $1.73t_w$, the thickness t_{LB} may be taken as the value t'_{LB} obtained from the following formula:

$$t'_{LB} = \left(t_{LB}^2 t_w\right)^{1/3}$$

where t_w is the net thickness of the side frame web, in mm, corresponding to A_{sh} determined in accordance to [3.3.1].

The flange outstand is not to exceed $12k^{0.5}$ times the net flange thickness.

3.3.4 Upper bracket of side frame

At the level of upper bracket as shown in Ch 3, Sec 6, Fig 19, the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is to be not less than twice the net section modulus w required for the frame mid-span area obtained from [3.3.1].

In addition, for holds intended to carry ballast water in heavy ballast condition, the net section modulus w, in cm^3, at the level of upper bracket is not to be less than twice the greater of the net sections moduli obtained from [3.2.3] and [3.3.1].

RCN 1 to July 2008 version (effective from 1 July 2009)

The net thickness t_{UB} of the frame upper bracket, in mm, is to be not less than the net thickness of the side frame web.

3.4 Upper and lower connections of side frames of single side bulk carriers

3.4.1

The section moduli of the:

- side shell and hopper tank longitudinals that support the lower connecting brackets,
- side shell and topside tank longitudinals that support the upper connecting brackets

are to be such that the following relationship is separately satisfied for each lower and upper connecting bracket (see also Ch 3, Sec 6, Fig 22):

$$\sum_n w_i d_i \ge \alpha_T \frac{(p_S + p_W)\ell^2 \ell_1^2}{16 R_Y}$$

where:

n : Number of the longitudinal stiffeners of side shell and hopper / topside tank that support the lower / upper end connecting bracket of the side frame, as applicable

w_i : Net section modulus, in cm^3, of the i-th longitudinal stiffener of the side shell or hopper / topside tank that support the lower / upper end connecting bracket of the side frame, as applicable

d_i : Distance, in m, of the above i-th longitudinal stiffener from the intersection point of the side shell and hopper /topside tank

ℓ_1 : Spacing, in m, of transverse supporting webs in hopper / topside tank, as applicable

R_y : Lowest value of equivalent yield stress, in N/mm^2, among the materials of the longitudinal stiffeners of side shell and hopper / topside tanks that support the lower / upper end connecting bracket of the side frame

α_T : Coefficient taken equal to:

α_T = 150 for the longitudinal stiffeners supporting the lower connecting brackets

α_T = 75 for the longitudinal stiffeners supporting the upper connecting brackets

ℓ : Side frame span, in m, as defined in [3.3.1]

p_s, p_w : Still water and wave pressures as those for the side frame.

3.4.2

The net connection area, A_i, in cm^2, of the bracket to the i-th longitudinal stiffener supporting the bracket is to be obtained from the following formula:

$$A_i = 0.4 \frac{w_i s}{\ell_1^2} \frac{k_{bkt}}{k_{lg,i}}$$

where:

w_i : Net section modulus, in cm^3, of the i-th longitudinal stiffener of the side or sloped bulkheads that support the lower or the upper end connecting bracket of the side frame, as applicable

ℓ_1 : As defined in [3.4.1]

k_{bkt} : Material factor for the bracket

$k_{lg,i}$: Material factor for the i-th longitudinal stiffener.

s : Frame spacing, in m

3.5 Strength criteria for multi-span ordinary stiffeners

3.5.1 Checking criteria

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener, calculated according to [3.5.2], are to comply with the formulae in Tab 6.

Table 6: Checking criteria for multi-span ordinary stiffeners

Condition	Intact	Flooded	Testing
Normal stress	$\sigma \le \lambda_S R_Y$	$\sigma \le \alpha \lambda_S R_Y$	$\sigma \le 1.05 R_Y$
Shear stress	$\tau \le \tau_a$	$\tau \le \alpha \tau_a$	$\tau \le 1.05 \tau_a$
Note 1: λ_s : Coefficient defined in [3.2.3] α : Coefficient defined in [3.2.5]			

3.5.2 Multi-span ordinary stiffeners

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to be determined by a direct calculation taking into account:

- the distribution of still water and wave pressure and forces, if any
- the number and position of intermediate supports (decks, girders, etc.)
- the condition of fixity at the ends of the stiffener and at intermediate supports
- the geometrical characteristics of the stiffener on the intermediate spans.

3.6 Scantlings of transverse vertically corrugated watertight bulkheads separating cargo holds for flooded conditions

3.6.1 Bending capacity and shear capacity of the corrugations of transverse vertically corrugated watertight bulkheads separating cargo holds

The bending capacity and the shear capacity of the corrugations of watertight bulkheads between separating cargo holds are to comply with the following formulae:

$$0.5W_{LE} + W_M \geq \frac{M}{0.95R_{eH}}10^3$$

$$\tau \leq \frac{R_{eH}}{2}$$

where:

M : Bending moment in a corrugation, to be obtained, in kNm, from the following formula:

$M = F\ell_C/8$

F : force F_F or resultant force F, in kN, to be calculated according to Ch 4, Sec 6, [3.3.6] and [3.3.7], respectively

ℓ_C : Span of the corrugations, in m, to be obtained according to [3.6.2]

W_{LE} : Net section modulus, in cm³, of one half pitch corrugation, to be calculated at the lower end of the corrugations according to [3.6.2], without being taken greater than the value obtained from the following formula:

$$W_{LE,M} = W_G + \left(\frac{Qh_G - 0.5h_G^2 s_C p_G}{R_{eH}}\right)10^3$$

W_G : Net section modulus, in cm³, of one half pitch corrugation, to be calculated in way of the upper end of shedder or gusset plates, as applicable, according to [3.6.2]

Q : Shear force at the lower end of a corrugation, to be obtained, in kN, from the following formula:

$Q = 0.8F$

h_G : Height, in m, of shedders or gusset plates, as applicable (see Fig 11 to Fig 15)

p_G : pressure p_F or resultant pressure p, in kN/m², to be calculated in way of the middle of the shedders or gusset plates, as applicable, according to Ch 4, Sec 6, [3.3.6] and [3.3.7], respectively

s_C : Spacing of the corrugations, in m, to be taken according to Ch3, Sec 6, Fig 28

W_M : Net section modulus in cm³ of one half pitch corrugation, to be calculated at the mid-span of corrugations according to [3.6.2] without being taken greater than $1.15W_{LE}$

τ : Shear stress in the corrugation, in N/mm², to be obtained from the following formula:

$$\tau = 10\frac{Q}{A_{sh}}$$

A_{sh} : Shear area, in cm², calculated according to the followings.

The shear area is to be reduced in order to account for possible non-perpendicular between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by (sin φ), φ being the angle between the web and the flange (see Ch 3, Sec 6, Fig 28).

The actual net section modulus of corrugations is to be calculated according to [3.6.2].

The net section modulus of the corrugations upper part of the bulkhead, as defined in Sec 1, Fig 5, is not to be less than 75% of that of the middle part complying with this requirement and Sec 1, [3.2.1], corrected for different minimum yield stresses.

RCN 1 to July 2008 version (effective from 1 July 2009)

RCN 1 to July 2010 version (effective from 1July 2012)

3.6.2 Net section modulus at the lower end of the corrugations

a) The net section modulus at the lower end of the corrugations (Fig 11 to Fig 15) is to be calculated with the compression flange having an effective flange width b_{ef} not larger than that indicated in Ch 3, Sec 6, [10.4.10].

b) Webs not supported by local brackets

Except in case e), if the corrugation webs are not supported by local brackets below the stool top plate (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30% effective.

c) Effective shedder plates

Provided that effective shedder plates, as defined in Ch 3, Sec 6, [10.4.11] are fitted (see Fig 11 and Fig 12), when calculating the section modulus of corrugations at the lower end (cross-sections 1 in Fig 11 and Fig 12), the net area of flange plates may be increased by the value obtained, in cm², from the following formula:

$I_{SH} = 2.5a\sqrt{t_f t_{SH}}$ without being taken greater than $2.5at_f$,

where:

a : Width, in m, of the corrugation flange (Ch 3, Sec 6, Fig 28)

t_{SH} : Net shedder plate thickness, in mm

t_f : Net flange thickness, in mm.

d) Effective gusset plates

Provided that effective gusset plates, as defined in Ch 3, Sec 6, [10.4.12], are fitted (see Fig 13 to Fig15), when calculating the net section modulus of corrugations at the lower end (cross-sections 1 in Fig 13 to Fig 15), the area of flange plates may be increased by the value obtained, in cm², from the following formula:

$$I_G = 7h_G t_f$$

where:

h_G : Height, in m, of gusset plates (see Fig 13 to Fig 15) to be taken not greater than $(10/7)S_{GU}$

S_{GU} : Width, in m, of gusset plates

t_f : Net flange thickness, in mm

e) Sloping stool top plate

If the corrugation webs are welded to a sloping stool top plate which has an angle not less than 45º with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. For angles less than 45º, the effectiveness of the web may be obtained by linear interpolation between 30% for 0º and 100% for 45º.

Where effective gusset plates are fitted, when calculating the net section modulus of corrugations the net area of flange plates may be increased as specified in d) above. No credit may be given to shedder plates only.

RCN 1 to July 2008 version (effective from 1 July 2009)

3.6.3 Stiffeners in lower stool and upper stool

The net section modulus of stiffeners in lower stool and upper stool is to be greater of the values obtained from the following formula or required by [3.2.5].

$$w = \frac{ps\ell^2}{16a\lambda_s R_Y}10^3$$

Where,

p : Pressure, in kN/m², as defined in Ch 4 Sec 6, [3.3.7]

a and λ_s : defined in [3.2.5]

RCN 1 to July 2008 version (effective from 1 July 2009)

4. Web stiffeners of primary supporting members

4.1 Net scantlings

4.1.1

Where primary supporting member web stiffeners are welded to ordinary stiffener face plates, their net sectional area at the web stiffener mid-height is to be not less than the value obtained, in cm^2, from the following formula:

$$A = 0.1k_1 ps\ell$$

where:

k_1 : Coefficient depending on the web connection with the ordinary stiffener, to be taken as:

- $k_1 = 0.30$ for connections without collar plate (see Ch 3, Sec 6, Fig 8)
- $k_1 = 0.225$ for connections with a collar plate (see Ch 3, Sec 6, Fig 9)
- $k_1 = 0.20$ for connections with one or two large collar plates (see Ch 3, Sec 6, Fig 10 and 11)

p : Pressure, in kN/m^2, acting on the ordinary stiffener.

4.1.2

The net section modulus of web stiffeners of non-watertight primary supporting members is to be not less than the value obtained, in cm^3, from the following formula:

$$w = 2.5 s^2 t S_S^2$$

where:

s : Length, in m, of web stiffeners

t : Web net thickness, in mm, of the primary supporting member

S_S : Spacing, in m, of web stiffeners.

4.1.3 Connection ends of web stiffeners

Where the web stiffeners of primary supporting members are welded to ordinary stiffener face plates, the stress at ends of web stiffeners of primary supporting members in water ballast tanks, in N/mm^2, is to comply with the following formula when no bracket is fitted :

$$\sigma \le 175$$

where:

$$\sigma = K_{con} K_{longi} K_{stiff} \frac{\Delta\sigma}{\cos\theta}$$

RCN 1 to July 2010 version (effective from 1July 2012)

K_{con} : Coefficient considering stress concentration, taken equal to:

$K_{con} = 3.5$ for stiffeners in the double bottom or double side space (see Fig 8)

$K_{con} = 4.0$ for other cases (e.g. hopper tank, top side tank, etc.) (see Fig 8)

K_{longi} : Coefficient considering shape of cross section of the longitudinal, taken equal to:

$K_{longi} = 1.0$ for symmetrical profile of stiffener (e.g. T-section, flat bar)

$K_{longi} = 1.3$ for asymmetrical profile of stiffener (e.g. angle section, bulb profile)

K_{stiff} : Coefficient considering the shape of the end of the stiffener, taken equal to:

$K_{stiff} = 1.0$ for standard shape of the end of the stiffener (see Fig 9)

$K_{stiff} = 0.8$ for the improved shape of the end of the stiffener (see Fig 9)

θ : As given in Fig 10

$\Delta\sigma$: Stress range, in N/mm^2, transferred from longitudinals into the end of web stiffener, as obtained from the following formula:

$$\Delta\sigma = \frac{2W}{0.322h'\left[\left(A_{w1}/\ell_1\right)+\left(A_{w2}/\ell_2\right)\right]+A_{s0}}$$

W : Dynamic load, in N, as obtained from the following formula:

$$W = 1000\left(\ell - 0.5s\right)sp$$

p : Maximum inertial pressure due to liquid in the considered compartment where the web stiffener is located according to Ch 4 Sec 6 [2.2.1], in kN/m^2, of the probability level of 10^{-4}, calculated at mid-span of the ordinary stiffener

ℓ : Span of the longitudinal, in m

s : Spacing of the longitudinal, in m

A_{s0}, A_{w1}, A_{w2} : Geometric parameters as given in Fig 10, in mm^2

ℓ_1, ℓ_2 : Geometric parameters as given in Fig 10, in mm

h' : As obtained from following formula, in mm:

$$h' = h_s + h_0'$$

h_s : As given in Fig 10, in mm

h_0' : As obtained from the following formula, in mm

$$h_0' = 0.636b' \quad \text{for } b' \le 150$$

$$h_0' = 0.216b' + 63 \quad \text{for } 150 < b'$$

b' : Smallest breadth at the end of the web stiffener, in mm, as shown in Fig 9

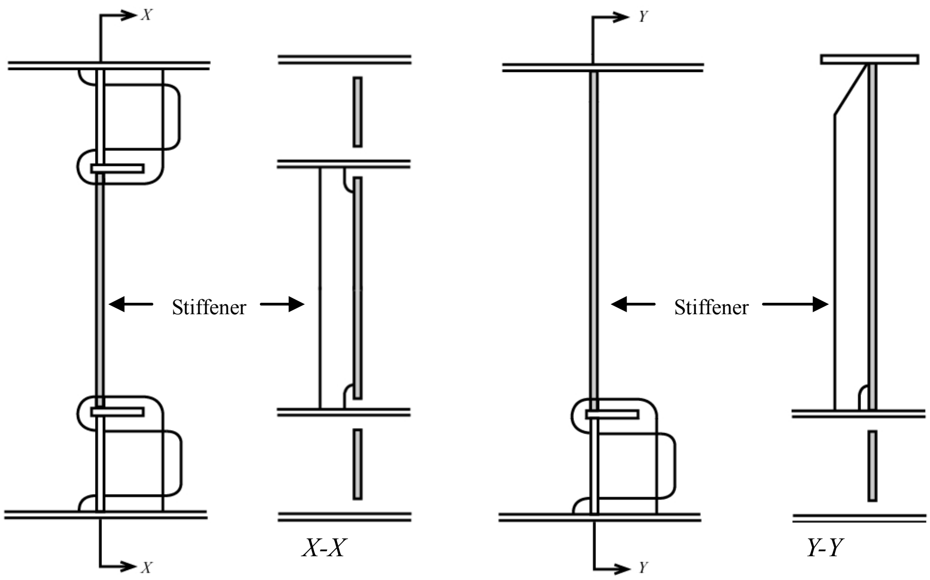

Figure 8: Web stiffeners fitted on primary supporting members

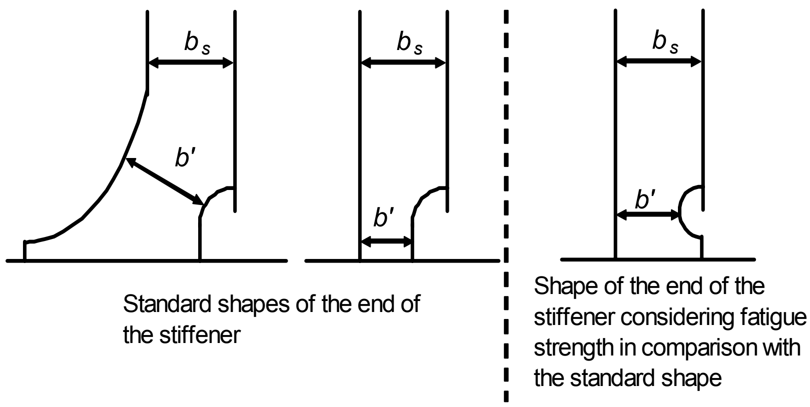

Figure 9: Shape of the end of the web stiffener

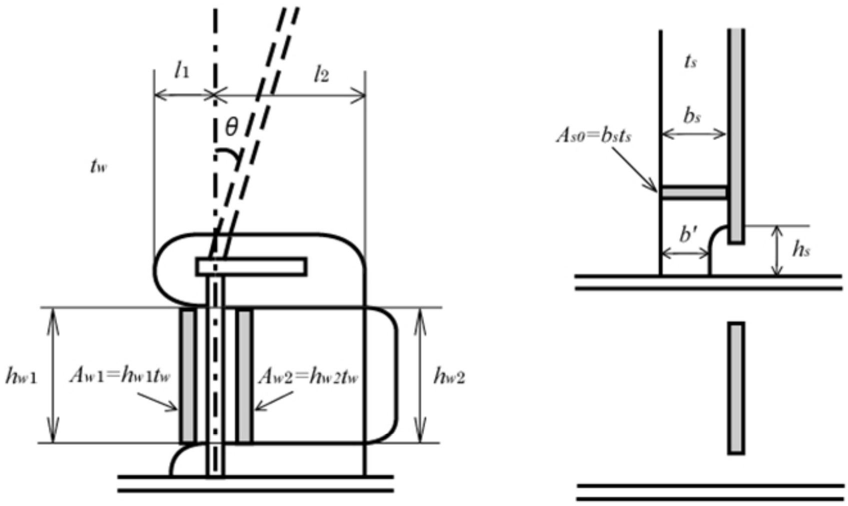


Note:

t_s: net thickness of the web stiffener, in *mm*.

t_w: net thickness of the collar plate, in *mm*.

Figure 10: Definitions of geometric parameters

Section 3 – BUCKLING & ULTIMATE STRENGTH OF ORDINARY STIFFENERS AND STIFFENED PANELS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

In this section, compressive and shear stresses are to be taken positive, tension stresses are to be taken negative.

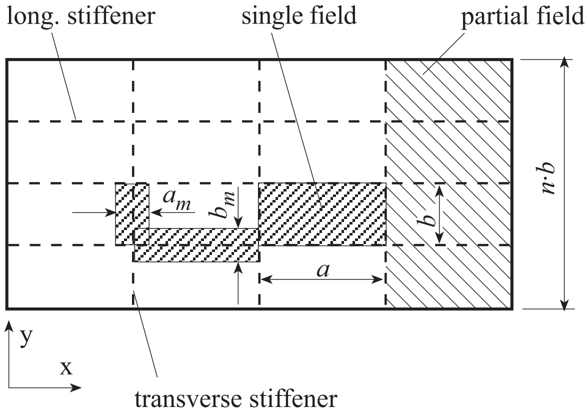
a : Length in mm of the longer side of the partial plate field in general or length in mm of the side of the partial plate field according Table 2, BLC 3 - 10

b : Length in mm of the shorter side of the partial plate field in general or length in mm of the side of the partial plate field according Table 2, BLC 3 - 10

α : Aspect ratio of elementary plate panel, taken equal to:

$$\alpha = \frac{a}{b}$$

n : Number of elementary plate panel breadths within the partial or total plate panel



longitudinal : stiffener in the direction of the length a
transverse : stiffener in the direction of the breath b

Figure 1: General arrangement of panel

t : Net plate thickness, in mm

σ_n : Normal stress resulting from hull girder bending, in N/mm^2

τ_{SF} : Shear stress induced by the shear forces as defined in [2.1.3], in N/mm^2

σ_x : Membrane stress in x-direction, in N/mm^2

σ_y : Membrane stress in y-direction, in N/mm^2

τ : Shear stress in the x-y plane, in N/mm^2

λ : Reference degree of slenderness, taken equal to:

$$\lambda = \sqrt{\frac{R_{eH}}{K\sigma_e}}$$

K : Buckling factor according to Tab 2 and Tab 3

Reference stress, to be the following for LC 1 and 2:

σ_e : Reference stress, taken equal to:

$$\sigma_e = 0.9E\left(\frac{t}{b'}\right)^2$$

b' : shorter side of elementary plate panel

Reference stress, to be the following for LC 3 through 10:

σ_e : Reference stress, taken equal to:

$$\sigma_e = 0.9E\left(\frac{t}{b}\right)^2$$

ψ : Edge stress ratio taken equal to:

$\psi = \sigma_2 / \sigma_1$

where:

σ_1 : maximum compressive stress

σ_2 : minimum compressive stress or tensile stress

S : Safety factor, taken equal to:

$S = 1.0$ except for the case mentioned below

$S = 1.1$ for structures which are exclusively exposed to local loads (e.g. hatch covers, foundations)

$S = 1.15$ for the ultimate strength in lateral buckling mode of longitudinal and transverse ordinary stiffeners of the hatchway coamings, sloping plating of the topside tanks and hopper tanks, inner bottom, inner side if any, side shell of single side skin construction and top and bottom stools of transverse bulkheads, assessed according to [4.2].

For constructions of aluminium alloys the safety factors are to be increased in each case by 0.1

F_1 : Correction factor for boundary condition of stiffeners on the longer side of elementary plate panels according to Tab 1. If the clamping is unequal on the longitudinal sides of the panel, the minimum value of the appropriate F_1-parameter has to be used.

Table 1: Correction factor F_1

	F_1 [(2)]	Edge stiffener
Stiffeners sniped at both ends	1.00	
Guidance values where both ends are effectively connected to adjacent structures [(1)]	1.05	Flat bar
	1.10	Bulb section
	1.21	Angle and tee-sections
	1.30	Girders of high rigidity (e.g. bottom transversers)

(1) Exact values may be determined by direct calculations.
(2) An average value of F_1 is to be used for plate panels having different edge stiffeners.

Corrigenda 1 to July 2012 version (effective from 1July 2012)

1. General

1.1

1.1.1

The requirements of this Section apply for the buckling check of structural members subjected to compressive stresses, shear stresses and lateral pressure.

1.1.2

The buckling checks have to be performed for the following elements:

a) according to requirements of [2], [3] and[4] and for all load cases as defined in Ch 4, Sec 4 in intact condition:
   - elementary plate panels and ordinary stiffeners in a hull transverse section analysis,
   - elementary plate panels modeled in FEM as requested in Ch 7.

b) according to requirements of [6] and only in flooded condition:
   - transverse vertically corrugated watertight bulkheads.

1.1.3

The boundary condition for elementary plate panels are to be considered as simply supported. If the boundary condition differs significantly from simple support, more appropriate boundary condition can be applied according to cases 3, 4 and 7 to 10 of Tab 2.

2. Application

2.1 Load model for hull transverse section analysis

2.1.1 General

The structural members at a considered hull transverse section are to be checked for buckling criteria under the combination of:

- the normal stress σ_n resulting from hull girder bending, as defined in [2.1.2]
- the shear stress τ_{SF} as defined in [2.1.3]
- the lateral pressure in intact condition applied on the members as the case may be.

The lateral pressures and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in Ch 4, Sec 4.

2.1.2 Normal stress σ_n

The normal stress σ_n to be considered for each of the mutually exclusive load cases as referred in [2.1.1] is the maximum compressive stress on the considered structural member according to the formulas given in Ch 6, Sec 1, [3.1.5] and Ch 6, Sec 2, [3.1.5], respectively for elementary plate panels and ordinary stiffeners.

For transverse ordinary stiffeners, the normal stress σ_n for each of the mutually exclusive load cases is the maximum compressive stress calculated at each end.

2.1.3 Shear stress

The shear stress τ_{SF} to be considered for each of the mutually exclusive load cases as referred in [2.1.1] is the shear stress induced by the shear forces, in kN, equal to:

$$Q = Q_{SW} + C_{QW} \, Q_{WV}$$

where:

Q_{SW} : Design still water shear force in intact condition, in kN, at the hull transverse section considered, defined in Ch 4, Sec 3, [2.3]

Q_{WV} : Vertical wave shear force in intact condition, in kN, at the hull transverse section considered, defined in Ch 4, Sec 3, [3.2]

C_{QW} : Load combination factor as defined in Ch 4, Sec 4, Tab 3

If the design still water shear force is not available at preliminary design stage, the following default value, in kN, may be used:

$$Q_{SW0} = 30 \, CLB(C_B + 0.7) 10^{-2}$$

2.1.4 Lateral pressure

The lateral pressure to be considered for the buckling check is defined in Ch 6, Sec 1, [3.1] for curved plate panel and in Ch 6, Sec 2, [3.1] for ordinary stiffeners.

The load calculation point for the curved plate panel is located at mid distance of the curved plate panel extremities along the curve.

The load calculation point of ordinary stiffeners is defined in Ch 6, Sec 2, [1.4]

2.2 Application

2.2.1

Application of the buckling and ultimate strength criterion is described in App 1.

Table 2: Buckling and reduction factors for plane elementary plate panels

	$\frac{b}{R} > 0.5\sqrt{\frac{R}{t}}$	$K = 0.267\frac{b^2}{R\,t}\left[3 - \frac{b}{R}\sqrt{\frac{t}{R}}\right]$ $\ge 0.4\frac{b^2}{R\,t}$	
3 	$\frac{b}{R} \le \sqrt{\frac{R}{t}}$	$K = \frac{0.6 \cdot b}{\sqrt{R\,t}} + \frac{\sqrt{R\,t}}{b} - 0.3\frac{R\,t}{b^2}$	as in load case 1a
	$\frac{b}{R} > \sqrt{\frac{R}{t}}$	$K = 0.3\frac{b^2}{R^2} + 0.291\left(\frac{R^2}{b\,t}\right)^2$	
4 	$\frac{b}{R} \le 8.7\sqrt{\frac{R}{t}}$	$K = K_\tau\sqrt{3}$ $K_\tau = \left[28.3 + \frac{0.67\,b^3}{R^{1.5}\,t^{1.5}}\right]^{0.5}$	$\kappa_\tau = 1$ for $\lambda \le 0.4$ $\kappa_\tau = 1.274 - 0.686 \cdot \lambda$ for $0.4 < \lambda \le 1.2$ $\kappa_\tau = \frac{0.65}{\lambda^2}$ for $\lambda > 1.2$
	$\frac{b}{R} > 8.7\sqrt{\frac{R}{t}}$	$K_\tau = 0.28\frac{b^2}{R\sqrt{R\,t}}$	

Explanations for boundary conditions
- - - - - plate edge free
——— plate edge simply supported
▬▬▬ plate edge clamped

[1] For curved plate fields with a very large radius the κ-value need not to be taken less than for the expanded plane field

[2] For curved single fields, e.g. bilge strake, which are located within plane partial or total fields, the reduction factor κ may taken as follow:
Load case 1b: $\kappa_x = \frac{0.8}{\lambda^2} \le 1{,}0$ Load case 2: $\kappa_y = \frac{0.65}{\lambda^2} \le 1.0$

3. Buckling criteria of elementary plate panels

3.1 Plates

3.1.1 General

The net thickness of the elementary plate panel is to comply with the following:

$t \geq b/100$

The verification of an elementary plate panel in a transverse section analysis is to be carried out according to [3.1.2]. It is to be performed for the two different following combinations of stresses:

- stress combination 1: 100% of the normal stress as defined in [2.1.2] and 70% of the shear stress as defined in [2.1.3]
- stress combination 2: 70% of the normal stress as defined in [2.1.2] and 100% of the shear stress as defined in [2.1.3].

The verification of elementary plate panel in a FEM analysis is to be carried out according to [3.2].

3.1.2 Verification of elementary plate panel in a transverse section analysis

Each elementary plate panel is to comply with the following criteria, taking into account the loads defined in [2.1]:

- longitudinally framed plating

$$\left(\frac{|\sigma_x| S}{\kappa_x R_{eH}}\right)^{e1} + \left(\frac{|\tau| S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$ for stress combination 1 with $\sigma_x = \sigma_n$ and $\tau = 0.7\tau_{SF}$

$$\left(\frac{|\sigma_x| S}{\kappa_x R_{eH}}\right)^{e1} + \left(\frac{|\tau| S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$ for stress combination 2 with $\sigma_x = 0.7\sigma_n$ and $\tau = \tau_{SF}$

- transversely framed plating

$$\left(\frac{|\sigma_y| S}{\kappa_y R_{eH}}\right)^{e2} + \left(\frac{|\tau| S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$ for stress combination 1 with $\sigma_y = \sigma_n$ and $\tau = 0.7\tau_{SF}$

$$\left(\frac{|\sigma_y| S}{\kappa_y R_{eH}}\right)^{e2} + \left(\frac{|\tau| S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$ for stress combination 2 with $\sigma_y = 0.7\sigma_n$ and $\tau = \tau_{SF}$

Each term of the above conditions must be less than 1.0.

The reduction factors κ_x and κ_y are given in Tab 2 and/or Tab 3.

The coefficients $e1$, $e2$ and $e3$ are defined in Tab 4.

For the determination of $e3$, κ_y is to be taken equal to 1 in case of longitudinally framed plating and κ_x is to be taken equal to 1 in case of transversely framed plating.

3.2 Verification of elementary plate panel within FEM analysis

3.2.1 General

The buckling check of the elementary plate panel is to be performed under the loads defined in [3.2.2], according to the requirements of [3].

The determination of the buckling and reduction factors is made for each relevant case of Tab 2 according to the stresses calculated in [3.2.2] loading the considered elementary plate panel.

3.2.2 Stresses

For the buckling check, the buckling stresses are to be determined according to Tab 2 and Tab 3 including their stress ratio Ψ for the loading conditions required in Ch 4, Sec 7 and according to the requirements of Ch 7.

3.2.3 Poisson effect

Stresses derived with superimposed or direct method have to be reduced for buckling assessment because of the Poisson effect, which is taken into consideration in both analysis methods. The correction has to be carried out after summation of stresses due to local and global loads.

Both stresses σ_x^* and σ_y^* are to be compressive stresses, in order to apply the stress reduction according to the following formulae:

$$\sigma_x = (\sigma_x^* - 0.3\sigma_y^*)/0.91$$

$$\sigma_y = (\sigma_y^* - 0.3\sigma_x^*)/0.91$$

where:

σ_x^*, σ_y^* : Stresses containing the Poisson effect

Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

3.2.4 Checking Criteria

Each elementary plate panel is to comply with the following criteria, taking into account the loads defined in [2.1] :

$$\left(\frac{|\sigma_x|S}{\kappa_x R_{eH}}\right)^{e1} + \left(\frac{|\sigma_y|S}{\kappa_y R_{eH}}\right)^{e2} - B\left(\frac{\sigma_x \sigma_y S^2}{R_{eH}^2}\right) + \left(\frac{|\tau|S\sqrt{3}}{\kappa_\tau R_{eH}}\right)^{e3} \leq 1.0$$

In addition, each compressive stress σ_x and σ_y, and the shear stress τ are to comply with the following formulae:

$$\left(\frac{\sigma_x\, S}{\kappa_x\, R_{eH}}\right)^{e1} \leq 1.0$$

$$\left(\frac{\sigma_y\, S}{\kappa_y\, R_{eH}}\right)^{e2} \leq 1.0$$

$$\left(\frac{|\tau|\, S\sqrt{3}}{\kappa_\tau\, R_{eH}}\right)^{e3} \leq 1{,}0$$

The reduction factors κ_x , κ_y and κ_τ are given in Tab 2 and/or Tab 3.

- where $\sigma_x \le 0$ (tensile stress), $\kappa_x = 1.0$.
- where $\sigma_y \le 0$ (tensile stress), $\kappa_Y = 1.0$.

The coefficients $e1$, $e2$ and $e3$ as well as the factor B are defined in Tab 4.

Table 4: Coefficients *e*1, *e*2, *e*3 and factor *B*

Exponents *e*1 – *e*3 and factor *B*	Plate panel plane	Plate panel curved
$e1$	$1+\kappa_x^4$	1.25
$e2$	$1+\kappa_y^4$	1.25
$e3$	$1+\kappa_x\kappa_y\kappa_\tau^2$	2.0
B σ_x and σ_y positive (compressive stress)	$(\kappa_x\kappa_y)^5$	0
B σ_x or σ_y negative (tensile stress)	1	-

3.3 Webs and flanges

3.3.1

For non-stiffened webs and flanges of sections and girders proof of sufficient buckling strength as for elementary plate panels is to be provided according to [3.1].

4. Buckling criteria of partial and total panels

4.1 Longitudinal and transverse stiffeners

4.1.1

In a hull transverse section analysis, the longitudinal and transverse ordinary stiffeners of partial and total plate panels are to comply with the requirements of [4.2] and [4.3].

4.2 Ultimate strength in lateral buckling mode

4.2.1 Checking criteria

The longitudinal and transverse ordinary stiffeners are to comply with the following criteria:

$$\frac{\sigma_a + \sigma_b}{R_{eH}} S \le 1$$

σ_a : Uniformly distributed compressive stress, in N/mm^2 in the direction of the stiffener axis.

$\sigma_a = \sigma_n$ for longitudinal stiffeners

$\sigma_a = 0$ for transverse stiffeners

σ_b : Bending stress, in N/mm^2, in the stiffener.

σ_b calculated as in [4.2.2] with $\sigma_x = \sigma_n$ and $\tau = \tau_{SF}$

4.2.2 Evaluation of the bending stress σ_b

The bending stress σ_b, in N/mm^2, in the stiffeners is equal to:

$$\sigma_b = \frac{M_0 + M_1}{W_{st}\, 10^3}$$

with:

M_0 : Bending moment, in N.mm, due to the deformation w of stiffener, taken equal to:

$$M_0 = F_{Ki} \frac{p_z w}{c_f - p_z}$$

with $(c_f - p_z) > 0$

M_1 : Bending moment, in N.mm, due to the lateral load p, taken equal to:

$$M_1 = \frac{pba^2}{24 \cdot 10^3}$$ for longitudinal stiffeners

$$M_1 = \frac{pa(n \cdot b)^2}{8 c_S\, 10^3}$$ for transverse stiffeners, with n equal to 1 for ordinary transverse stiffeners.

W_{st} : Net section modulus of stiffener (longitudinal or transverse), in cm^3, including effective width of plating according to [5], taken equal to:

- if a lateral pressure is applied on the stiffener:

  W_{st} is the net section modulus calculated at flange if the lateral pressure is applied on the same side as the stiffener.

  W_{st} is the net section modulus calculated at attached plate if the lateral pressure is applied on the side opposite to the stiffener.

  Note: For stiffeners sniped at both ends, W_{st} is the net section modulus calculated at attached plate. However, if M_1 is larger than M_0 and the lateral pressure is applied on the same side as the stiffener, W_{st} is the net section modulus calculated at flange.

- if no lateral pressure is applied on the stiffener:

  W_{st} is the minimum net section modulus among those calculated at flange and attached plate

  Note: For stiffeners sniped at both ends, W_{st} is the net section modulus calculated at attached plate.

RCN 1 to July 2010 version (effective from 1July 2012)

c_S : Factor accounting for the boundary conditions of the transverse stiffener

$c_S = 1.0$ for simply supported stiffeners

$c_S = 2.0$ for partially constraint stiffeners

p : Lateral load in kN/m^2, as defined in Ch 4, Sec5 and Ch 4, Sec 6 calculated at the load point as defined in Ch 6, Sec 2, [1.4]

F_{Ki} : Ideal buckling force, in N, of the stiffener, taken equal to:

$$F_{Kix} = \frac{\pi^2}{a^2} EI_x\, 10^4$$ for longitudinal stiffeners

$$F_{Kiy} = \frac{\pi^2}{(nb)^2} EI_y\, 10^4$$ for transverse stiffeners

I_x, I_y : Net moments of inertia, in cm^4, of the longitudinal or transverse stiffener including effective width of attached plating according to [5]. I_x and I_y are to comply with the following criteria:

$$I_x \geq \frac{bt^3}{12 \cdot 10^4}$$

$$I_y \geq \frac{at^3}{12 \cdot 10^4}$$

p_z : Nominal lateral load, in N/mm^2, of the stiffener due to σ_x, σ_y and τ

$$p_{zx} = \frac{t_a}{b}\left(\sigma_{xl}\left(\frac{\pi b}{a}\right)^2 + 2c_y\sigma_y + \tau_1\sqrt{2}\right) \text{ for longitudinal stiffeners}$$

$$p_{zy} = \frac{t_a}{a}\left(2c_x\sigma_{xl} + \sigma_y\left(\frac{\pi a}{nb}\right)^2\left(1+\frac{A_y}{at_a}\right) + \tau_1\sqrt{2}\right) \text{ for transverse stiffeners}$$

$$\sigma_{xl} = \sigma_x\left(1+\frac{A_x}{b \cdot t_a}\right)$$

t_a : Net thickness offered of attached plate, in mm

c_x, c_y : Factor taking into account the stresses vertical to the stiffener's axis and distributed variable along the stiffener's length taken equal to:

$0.5\,(1+\psi)$ for $0 \leq \psi \leq 1$

$\dfrac{0.5}{1-\psi}$ for $\psi < 0$

A_x, A_y : Net sectional area, in mm^2, of the longitudinal or transverse stiffener respectively without attached plating

$$\tau_1 = \left[\tau - t\sqrt{R_{eH}E\left(\frac{m_1}{a^2}+\frac{m_2}{b^2}\right)}\right] \geq 0$$

m_1, m_2 : Coefficients taken equal to:

for longitudinal stiffeners:

$\dfrac{a}{b} \geq 2,0$: $m_1 = 1.47$ $m_2 = 0.49$

$\dfrac{a}{b} < 2,0$: $m_1 = 1.96$ $m_2 = 0.37$

for transverse stiffeners:

$\dfrac{a}{n \cdot b} \geq 0,5$: $m_1 = 0.37$ $m_2 = \dfrac{1.96}{n^2}$

$\dfrac{a}{n \cdot b} < 0,5$: $m_1 = 0.49$ $m_2 = \dfrac{1.47}{n^2}$

$w = w_0 + w_1$ generally

$w = |w_0 - w_1|$ for stiffeners sniped at both ends, on which the same side lateral pressure as the stiffener is applied.

RCN 1 to July 2010 version (effective from 1July 2012)

w_0 : Assumed imperfection, in mm, taken equal to:

$$w_0 = \min\left(\frac{a}{250}, \frac{b}{250}, 10\right) \text{ for longitudinal stiffeners}$$

$$w_0 = \min\left(\frac{a}{250}, \frac{n \cdot b}{250}, 10\right) \text{ for transverse stiffeners}$$

For stiffeners sniped at both ends w_0 must not be taken less than the distance from the midpoint of attached plating to the neutral axis of the stiffener calculated with the effective width of its attached plating.

w_1 : Deformation of stiffener, in mm, at midpoint of stiffener span due to lateral load p. In case of uniformly distributed load the following values for w_1 may be used:

$$w_1 = \frac{pba^4}{384 \cdot 10^7 EI_x} \quad \text{for longitudinal stiffeners}$$

$$w_1 = \frac{5ap(nb)^4}{384 \cdot 10^7 EI_y c_S^2} \quad \text{for transverse stiffeners}$$

c_f : Elastic support provided by the stiffener, in N/mm^2, taken equal to:

- for longitudinal stiffeners

$$c_f = F_{Kix} \frac{\pi^2}{a^2}(1 + c_{px})$$

$$c_{px} = \frac{1}{1 + \dfrac{0.91\left(\dfrac{12 \cdot 10^4 I_x}{t^3 b} - 1\right)}{c_{xa}}}$$

c_{xa} : Coefficient taken equal to :

$$c_{xa} = \left[\frac{a}{2b} + \frac{2b}{a}\right]^2 \quad \text{for} \quad a \geq 2b$$

$$c_{xa} = \left[1 + \left(\frac{a}{2b}\right)^2\right]^2 \quad \text{for} \quad a < 2b$$

- for transverse. stiffeners :

$$c_f = c_S F_{Kiy} \frac{\pi^2}{(n \cdot b)^2}\left(1 + c_{py}\right)$$

$$c_{py} = \frac{1}{1 + \dfrac{0.91\left(\dfrac{12 \cdot 10^4 I_y}{t^3 a} - 1\right)}{c_{ya}}}$$

c_{ya} : Coefficient taken equal to :

$$c_{ya} = \left[\frac{nb}{2a} + \frac{2a}{nb}\right]^2 \quad \text{for} \quad nb \geq 2a$$

$$c_{ya} = \left[1 + \left(\frac{nb}{2a}\right)^2\right]^2 \quad \text{for} \quad nb < 2a$$

4.2.3 Equivalent criteria for longitudinal and transverse ordinary stiffeners not subjected to lateral pressure

Longitudinal and transverse ordinary stiffeners not subjected to lateral pressure, except for sniped stiffeners, are considered as complying with the requirement of [4.2.1] if their net moments of inertia I_x and I_y, in cm^4, are not less than the value obtained by the following formula:

- For longitudinal stiffener : $I_x = \dfrac{p_{zx} a^2}{\pi^2 10^4}\left(\dfrac{w_0 h_w}{\dfrac{R_{eH}}{S} - \sigma_x} + \dfrac{a^2}{\pi^2 E}\right)$
- For transverse stiffener : $I_y = \dfrac{p_{zy} (nb)^2}{\pi^2 10^4}\left(\dfrac{w_0 h_w}{\dfrac{R_{eH}}{S} - \sigma_y} + \dfrac{(nb)^2}{\pi^2 E}\right)$

RCN 1 to July 2010 version (effective from 1July 2012)

4.3 Torsional buckling

4.3.1 Longitudinal stiffeners

The longitudinal ordinary stiffeners are to comply with the following criteria:

$$\frac{\sigma_x S}{\kappa_T R_{eH}} \le 1.0$$

κ_T : Coefficient taken equal to:

$$\kappa_T = 1.0 \text{ for } \lambda_T \le 0.2$$

$$\kappa_T = \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_T^2}} \text{ for } \lambda_T > 0.2$$

$$\Phi = 0.5\left(1 + 0.21(\lambda_T - 0.2) + \lambda_T^2\right)$$

λ_T : Reference degree of slenderness taken equal to:

$$\lambda_T = \sqrt{\frac{R_{eH}}{\sigma_{KiT}}}$$

$$\sigma_{KiT} = \frac{E}{I_P}\left(\frac{\pi^2 I_\omega 10^2}{a^2}\varepsilon + 0.385 I_T\right) \quad \text{, in N/mm}^2$$

I_P : Net polar moment of inertia of the stiffener, in cm^4, defined in Tab 5, and related to the point C as shown in Fig 2

I_T : Net St. Venant's moment of inertia of the stiffener, in cm^4, defined in Tab 5,

I_ω : Net sectorial moment of inertia of the stiffener, in cm^6, defined in Tab 5, related to the point C as shown in Fig 2

ε : Degree of fixation taken equal to:

$$\varepsilon = 1 + 10^{-3}\sqrt{\frac{a^4}{\frac{3}{4}\pi^4 I_w\left(b/t^3 + 4h_w/3t_w^3\right)}}$$

A_w : Net web area equal to: $A_w = h_w t_w$

A_f : Net flange area equal to: $A_f = b_f t_f$

$e_f = h_w + \dfrac{t_f}{2}$, in mm

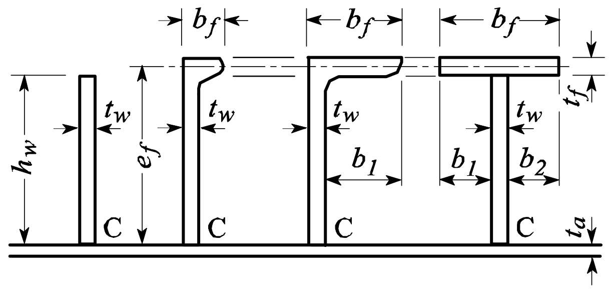

Figure 2: Dimensions of stiffeners

Table 5: Moments of inertia

Profile	I_P	I_T	I_w
Flat bar	$\dfrac{h_w^3 t_w}{3 \cdot 10^4}$	$\dfrac{h_w t_w^3}{3 \cdot 10^4}\left(1 - 0.63\dfrac{t_w}{h_w}\right)$	$\dfrac{h_w^3 t_w^3}{36 \cdot 10^6}$
Sections with bulb or flange	$\left(\dfrac{A_w h_w^2}{3} + A_f e_f^2\right)10^{-4}$	$\dfrac{h_w t_w^3}{3 \cdot 10^4}\left(1 - 0.63\dfrac{t_w}{h_w}\right)$ + $\dfrac{b_f t_f^3}{3 \cdot 10^4}\left(1 - 0.63\dfrac{t_f}{b_f}\right)$	for bulb and angle sections: $\dfrac{A_f e_f^2 b_f^2}{12 \cdot 10^6}\left(\dfrac{A_f + 2.6 A_w}{A_f + A_w}\right)$ for tee-sections $\dfrac{b_f^3 t_f e_f^2}{12 \cdot 10^6}$

4.3.2 Transverse stiffeners

Transverse stiffeners loaded by axial compressive stresses and which are not supported by longitudinal stiffeners are to comply with the requirements of [4.3.1] analogously.

5. Effective width of attached plating

5.1 Ordinary stiffeners

5.1.1

The effective width of attached plating of ordinary stiffeners is determined by the following formulae (see also Fig 1):

- for longitudinal stiffeners: $b_m = \min(\kappa_x b, \kappa_s s)$
- for transverse stiffeners: $a_m = \min(\kappa_y a, \kappa_s s)$

where:

$\kappa_s = 0.0035\left(\dfrac{\ell_{eff}}{s}\right)^3 - 0.0673\left(\dfrac{\ell_{eff}}{s}\right)^2 + 0.4422\left(\dfrac{\ell_{eff}}{s}\right) - 0.0056$, to be taken not greater than 1,0

s : Spacing of the stiffener, in mm

ℓ_{eff} : Value taken as follows:

- for longitudinal stiffeners:

  $\ell_{eff} = a$ if simply supported at both ends

  $\ell_{eff} = 0.6\ a$ if fixed at both ends

- for transverse stiffeners:

  $\ell_{eff} = b$ if simply supported at both ends

  $\ell_{eff} = 0.6\ b$ if fixed at both ends

5.2 Primary supporting members

The effective width $e_m^{'}$ of stiffened flange plates of primary supporting members may be determined as described in a) and b), with the notations:

e : Width of plating supported, in mm, measured from centre to centre of the adjacent unsupported fields

e_m : Effective width, in mm, of attached plating of primary supporting member according to Tab 6 considering the type of loading (special calculations may be required for determining the effective width of one-sided or non-symmetrical flanges).

e_{m1} is to be applied where primary supporting members are loaded by uniformly distributed loads or else by not less than 6 equally spaced single loads.

e_{m2} is to be applied where primary supporting members are loaded by 3 or less single loads.

a) Stiffening parallel to web of the primary supporting member (see Fig 3)

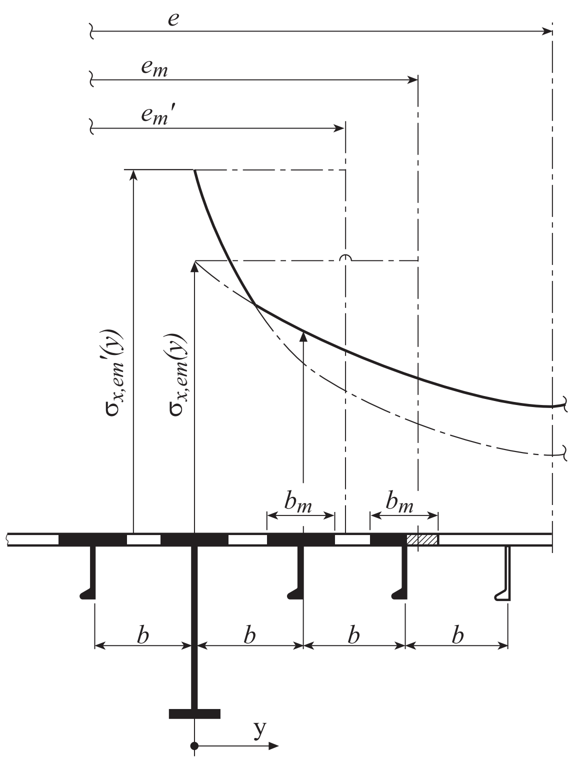

Figure 3: Stiffening parallel to web

$b < e_m$

$e_m^{'} = n \cdot b_m$

n : Integral number of the stiffener spacing b inside the effective width e_m., taken equal to:

$$n = \text{int}\left(\frac{e_m}{b}\right)$$

b) Stiffening perpendicular to web of the primary supporting member (see Fig 4)

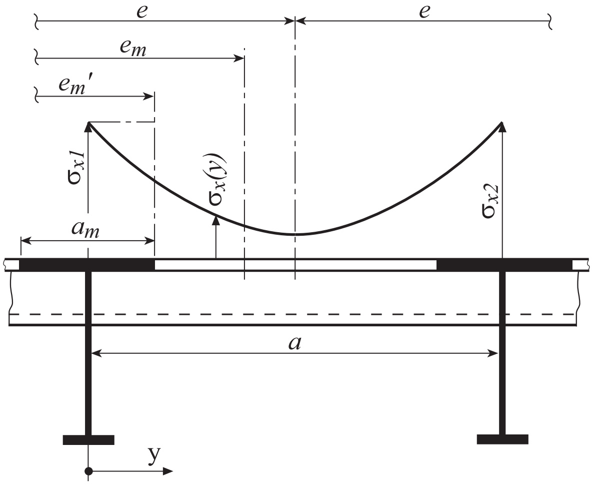

Figure 4: Stiffening perpendicular to web

$a \geq e_m$

$e_m^{'} = n a_m < e_m$

$n = 2.7\dfrac{e_m}{a}$, to be taken not greater than 1.0

For $b \geq e_m$ or $a < e_m$ respectively, b and a must be exchanged.

Table 6: Effective Width of attached plating

ℓ/e	0	1	2	3	4	5	6	7	≥ 8
e_{m1}/e	0	0.36	0.64	0.82	0.91	0.96	0.98	1.00	1.00
e_{m2}/e	0	0.20	0.37	0.52	0.65	0.75	0.84	0.89	0.90

Intermediate values may be obtained by direct interpolation.

ℓ : Length between zero-points of bending moment curve, i.e. unsupported span in case of simply supported girders and 0.6 times the unsupported span in case of constraint of both ends of girder

6. Transverse vertically corrugated watertight bulkhead in flooded conditions

6.1 General

6.1.1 Shear buckling check of the bulkhead corrugation webs

The shear stress τ, calculated according to Ch 6, Sec 2, [3.6.1], is to comply with the following formula:

$\tau \leq \tau_C$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

where:

τ_C : Critical shear buckling stress to be obtained, in N/mm^2, from the following formulae:

$$\tau_c = \tau_E \qquad \text{for} \quad \tau_E \le \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_c = \frac{R_{eH}}{\sqrt{3}}\left(1 - \frac{R_{eH}}{4\sqrt{3}\,\tau_E}\right) \qquad \text{for} \quad \tau_E > \frac{R_{eH}}{2\sqrt{3}}$$

τ_E : Euler shear buckling stress to be obtained, in N/mm^2, from the following formula:

$$\tau_E = 0.9 k_t E \left(\frac{t_w}{10^3 c}\right)^2$$

k_t : Coefficient, to be taken equal to 6.34

t_W : Net thickness, in mm, of the corrugation webs

c : Width, in m of the corrugation webs (see Ch 3, Sec 6, Fig 28). *RCN 1 to July 2008 version (effective from 1 July 2009)*

Section 4 - PRIMARY SUPPORTING MEMBERS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

L_2 : Rule length L, but to be taken not greater than 300 m

I_Y : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to Ch 5, Sec 1, [1.5], on gross offered thickness reduced by $0.5t_C$ for all structural members

I_Z : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to Ch 5, Sec 1, [1.5], on gross offered thickness reduced by $0.5t_C$ for all structural members

N : Z co-ordinate with respect to the reference co-ordinate system defined in Ch 1, Sec 4, [4], in m, of the centre of gravity of the hull net transverse section defined in Ch 5, Sec 1, [1.2], considering gross offered thickness reduced by $0.5t_C$ for all structural members

p_S, p_W : Still water and wave pressure, in kN/m^2, in intact conditions, defined in [2.1.2]

σ_X : Normal stress, in N/mm^2, defined in [2.1.5]

s : Spacing, in m, of primary supporting members

ℓ : Span, in m, of primary supporting members, measured between the supporting members, see Ch 3, Sec 6, [5.3]

h_w : Web height, in mm

t_w : Net web thickness, in mm

b_f : Face plate width, in mm

t_f : Net face plate thickness, in mm

b_p : Width, in m, of the plating attached to the member, for the yielding check, defined in Ch 3, Sec 6, [4.3]

w : Net section modulus, in cm^3, of the member, with an attached plating of width b_p, to be calculated as specified in Ch 3, Sec 6, [4.4]

A_{sh} : Net shear sectional area, in cm^2, of the member, to be calculated as specified in Ch 3, Sec 6, [5.5]

m : Coefficient taken equal to 10

τ_a : Allowable shear stress, in N/mm^2, taken equal to:

$\tau_a = 0.4\ R_Y$

k : Material factor, as defined in Ch 1, Sec 4, [2.2.1]

x, y, z : X, Y and Z co-ordinates, in m, of the evaluation point with respect to the reference co-ordinate system defined in Ch 1, Sec 4

1. General

1.1 Application

1.1.1

The requirements of this Section apply to the strength check of pillars and primary supporting members, subjected to lateral pressure and/or hull girder normal stresses for such members contributing to the hull girder longitudinal strength.

The yielding check is also to be carried out for such members subjected to specific loads.

1.2 Primary supporting members for ships less than 150 m in length *L*

1.2.1

For primary supporting members for ships having a length L less than 150 m, the strength check of such members is to be carried out according to the provisions specified in [2] and [4].

1.2.2

Notwithstanding the above, the strength check of such members may be carried out by a direct strength assessment deemed as appropriate by the Society.

1.3 Primary supporting members for ships of 150 m or more in length *L*

1.3.1

For primary supporting members for ships having a length L of 150 m or more, the direct strength analysis is to be carried out according to the provisions specified in Ch 7, and the requirements in [4] are also to be complied with. In addition, the primary supporting members for **BC-A** and **BC-B** ships are to comply with the requirements in [3].

1.4 Net scantlings

1.4.1

As specified in Ch 3, Sec 2, all scantlings referred to in this Section are net, i.e. they do not include any corrosion addition.

The gross scantlings are obtained as specified in Ch 3, Sec 2, [3].

1.5 Minimum net thicknesses of webs of primary supporting members

1.5.1

The net thickness of the web of primary supporting members, in mm, is to be not less than $0.6\sqrt{L_2}$.

1.6 Flooding check of primary supporting members

1.6.1 General

Flooding check of primary supporting members is to be carried out according to the requirements in [5].

RCN 1 to July 2010 version (effective from 1July 2012)

2. Scantling of primary supporting members for ships of less than 150 m in length *L*

2.1 Load model

2.1.1 General

The still water and wave lateral loads induced by the sea and the various types of cargoes and ballast in intact conditions are to be considered, depending on the location of the primary supporting members under consideration and the type of the compartments adjacent to it.

The wave lateral loads and hull girder loads are to be calculated, for the probability level of 10^{-8}, in the mutually exclusive load cases H1, H2, F1, F2, R1, R2, P1 and P2, as defined in Ch 4, Sec 4.

2.1.2 Lateral pressure in intact conditions

The lateral pressure in intact conditions is constituted by still water pressure and wave pressure.

Still water pressure (p_S) includes:

a) the hydrostatic pressure, defined in Ch 4, Sec 5, [1]
b) the still water internal pressure, defined in Ch 4, Sec 6 for the various types of cargoes and for ballast.

Wave pressure (p_W) includes for each load case H1, H2, F1, F2, R1, R2, P1 and P2:

c) the hydrodynamic pressure, defined in Ch 4, Sec 5, [1]
d) the inertial pressure, defined in Ch 4, Sec 6 for the various types of cargoes and for ballast.

2.1.3 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering separately:

- the still water and wave external sea pressures
- the still water and wave internal pressure, considering the compartment adjacent to the outer shell as being loaded

If the compartment adjacent to the outer shell is not intended to carry liquids, only the external sea pressures are to be considered.

2.1.4 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

2.1.5 Normal stresses

The normal stress to be considered for the strength check of primary supporting members contributing to the hull girder longitudinal strength is the maximum value of σ_X between sagging and hogging conditions, when applicable, obtained , in N/mm^2, from the following formula:

$$\sigma_X = \left[C_{SW} \left| \frac{M_{SW}}{I_Y} \right| (z-N) + C_{WV} \left| \frac{M_{WV}}{I_Y} \right| (z-N) - C_{WH} \left| \frac{M_{WH}}{I_Z} \right| y \right] 10^{-3}$$

where:

M_{SW} : Permissible still water bending moments, in kN.m, in hogging or sagging as the case may be

M_{WV} : Vertical wave bending moment, in kN.m, in hogging or sagging as the case may be, as defined in Ch 4, Sec 3

M_{WH} : Horizontal wave bending moment, in kN.m, as defined in Ch 4, Sec 3

C_{SW} : Combination factor for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and defined in the Tab 1

C_{WV}, C_{WH} : Combination factors defined in Ch 4, Sec 4, [2.2] for each load case H1, H2, F1, F2, R1, R2, P1 and P2 and given in the Tab 1

Table 1: Combination factors C_{SW}, C_{WV} and C_{WH}

LC	Hogging			Sagging		
	C_{SW}	C_{WV}	C_{WH}	C_{SW}	C_{WV}	C_{WH}
H1	Not Applicable			-1	-1	0
H2	1	1	0	Not Applicable		
F1	Not Applicable			-1	-1	0
F2	1	1	0	Not Applicable		
R1	1	0	$1.2-\frac{T_{LC}}{T_S}$	-1	0	$1.2-\frac{T_{LC}}{T_S}$
R2	1	0	$\frac{T_{LC}}{T_S}-1.2$	-1	0	$\frac{T_{LC}}{T_S}-1.2$
P1	1	$0.4-\frac{T_{LC}}{T_S}$	0	-1	$0.4-\frac{T_{LC}}{T_S}$	0
P2	1	$\frac{T_{LC}}{T_S}-0.4$	0	-1	$\frac{T_{LC}}{T_S}-0.4$	0

2.2 Center Girders and Side Girders

2.2.1 Net web thickness

The net thickness of girders in double bottom structure, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = C_1 \frac{pS|x-x_c|}{(d_0-d_1)\tau_a}\left\{1-4\left(\frac{y}{B_{DB}}\right)^2\right\}$$ where $|x-x_c|$ is less than $0.25\ell_{DB}$, $|x-x_c|$ is to be taken as $0.25\ell_{DB}$

$$t_2 = 1.75\cdot\sqrt[3]{\frac{H^2a^2\tau_a}{C_1'}t_1}$$

$$t_3 = \frac{C_1''a}{\sqrt{k}}$$

where:

p : Differential pressure given by the following formula in kN/m^2:

$$p = \left|(p_{S,IB}+p_{W,IB})-(p_{S,BM}+p_{W,BM})\right|$$

$p_{S,IB}$: Cargo or ballast pressure of inner bottom plating in still water, in kN/m^2, as calculated at the center of the double bottom structure under consideration, according to Ch 4, Sec 6

$p_{W,IB}$: Cargo or ballast pressure of inner bottom plating due to inertia, in kN/m^2, as calculated at the center of the double bottom structure under consideration, according to Ch 4, Sec 6

$p_{S,BM}$: External sea and ballast pressure of bottom plating in still water, in kN/m^2, as calculated at the center of the double bottom structure under consideration, according to Ch 4, Sec 5 and Ch 4, Sec 6

$p_{W,BM}$: External sea and ballast pressure of bottom plating due to inertia, in kN/m^2, as calculated at the center of the double bottom structure under consideration, according to Ch 4, Sec 5 and Ch 4, Sec 6

S : Distance between the centers of the two spaces adjacent to the center or side girder under consideration, in m

d_0 : Depth of the center or side girder under consideration, in m

d_1 : Depth of the opening, if any, at the point under consideration, in m

ℓ_{DB} : Length of the double bottom, in m. Where stools are provided at transverse bulkheads, ℓ_{DB} may be taken as the distance between the toes.

x_c : X co-ordinate, in m, of the center of double bottom structure under consideration with respect to the reference co-ordinate system defined in Ch 1, Sec 4

B_{DB} : Distance between the toes of hopper tanks at the midship part, in m, see Fig 3

C_1 : Coefficient obtained from Tab 2 depending on B_{DB} / ℓ_{DB}. For intermediate values of B_{DB} / ℓ_{DB}, C_1 is to be obtained by linear interpolation

a : Depth of girders at the point under consideration, in m. However, where horizontal stiffeners are fitted on the girder, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of vertical ordinary stiffeners or floors

C_1' : Coefficient obtained from Tab 3 depending on S_1 / a. For intermediate values of S_1 / a, C_1' is to be determined by linear interpolation

H : Value obtained from the following formulae:

- where the girder is provided with an unreinforced opening : $H = 1 + 0.5\dfrac{\phi}{\alpha}$
- In other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1, in m.

C_1'' : Coefficient obtained from Tab 4 depending on S_1 / a. For intermediate values of S_1 / a, C_1'' is to be obtained by linear interpolation.

Table 2: Coefficient C_1

2.3 Floors

2.3.1 Net web thickness

The net thickness of floors in the double bottom structure, in mm, is not to be less than the greatest of values t_1 to t_3 specified in the following according to each location:

$t_1 = C_2 \dfrac{pSB_{DB}}{(d_0 - d_1)\tau_a}\left(\dfrac{2|y|}{B'_{DB}}\right)\left\{1-2\left(\dfrac{x-x_c}{l_{DB}}\right)^2\right\}$, where $|x-x_c|$ is less than $0.25\ell_{DB}$, $|x-x_c|$ is to be taken as $0.25\ell_{DB}$, and where $|y|$ is less than $B'_{DB}/4$, $|y|$ is to be taken as $B'_{DB}/4$,

$$t_2 = 1.75 \cdot \sqrt[3]{\frac{H^2 a^2 \tau_a}{C_2'} t_1}$$

$$t_3 = \frac{8.5 S_2}{\sqrt{k}}$$

where :

S : Spacing of solid floors, in m

d_0 : Depth of the solid floor at the point under consideration in m

d_1 : Depth of the opening, if any, at the point under consideration in m

B'_{DB} : Distance between toes of hopper tanks at the position of the solid floor under consideration, in m

C_2 : Coefficient obtained from Tab 5 depending on B_{DB}/ℓ_{DB}. For intermediate values of B_{DB}/ℓ_{DB}, C_2 is to be obtained by linear interpolation

p, B_{DB}, x_c, ℓ_{DB} : As defined in [2.2.1]

a : Depth of the solid floor at the point under consideration, in m. However, where horizontal stiffeners are fitted on the floor, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or the inner bottom plating or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of vertical ordinary stiffeners or girders

C_2' : Coefficient given in Tab 6 depending on S_1/d_0. For intermediate values of S_1/d_0, C_2' is to be determined by linear interpolation.

H : Value obtained from the following formulae:

a) where openings with reinforcement or no opening are provided on solid floors:

1) where slots without reinforcement are provided:

$$H = \sqrt{4.0\frac{d_2}{S_1} - 1.0}\text{, without being taken less than 1.0}$$

2) where slots with reinforcement are provided: $H = 1.0$

b) where openings without reinforcement are provided on solid floors:

1) where slots without reinforcement are provided:

$$H = \left(1 + 0.5\frac{\phi}{d_0}\right)\sqrt{4.0\frac{d_2}{S_1} - 1.0}\text{, without being taken less than } 1 + 0.5\frac{\phi}{d_0}$$

2) where slots with reinforcement are provided:

$$H = 1 + 0.5\frac{\phi}{d_0}$$

d_2 : Depth of slots without reinforcement provided at the upper and lower parts of solid floors, in m, whichever is greater

ϕ : Major diameter of the openings, in m

S_2 : The smaller of S_1 or a , in m.

Table 5: Coefficient C_2

2.4 Stringer of double side structure

2.4.1 Net web thickness

The net thickness of stringers in double side structure, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = C_3\frac{pS|x - x_c|}{(d_0 - d_1)\tau_a}$$, where $|x - x_c|$ is under $0.25\ell_{DS}$, $|x - x_c|$ is to be taken as $0.25\ell_{DS}$

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 \tau_a}{C_3'} t_1}$$

$$t_3 = \frac{8.5S_2}{\sqrt{k}}$$

where :

p : Differential pressure given by the following formula in kN/m^2:

$$p = \left| \left(p_{S,SS} + p_{W,SS} \right) - \left(p_{S,LB} + p_{W,LB} \right) \right|$$

$p_{S,SS}$: External sea and ballast pressure of side shell plating in still water, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to Ch 4, Sec 5 and Ch 4, Sec 6

$p_{W,SS}$: External sea and ballast pressure of side shell plating due to inertia, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to Ch 4, Sec 5 and Ch 4, Sec 6

$p_{S,LB}$: Ballast pressure of longitudinal bulkhead in still water, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to Ch 4, Sec 6

$p_{W,LB}$: Ballast pressure of longitudinal bulkhead due to inertia, in kN/m^2, as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}, according to Ch 4, Sec 6

S : Breadth of part supported by stringer, in m

d_0 : Depth of stringers, in m

d_1 : Depth of opening, if any, at the point under consideration, in m.

x_c : X co-ordinate, in m, of the center of double side structure under consideration with respect to the reference co-ordinate system defined in Ch 1, Sec 4

ℓ_{DS} : Length of the double side structure between the transverse bulkheads under consideration, in m

h_{DS} : Height of the double side structure between the upper end of hopper tank and the lower end of topside tank, in m

C_3 : Coefficient obtained from Tab 7 depending on h_{DS} / ℓ_{DS}. For intermediate values of h_{DS} / ℓ_{DS}, C_3 is to be obtained by linear interpolation.

a : Depth of stringers at the point under consideration, in m. However, where horizontal stiffeners are fitted on the stringer, a is the distance from the horizontal stiffener under consideration to the side shell plating or the longitudinal bulkhead of double side structure or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of transverse ordinary stiffeners or web frames

C_3' : Coefficient obtained from Tab 8 depending on S_1 / a. For intermediate values of S_1 / a, C_3' is to be obtained by linear interpolation.

H : Value obtained from the following formulae:

- where the stringer is provided with an unreinforced opening: $H = 1 + 0.5\dfrac{\phi}{\alpha}$
- in other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1, in m

S_2 : The smaller of a or S_1, in m

Table 7: Coefficient C_3

$\frac{h_{DS}}{\ell_{DS}}$	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over

2.5 Transverse web in double side structure

2.5.1 Net web thickness

The net thickness of transverse webs in double side structure, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$t_1 = C_4 \dfrac{pSh_{DS}}{(d_0 - d_1)\tau_a}\left(1 - 1.75\dfrac{z - z_{BH}}{h_{DS}}\right)$, where $z - z_{BH}$ is greater than $0.4h_{DS}$, $z - z_{BH}$ is to be taken as $0.4h_{DS}$

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 \tau_a}{C_4'} t_1}$$

$$t_3 = \frac{8.5S_2}{\sqrt{k}}$$

where :

S : Breadth of part supported by transverses, in m

d_0 : Depth of transverses, in m

d_1 : Depth of opening at the point under consideration, in m

C_4 : Coefficient obtained from Tab 9 depending on h_{DS}/ℓ_{DS}. For intermediate values of h_{DS}/ℓ_{DS}, C_4 is to be obtained by linear interpolation

z_{BH} : Z co-ordinates, in m, of the upper end of hopper tank with respect to the reference co-ordinate system defined in Ch 1, Sec 4

p, h_{DS} and ℓ_{DS} : as defined in the requirements of [2.4.1]

a : Depth of transverses at the point under consideration, in m. However, where vertical stiffeners are fitted on the transverse, a is the distance from the vertical stiffener under consideration to the side shell or the longitudinal bulkhead of double side hull or the distance between the vertical stiffeners under consideration.

S_1 : Spacing, in m, of horizontal ordinary stiffeners or stringers

C_4' : Coefficient obtained from Tab 10 depending on S_1/a. For intermediate values of S_1/a, C_4' is to be obtained by linear interpolation.

H : Value obtained from the following formulae :

- where the transverse is provided with an unreinforced opening: $H = 1 + 0.5\dfrac{\phi}{\alpha}$
- in other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1. in m

S_2 : The smaller of a or S_1, in m

Table 9: Coefficient C_4

$\dfrac{h_{DS}}{\ell_{DS}}$	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over

2.6 Primary supporting member in bilge hopper tanks and topside tanks and other structures

2.6.1 Load calculation point

For horizontal members, the lateral pressure and hull girder stress, if any, are to be calculated at mid-span of the primary supporting members considered, unless otherwise specified.

For vertical members, the lateral pressure p is to be calculated as the maximum between the values obtained at mid-span and the pressure obtained from the following formula:

- $p = \dfrac{p_U + p_L}{2}$, when the upper end of the vertical member is below the lowest zero pressure level
- $p = \dfrac{\ell_1}{\ell}\dfrac{p_L}{2}$, when the upper end of the vertical member is at or above the lowest zero pressure level (see Fig 1)

where:

ℓ_1 : Distance, in m, between the lower end of vertical member and the lowest zero pressure level

p_U, p_L : Lateral pressures at the upper and lower end of the vertical member span ℓ, respectively

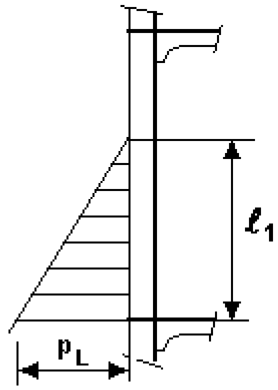

Figure 1: Definition of pressure for vertical members

2.6.2 Boundary conditions

The requirements of this sub-article apply to primary supporting members considered as clamped at both ends. For boundary conditions deviated from the above, the yielding check is to be considered on a case by case basis.

2.6.3 Net section modulus, net shear sectional area and web thickness under intact conditions

The net section modulus w, in cm^3, the net shear sectional area A_{sh}, in cm^2, and the net web thickness t_w, in mm, subjected to lateral pressure are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{m\lambda_S R_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

$$t_w = 1.75 \cdot \sqrt[3]{\frac{h_w \tau_a}{10^4 C_5} A_{sh}}$$

where:

λ_S : Coefficient defined in Tab 11

ϕ : Angle, in deg, between the primary supporting member web and the shell plate, measured at the middle of the member span; the correction is to be applied when ϕ is less than 75 deg.

C_5 : Coefficient defined in Tab 12 according to s_1 and d_0. For intermediate values of s_1 / d_0, coefficient C_5 is to be obtained by linear interpolation.

s_1 : Spacing of stiffeners or tripping brackets on web plate, in m

d_0 : Spacing of stiffeners parallel to shell plate on web plate, in m

Table 11: Coefficient λ_S

Primary supporting members	Coefficient λ_S
Longitudinal members contributing to the hull girder longitudinal strength	$1.1\left(1.0-0.85\left\|\dfrac{\sigma_X}{R_Y}\right\|\right)$, without being taken greater than 0.8
Other members	0.8

3. Additional requirements for primary supporting members of BC-A and BC-B ships

3.1 Evaluation of double bottom capacity and allowable hold loading in flooded conditions

3.1.1 Shear capacity of the double bottom

The shear capacity of the double bottom is to be calculated as the sum of the shear strength at each end of:

- all floors adjacent to both hopper tanks, less one half of the shear strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted (see Fig 2); the floor shear strength is to be calculated according to [3.1.2]
- all double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted; the girder shear strength is to be calculated according to [3.1.3].

Where in the end holds, girders or floors run out and are not directly attached to the boundary stool or hopper tank girder, their strength is to be evaluated for the one end only.

The floors and girders to be considered in calculating the shear capacity of the double bottom are those inside the hold boundaries formed by the hopper tanks and stools (or transverse bulkheads if no stool is fitted). The hopper tank side girders and the floors directly below the connection of the stools (or transverse bulkheads if no stool is fitted) to the inner bottom may not be included.

When the geometry and/or the structural arrangement of the double bottom is/are such as to make the above assumptions inadequate, the shear capacity of the double bottom is to be calculated by means of direct calculations to be carried out according to the requirements specified in Ch 7, as far as applicable.

3.1.2 Floor shear strength

The floor shear strength, in kN, is to be obtained from the following formulae:

- in way of the floor panel adjacent to the hopper tank:

$$S_{f1} = A_f \frac{\tau_A}{\eta_1} 10^{-3}$$

- in way of the openings in the outermost bay (i.e. that bay which is closer to the hopper tank):

$$S_{f2} = A_{f,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

where:

A_f : Net sectional area, in mm^2, of the floor panel adjacent to the hopper tank

$A_{f,h}$: Net sectional area, in mm^2, of the floor panels in way of the openings in the outermost bay (i.e. that bay which is closer to the hopper tank)

τ_A : Allowable shear stress, in N/mm^2, equal to the lesser of:

$$\tau_A = 0.645 \frac{R_{eH}^{0.6}}{\left(s / t_N\right)^{0.8}} \text{ and } \tau_A = \frac{R_{eH}}{\sqrt{3}}$$

t_N : Floor web net thickness, in mm

s : Spacing, in m, of stiffening members of the panel considered

η_1 : Coefficient to be taken equal to 1.1

η_2 : Coefficient to be taken equal to 1.2. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the openings in the outermost bay, to be examined by the Society on a case-by-case basis.

3.1.3 Girder shear strength

The girder shear strength, in kN, is to be obtained from the following formulae:

- in way of the girder panel adjacent to the stool (or transverse bulkhead, if no stool is fitted):

$$S_{g1} = A_g \frac{\tau_A}{\eta_1} 10^{-3}$$

- in way of the largest opening in the outermost bay (i.e. that bay which is closer to the stool, or transverse bulk-head, if no stool is fitted):

$$S_{g2} = A_{g,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

A_g : Net sectional area, in mm^2, of the girder panel adjacent to the stool (or transverse bulkhead, if no stool is fitted)

$A_{g,h}$: Net sectional area, in mm^2, of the girder panel in way of the largest opening in the outermost bay (i.e. that bay which is closer to the stool, or transverse bulkhead, if no stool is fitted)

τ_A : Allowable shear stress, in N/mm^2, defined in [3.1.2], where t_N is the girder web net thickness

η_1 : Coefficient to be taken equal to 1.1

η_2 : Coefficient to be taken equal to 1.15. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the largest opening in the outermost bay, to be examined by the Society on a case-by-case basis.

3.1.4 Allowable hold loading

The allowable hold loading is to be obtained, in t, from the following formula:

$$W = \rho_C V \frac{1}{F}$$

where:

F : Coefficient to be taken equal to:

$F = 1.1$ in general

$F = 1.05$ for steel mill products

V : Volume, in m^3, occupied by cargo at a level h_B

h_B : Level of cargo, in m^2, to be obtained from the following formula:

$$h_B = \frac{X}{\rho_C g}$$

X : Pressure, in kN/m^2, to be obtained from the following formulae:

- for dry bulk cargoes, the lesser of:

$$X = \frac{Z + \rho g(z_F - 0.1D_1 - h_F)}{1 + \frac{\rho}{\rho_C}(perm - 1)}$$

$$X = Z + \rho g(z_F - 0.1D_1 - h_F\, perm)$$

- for steel mill products:

$$X = \frac{Z + \rho g(z_F - 0.1D_1 - h_F)}{1 - \frac{\rho}{\rho_C}}$$

D_1 : Distance, in m, from the base line to the freeboard deck at side amidships

h_F : Inner bottom flooding head is the distance, in m, measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance z_F, in m, from the baseline.

z_F : Flooding level, in m, defined in Ch 4, Sec 6, [3.4.3]

perm : Permeability of cargo, which need not be taken greater than 0.3

Z : Pressure, in kN/m^2, to be taken as the lesser of:

$$Z = \frac{C_H}{A_{DB,H}}$$

$$Z = \frac{C_E}{A_{DB,E}}$$

C_H : Shear capacity of the double bottom, in kN, to be calculated according to [3.1.1], considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} (see [3.1.2]) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see [3.1.3])

C_E : Shear capacity of the double bottom, in kN, to be calculated according to [3.1.1], considering, for each floor, the shear strength S_{f1} (see [3.1.2]) and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} (see [3.1.3])

- $$A_{DB,H} = \sum_{i=1}^{n} S_i B_{DB,i}$$

- $A_{DB,E} = \sum_{i=1}^{n} S_i \left(B_{DB} - s\right)$

n : Number of floors between stools (or transverse bulkheads, if no stool is fitted)

S_i : Space of i-th floor, in m

$B_{DB,i}$: Length, in m, to be taken equal to :

$B_{DB,i} = B_{DB} - s$ for floors for which $S_{f1} < S_{f2}$ (see [3.1.2])

$B_{DB,i} = B_{DB,h}$ for floors for which $S_{f1} \geq S_{f2}$ (see [3.1.2])

B_{DB} : Breadth, in m, of double bottom between the hopper tanks (see Fig 3)

$B_{DB,h}$: Distance, in m, between the two openings considered (see Fig 3)

s : Spacing, in m, of inner bottom longitudinal ordinary stiffeners adjacent to the hopper tanks.

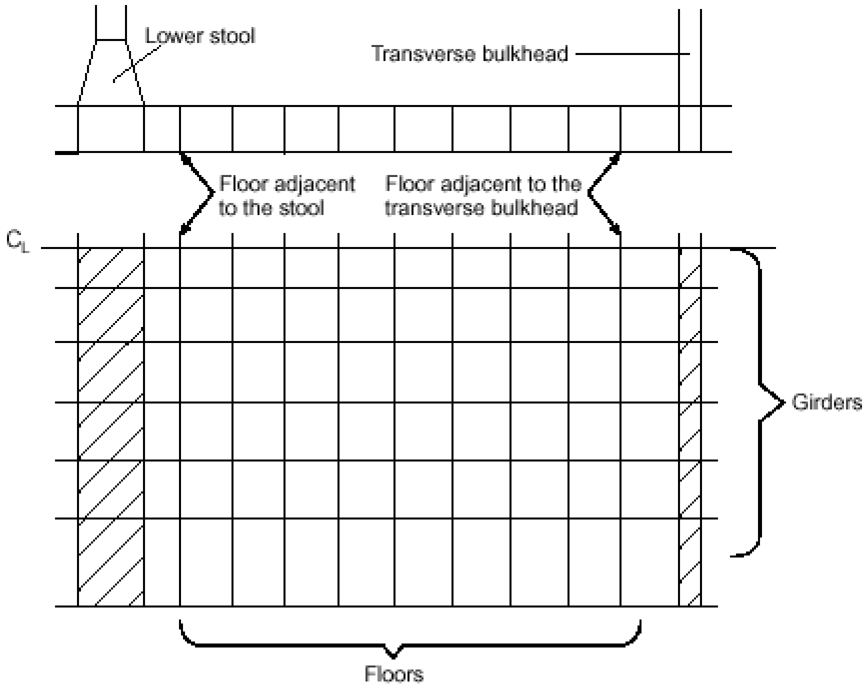

Figure 2: Double bottom structure

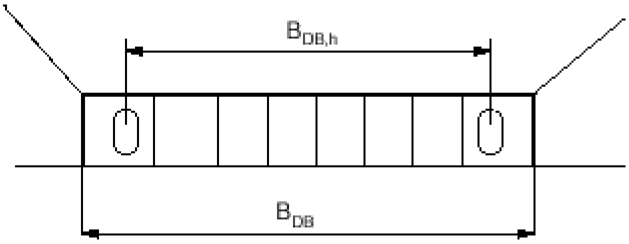

Figure 3: Dimensions B_{DB} and $B_{DB,h}$

4. Pillars

4.1 Buckling of pillars subjected to compressive axial load

4.1.1 General

It is to be checked that the compressive stress of pillars does not exceed the critical column buckling stress calculated according to [4.1.2].

4.1.2 Critical column buckling stress of pillars

The critical column buckling stress of pillars is to be obtained, in N/mm^2, from the following formulae:

$$\sigma_{cB} = \sigma_{E1} \qquad \text{for } \sigma_{E1} \le \frac{R_{eH}}{2}$$

$$\sigma_{cB} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{E1}}\right) \qquad \text{for } \sigma_{E1} > \frac{R_{eH}}{2}$$

where:

σ_{E1} : Euler column buckling stress, to be obtained, in N/mm^2, from the following formula:

$$\sigma_{E1} = \pi^2 E \frac{I}{A(fl)^2} 10^{-4}$$

I : Minimum net moment of inertia, in cm^4, of the pillar

A : Net cross-sectional area, in cm^2, of the pillar

f : Coefficient to be obtained from Tab 13.

Table 13: Coefficient *f*

Boundary conditions of the pillar	f
Both ends fixed 	0.5
One end fixed, one end pinned 	$\frac{\sqrt{2}}{2}$
Both ends pinned 	1.0

5. Flooding check of primary supporting members

5.1 Net section modulus and net shear sectional area under flooded conditions

5.1.1

The net section modulus w, in cm^3, the net shear sectional area A_{sh}, in cm^2 subjected to flooding are to be not less than the values obtained from the following formulae:

$$w = \frac{p_F s \ell^2}{16 \alpha \lambda_S R_Y} 10^3$$

$$A_{sh} = \frac{5 p_F s \ell}{\alpha \tau_a \sin \phi}$$

Where :

α: Coefficient taken equal to:

- $\alpha = 0.95$ for the primary supporting member of collision bulkhead,
- $\alpha = 1.15$ for the primary supporting member of other watertight boundaries of compartments.

λ_S : Coefficient defined in Ch 6, Sec 4 Table 11, determined by considering σ_X in flooded condition.

p_F : Pressure, in kN/m^2, in flooded conditions, defined in Ch 4, Sec 6, [3.2.1].

RCN 1 to July 2010 version (effective from 1July 2012)

Appendix 1 – BUCKLING & ULTIMATE STRENGTH

1. Application of Ch 6, Sec 3

1.1 General application

1.1.1 Mutable shear stress

If shear stresses are not uniform on the width b of the elementary plate panel, the greater of the two following values is to be used:

- mean value of τ
- $0.5\tau_{max}$

1.1.2 Change of thickness within an elementary plate panel

If the plate thickness of an elementary plate panel varies over the width b, the buckling check may be performed for an equivalent elementary plate panel $a \times b'$ having a thickness equal to the smaller plate thickness t_1.

The width of this equivalent elementary plate panel is defined by the following formula:

$$b' = b_1 + b_2\left(\frac{t_1}{t_2}\right)^{1.5}$$

where:

b_1 : Width of the part of the elementary plate panel with the smaller plate thickness t_1

b_2 : Width of the part of the elementary plate panel with the greater plate thickness t_2

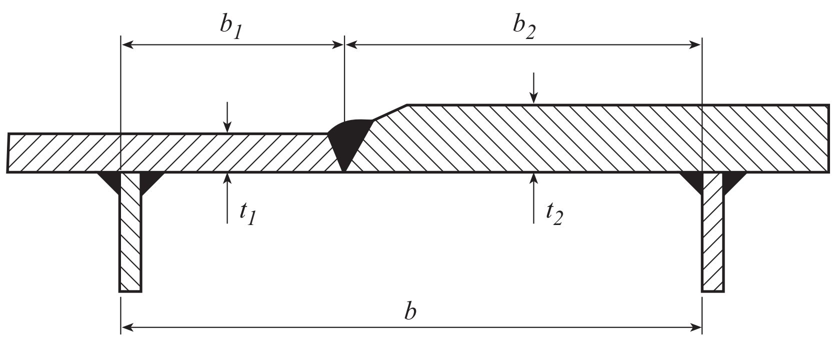

Figure 1: Plate thickness change within the field breath

1.1.3 Evaluation of floors or other high girders with holes

The following procedure may be used to assess high girders with holes:

a) Divide the plate field in sub elementary plate panels according the Fig 2

b) Assess the elementary plate panel and all sub elementary plate panels separately with the following boundary conditions:

- for sub panels 1 to 4: all edges are simply supported (load cases 1 and 2 in Ch 6, Sec 3, Tab 2)
- for sub panels 5 and 6: simply supported, one side free (load case 3 in Ch 6, Sec 3, Tab 2).

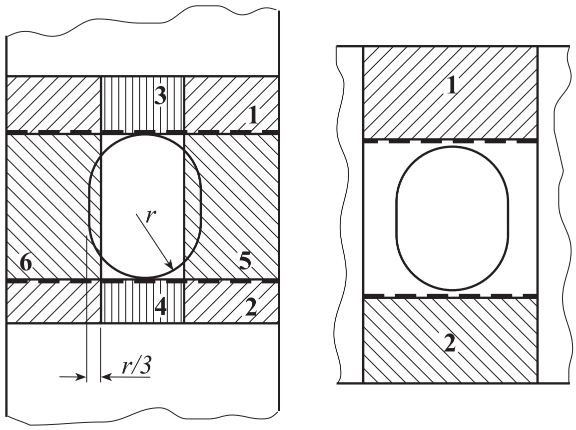

Figure 2: Elementary plate panels of high girder with hole

1.2 Application to hull transverse section analysis

1.2.1 Idealization of elementary plate panels

The buckling check of the elementary plate panel is to be performed under the loads defined in Ch 6, Sec 3, [2.1], according to the requirements of Ch 6, Sec 3, [3].

The determination of the buckling and reduction factors is made according to the Ch 6, Sec 3, Tab 2 for the plane plate panel and Ch 6, Sec 3, Tab 3 for the curved plate panel.

For the determination of the buckling and reduction factors in Ch 6, Sec 3, Tab 2, the following cases are to be used according to the type of stresses and framing system of the plating:

- For the normal compressive stress:
  - Buckling load case 1 for longitudinally framed plating, the membrane stress in *x*-direction σ_x being the normal stress σ_n defined in Ch 6, Sec 3, [2.1.2]
  - Buckling load case 2 for transversely framed plating, the membrane stress in y-direction σ_y being the normal stress σ_n defined in Ch 6, Sec3, [2.1.2], and the values *a* and *b* being exchanged to obtain α value greater than 1 as it is considered in load case 2.
- For the shear stress: Buckling case 5, τ being the shear stress τ_{SF} defined in Ch 6, Sec 3, [2.1.3].

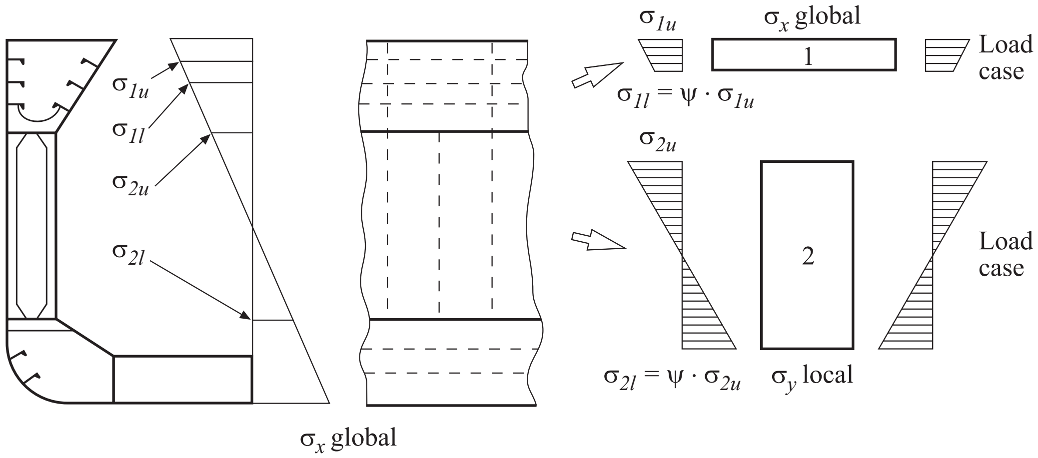

Figure 3: Idealization of elementary plate panels

1.2.2 Ordinary stiffeners

The buckling check of the longitudinal and transverse ordinary stiffeners of partial and total plate panels is to be performed under the loads defined in Ch 6, Sec 3, [2.1], according to Ch 6, Sec 3, [4] with:

- σ_x = normal stress σ_n defined in Ch 6 Sec 3 [2.1.2]
- $\sigma_y = 0$

The effective width of the attached plating of the stiffeners is to be determined in accordance with Ch 6, Sec 3 [5]. A constant stress is to be assumed corresponding to the greater of the following values:

- stress at half length of the stiffener
- 0.5 of the maximum compressive stress of adjacent elementary plate panels

1.2.3 Primary supporting members with stiffeners in parallel

The effective width of the attached plating of the primary supporting members is to be determined in accordance with Ch 6, Sec 3, [5.2].

In addition, when ordinary stiffeners are fitted on the attached plate and parallel to a primary supporting member, the buckling check is to consider a moment of inertia I_x taking account the moments of inertia of the parallel ordinary stiffeners connected to its attached plate (see Ch 6, Sec 3, Fig 3).

1.2.4 Primary supporting members with stiffener perpendicular to girder

The effective width of the attached plating of the primary supporting members is to be determined in accordance with Ch 6, Sec 3, [5.2].

In addition, when ordinary stiffeners are fitted on the attached plate and perpendicular to a primary supporting member, the buckling check is to consider a moment of inertia I_x taking account the effective width according to (see Ch 6, Sec 3, Fig. 4).

1.3 Additional application to FEM analysis

1.3.1 Non uniform compressive stresses along the length of the buckling panel

If compressive stresses are not uniform over the length of the unloaded plate edge (e.g. in case of girders subjected to bending), the compressive stress value is to be taken at a distance of $b/2$ from the transverse plate edge having the largest compressive stress (see Fig 4). This value is not to be less than the average value of the compressive stress along the longitudinal edge.

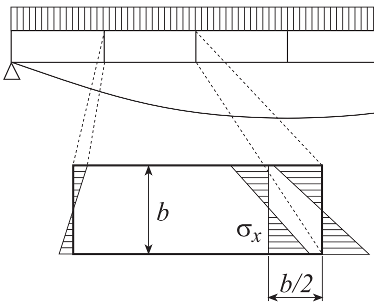

Figure 4: Non uniform compressive stress along longitudinal edge *a*

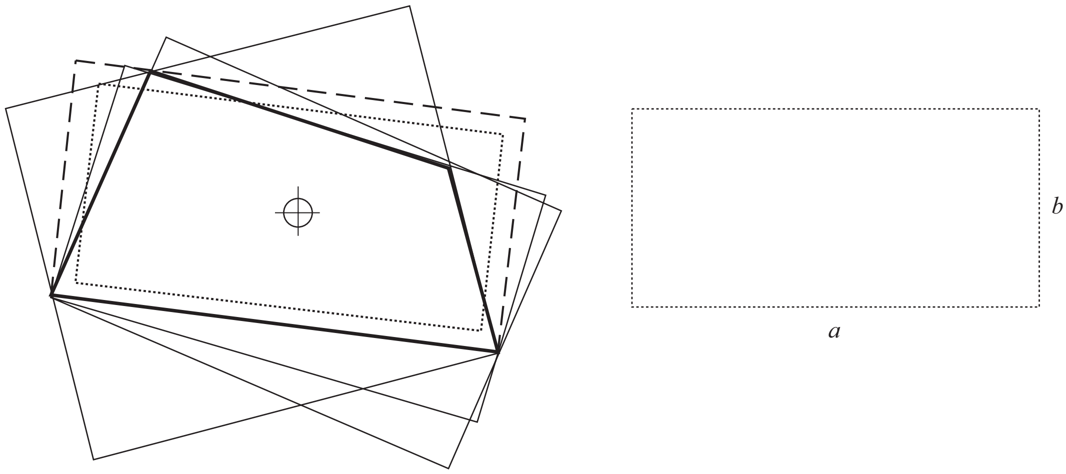
1.3.2 Buckling stress calculation of non rectangular elementary plate panels

a) Quadrilateral panels

According to Fig 5, rectangles that completely surround the irregular buckling panel are searched. Among several possibilities the rectangle with the smallest area is taken. This rectangle is shrunk to the area of the original panel, where the aspect ratio and the centre are maintained. This leads to the final rectangular panel with the dimensions a, b.



Original irregular panel ( )

Intermediate rectangles ( )

Rectangle with smallest area ( )

Final rectangle ( )

Figure 5: Approximation of non rectangular elementary plate panels

b) Trapezoidal elementary plate panel

A rectangle is derived with *a* being the mean value of the bases and *b* being the height of the original panel.

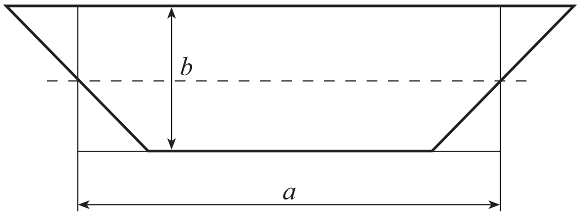


Figure 6: Approximation of trapezoidal elementary plate panel

c) Right triangle

The legs of the right triangle are reduced by $\sqrt{0.5}$ to obtain a rectangle of same area and aspect ratio.

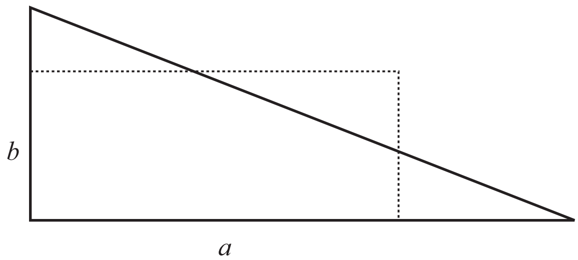

Figure 7: Approximation of right triangle

d) General triangle

General triangle is treated according to a) above.

1.3.3 Buckling assessment of side shell plates

In order to assess the buckling criteria for vertically stiffened side shell plating, the following cases have to be considered:

In case vertical and shear stresses are approximately constant over the height of the elementary plate panel:

- Buckling load cases 1, 2 and 5, according to Ch 6, Sec 3, Tab 2 are to be considered
- $\psi = f(\sigma_1, \sigma_2)$ for horizontal stresses
- $\psi = 1.0$ for vertical stresses
- $t = t_{min}$ (Elementary plate panel)

In case of distributed horizontal, vertical and shear stresses over the height of the elementary plate panel, the following stress situations are to be considered separately:

a) Pure vertical stress

- The size of buckling field to be considered is *b* times *b* ($\alpha = 1$)
- $\psi = 1.0$
- The maximum vertical stress in the elementary plate panel is to be considered in applying the criteria

b) Shear stress associated to vertical stress

- The size of buckling field to be considered is $2b$ times b ($\alpha = 2$)
- $\psi = 1.0$
- The following two stress combinations are to be considered:
  - The maximum vertical stress in the elementary plate panel plus the shear stress and longitudinal stress at the location where maximum vertical stress occurs
  - The maximum shear stress in the elementary plate panel plus the vertical stress and longitudinal stress at the location where maximum shear stress occurs
- The plate thickness t to be considered is the one at the location where the maximum vertical/shear stress occurs

c) Distributed longitudinal stress associated with vertical and shear stress

- The actual size of the elementary plate panel is to be used ($\alpha = f(a,b)$).
- The actual edge factor ψ for longitudinal stress is to be used
- The average values for vertical stress and shear stress are to be used.
- $t = t_{min}$ (Elementary plate panel)

1.3.4 Buckling assessment of corrugated bulkheads

The transverse elementary plate panel (face plate) is to be assesed using the normal stress parallel to the corrugation. The slanted elementary plate panel (web plate) is to be assessed using the combination of normal and shear stresses.

The plate panel breadth b is to be measured according to Fig 8.

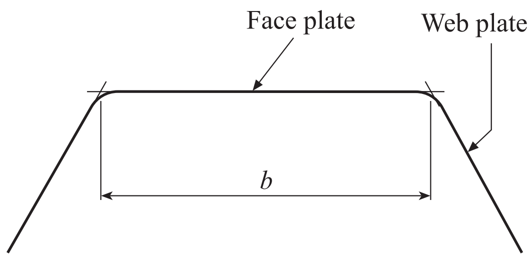

Figure 8: Measuring *b* of corrugated bulkheads

a) Face plate assessment

- The buckling load case 1, according to Ch 6, Sec 3, Tab 2, is to be used
- The size of the buckling field to be considered is b times b ($\alpha = 1$)
- $\psi = 1.0$
- The maximum vertical stress in the elementary plate panel is to be considered in applying the criteria
- The plate thickness t to be considered is the one at the location where the maximum vertical stress occurs

b) Web plate assessment

- The buckling load cases 1 and 5, according to Ch 6, Sec 3, Tab 2, are to be used.
- The size of the buckling field to be considered is 2*b* times *b* ($\alpha = 2$)
- $\psi = 1.0$
- The following two stress combinations are to be considered:
  - The maximum vertical stress in the elementary plate panel plus the shear stress and longitudinal stress at the location where maximum vertical stress occurs
  - The maximum shear stress in the elementary plate panel plus the vertical stress and longitudinal stress at the location where maximum shear stress occurs
- The plate thickness *t* to be considered is the one at the location where the maximum vertical/shear stress occurs.

Chapter 7

Direct Strength Analysis

Section 1 – DIRECT STRENGTH ASSESSMENT OF THE PRIMARY SUPPORTING MEMBERS

1. General

1.1 Application

1.1.1

Direct strength assessment of primary supporting members based on a three-dimensional (3D) finite element (FE) analysis is to be applied to ships having length L of 150 m or above.

1.1.2

Three kinds of FE analysis procedures are specified in this Chapter:

a) global strength FE analysis (first FE analysis step) to assess global strength of primary supporting members of the cargo hold structure, according to Sec 2.
b) detailed stress assessment (second FE analysis step) to assess highly stressed areas with refined meshes, according to Sec 3
c) hot spot stress analysis (third FE analysis step) to calculate hot spot stresses at stress concentration points with very fine meshes for fatigue strength assessment, according to Sec 4.

A flowchart of FE analysis procedure for direct strength assessment is shown in Fig 1.

1.2 Computer program

1.2.1

Computer programs for FE analysis are to be suitable for the intended analysis. Reliability of unrecognized programs is to be demonstrated to the satisfaction of the Society prior to the commencement of the analysis.

1.3 Submission of analysis report

1.3.1

A detailed report of direct strength FE analysis is to be submitted, including background information of the analysis. This report is to include the following items:

a) list of drawings/plans used in the analysis, including their versions and dates
b) detailed description of structural modeling principles and any deviations in the model from the actual structures
c) plots of structural model
d) material properties, plate thickness and beam properties used in the model
e) details of boundary conditions
f) all loading conditions analyzed
g) data for loads application
h) summaries and plots of calculated deflections
i) summaries and plots of calculated stresses

j) details of buckling strength assessment

k) tabulated results showing compliance with the design criteria

l) reference of the finite element computer program, including its version and date.

1.4 Net scantling

1.4.1

Direct strength analysis is to be based on the net scantling approach according to Ch 3, Sec 2.

1.5 Applied loads

1.5.1 Design loads

Direct strength analysis is to be carried out by applying design loads given in Ch 4 at a probability level of 10^{-8}, except for fatigue strength assessment where probability level is 10^{-4}. Combination of static and dynamic loads which are likely to impose the most severe load regime are to be applied to the 3D FE model.

1.5.2 Structural weight

Effect of the hull structure weight is to be included in static loads, but is not to be included in dynamic loads. Standard density of steel is to be taken as 7.85 t/m^3.

1.5.3 Loading conditions

The loading conditions specified in Ch 4, Sec 7 are to be considered in 3D FE analysis.

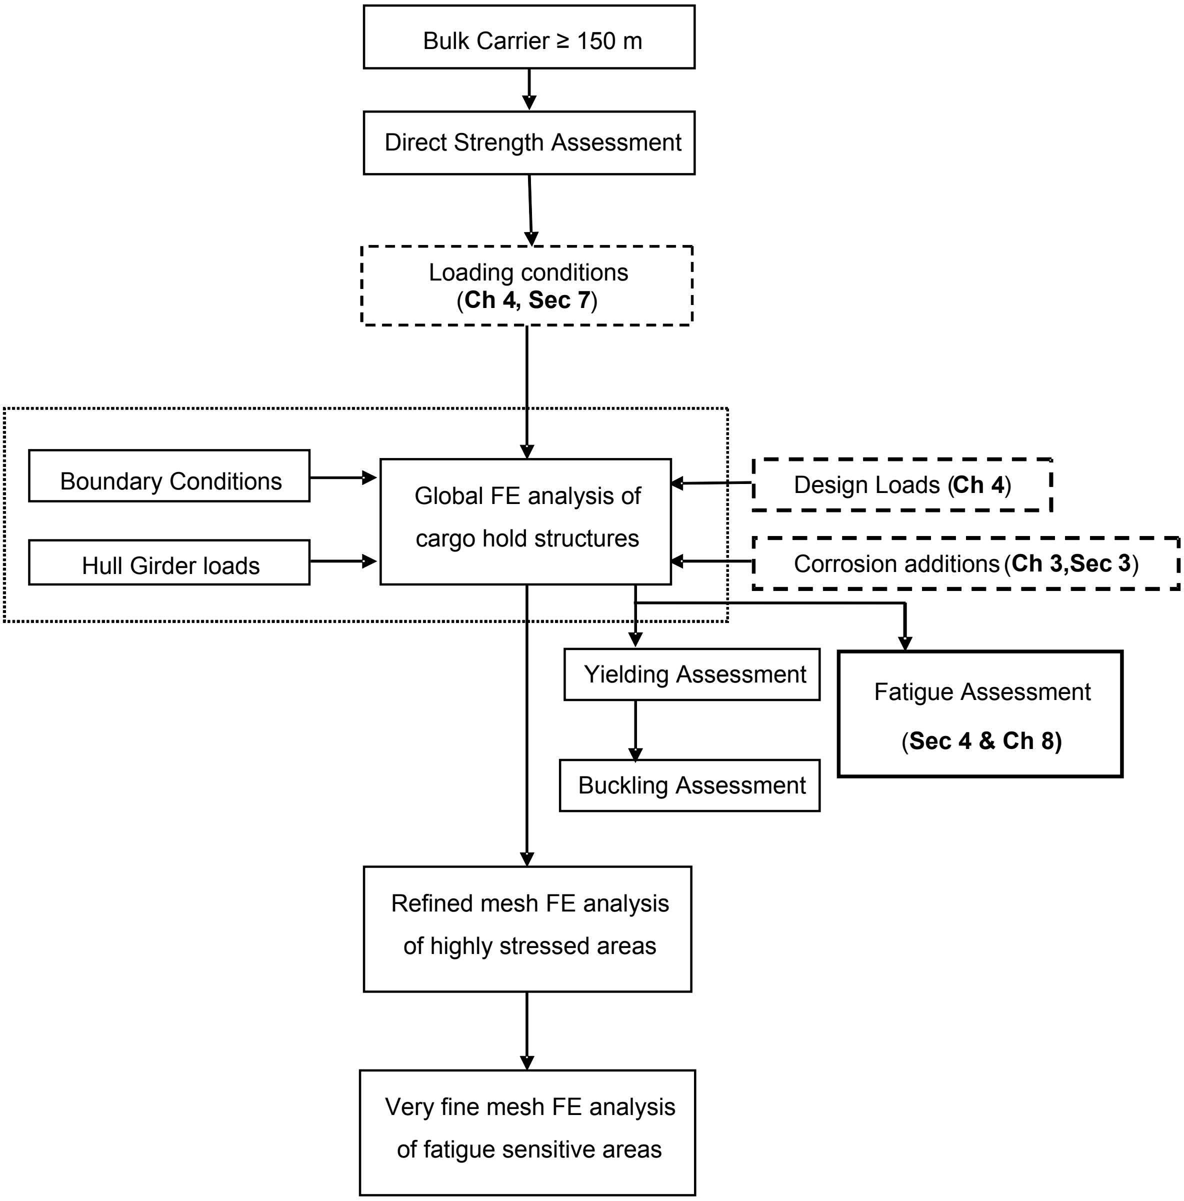

Figure 1: Flowchart of FE analysis procedure

Section 2 – GLOBAL STRENGTH FE ANALYSIS OF CARGO HOLD STRUCTURES

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

M_{SW} : Design vertical bending moment as defined in Ch 4, Sec 7, Tab 2.

M_{WV} : Vertical wave bending moment, in hogging or sagging condition, as defined in Ch 4, Sec 3, [3.1.1]

M_{WH} : Horizontal wave bending moment, as defined in Ch 4, Sec 3, [3.3.1]

Q_{SW} : Allowable still water shear force at the considered bulkhead position as provided in Ch 4, Sec 7, Tab 3

Q_{WV} : Vertical wave shear force as defined in Ch 4, Sec 3, [3.2.1]

C_{WV} , C_{WH} : Load combination factors, as defined in Ch 4, Sec 4, Tab 3.

1. General

1.1 Application

1.1.1

The procedure given in this Section focuses on direct strength analysis of cargo hold structures in midship area.

1.1.2

The global strength FE analysis of cargo hold structures is intended to verify that the following are within the acceptance criteria under the applied static and dynamic loads:

a) stress level in the hull girder and primary supporting members
b) buckling capability of primary supporting members
c) deflection of primary supporting members.

2. Analysis model

2.1 Extent of model

2.1.1

The longitudinal extent of FE model is to cover three cargo holds and four transverse bulkheads. The transverse bulkheads at the ends of the model extent are to be included, together with their associated stools. Both ends of the model are to form vertical planes and to include any transverse web frames on the planes if any. The details of the extent of the model are given in App 1.

2.1.2

FE model is to include both sides of ship structures considering unsymmetrical wave-induced loads in the transverse direction.

2.1.3

All main structural members are to be represented in FE model. These include inner and outer shell, floor and girder system in double bottom, transverse and vertical web frames, stringers, transverse and longitudinal bulkhead structures. All plates and stiffeners on these structural members are to be modelled.

2.2 Finite element modeling

2.2.1

All main structural members (plates and stiffeners) detailed in [2.1.3] are to be represented in FE model.

2.2.2

Mesh boundaries of finite elements are to simulate the stiffening systems on the actual structures as far as practical and are to represent the correct geometry of the panels between stiffeners.

2.2.3

Stiffness of each structural member is to be represented correctly by using proper element type for the structural member. The principle for selection of element type is given below.

(1) Stiffeners are to be modeled by beam or bar element having axial, torsional, bi-directional shear and bending stiffness. However, web stiffeners and face plates of primary supporting members may be modeled by rod element having only axial stiffness and a constant cross-sectional area along its length.

(2) Plates are to be modeled by shell element having out-of-plane bending stiffness in addition to bi-axial and in-plane stiffness. However, membrane element having only bi-axial and in-plane stiffness can be used for plates that are not subject to lateral pressures.

For membrane and shell elements, only linear quad or triangle elements, as shown in Fig 1, are to be adopted.

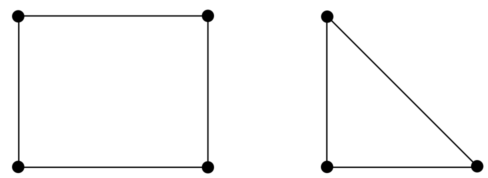

Figure 1: Linear membrane and shell quad and triangle elements

Triangle elements are to be avoided as far as possible, especially in highly stressed areas and in such areas around openings, at bracket connections and at hopper connections where significant stress gradient should be predicted.

(3) Stiffened panels may be modeled by two-dimensional (2D) orthotropic elements that can represent the stiffness of the panels properly.

2.2.4

When orthotropic elements are not used in FE model:

- mesh size is to be equal to or less than the representative spacing of longitudinal stiffeners or transverse side frames
- stiffeners are to be modeled by using rod and/or beam/bar elements

- webs of primary supporting members are to be divided by at least three elements height-wise. However, for transverse primary supporting members inside hopper tank and top side tank, which are less in height than the space between ordinary longitudinal stiffeners, two elements on the height of supporting primary members are accepted.

RCN 1 to July 2008 version (effective from 1 July 2009)

- side shell frames and their end brackets are to be modeled by using shell elements for web and shell/beam/rod elements for face plate. Webs of side shell frames need not be divided along the direction of depth

RCN 1 to July 2008 version (effective from 1 July 2009)

- aspect ratio of elements is not to exceed 1:4.

An example of typical mesh is given in App 1.

2.2.5

When orthotropic elements are used in FE model for stiffened panels:

- for the members such as the double bottom girder or floor, the element height is to be the double bottom height.
- where a stiffener is located along the edge between two orthotropic elements, either it is to be modelled by using beam/rod element, or it is virtually modelled by reporting the stiffness of the stiffener onto the two orthotropic elements
- where a stiffener is located along the edge between an orthotropic element and a membrane/shell element, it is to be modelled by using beam/rod element
- where a stiffener is located along the edge between two membrane/shell elements, it is to be modelled by using beam/rod element
- where a double hull is fitted, the web of the primary supporting members is to be modelled with one element on its height
- where no double hull construction is fitted, at least one over three frame and its associated end brackets are to be modelled by using shell elements for the webs and shell/beam elements for the flanges
- the aspect ratio of the elements is not to exceed 1:2.

2.3 Boundary conditions

2.3.1

Both ends of the model are to be simply supported according to Tab 1 and Tab 2. The nodes on the longitudinal members at both end sections are to be rigidly linked to independent points at the neutral axis on the centreline as shown in Tab 1. The independent points of both ends are to be fixed as shown in Tab 2.

RCN 1 to July 2008 version (effective from 1 July 2009)

Table 1: Rigid-link of both ends

Nodes on longitudinal members at both ends of the model	Translational			Rotational		
	Dx	Dy	Dz	Rx	Ry	Rz
All longitudinal members	RL	RL	RL	-	-	-
RL means rigidly linked to the relevant degrees of freedom of the independent point						

Table 2: Support condition of the independent point

Location of the independent point	Translational			Rotational		
	Dx	Dy	Dz	Rx	Ry	Rz
Independent point on aft end of model	-	Fix	Fix	Fix	-	-
Independent point on fore end of model	Fix	Fix	Fix	Fix	-	-

RCN 1 to July 2008 version (effective from 1 July 2009)

2.4 Loading conditions

2.4.1 General

The loading conditions, combined with loading patterns and load cases, as illustrated in Ch 4, App 2, are to be considered as mandatory conditions for the conventional designs.

2.5 Consideration of hull girder loads

2.5.1 General

Each loading condition is to be associated with its corresponding hull girder loads. The load combination is to be considered using Load Combination Factors (LCFs) of the wave-induced vertical and horizontal bending moments and of the wave-induced vertical shear forces specified in Ch 4, Sec 4 for each Load Case.

2.5.2 Vertical bending moment analysis

Vertical bending moment analysis is to be performed for cases listed in Ch 4, Sec 7, Tab 2, the minimum required cases being listed in Ch 4, App 2.

In vertical bending moment analysis the target hull girder loads are the maximum vertical bending moments which may occur at the centre of the mid-hold in the FE model. The target values of hull girder loads are to be obtained in accordance with Tab 3 with considering still water vertical bending moments specified in Ch 4, Sec 7, Tab 2, and in Ch 4, App 2.

Table 3: Target loads for vertical bending moment analysis

Hull girder effect	Still water	Wave	Considered Location
Vertical bending moment	M_{SW}	$C_{WV}\,M_{WV}$	Centre of mid-hold
Vertical shear force	0	0	Centre of mid-hold
Horizontal bending moment	---	$C_{WH}\,M_{WH}$	Centre of mid-hold
Horizontal shear force	---	0	Centre of mid-hold

2.5.3 Vertical shear force analysis

Vertical shear force analysis is to be performed for cases listed in Ch 4, Sec 7, Tab 3, the minimum required cases being listed in Ch 4, App 2.

In vertical shear force analysis the target hull girder loads are the maximum vertical shear force which may occur at one of the transverse bulkheads of the mid-hold in the FE model. Reduced vertical bending moments are considered simultaneously. The target values of hull girder loads are to be obtained in accordance with Tab 4 with considering still water vertical bending moments and shear forces specified in Ch 4, Sec 7, Tab 2 and Ch 4, Sec 7, Tab 3, and in Ch 4, App 2.

Table 4: Target loads for vertical shear force analysis

Hull girder effect	Still water	Wave	Location
Vertical bending moment	$0.8M_{SW}$	$0.65\ C_{WV}\ M_{WV}$	Transverse bulkhead
Vertical shear force	Q_{SW}	Q_{WV}	Transverse bulkhead
Horizontal bending moment	---	0	Transverse bulkhead
Horizontal shear force	---	0	Transverse bulkhead

2.5.4 Influence of local loads

The distribution of hull girder shear force and bending moment induced by local loads applied on the model are calculated using a simple beam theory for the hull girder.

Reaction forces at both ends of the model and distributions of shearing forces and bending moments induced by local loads can be determined by following formulae:

$$R_{V\_fore} = -\frac{\sum_i (x_i - x_{aft})\vec{f}_i \cdot \vec{z}}{x_{fore} - x_{aft}} \qquad R_{V\_aft} = \sum_i \vec{f}_i \cdot \vec{z} + R_{V\_fore}$$

$$R_{H\_fore} = \frac{\sum_i (x_i - x_{aft})\vec{f}_i \cdot \vec{y}}{x_{fore} - x_{aft}} \qquad R_{H\_aft} = -\sum_i \vec{f}_i \cdot \vec{y} + R_{H\_fore}$$

$$Q_{V\_FEM}(x) = R_{V\_aft} - \sum_i \vec{f}_i \cdot \vec{z} \qquad \text{when } x_i < x$$

$$Q_{H\_FEM}(x) = R_{H\_aft} + \sum_i \vec{f}_i \cdot \vec{y} \qquad \text{when } x_i < x$$

$$M_{V\_FEM}(x) = (x - x_{aft})R_{V\_aft} - \sum_i (x - x_i)\vec{f}_i \cdot \vec{z} \qquad \text{when } x_i < x$$

$$M_{H\_FEM}(x) = (x - x_{aft})R_{H\_aft} + \sum_i (x - x_i)\vec{f}_i \cdot \vec{y} \qquad \text{when } x_i < x$$

where:

x_{aft} : Location of the aft end support,

x_{fore} : Location of the fore end support,

x : Considered location,

R_{V_aft}, R_{V_fore}, R_{H_aft} and R_{H_fore} : Vertical and horizontal reaction forces at the fore and aft ends

Q_{V_FEM}, Q_{H_FEM}, M_{V_FEM} and M_{H_FEM} : Vertical and horizontal shear forces and bending moments created by the local loads applied on the FE model. Sign of Q_{V_FEM}, M_{V_FEM} and M_{H_FEM} is in accordance with the sign convention defined in Ch 4, Sec 3. The sign convention for reaction forces is that a positive creates a positive shear force.

$\vec{f}_i$: Applied force on node i due to all local loads,

x_i : Longitudinal coordinate of node *i*.

2.5.5 Methods to account for hull girder loads

For bending moment analysis, two alternative methods can be used to consider the hull girder loads/stresses in the assessment of the primary supporting members:

a) to add the hull girder loads directly to FE model (direct method), or

b) to superimpose the hull girder stresses separately onto the stresses obtained from the structural analysis using the lateral loads (superimposition method).

For shear force analysis, the "direct method" is to be used.

2.5.6 Direct method

In direct method the effect of hull girder loads are directly considered in 3D FE model. The equilibrium loads are to be applied at both model ends in order to consider the hull girder loads as specified in [2.5.2] and [2.5.3] and influence of local loads as specified in [2.5.4].

In order to control the shear force at the target locations, two sets of enforced moments are applied at both ends of the model. These moments are calculated by following formulae:

$$M_{Y\_aft\_SF} = M_{Y\_fore\_SF} = \frac{(x_{fore} - x_{aft})}{2}\left[Q_{V\_T}(x_{eq}) - Q_{V\_FEM}(x_{eq})\right]$$

$$M_{Z\_aft\_SF} = M_{Z\_fore\_SF} = \frac{(x_{fore} - x_{aft})}{2}\left[Q_{H\_T}(x_{eq}) - Q_{H\_FEM}(x_{eq})\right]$$

In order to control the bending moments at the target locations, another two sets of enforced moments are applied at both ends of the model. These moments are calculated by following formulae:

$$M_{Y\_aft\_BM} = -M_{Y\_fore\_BM} = -\left[M_{V\_T}(x_{eq}) - M_{V\_FEM}(x_{eq}) - M_{Y\_aft\_SF}\left(2\frac{x_{eq} - x_{aft}}{x_{fore} - x_{aft}} - 1\right)\right]$$

$$M_{Z\_aft\_BM} = -M_{Z\_fore\_BM} = -\left[M_{H\_T}(x_{eq}) - M_{H\_FEM}(x_{eq}) - M_{Z\_aft\_SF}\left(2\frac{x_{eq} - x_{aft}}{x_{fore} - x_{aft}} - 1\right)\right]$$

where:

x_{eq} : Considered location for the hull girder loads evaluation,

Q_{V_FEM}, Q_{H_FEM}, M_{V_FEM}, M_{H_FEM} : As defined in [2.5.4]

Q_{V_T}, Q_{H_T}, M_{V_T}, M_{H_T} : Target vertical and horizontal shear forces and bending moments, defined in Tab 3 or Tab 4, at the location x_{eq}. Sign of Q_{V_T}, M_{V_T} and M_{H_T} is in accordance with sign convention defined in Ch 4, Sec 3.

$M_{Y\_aft\_SF}$, $M_{Y\_fore\_SF}$, $M_{Y\_aft\_BM}$, $M_{Y\_fore\_BM}$: Enforced moments to apply at the aft and fore ends for vertical shear force and bending moment control, positive for clockwise around *y*-axis. The sign convention for $M_{Y\_aft\_SF}$, $M_{Y\_fore\_SF}$, $M_{Y\_aft\_BM}$ and $M_{Y\_fore\_BM}$ is that of the FE model axis. The sign convention for other bending moment, shear forces and reaction forces is in accordance with the sign convention defined in Ch 4, Sec 3.

$M_{Z\_aft\_SF}$, $M_{Z\_fore\_SF}$, $M_{Z\_aft\_BM}$, $M_{Z\_fore\_BM}$: Enforced moments to apply at the aft and fore ends for horizontal shear force and bending moment control, positive for clockwise around *z*-axis. The sign convention for $M_{Z\_aft\_SF}$, $M_{Z\_fore\_SF}$, $M_{Z\_aft\_BM}$ and $M_{Z\_fore\_BM}$ is that of the FE model axis. The sign

convention for other bending moment, shear forces and reaction forces is in accordance with the sign convention defined in Ch 4, Sec 3.

The enforced moments at the model ends can be generated by one of the following methods:

- to apply distributed forces at the end section of the model, with a resulting force equal to zero and a resulting moment equal to the enforced moment. The distributed forces are applied to the nodes on the longitudinal members where boundary conditions are given according to Tab 1. The distributed forces are to be determined by using the thin wall beam theory
- to apply concentrated moments at the independent points defined in [2.3.1].

2.5.7 Superimposition method

For vertical bending moment analysis in the superimposition method, the stress obtained from the following formula is to be superimposed to the longitudinal stress of each element in longitudinal members obtained from 3D FE analysis. Vertical shear force analyses are to be in accordance with [2.5.6].

$$\sigma_{SIM} = \frac{M_{V\_T}}{I_Y/(z-N)} - \frac{M_{H\_T}}{I_Z/y}$$

where

M_{V_T}, M_{H_T} : Target vertical and horizontal bending moments at considering section, respectively, with corrections due to local loads, taken equal to:

$$M_{V\_T} = M_{SW} + C_{WV} \cdot M_{WV} - M_{V\_FEM}$$

$$M_{H\_T} = C_{WH} \cdot M_{WH} - M_{H\_FEM}$$

I_Y : Vertical inertia of the section around horizontal neutral axis, calculated according to Ch 3, Sec 2, [3.2.1]

I_Z : Horizontal inertia of the section, calculated according to Ch 3, Sec 2, [3.2.1]

N : Z co-ordinate of the centre of gravity of the hull transverse section, as defined in Ch 5, Sec 1

y : Y co-ordinate of the element

z : Z co-ordinate of the element.

3. Analysis criteria

3.1 General

3.1.1 Assessment holds

All the primary supporting members in the mid-hold of the three-hold (1+1+1) FE model, including bulkheads, are to be evaluated in 3D FE analysis.

3.1.2

The results of the structural analysis are to satisfy the criteria for yielding strength, buckling strength and deflection of primary members.

3.2 Yielding strength assessment

3.2.1 Reference stresses

Reference stress is Von Mises equivalent stress at the centre of a plane element (shell or membrane) or axial stress of a line element (bar, beam or rod) obtained by FE analysis through considering hull girder loads according to [2.5.4] or [2.5.5].

Where the effects of openings are not considered in the FE model, the reference stresses in way of the openings are to be properly modified with adjusting shear stresses in proportion to the ratio of web height and opening height.

Where elements under assessment are smaller than the standard mesh size specified in [2.2.4] or [2.2.5], the reference stress may be obtained from the averaged stress over the elements within the standard mesh size.

RCN 1 to July 2008 version (effective from 1 July 2009)

3.2.2 Equivalent stress

Von Mises equivalent stress is given by the following formula:

$$\sigma_{eq} = \sqrt{\sigma_x{}^2 - \sigma_x \sigma_y + \sigma_y{}^2 + 3\tau_{xy}{}^2}$$

σ_x, σ_y : Element normal stresses, in N/mm^2

τ_{xy} : Element shear stress, in N/mm^2

In superimposition method, the stress σ_{SIM} , defined in [2.5.7], is to be superimposed onto to longitudinal stress component.

3.2.3 Allowable stress

The reference stresses in FE model that does not include orthotropic elements, as specified in [2.2.4], are not to exceed 235/*k* N/mm^2, where *k* is the material factor defined in Ch 3, Sec 1.

The reference stresses in FE model that includes orthotropic elements, as specified in [2.2.5], are not to exceed 205/*k* N/mm^2, where *k* is the material factor defined in Ch 3, Sec 1.

3.3 Buckling and ultimate strength assessment

3.3.1 General

Buckling and ultimate strength assessment is to be performed for the panels on primary supporting members according to Ch 6, Sec 3.

3.3.2 Stresses of panel

The stresses in each panel are to be obtained according to the following procedures:

1) when the mesh model differs from the elementary plate panel geometry, the stresses σ_x.,σ_y and τ acting on an elementary plate panel are to be evaluated by extrapolation and/or interpolation of surrounding meshes using the elements stresses or using the displacement based method described in App 2.
2) stresses obtained from with superimposed or direct method have to be reduced for buckling assessment because of the Poisson effect, which is taken into consideration in both analysis methods. The correction has to be carried out after summation of stresses due to local and global loads.

When the stresses σ_x^* and σ_y^* are both compressive stresses, a stress reduction is to be made according to the following formulae:

$\sigma_x = (\sigma_x^* - 0.3\sigma_y^*) / 0.91$

$\sigma_y = (\sigma_y^* - 0.3\sigma_x^*) / 0.91$

Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

σ_x^*, σ_y^* : Stresses containing the Poisson effect

3) determine stress distributions along edges of the considered buckling panel by introducing proper linear approximation as shown in Fig 2.
4) calculate edge factor ψ according to Ch 6, Sec 3.

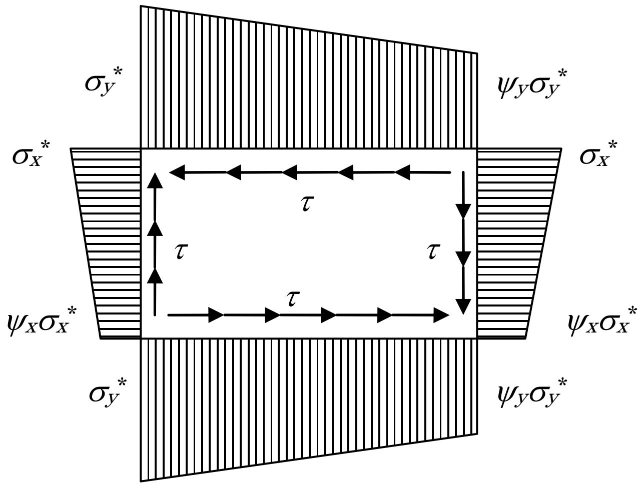

Figure 2: Stresses of panel for buckling assessment

3.3.3 Boundary conditions

Buckling load cases 1, 2, 5 or 6 of Ch 6, Sec 3, Tab 2 are to be applied to the buckling panel under evaluation, depending on the stress distribution and geometry of openings.

If the actual boundary conditions are significantly different from simple support condition, another case in Ch 6, Sec 3, Tab 2 can be applied.

3.3.4 Safety factor

The safety factor for the buckling and ultimate strength assessment of the plate is to be taken equal to 1.0.

3.4 Deflection of primary supporting members

The relative deflection, δ_{max}, in mm, in the outer bottom plate obtained by FEA is not to exceed the following criteria: *RCN 1 to July 2008 version (effective from 1 July 2009)*

$$\delta_{max} \le \frac{\ell_i}{150}$$

where:

δ_{max} : Maximum relative deflection, in mm, obtained by the following formula, and not including secondary deflection

$$\delta_{\max} = \max(|\delta_{B1}|, |\delta_{B2}|)$$

where, δ_{B1} and δ_{B2} are shown in Fig 3.

ℓ_i : Length or breadth of the flat part of the double bottom, in mm, whichever is the shorter.

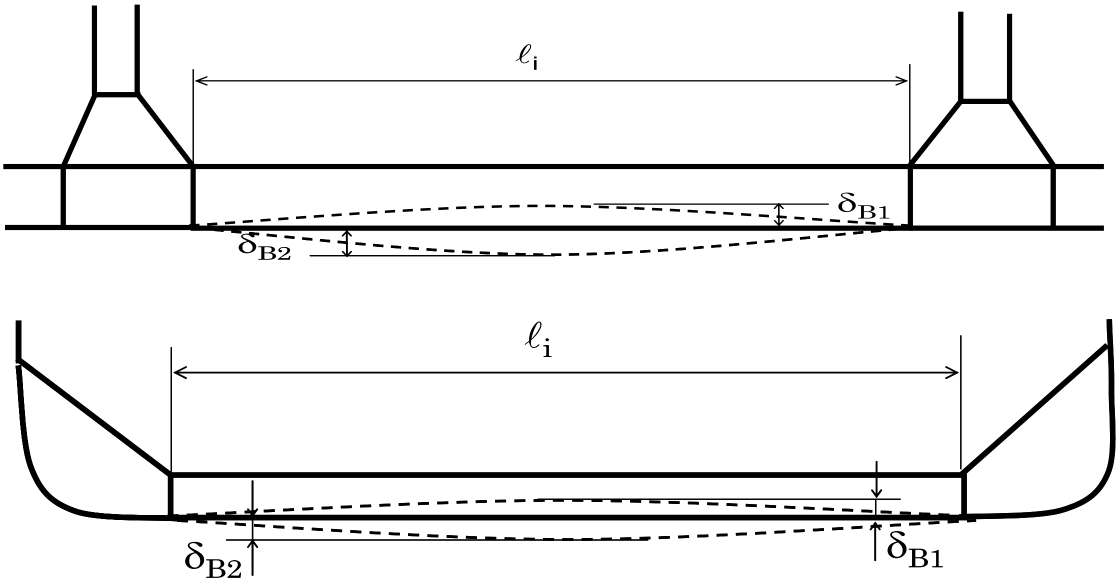

Figure 3: Definition of relative deflection

RCN 1 to July 2008 version (effective from 1 July 2009)

Section 3 – DETAILED STRESS ASSESSMENT

1. General

1.1 Application

1.1.1

This Section describes the procedure for the detailed stress assessment with refined meshes to evaluate highly stressed areas of primary supporting members.

Where the global cargo hold analysis of Sec 2 is carried out using a model complying with the modeling criteria of Sec 2, [2.2.4], the areas listed in Tab 1 are to be refined at the locations whose calculated stresses exceed 95% for non-orthotropic elements or 85% for orthotropic element but do not exceed 100% of the allowable stress as specified in Sec 2, [3.2.3].

RCN 1 to July 2008 version (effective from 1 July 2009)

2. Analysis model

2.1 Areas to be refined

2.1.1

Where the global cargo hold analysis of Sec 2 is carried out using a model complying with the modeling criteria of Sec 2, [2.2.4], the areas listed in Tab 1 are to be refined at the locations whose calculated stresses exceed 95% of the allowable stress as specified in Sec 2, [3.2.3].

2.1.2

Where the global cargo hold analysis of Sec 2 is carried out using a model complying with the modeling criteria of Sec 2, [2.2.5], all the high stressed areas listed below are to be refined:

- areas whose calculated stresses exceed 85% of the allowable stress as specified in Sec 2, [3.2.3].
- typical details of the primary supporting members as shown in Tab 1.
- typical details of the transverse bulkheads of the considered hold as shown in Tab 1.

Table 1: Typical details to be refined

Structural member	Area of interest	Additional specifications	Description
Primary supporting member	Most stressed transverse primary supporting member for double side skin constructions	Refining of the most stressed transverse primary supporting members located in: • double bottom • hopper tank • double skin side • topside tank		Most stressed transverse primary supporting member for single side skin constructions	Refining of the most stressed transverse primary supporting members located in: • double bottom • hopper tank • topside tank side shell frame with end brackets and connections to hopper tank and topside tank	Transverse bulkhead and its associated lower stool	Most stressed connection of the corrugations with the lower stool	High stressed elements, including the diaphragm(s) of the lower stool, are to be modeled		Most stressed connection of the lower stool with the inner bottom	High stressed elements are to be modeled	
Structural member	Area of interest	Additional specifications	Description
Inner bottom and hopper sloping plates with their associated supporting members	Most stressed connection of the inner bottom with the hopper sloping plate	Refining of the most stressed following members: • inner bottom • hopper sloping plate • floor • girder	Deck plating	Deck plating in way of the most stressed hatch corners	High stressed elements are to be modeled	
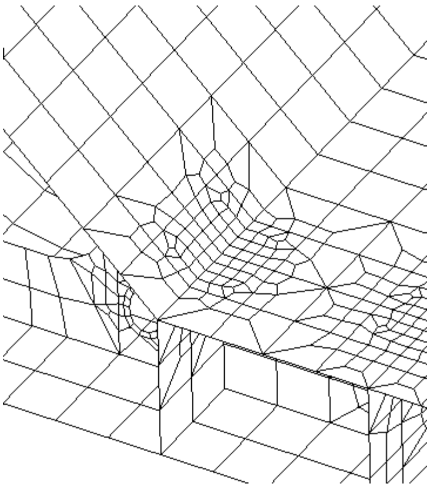
RCN 1 to July 2010 version (effective from 1July 2012)

2.2 Refining method

2.2.1

Two methods can be used for refining the high stressed areas:

- refined areas can be directly included in FE model used for the global cargo hold analysis of Ch 7, Sec 2 (See Fig 1).
- detailed stresses in refined areas can be analysed by separate sub-models.



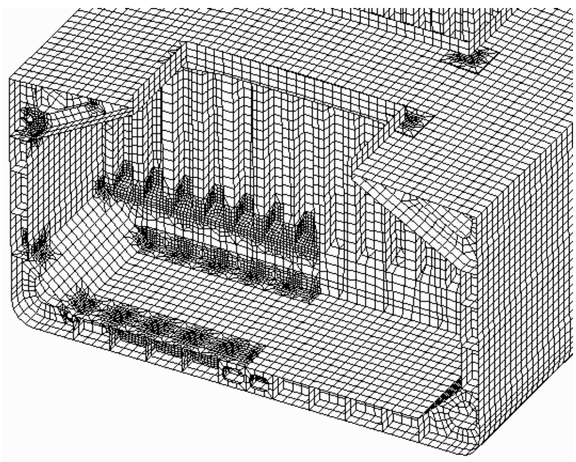


Figure 1: "Direct" modelling with refined meshes

2.3 Modeling

2.3.1 Element type

Each structural members is to be modeled by using proper element type for the structure in accordance with the principle in Sec 2, [2.2.3]. Orthotropic elements are not to be used in refined areas.

2.3.2 Mesh

The element size in refined areas is to be approximately one fourth of the representative spacing of ordinary stiffeners in the corresponding area, i.e. 200 × 200mm mesh size for structures whose ordinary stiffener spacing is 800 mm.

In addition, the web height of primary supporting members and web frames of single side bulk carriers is to be divided at least into 3 elements.

The aspect ratio of element is not to exceed 3. Quad elements are to have 90° angles as much as practicable, or to have angles between 45° and 135°.

2.3.3 Extent of sub-model

The minimum extent of sub-model is to be such that the boundaries of the sub-model correspond to the locations of adjacent supporting members (see Fig 2).

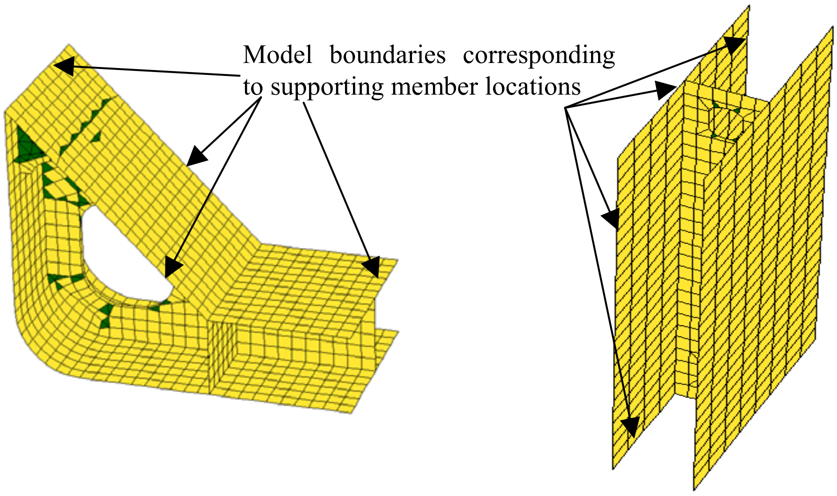

Figure 2: Boundaries of sub-models

2.4 Loading conditions

2.4.1

Loading conditions, which are applied to 3D FE model for the global cargo hold analysis according to Sec 2 and which induce stresses at considered locations exceeding the criteria specified in [2.1], are to be considered in the detailed stress assessment.

2.5 Boundary conditions

2.5.1

Boundary conditions as specified in Sec 2, [2.3.1] are to be applied to the global cargo hold FE model with refined meshes.

2.5.2
Nodal forces or nodal displacements obtained from the global cargo hold analysis of Sec 2 are to be applied to the sub-models. Where nodal forces are given, the supporting members located at the boundaries of a sub-model are to be included in the sub-model. Where nodal displacements are given and additional nodes are provided in sub-models, nodal displacements at the additional nodes are to be determined by proper interpolations.

3. Analysis criteria

3.1 Allowable stress

3.1.1
Von Mises equivalent stresses in plate elements and axial stresses in line elements within refined areas are not to exceed $280/k$ N/mm^2, where k is the material factor defined in Ch3, Sec 1.
In case elements significantly smaller than the size defined in [2.3.2] are used, this criteria applies to the average stress of all elements included in an area corresponding to a single element having the size specified in [2.3.2].

Section 4 – HOT SPOT STRESS ANALYSIS FOR FATIGUE STRENGTH ASSESSMENT

1. General

1.1 Application

1.1.1

This Section describes the procedure to compute hot spot stresses for fatigue strength assessment of each location specified in Ch 8, Sec 1, Tab 1 by using finite element method.

1.1.2

The loading conditions and the load cases specified in [2.2] are to be considered for hot spot stress analysis.

2. Analysis model

2.1 Modeling

2.1.1

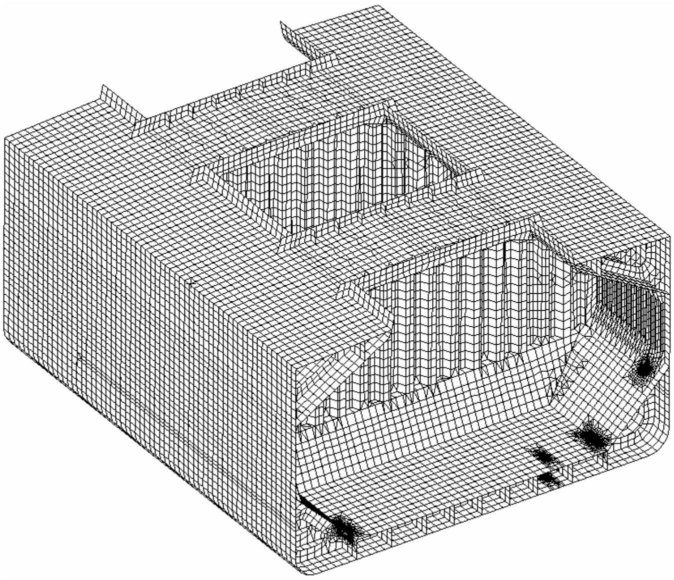
Hot spot stresses for fatigue assessment are to be obtained by the global cargo hold models where the areas for fatigue assessment are modeled by very fine meshes, as shown in Fig 1.
Alternatively, hot spot stresses can be obtained from sub-models, by using the similar procedures specified in Sec 3, [2].

2.1.2

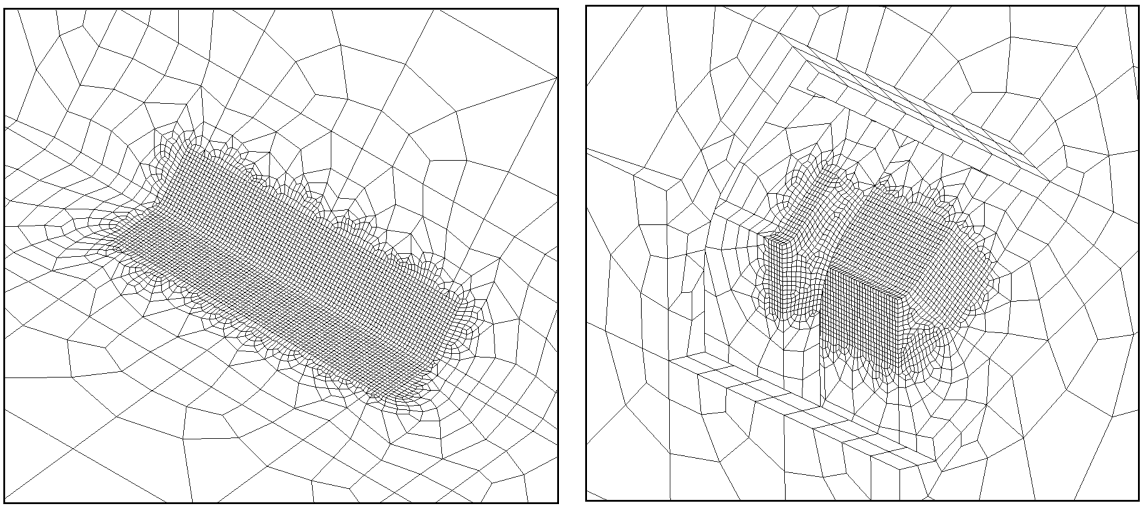
Areas within at least a quarter of frame spacing in all directions from the hot spot position are to be modeled by very fine meshes. The element size in very fine mesh areas is to be approximately equal to the representative net thickness in the assessed areas, and the aspect ratio of elements is to be close to 1.

2.1.3

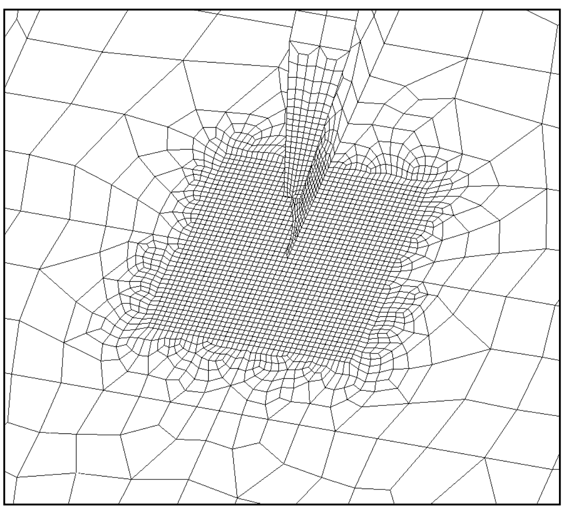
The mesh size is to be gradually changed from very fine mesh to fine mesh through the transition areas as shown in Fig 2. All structural members, including brackets, stiffeners, longitudinals and faces of transverse rings, etc., within transition areas are to be modeled by shell elements with bending and membrane properties. Geometries of welds are not to be modeled.



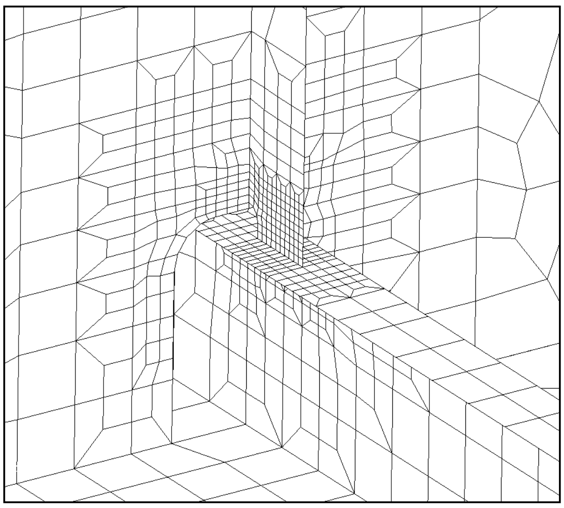
(a) Part of global cargo hold model with very fine mesh



(b) Bilge hopper knuckle part



(c) End of hold frame



(d) Longitudinal

Figure 1: Example of very fine mesh model

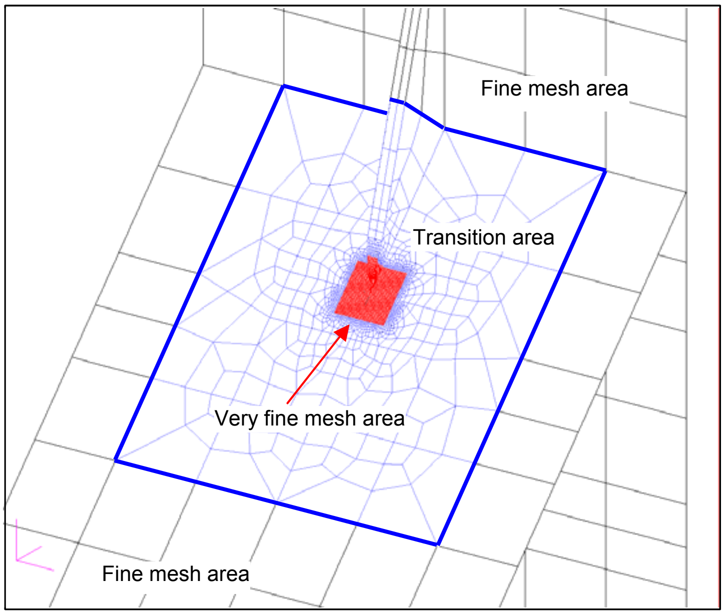


Figure 2: Very fine mesh area, transition area and fine mesh area

2.2 Loading conditions

2.2.1

The loading conditions, specified in Ch 8, Sec 1, Tab 2 and illustrated in Ch 4, App 3, are to be considered.

2.2.2

Probability level of 10^{-4} is to be used for calculation of design loads.

2.3 Boundary conditions

2.3.1

The boundary conditions specified in Sec2, [2.3.1] are to be applied to the cargo hold model with localized very fine meshes or the mother model for sub-models. When using sub-models, nodal displacements or forces obtained from the mother model are to be applied to sub-models.

3. Hot spot stress

3.1 Definition

3.1.1

The hot spot stress is defined as the structural geometric stress on the surface at a hot spot.

3.1.2

The hot spot stresses obtained by using superimposition method are to be modified according to Ch 8, Sec 3, [2.2] and [3.2].

3.2 Evaluation of hot spot stress

3.2.1

The hot spot stress in a very fine mesh is to be obtained using a linear extrapolation. The surface stresses located at 0.5 times and 1.5 times the net plate thickness are to be linearly extrapolated at the hot spot location, as described in Fig 3 and Fig.4.

The principal stress at the hot spot location having an angle with the assumed fatigue crack greater than 45° is to be considered as the hot spot stress.

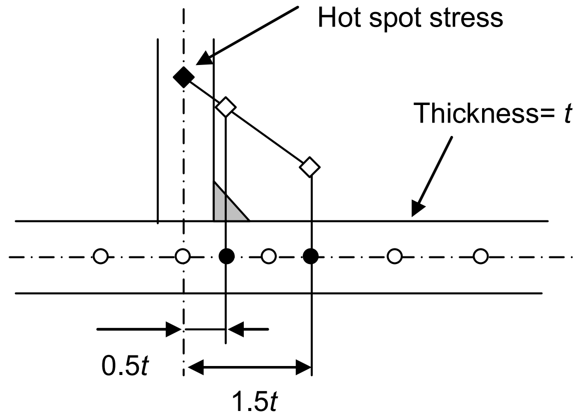

Figure 3: Definition of hot spot stress at an intersection of two plates

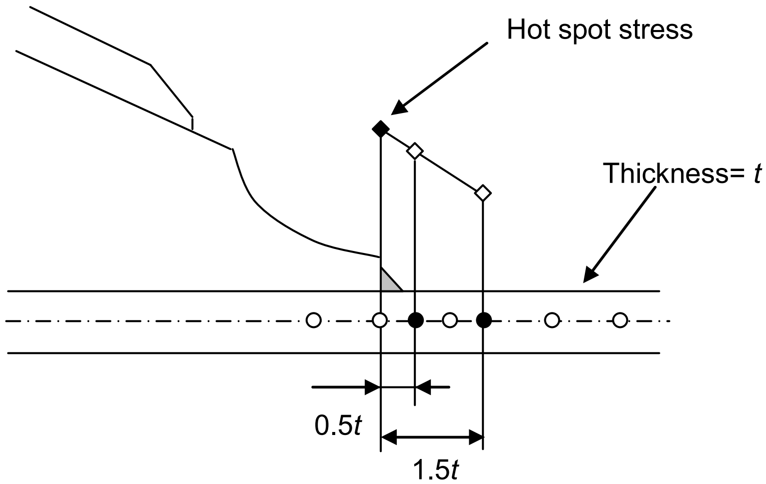

Figure 4: Definition of hot spot stress at an intersection of plating and bracket

3.2.2

The hot spot stress at the intersection of two plates, as obtained from [3.2.1], is to be multiplied by the correction factor λ defined below, considering the difference between the actual hot spot location and assumed location and the difference of stress gradient depending on the angle θ, in deg, between the two plates, to be measured between 0° and 90°.

- welded intersection between plane plates:

$$\lambda = \begin{cases} 0.8 & : \ \theta \le 75 \\ 0.8 - \dfrac{0.2}{15}(\theta - 75) & : \ 75 < \theta \end{cases}$$

- welded intersection between bent plate and plane plate: $\lambda = 0.7$ (i.e. bend type bilge knuckle part)

3.2.3

The hot spot stress in a non-welded area or along free edge is to be determined by extrapolating the principal stresses of the two adjacent elements, as shown in Fig 5.

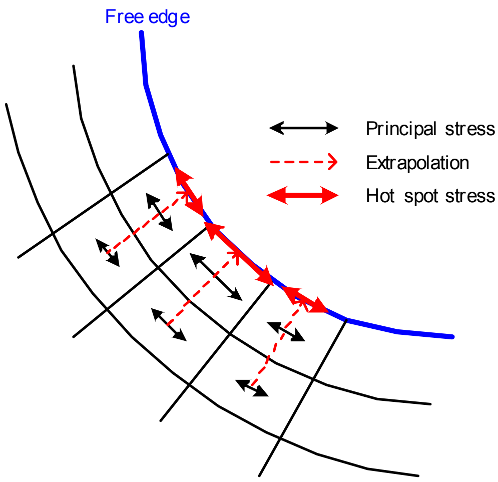

Figure 5: Definition of the hot spot stress along free edge

3.3 Simplified method for the bilge hopper knuckle part

3.3.1

At the bilge knuckle part, the hot spot stress $\sigma_{hotspot}$ may be computed by multiplying the nominal stress $\sigma_{nominal}$ with the stress concentration factor K_{gl} defined in [3.3.3].

$$\sigma_{hotspot} = K_{gl}\,\sigma_{nominal}$$

3.3.2

The nominal stress at the hot spot location is to be determined by extrapolating the membrane stresses located at 1.5 times and 2.5 times the frame spacing from the hot spot location, as shown in Fig 6.

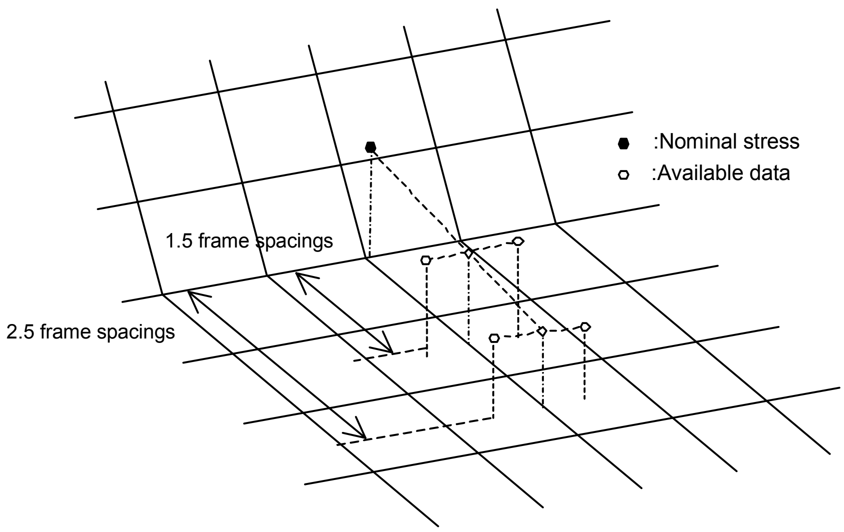

Figure 6: Definition of nominal stress at the bilge hopper knuckle part

3.3.3

The geometrical stress concentration factor K_{gl} for the bilge hopper knuckle part is given by the following equation:

$K_{gl} = K_0 \, K_1 \, K_2 \, K_3 \, K_4$

where:

K_0 : Stress concentration factor depending on the dimensions of the considered structure, defined in Tab 1

K_1 : Correction coefficient depending on the type of knuckle connection, defined in Tab 2

K_2 : Correction coefficient depending on the thickness increment of the transverse web, defined in Tab 2 or taken equal to 1.0 if there is no thickness increment

K_3 : Correction coefficient depending on the insertion of horizontal gusset or longitudinal rib (see Fig 7), defined in Tab 2 or taken equal to 1.0 if there is no horizontal gusset or longitudinal rib

K_4 : Correction coefficient depending on the insertion of transverse rib, defined in Tab 2 (see Fig 8) or taken equal to 1.0 if there is no transverse rib

Table 1: Stress concentration factor K_0

Plate net thickness in FE model t (mm)	Angle of hopper slope plate to the horizontal θ (deg.)			
	40	**45**	**50**	**90**
16	3.0	3.2	3.4	4.2
18	2.9	3.1	3.3	4.0
20	2.8	3.0	3.2	3.8
22	2.7	2.9	3.1	3.6
24	2.6	2.8	3.0	3.5
26	2.6	2.7	2.9	3.4
28	2.5	2.7	2.8	3.3
30	2.4	2.6	2.7	3.2

Note: Alternatively, K_0 can be determined by the following formula.

$$K_0 = \frac{0.14\theta \cdot (1.15 - 0.0033\theta)}{(0.5t)^{(0.2+0.0028\theta)}}$$

Table 2: **Correction coefficients**

Type of knuckle	K_1	K_2	K_3	K_4
Weld Type	1.7	0.9	0.9	0.9
Bend Type	1.75 ; $R/t < 4$ 2.80 ; $R/t > 8$		0.85 ; $R/t < 4$ 0.55 ; $R/t > 8$	

Notes :

(1) The linear interpolation is applied between $4 \le R/t \le 8$

"R" denotes the radius of bend part and "*t*" denotes the plate thickness

(2) In using the correction coefficient K_2, the members should be arranged such that the bending deformation of the radius part is effectively suppressed.

(3) The increase in web thickness is taken based on the plate thickness of the inner bottom plating.

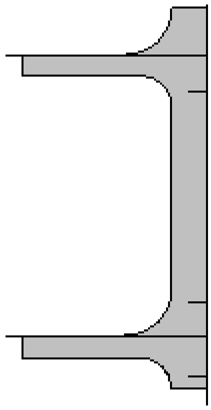

Figure 7: **Example of insertion of horizontal gusset or longitudinal rib**

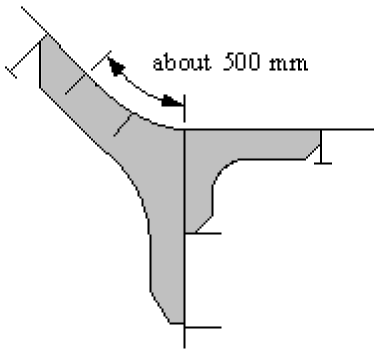

Figure 8: **Example of insertion of transverse rib**

Appendix 1 – LONGITUDINAL EXTENT OF THE FINITE ELEMENT MODELS

1. Longitudinal extent

A three-hold length finite element model is recommended for the analysis, with the mid-hold as the target of assessment.

The three-hold length finite element model reduces the adverse effects of the boundary conditions to a minimum in the assessed mid-hold.

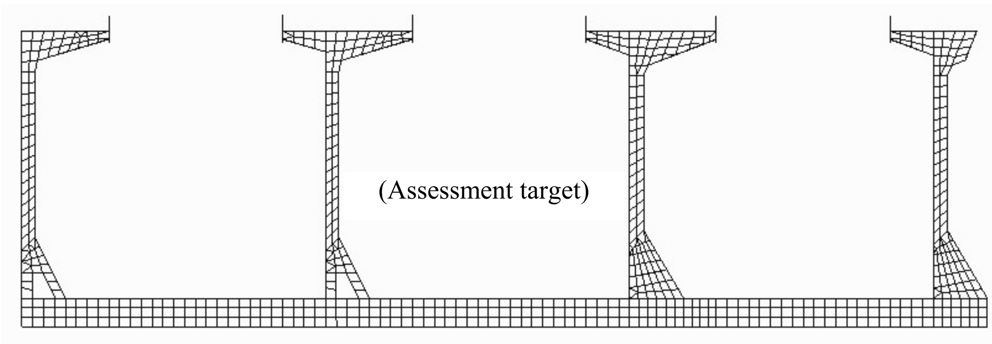

Figure 1: Longitudinal extent of the finite element model

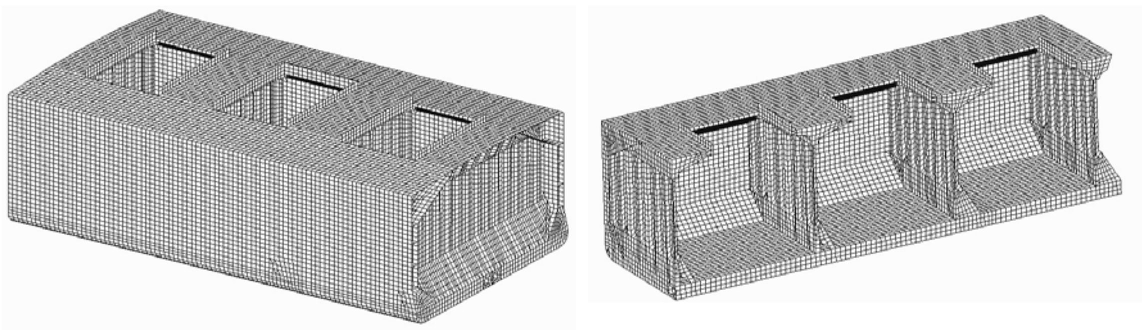

Figure 2: Example of a finite element model

2. Typical Mesh

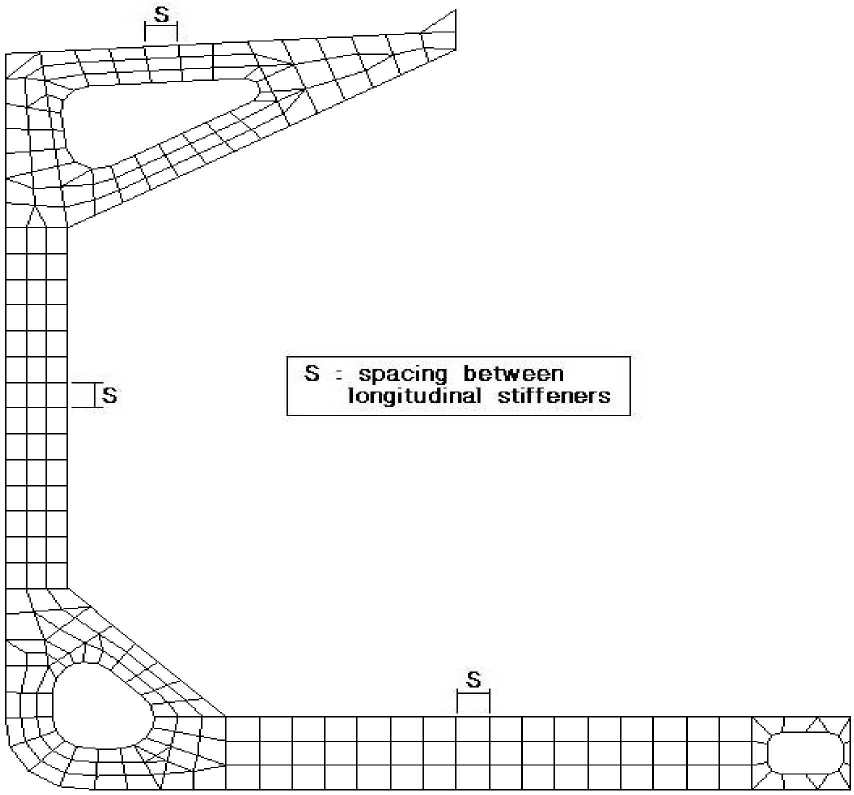

Figure 3: Typical mesh of a web frame

Appendix 2 – DISPLACEMENT BASED BUCKLING ASSESSMENT IN FINITE ELEMENT ANALYSIS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

a : Length of the longer plate panel side

b : Length of the shorter plate panel side

x : Direction parallel to a, taken as the longitudinal direction

y : Direction parallel to b, taken as the transverse direction

C : Coefficient taken equal to:

for 4-node buckling panel: $C = \dfrac{E}{2(1-\nu^2)}$

for 8-node buckling panel: $C = \dfrac{E}{4(1-\nu^2)}$

ν : Poisson ratio

m : Coefficient taken equal to:

$m = 1 - \nu$

1. Introduction

1.1

1.1.1

This Appendix provides a method to obtain the buckling stresses and edge stress ratios for elementary plate panels (EPP) from a finite element calculation. This method is called “Displacement Method”.

2. Displacement method

2.1 General

2.1.1

As the mesh of the finite elements does not correspond, in general, to the buckling panels the nodal points of the EPP can be mapped onto the FE-mesh and the displacements of these nodes can be derived from the FE-calculation.

Whenever operations on displacements are performed, full numerical accuracy of the displacements should be used.

2.1.2 4-node and 8-node panels

When the aspect ratio of the EPP is less than 3 and the variation of the longitudinal stresses in longitudinal direction of the EPP is small, a 4-node panel may be used. Otherwise an 8-node panel is to be taken.

2.1.3 Calculation of nodal displacements

Three different node locations are possible:

- If a node of the buckling panel is located at an FE-node, then the displacements can be transferred directly.
- If a node of the buckling panel is located on the edge of a plane stress element, then the displacements can be linearly interpolated between the FE-nodes at the edge.
- If a node of the buckling panel is located inside of an element, then the displacements can be obtained using bi-linear interpolation of all nodes of the element.

2.1.4 Transformation in local system

The transformation of the nodal displacements from the global FE-system into the local system of the buckling panel is performed by

$$(u) = [\lambda] \cdot (u_g)$$

where:

(u) : Local displacement vector

(u_g) : Global displacement vector

$[\lambda]$: Transformation matrix (2×3), of direction cosines of angles formed between the two sets of axes.

2.2 Calculation of buckling stresses and edge stress ratios

2.2.1

The displacements, derived at the corners of the elementary plate panel, are to be considered as input from which the stresses at certain stress-points are derived. In the 4-node buckling panel these points are identical but in the 8-node buckling panel they differ. The locations and the numbering convention may be taken from Fig 1 and Fig 2.

The derived stresses at EPP corner nodes can be directly used as input for the buckling assessment according Ch 6, Sec 3. The buckling load cases, which have to be considered in the FEM buckling assessment and defined in Ch 7 are buckling load cases 1, 2 and 5 of Ch 6, Sec 3, Tab 2 and 1a, 1b, 2 and 4 of Ch 6, Sec 3, Tab 3. In special cases, other buckling load cases may be used for the buckling assessment by a hand calculation.

2.2.2 4-node buckling panel

Stress displacement relationship for a 4-node buckling panel (compressive Stresses are positive)

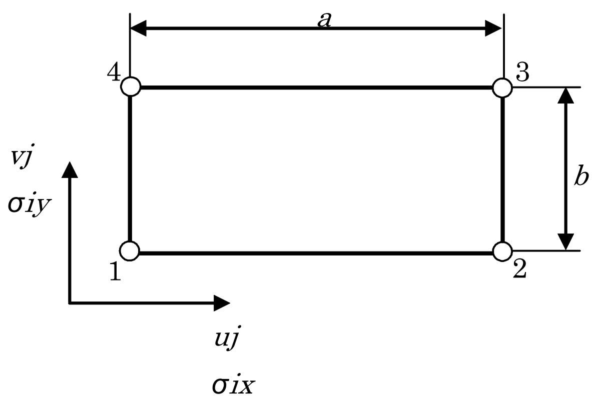

Figure 1: 4-node buckling panel

From the displacements of the EPP corner nodes the stresses of these nodes can be obtained using

$$
\begin{pmatrix} \sigma_{1x}^* \\ \sigma_{1y}^* \\ \tau_1 \\ \sigma_{2x}^* \\ \sigma_{2x}^* \\ \tau_2 \\ \sigma_{3x}^* \\ \sigma_{3y}^* \\ \tau_3^* \\ \sigma_{4x}^* \\ \sigma_{4y}^* \\ \tau_4 \end{pmatrix} = -C \cdot \begin{pmatrix}
-2/a & -2\nu/b & 2/a & 0 & 0 & 0 & 0 & 2\nu/b \\
-2\nu/a & -2/b & 2\nu/a & 0 & 0 & 0 & 0 & 2/b \\
-m/b & -m/a & 0 & m/a & 0 & 0 & m/b & 0 \\
-2/a & 0 & 2/a & -2\nu/b & 0 & 2\nu/b & 0 & 0 \\
-2\nu/a & 0 & 2\nu/a & -2/b & 0 & 2/b & 0 & 0 \\
0 & -m/a & -m/b & m/a & m/b & 0 & 0 & 0 \\
0 & 0 & 0 & -2\nu/b & 2/a & 2\nu/b & -2/a & 0 \\
0 & 0 & 0 & -2/b & 2\nu/a & 2/b & -2\nu/a & 0 \\
0 & 0 & -m/b & 0 & m/b & m/a & 0 & -m/a \\
0 & -2\nu/b & 0 & 0 & 2/a & 0 & -2/a & 2\nu/b \\
0 & -2/b & 0 & 0 & 2\nu/a & 0 & -2\nu/a & 2/b \\
-m/b & 0 & 0 & 0 & 0 & m/a & m/b & -m/a
\end{pmatrix} \cdot \begin{pmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \\ u_4 \\ v_4 \end{pmatrix}
$$

where:

$(\sigma_{1x}^*, \sigma_{1y}^*, \tau_1, \cdots, \sigma_{4x}^*, \sigma_{4y}^*, \tau_4)^T = (\sigma^*)$: Element stress vector

$(u_1, v_1, \cdots, u_4, v_4)^T = (u)$: Local node displacement vector

If both σ_x^* and σ_y^* are compressive stresses then the stresses σ_x and σ_y must be obtained as follows:

$$\sigma_x = (\sigma_x^* - 0.3\sigma_y^*)/0.91$$

$$\sigma_y = (\sigma_y^* - 0.3\sigma_x^*)/0.91$$

Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

This leads to the following stress vector:

$(\sigma) = (\sigma_{1x}, \sigma_{1y}, \tau_1, \cdots, \sigma_{4x}, \sigma_{4y}, \tau_4)^T$

Finally the relevant buckling stresses and edge stress ratios are obtained by:

- LC 1: longitudinal compression

$$\sigma_l = \max\left(\frac{\sigma_{1x} + \sigma_{4x}}{2}, \frac{\sigma_{2x} + \sigma_{3x}}{2}\right)$$

$$\Delta\sigma_l = \frac{1}{2}\left(-\sigma_{1x} + \sigma_{4x} - \sigma_{2x} + \sigma_{3x}\right)$$

$$\sigma_x = \sigma_l + 0.5\left|\Delta\sigma_l\right|$$

$$\psi_x = 1 - \left|\Delta\sigma_l\right| / \sigma_x$$

- LC 2: transverse compression

$$\sigma_t = 0.25\sum_{i=1}^{4}\sigma_{iy}$$

$$\Delta\sigma_t = \frac{1}{2}\left(-\sigma_{1y} - \sigma_{4y} + \sigma_{2y} + \sigma_{3y}\right)$$

$$\sigma_y = \sigma_t + 0.5\left|\Delta\sigma_t\right|$$

$$\psi_y = 1 - \left|\Delta\sigma_t\right| / \sigma_y$$

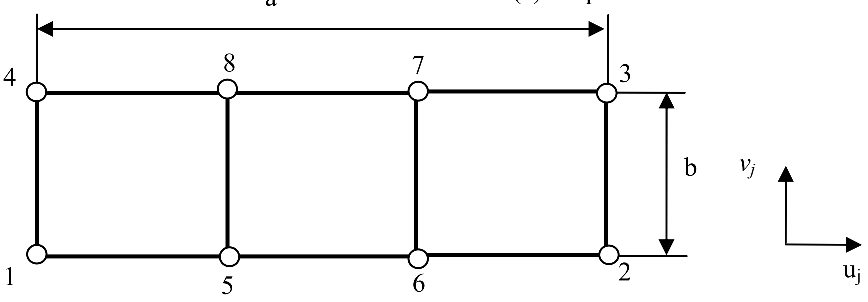
- LC 5: shear

$$\tau = \left| \frac{\tau_1 + \tau_2 + \tau_3 + \tau_4}{4} \right|$$

2.2.3 8-node buckling panel

Stress displacement relationship for a 8-node buckling panel (compressive stresses are positive)

(a) Displacement Nodes



(b) Stress Nodes

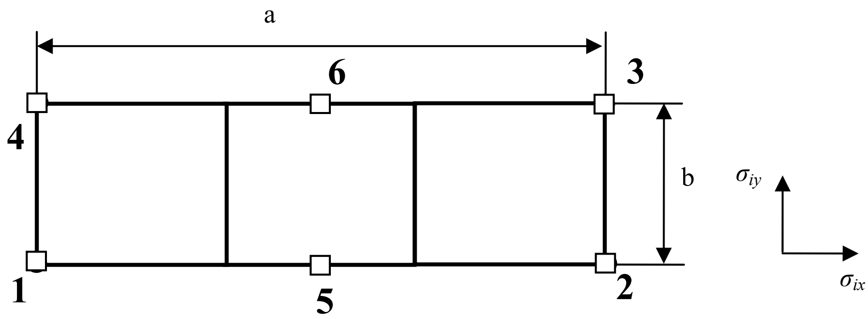


Figure 2: 8-node buckling panel

From the displacements of the EPP corner nodes the stresses of these nodes and on mid positions can be obtained using:

$$\begin{pmatrix} \sigma^*_{1x} \\ \sigma^*_{1y} \\ \tau_1 \\ \sigma^*_{2x} \\ \sigma^*_{2y} \\ \tau_2 \\ \sigma^*_{3x} \\ \sigma^*_{3y} \\ \tau_3 \\ \sigma^*_{4x} \\ \sigma^*_{4y} \\ \tau_4 \\ \sigma^*_{5x} \\ \sigma^*_{5y} \\ \tau_5 \\ \sigma^*_{6x} \\ \sigma^*_{6y} \\ \tau_6 \end{pmatrix} = -C \cdot \begin{pmatrix}
-12/a & -4\nu/b & 0 & 0 & 0 & 0 & 0 & 4\nu/b & 12/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-12\nu/a & -4/b & 0 & 0 & 0 & 0 & 0 & 4/b & 12\nu/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-2m/b & -6m/a & 0 & 0 & 0 & 0 & 2m/b & 0 & 0 & 6m/a & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 12/a & -4\nu/b & 0 & 4\nu/b & 0 & 0 & 0 & 0 & -12/a & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 12\nu/a & -4/b & 0 & 4/b & 0 & 0 & 0 & 0 & -12\nu/a & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & -2m/b & 6m/a & 2m/b & 0 & 0 & 0 & 0 & 0 & 0 & -6m/a & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -4\nu/b & 12/a & 4\nu/b & 0 & 0 & 0 & 0 & 0 & 0 & -12/a & 0 & 0 & 0 \\
0 & 0 & 0 & -4/b & 12\nu/a & 4/b & 0 & 0 & 0 & 0 & 0 & 0 & -12\nu/a & 0 & 0 & 0 \\
0 & 0 & -2m/b & 0 & 2m/b & 6m/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -6m/a & 0 & 0 \\
0 & -4\nu/b & 0 & 0 & 0 & 0 & -12/a & 4\nu/b & 0 & 0 & 0 & 0 & 0 & 0 & 12/a & 0 \\
0 & -4/b & 0 & 0 & 0 & 0 & -12\nu/a & 4/b & 0 & 0 & 0 & 0 & 0 & 0 & 12\nu/a & 0 \\
-2m/b & 0 & 0 & 0 & 0 & 0 & 2m/b & -6m/a & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 6m/a \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -12/a & -2\nu/b & 12/a & -2\nu/b & 0 & 2\nu/b & 0 & 2\nu/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -12\nu/a & -2/b & 12\nu/a & -2/b & 0 & 2/b & 0 & 2/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -m/b & -6m/a & -m/b & 6m/a & m/b & 0 & m/b & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -2\nu/b & 0 & -2\nu/b & 12/a & 2\nu/b & -12/a & 2\nu/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -2/b & 0 & -2/b & 12\nu/a & 2/b & -12\nu/a & 2/b \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -m/b & 0 & -m/b & 0 & m/b & 6m/a & m/b & -6m/a
\end{pmatrix} \cdot \begin{pmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \\ u_4 \\ v_4 \\ u_5 \\ v_5 \\ u_6 \\ v_6 \\ u_7 \\ v_7 \\ u_8 \\ v_8 \end{pmatrix}$$

where:

$$(\sigma^*) = (\sigma^*_{1x}, \sigma^*_{1y}, \tau_1, \cdots, \sigma^*_{6x}, \sigma^*_{6y}, \tau_6)^T$$

$$(u) = (u_{1x}, v_{1y}, \cdots, u_{8x}, v_{8y})^T$$

If both σ^*_x and σ^*_y are compressive stresses then the stresses σ_x and σ_y must be obtained as follows:

$$\sigma_x = (\sigma^*_x - 0.3 \cdot \sigma^*_y) / 0.91$$
$$\sigma_y = (\sigma^*_y - 0.3 \cdot \sigma^*_x) / 0.91$$

Where compressive stress fulfils the condition $\sigma^*_y < 0.3\sigma^*_x$, then $\sigma_y = 0$ and $\sigma_x = \sigma^*_x$

Where compressive stress fulfils the condition $\sigma^*_x < 0.3\sigma^*_y$, then $\sigma_x = 0$ and $\sigma_y = \sigma^*_y$

This leads to the following stress vector:

$$(\sigma) = (\sigma_{1x}, \sigma_{1y}, \tau_1, \cdots, \sigma_{6x}, \sigma_{6y}, \tau_6)^T$$

The relevant buckling stresses can be obtained by:

- LC 1: longitudinal compression

$$\sigma_l = \max\left(\frac{\sigma_{1x} + \sigma_{4x}}{2}, \frac{\sigma_{6x} + \sigma_{5x}}{2}, \frac{\sigma_{2x} + \sigma_{3x}}{2}\right)$$
$$\Delta\sigma_l = \frac{1}{3}\left(\sigma_{4x} - \sigma_{1x} - \sigma_{5x} + \sigma_{6x} + \sigma_{3x} - \sigma_{2x}\right)$$
$$\sigma_x = \sigma_l + 0.5\left|\Delta\sigma_l\right|$$
$$\psi_x = 1 - \left|\Delta\sigma_l\right| / \sigma_x$$

- LC 2: transverse compression

$$\sigma_t = \frac{1}{6}\sum_{i=1}^{6}\sigma_{iy}$$
$$\Delta\sigma_t = \frac{1}{2}\left(-\sigma_{1y} - \sigma_{4y} + \sigma_{2y} + \sigma_{3y}\right)$$
$$\sigma_y = \sigma_t + 0.5\left|\Delta\sigma_t\right|$$
$$\psi_y = 1 - \left|\Delta\sigma_t\right| / \sigma_y$$

- LC 5: shear

$$\tau = Max\left\{\left|\frac{\tau_1 + \tau_4 + \tau_5 + \tau_6}{4}\right|, \left|\frac{\tau_2 + \tau_3 + \tau_5 + \tau_6}{4}\right|\right\}$$

Chapter 8

Fatigue Check of Structural Details

Section 1 – GENERAL CONSIDERATION

1. General

1.1 Application

1.1.1

The requirements of this Chapter are to be applied to ships having length *L* of 150 m or above, with respect to 25 years operation life in North Atlantic.

1.1.2

The requirements of this Chapter apply to fatigue cycles induced by wave loads. Fatigue induced by vibrations, low cycle loads or impact loads such as slamming, is out of the scope of this Chapter.

1.1.3

The requirements of this Chapter are applicable where steel materials have a minimum yield stress less than 400 N/mm^2.

1.2 Net scantlings

1.2.1

All scantlings and stresses referred to in this Chapter are net scantlings obtained in accordance with Ch 3, Sec 2.

1.3 Subject members

1.3.1

Fatigue strength is to be assessed, in cargo hold area, for all the connected members at the considered locations described in Tab 1.

RCN 1 to July 2010 version (effective from 1July 2012)

Table 1: Members and locations subjected to fatigue strength assessment

Members	Details
Inner bottom plating	Connection with sloping and /or vertical plate of lower stool
	Connection with sloping plate of hopper tank
Inner side plating	Connection with sloping plate of hopper tank
Transverse bulkhead	Connection with sloping plate of lower stool
	Connection with sloping plate of upper stool
Hold frames of single side bulk carriers	Connection to the upper and lower wing tank
Ordinary stiffeners in double side space	Connection of longitudinal stiffeners with web frames and transverse bulkhead
	Connection of transverse stiffeners with stringer or similar
Ordinary stiffeners in upper and lower wing tank	Connection of longitudinal stiffeners with web frames and transverse bulkhead
Ordinary stiffeners in double bottom	Connection of longitudinal stiffeners with floors and floors in way of lower stool or transverse bulkhead
Hatch corners	Free edges of hatch corners

RCN 1 to July 2008 version (effective from 1 July 2009)

2. Definitions

2.1 Hot spot

2.1.1
Hot spot is the location where fatigue crack may initiate.

2.2 Nominal stress

2.2.1
Nominal stress is the stress in a structural component taking into account macro-geometric effects but disregarding the stress concentration due to structural discontinuities and to the presence of welds.

Nominal stresses are to be obtained either with the coarse mesh FE analysis specified in Ch 7, Sec 4, or with the simplified procedure specified in Sec4.

2.3 Hot spot stress

2.3.1
Hot spot stress is defined as the local stress at the hot spot. The hot spot stress takes into account the influence of structural discontinuities due to the geometry of the connection but excludes the effects of welds.

Hot spot stresses are to be obtained either by fine mesh FE analysis specified in Ch 7, Sec 4, or by multiplying nominal stresses by stress concentration factors defined in Sec 4.

2.4 Notch stress

2.4.1
Notch stress is defined as the peak stress at the weld toe taking into account stress concentrations due to the effects of structural geometry as well as the presence of welds.

Notch stress is to be obtained by multiplying hot spot stress by fatigue notch factor defined in Sec 2, [2.3.1], Tab 1.

3. Loading

3.1 Loading condition

3.1.1
The loading conditions to be considered are defined in Tab 2 depending on the ship type. The standard loading conditions illustrated in Ch 4, App 3 are to be considered. *RCN 1 to July 2008 version (effective 1 July 2009)*

Table 2: Loading conditions

Ship type	Full load condition		Ballast condition	
	Homogeneous	Alternate	Normal ballast	Heavy ballast
BC-A	✓	✓	✓	✓
BC-B	✓	---	✓	✓
BC-C	✓	---	✓	✓

3.2 Load case

3.2.1 Load cases

For each loading condition, the load cases to be considered, defined in Ch 4, Sec 4, [2], are:

(a) "H1" and "H2" corresponding to the EDW "H" (head sea)

(b) "F1" and "F2" corresponding to the EDW "F" (following sea)

(c) "R1" and "R2" corresponding to the EDW "R" (beam sea)

(d) "P1" and "P2" corresponding to the EDW "P" (beam sea)

3.2.2

In the case of fatigue assessment of hatch corners, only oblique sea is to be considered, taking into account the wave torsional moments defined in Ch 4, Sec 3, [3.4].

3.2.3 Predominant load case

From the above mentioned load cases and for each loading condition, the load case where the combined stress range is maximum, corresponds to the predominant load case.

Section 2 – FATIGUE STRENGTH ASSESSMENT

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

i : Suffix which denotes load case "H", "F", "R" or "P" specified in Ch 4, Sec 4
"i1" denotes load case "H1", "F1", "R1" or "P1" and "i2" denotes load case "H2", "F2", "R2" or "P2"

(k) : Suffix which denotes loading condition "homogeneous condition", "alternate condition", "normal ballast condition" or "heavy ballast condition" as defined in Sec 1, Tab 2

$\Delta\sigma_{W,\,i(k)}$: Hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)"

$\sigma_{mean,\,i(k)}$: Structural hot spot mean stress, in N/mm^2, in load case "i" of loading condition "(k)"

1. General

1.1 Application

1.1.1

This Section gives the linear cumulative damage procedure for the fatigue strength assessment of this Chapter.

1.1.2

Fatigue strength is assessed based on an equivalent notch stress range obtained by multiplying an equivalent hot spot stress range by a fatigue notch factor.

1.1.3

Hot spot stress ranges and hot spot mean stresses of primary members, longitudinal stiffeners connections and hatch corners are to be assessed respectively by Sec 3, Sec 4 and Sec 5.

1.1.4 Primary members and longitudinal stiffeners connections

Predominant load cases and 'condition 1' are to be obtained respectively in [2.1] and [2.2]. The hot spot stress ranges calculated in Sec 3 or Sec 4, corresponding to the predominant load case for each loading condition, are to be used in [2.3.2] to calculate the equivalent hot spot stress range.

1.1.5 Hatch corners

The hot spot stress range calculated in Sec 5 is to be used in [2.3.2] to calculate the equivalent hot spot stress range.

2. Equivalent notch stress range

2.1 Predominant load case

2.1.1

The predominant load case "I" in fatigue assessment for each loading condition is the load case for which the combined stress range for the considered member is the maximum among the load cases "H", "F", "R" and "P" specified in Sec 1, [3.2.1].

$$\Delta\sigma_{W,I(k)} = \max_i\left(\Delta\sigma_{W,i(k)}\right)$$

where:

$\Delta\sigma_{W,i(k)}$: Combined hot spot stress range, in N/mm^2, defined either in Sec 3, [2.1.1], [2.2.1] or Sec 4, [2.3.1].

I : Suffix which denotes the selected predominant load case of loading condition "(k)".

2.2 Loading 'condition 1'

2.2.1

The 'condition 1' is the condition in which the maximum stress calculated by the equation below for the considered member is the largest on the tension side among the loading conditions "homogeneous", "alternate", "normal ballast" and "heavy ballast" specified in Sec 1, Tab 2.

$$\sigma_{\max,1} = \max_k\left(\sigma_{mean,I(k)} + \frac{\Delta\sigma_{W,I(k)}}{2}\right)$$

where:

$\sigma_{mean,I(k)}$: Structural hot spot mean stress, in N/mm^2, in predominant load case of loading condition "(k)" defined in [2.1.1]

$\Delta\sigma_{W,I(k)}$: Hot spot stress range, in N/mm^2, in predominant load case of loading condition "(k)" defined in [2.1.1]

2.2.2

Further to the determination of 'condition 1'according to [2.2.1], the corresponding loading condition is to be indexed with the suffix "j" equal 1.

2.3 Equivalent notch stress range

2.3.1 Equivalent notch stress range

The equivalent notch stress range, in N/mm^2, for each loading condition is to be calculated with the following formula:

$$\Delta\sigma_{eq,j} = K_f \Delta\sigma_{equiv,j}$$

where:

$\Delta\sigma_{equiv,j}$: Equivalent hot spot stress range, in N/mm^2, in loading condition "j" obtained by [2.3.2].

K_f : Fatigue notch factor defined in Tab 1.

Table 1: Fatigue notch factors K_f *(RCN 3, effective from 12 Sept 2008)*

Subject	Without weld grinding	With weld grinding (not applicable for ordinary stiffeners and boxing fillet welding[1])
Butt welded joint	1.25	1.10
Fillet welded joint	1.30	1.15[2]
Non welded part	1.00	-

Note:

1) Boxing fillet welding is defined as a fillet weld around a corner of a member as an extension of the principal weld.
2) This is applicable for deep penetration welding, or full penetration welding only

In case where grinding is performed, full details regarding grinding standards including the extent, smoothness particulars, final welding profiles and grinding workmanship as well as quality acceptance criteria are to be submitted to the Society for approval.

It is preferred that any grinding is carried out by rotary burrs, is to extend below plate surfaces in order to remove any toe defects and ground areas are to have sufficient corrosion protection. Such treatments are to procedure smooth concave profiles at weld toes with the depth of these depressions penetrating into plate surfaces to at least 0.5mm below the bottom of any visible undercuts.

The depth of any grooves produced is to be kept to a minimum and, in general, kept to a maximum of 1mm. Under no circumstances is grinding depth to exceed 2mm or 7% of plate growth thickness, whichever is smaller. Grinding has to extend to 0.5 longitudinal spacing or 0.5 frame spacing at the each side of hot spot locations.

(RCN 3, effective from 12 Sept 2008)

2.3.2 Equivalent hot spot stress range

The equivalent hot spot stress range, in N/mm^2, is to be calculated for each loading condition with the following formula:

$$\Delta\sigma_{equiv,\,j} = f_{mean,\,j}\,\Delta\sigma_{W,\,j}$$

where:

$f_{mean,j}$: Correction factor for mean stress:

- for hatch corners $f_{mean,j} = 0.77$
- for primary members and longitudinal stiffeners connections, $f_{mean,j}$ corresponding to the condition "*j*" taken equal to:

$$f_{mean,\,j} = \max\left\{0.4,\left[\max\left(0,\ \frac{1}{2} + \frac{-\ln\left(10^{-4}\right)}{4}\frac{\sigma_{m,\,j}}{\Delta\sigma_{W,\,j}}\right)\right]^{0.25}\right\}$$

$\sigma_{m,1}$: Local hot spot mean stress, in N/mm^2, in the condition "1", obtained from the following formulae:

- if $0.6\Delta\sigma_{W,1} \geq 2.5R_{eH}$:

$$\sigma_{m,1} = -0.18\Delta\sigma_{W,1}$$

- if $0.6\Delta\sigma_{W,1} < 2.5R_{eH}$:

$$\sigma_{m,1} = R_{eH} - 0.6\Delta\sigma_{W,1} \quad \text{for} \quad 0.6\Delta\sigma_{W,1} > R_{eH} - \sigma_{res} - \sigma_{mean,1}$$

$$\sigma_{m,1} = \sigma_{mean,1} + \sigma_{res} \quad \text{for} \quad 0.6\Delta\sigma_{W,1} \leq R_{eH} - \sigma_{res} - \sigma_{mean,1}$$

$\sigma_{m,j}$: Local hot spot mean stress, in N/mm^2, in the condition "*j*", obtained from the following formulae:

- if $0.24\Delta\sigma_{W,j} \geq R_{eH}$:

$$\sigma_{m,j(j\neq1)} = -0.18\Delta\sigma_{W,j}$$

- if $0.24\Delta\sigma_{W,j} < R_{eH}$:

$$\sigma_{m,j(j\neq1)} = -R_{eH} + 0.24\Delta\sigma_{W,j} \quad \text{for} \quad 0.24\Delta\sigma_{W,j} > R_{eH} + \sigma_{m,1} - \sigma_{mean,1} + \sigma_{mean,j}$$

$$\sigma_{m,j(j\neq 1)} = \sigma_{m,1} - \sigma_{mean,1} + \sigma_{mean,j} \quad \text{for} \quad 0.24\Delta\sigma_{W,j} \leq R_{eH} + \sigma_{m,1} - \sigma_{mean,1} + \sigma_{mean,j}$$

$\sigma_{mean,j}$: Structural hot spot mean stress, in N/mm^2, corresponding to the condition "*j*"

σ_{res} : Residual stress, in N/mm^2, taken equal to:

$\sigma_{res} = 0.25 R_{eH}$ for stiffener end connection

$\sigma_{res} = 0$ for non welded part and primary members (cruciform joint or butt weld)

(RCN 3, effective from 12 Sept 2008)

3. Calculation of fatigue damage

3.1 Correction of the equivalent notch stress range

3.1.1

The equivalent notch stress range is to be corrected with the following formula:

$$\Delta\sigma_{E,j} = f_{coat}\, f_{material}\, f_{thick}\, \Delta\sigma_{eq,j}$$

where:

f_{coat} : Correction factor for corrosive environment, taken equal to:

$f_{coat} = 1.05$ for water ballast tanks and fuel oil tank

$f_{coat} = 1.03$ for dry bulk cargo holds and void space

$f_{material}$: Correction factor for material, taken equal to:

$$f_{material} = \frac{1200}{965 + R_{eH}}$$

f_{thick} : Correction factor for plate thickness, taken equal to 1.0 for hatch corners, flat bar or bulb stiffeners, otherwise to be taken equal to:

$$f_{thick} = \left(\frac{t}{22}\right)^{0.25} \quad \text{for } t \geq 22 \text{ mm}$$

$$f_{thick} = 1.0 \quad \text{for } t < 22 \text{ mm}$$

t : Net thickness, in mm, of the considered member, taken as the flange in case of stiffeners

$\Delta\sigma_{eq,j}$: Equivalent notch stress range, in N/mm^2, defined in [2.3.1].

3.2 Long-term distribution of stress range

3.2.1

The cumulative probability density function of the long-term distribution of combined notch stress ranges is to be taken as a two-parameter Weibull distribution:

$$F(x) = 1 - \exp\left[-\left(\frac{x}{\Delta\sigma_{E,j}}\right)^{\xi} (\ln N_R)\right]$$

where:

ξ : Weibull shape parameter, taken equal to 1.0

N_R : Number of cycles, taken equal to 10^4.

3.3 Elementary fatigue damage

3.3.1

The elementary fatigue damage for each loading condition is to be calculated with the following formula:

$$D_j = \frac{\alpha_j N_L}{K} \frac{{\Delta\sigma_{E,j}}^4}{(\ln N_R)^{4/\xi}} \left[\Gamma\left(\frac{4}{\xi}+1, \nu\right) + \nu^{-3/\xi} \gamma\left(\frac{7}{\xi}+1, \nu\right) \right]$$

where:

K : S-N curve parameter, taken equal to $1.014 \cdot 10^{15}$

α_j : Coefficient taken equal to 1.0 for the assessment of hatch corners and depending on the loading condition specified in Tab 2 for primary members and longitudinal stiffeners connections.

N_L : Total number of cycles for the design ship's life, taken equal to:

$$N_L = \frac{0.85 T_L}{4 \log L}$$

T_L : Design life, in seconds, corresponding to 25 years of ship's life, taken equal to $7.884 \cdot 10^8$

$$\nu = \left(\frac{100.3}{\Delta\sigma_{E,j}}\right)^{\xi} \ln N_R$$

Γ : Type 2 incomplete gamma function

γ : Type 1 incomplete gamma function

Table 2: Coefficient α_j depending on the loading condition

	Loading Conditions	BC-A	BC-B, BC-C
$L < 200$ m	Homogeneous	0.6	0.7
	Alternate	0.1	---
	Normal ballast	0.15	0.15
	Heavy ballast	0.15	0.15
$L \geq 200$ m	Homogeneous	0.25	0.5
	Alternate	0.25	---
	Normal ballast	0.2	0.2
	Heavy ballast	0.3	0.3

4. Fatigue strength criteria

4.1 Cumulative fatigue damage

4.1.1

The cumulative fatigue damage D calculated for the combined equivalent stress is to comply with the following criteria:

$$D = \sum_j D_j \leq 1.0$$

where

D_j : Elementary fatigue damage for each loading condition "j".

Section 3 – STRESS ASSESSMENT OF PRIMARY MEMBERS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

i : Suffix which denotes load case "H", "F", "R" or "P" specified in Ch 4, Sec 4
"$i1$" denotes load case "H1", "F1", "R1" or "P1" and "$i2$" denotes load case "H2", "F2", "R2" or "P2"

(k) : Suffix which denotes loading condition, "homogeneous condition", "alternate condition", "normal ballast condition" or "heavy ballast condition" as defined in Sec 1, Tab 2

$\Delta\sigma_{W,\,i(k)}$: Hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)"

$\sigma_{mean,\,i(k)}$: Structural hot spot mean stress, in N/mm^2, in load case "i" of loading condition "(k)".

1. General

1.1 Application

1.1.1

Hot spot stress ranges and structural hot spot mean stresses of primary members are to be assessed according to the requirements of this Section, with the requirements given in Ch 7, Sec 4.

2. Hot spot stress range

2.1 Stress range according to the direct method

2.1.1

The hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)" is to be obtained from the following formula:

$$\Delta\sigma_{W,i(k)} = \left|\sigma_{W,i1(k)} - \sigma_{W,i2(k)}\right|$$

where:

$\sigma_{W,\,i1(k)}$, $\sigma_{W,\,i2(k)}$: Hot spot stress, in N/mm^2, in load case "$i1$" and "$i2$" of loading condition "(k)", obtained by direct FEM analysis using fine mesh model specified in Ch 7, Sec 4.

2.2 Stress range according to the superimposition method

2.2.1 Hot spot stress range

The hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)" is to be obtained from the following formula:

$$\Delta\sigma_{W,i(k)} = \left|\left(\sigma_{GW,i1(k)} + \sigma_{LW,i1(k)}\right) - \left(\sigma_{GW,i2(k)} + \sigma_{LW,i2(k)}\right)\right|$$

where:

$\sigma_{LW,i1(k)}$, $\sigma_{LW,i2(k)}$: Hot spot stress, in N/mm^2, due to local loads in load cases "i1" and "i2" for loading condition "(k)" obtained by the direct analysis using fine mesh FE model specified in Ch 7, Sec 4

$\sigma_{GW,i1(k)}$, $\sigma_{GW,i2(k)}$: Hot spot stress, in N/mm^2, due to hull girder moments in load cases "i1" and "i2" for loading condition "(k)" obtained according to [2.2.2].

2.2.2 Stress due to hull girder moments

The hull girder hot spot stress, in N/mm^2, in load cases "i1" and "i2" for loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{GW,ij(k)} = C_{WV,ij}\,\sigma_{WV,ij} - C_{WH,ij}\,\sigma_{WH,(k)} \qquad (j = 1, 2)$$

where:

$C_{WV,i1}$, $C_{WV,i2}$, $C_{WH,i1}$, $C_{WH,i2}$: Load combination factors for each load case defined in Ch 4, Sec 4, [2.2]

$\sigma_{WV,i1}$: Nominal hull girder stress, in N/mm^2, in sagging condition induced by vertical wave bending moment

$$\sigma_{WV,i1} = \frac{M_{WV,S}\,(z-N)}{I_Y}\,10^{-3}$$

$\sigma_{WV,i2}$: Nominal hull girder stress, in N/mm^2, in hogging condition induced by vertical wave bending moment

$$\sigma_{WV,i2} = \frac{M_{WV,H}\,(z-N)}{I_Y}\,10^{-3}$$

$M_{WV,H}$, $M_{WV,S}$: Vertical wave bending moments, in kN.m, in hogging and sagging conditions defined in Ch 4, Sec 3, [3.1.1], with $f_p = 0.5$

N : Z co-ordinate, in m, of the neutral axis , as defined in Ch 5, Sec 1

z : Z co-ordinate, in m, of the point considered

$\sigma_{WH,(k)}$: Nominal hull girder stress, in N/mm^2, induced by horizontal wave bending moment

$$\sigma_{WH,(k)} = \frac{M_{WH,(k)}\,y}{I_Z}\,10^{-3}$$

$M_{WH,(k)}$: Horizontal wave bending moment, in kN.m, in loading condition "(k)"defined in Ch 4, Sec 3, [3.3.1], with $f_p = 0.5$

y : Y co-ordinate, in m, of the point considered, to be taken positive at port side and negative at starboard side

I_Y , I_Z : Net moments of inertia of hull cross-section, in m^4, about transverse and vertical axis respectively, as defined in Ch 5, Sec 1.

3. Hot spot mean stress

3.1 Mean stress according to the direct method

3.1.1

The structural hot spot mean stress, in N/mm^2, in load case "i" for loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{mean,i(k)} = \frac{\sigma_{W,i1(k)} + \sigma_{W,i2(k)}}{2}$$

3.2 Mean stress according to the superimposition method

3.2.1 Hot spot mean stresses

The structural hot spot mean stress, in N/mm^2, in load case "*i*" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{mean,\,i(k)} = \sigma_{GS,\,(k)} + \frac{\sigma_{LW,\,i1(k)} + \sigma_{LW,\,i2(k)}}{2}$$

where:

$\sigma_{GS,\,(k)}$: Hot spot mean stress, in N/mm^2, due to still water hull girder moment in loading condition "(*k*)" obtained according to [3.2.2].

$\sigma_{LW,i1(k)}$, $\sigma_{LW,i2(k)}$: As defined in 2.2.1

3.2.2 Stress due to still water hull girder moment

The hot spot stress, in N/mm^2, due to still water bending moment in loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{GS,\,(k)} = \frac{M_{S,\,(k)}\left(z - N\right)}{I_Y} 10^{-3}$$

where:

$M_{S,\,(k)}$: Still water vertical bending moment, in kN.m, depending on the loading condition defined in Ch 4, Sec 3, [2.2]. If the design still water bending moments are not defined at a preliminary design stage, still water bending moment in each loading condition may be obtained from the following formulae:

homogeneous condition ; $M_{S,(1)} = -0.5 F_{MS} M_{SW,S}$

alternate condition ; $M_{S,(2)} = F_{MS} M_{SW,H}$

normal ballast condition ; $M_{S,(3)} = F_{MS} M_{SW,H}$

heavy ballast condition ;
$$M_{S,(4)} = \begin{cases} 2.66 \dfrac{x}{L} M_{SW,H} & ; \quad 0 < x \le 0.15L \\ 2.66\left(0.3 - \dfrac{x}{L}\right) M_{SW,H} & ; \quad 0.15L < x \le 0.3L \\ -3.5\left(\dfrac{x}{L} - 0.3\right) M_{SW,S} & ; \quad 0.3L < x \le 0.5L \\ -3.5\left(0.7 - \dfrac{x}{L}\right) M_{SW,S} & ; \quad 0.5L < x \le 0.7L \\ 2.66\left(\dfrac{x}{L} - 0.7\right) M_{SW,H} & ; \quad 0.7L < x \le 0.85L \\ 2.66\left(1 - \dfrac{x}{L}\right) M_{SW,H} & ; \quad 0.85L < x \le L \end{cases}$$

$M_{SW,H}$, $M_{SW,S}$: Permissible still water bending moment, in kN.m, in hogging and sagging conditions

F_{MS} : Distribution factor defined in Ch 4, Sec 3, Fig 2

Section 4 – STRESS ASSESSMENT OF STIFFENERS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

i : Suffix which denotes load case "H", "F", "R" or "P" specified in Ch 4, Sec 4
"i1" denotes load case "H1", "F1", "R1" or "P1" and "i2" denotes load case "H2", "F2", "R2" or "P2"

(k) : Suffix which denotes loading condition, "homogeneous condition", "alternate condition", "normal ballast condition" or "heavy ballast condition" as defined in Sec 1, Tab 2

$\Delta\sigma_{W\,,\,i(k)}$: Hot spot stress range, in N/mm^2, in load case "i" of loading condition "(k)"

$\sigma_{mean\,,\,i(k)}$: Structural hot spot mean stress, in N/mm^2, in load case "i" of loading condition "(k)"

1. General

1.1 Application

1.1.1

Hot spot stress ranges and structural hot spot mean stresses of longitudinal stiffeners are to be assessed in line with the requirements of this Section.

1.1.2

The hot spot stress ranges and structural hot spot mean stresses of longitudinal stiffeners are to be evaluated at the face plate of the longitudinal considering the type of longitudinal end connection and the following locations.

(1) Transverse webs or floors other than those at transverse bulkhead of cargo hold or in way of stools, such that additional hot spot stress due to the relative displacement may not be considered. These longitudinal end connections are defined in Tab.1. When transverse webs or floors are watertight, the coefficients K_{gl} and K_{gh} as defined in Tab 2 are to be considered instead of those defined in Tab 1.

(2) Transverse webs or floors at transverse bulkhead of cargo hold in way of stools, such that additional hot spot stress due to the relative displacement should be considered. These longitudinal end connections are defined in Tab 2. When transverse webs or floors at transverse bulkhead of cargo hold or in way of stools are not watertight, the coefficients K_{gl} and K_{gh} as defined in Tab 1 are to be considered instead of those defined in Tab 2.

RCN 1 to July 2008 version (effective from 1 July 2009)

2. Hot spot stress range

2.1 Stress range obtained by the direct method

2.1.1

Hot spot stress ranges, in N/mm^2, calculated with direct calculation for each load case "H", "F", "R" and "P" of each loading condition, are to be obtained according to Sec 3, [2.1].

2.2 Stress range according to the superimposition method

2.2.1

The hot spot stress ranges, in N/mm², for each load case "H", "F", "R" and "P" of each loading condition according to the superimposition method are to be obtained according to Sec 3, [2.2].

2.3 Stress range according to the simplified procedure

2.3.1 Hot spot stress ranges

The hot spot stress range, in N/mm², due to dynamic loads in load case "*i*" of loading condition "(*k*)" is to be obtained from the following formula:

$$\Delta\sigma_{W,i(k)} = \left|\left(\sigma_{GW,i1(k)} + \sigma_{W1,i1(k)} - \sigma_{W2,i1(k)} + \sigma_{d,i1(k)}\right) - \left(\sigma_{GW,i2(k)} + \sigma_{W1,i2(k)} - \sigma_{W2,i2(k)} + \sigma_{d,i2(k)}\right)\right|$$

where

$\sigma_{GW,i1(k)}$, $\sigma_{GW,i2(k)}$: Stress due to hull girder moment, defined in [2.3.2]

$\sigma_{W1,i1(k)}$, $\sigma_{W1,i2(k)}$: Stress $\sigma_{LW,ij(k)}$, $\sigma_{CW,ij(k)}$ and $\sigma_{LCW,ij(k)}$ due to hydrodynamic or inertial pressure when the pressure is applied on the same side as the ordinary stiffener depending on the considered case

$\sigma_{W2,i1(k)}$, $\sigma_{W2,i2(k)}$: Stress $\sigma_{LW,ij(k)}$, $\sigma_{CW,ij(k)}$ and $\sigma_{LCW,ij(k)}$ due to hydrodynamic or inertial pressure when the pressure is applied on the side opposite to the stiffener depending on the considered case

$\sigma_{LW,i1(k)}$, $\sigma_{LW,i2(k)}$: Stresses due to wave pressure, defined in [2.3.3]

$\sigma_{CW,i1(k)}$, $\sigma_{CW,i2(k)}$: Stresses due to liquid pressure, defined in [2.3.4]

$\sigma_{LCW,i1(k)}$, $\sigma_{LCW,i2(k)}$: Stresses due to dry bulk cargo pressure, defined in [2.3.5]

$\sigma_{d,i1(k)}$, $\sigma_{d,i2(k)}$: Stress due to relative displacement of transverse bulkhead, or floor in way of stools, defined in [2.3.6].

RCN 1 to July 2008 version (effective from 1July 2009)

2.3.2 Stress due to hull girder moments

The hull girder hot spot stress, in N/mm², in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{GW,ij(k)} = K_{gh} \cdot \left(C_{WV,ij}\,\sigma_{WV,ij} - C_{WH,ij}\,\sigma_{WH,(k)}\right) \qquad (j = 1, 2)$$

where:

K_{gh} : Geometrical stress concentration factor for nominal hull girder stress. K_{gh} is given in Tab 1 and Tab 2 for the longitudinal end connection specified in [1.1.2] (1) and [1.1.2] (2), respectively.
The stress concentration factor can be evaluated directly by the FE analysis.

RCN 1 to July 2008 version (effective from 1 July 2009)

$C_{WV,i1}$, $C_{WV,i2}$, $C_{WH,i1}$, $C_{WH,i2}$: Load combination factors for each load case defined in Ch 4, Sec 4, [2.2]

$\sigma_{WV,i1}$, $\sigma_{WV,i2}$, $\sigma_{WH,(k)}$: Nominal hull girder stresses, in N/mm², defined in Sec 3, [2.2.2]

2.3.3 Stress due to wave pressure

The hot spot stress, in N/mm^2, due to the wave pressure in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{LW,\,i\,j(k)} = \frac{K_{gl} K_s p_{CW,i\,j(k)}\, s\ell^2 \left(1 - \frac{6x_f}{\ell} + \frac{6x_f^{\,2}}{\ell^2}\right)}{12w} 10^3 \qquad (j = 1,\ 2)$$

$$p_{CW,i1(k)} = \begin{cases} 2C_{NE,i1(k)} p_{W,i1(k)} & ; C_{NE,i1(k)} < 0.5 \\ p_{w,i1(k)} & ; C_{NE,i1(k)} \geq 0.5 \end{cases}$$

$$p_{CW,i2(k)} = \begin{cases} 0 & ; C_{NE,i2(k)} < 0.5 \\ (2C_{NE,i2(k)} - 1) p_{W,i2(k)} & ; C_{NE,i2(k)} \geq 0.5 \end{cases}$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

$p_{W,\,i\,j(k)}$: Hydrodynamic pressure, in kN/m^2, specified in Ch 4, Sec 5, [1.3], [1.4] and [1.5] , with f_p = 0.5, in load case "*i*1" and "*i*2" for loading condition "(*k*)". When the location of the considered member is above the waterline, the hydrodynamic pressure is to be taken as the pressure at waterline.

K_{gl} : Geometrical stress concentration factor for stress due to lateral pressure. K_{gl} is given in Tab 1 and Tab 2 for the longitudinal end connection specified in [1.1.2] (1) and [1.1.2] (2), respectively. The stress concentration factor can be evaluated directly by the FE analysis.

RCN 1 to July 2008 version (effective from 1 July 2009)

K_s : Geometrical stress concentration factor due to stiffener geometry

$$K_s = 1 + \left[\frac{t_f (a^2 - b^2)}{2w_b}\right]\left[1 - \frac{b}{b_f}\left(1 + \frac{w_b}{w_a}\right)\right] 10^{-3}$$

a , b : Eccentricity, in mm, of the face plate as defined in Fig 1. For angle profile, "*b*" is to be taken as half the net actual thickness of the web.

t_f, b_f : Thickness and breadth of face plate, in mm, respectively, as defined in Fig 1

RCN 1 to July 2008 version (effective from 1 July 2009)

w_a , w_b : Net section modulus in A and B respectively (see Fig.1), in cm^3, of the stiffener about the neutral axis parallel to Z axis without attached plating.

$C_{NE,\,i\,j(k)}$: Correction factor for the non linearity of the wave pressure range in load case "*i*1" and "*i*2" of loading condition "(*k*)"

$$C_{NE,\,i\,j(k)} = \begin{cases} \exp\left[-\left(\dfrac{z - T_{LC(k)} + \dfrac{|p_{W,\,i\,j(k),WL}|}{\rho g}}{\dfrac{|p_{W,\,i\,j(k),WL}|}{\rho g}(-\ln 0.5)^{-1/2.5}}\right)^{2.5}\right] & \text{for} \quad z > T_{LC(k)} - \dfrac{|p_{W,\,i\,j(k),WL}|}{\rho g} \\ 1.0 & \text{for} \quad z \leq T_{LC(k)} - \dfrac{|p_{W,\,i\,j(k),WL}|}{\rho g} \end{cases}$$

$T_{LC(k)}$: Draught, in m, of the considered loading condition "(*k*)"

$p_{W,\,i\,j(k),\,WL}$: Hydrodynamic pressure, in kN/m^2, at water line in load case "*i*1" and "*i*2" of loading condition "(*k*)"

z : Z co-ordinate, in m, of the point considered

s : Stiffener spacing, in m

ℓ : Span, in m, to be measured as shown in Fig 2. The ends of the span are to be taken at points where the depth of the end bracket, measured from the face plate of the stiffener is equal to half the depth of the stiffener

x_f : Distance, in m, to the hot spot from the closest end of the span ℓ (see Fig 2)

w : Net section modulus, in cm^3, of the considered stiffener. The section modulus w is to be calculated considering an effective breadth s_e, in m, of attached plating obtained from the following formulae:

$$s_e = \begin{cases} 0.67s \cdot \sin\left[\dfrac{\pi}{6}\left(\dfrac{\ell\left(1-1/\sqrt{3}\right)}{2s}\right)\right] & \text{for} \quad \dfrac{\ell}{s} \le \dfrac{6}{1-1/\sqrt{3}} \\ 0.67s & \text{for} \quad \dfrac{\ell}{s} > \dfrac{6}{1-1/\sqrt{3}} \end{cases}$$

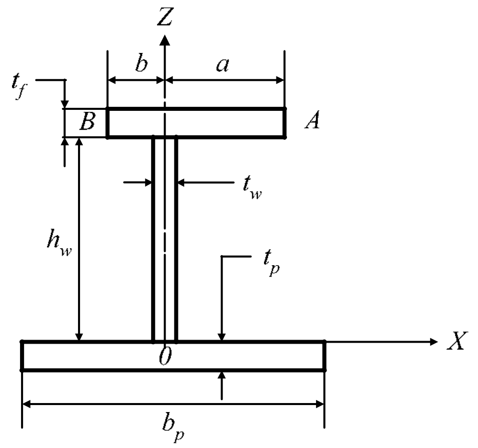

Figure 1: Sectional parameters of a stiffener

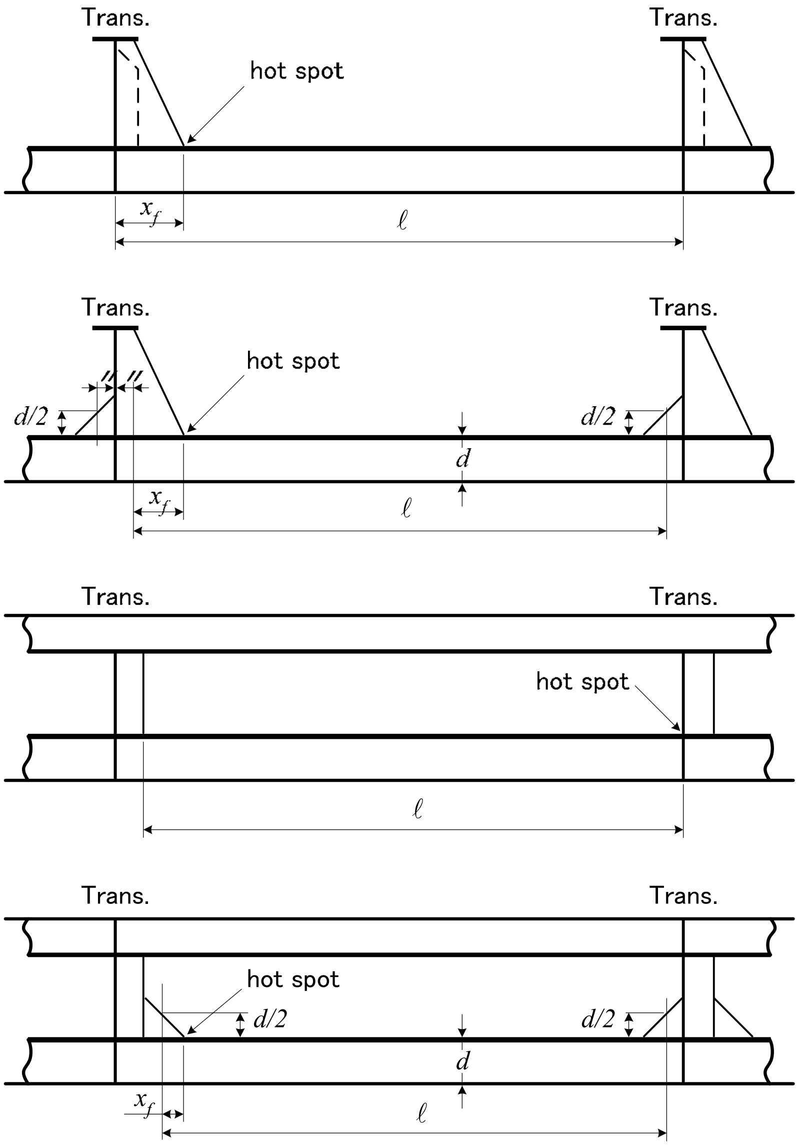

Figure 2: Span and hot spot of longitudinal stiffeners

2.3.4 Stress due to liquid pressure

The hot spot stress, in N/mm^2, due to the liquid pressure in load case "$i1$" and "$i2$" for loading condition "(k)" is to be obtained from the following formula:

$$\sigma_{CW,ij(k)} = \frac{K_{gl} K_s C_{NI,ij(k)} p_{BW,ij(k)} s \ell^2 \left(1 - \frac{6x_f}{\ell} + \frac{6x_f^{\ 2}}{\ell^2}\right)}{12w} \cdot 10^3 \qquad (j = 1, 2)$$

where:

$p_{BW,ij(k)}$: Inertial pressure, in kN/m^2, due to liquid specified in Ch 4, Sec 6, [2.2], with $f_p = 0.5$, in load case "$i1$" and "$i2$" for loading condition "(k)". Where the considered location is located in fuel oil, other oil or fresh water tanks, no inertial pressure is considered for the tank top longitudinals and when the location of the considered member is above the liquid surface in static and upright condition, the inertial pressure is to be taken at the liquid surface line. *RCN 1 to July 2008 version (effective from 1 July 2009)*

$C_{NI,\,i\,j(k)}$: Correction factor for the non linearity of the inertial pressure range due to liquid in load case "*i*1" and "*i*2" for loading condition "(*k*)"

$$C_{NI,\,i\,j(k)}=\begin{cases}\exp\left[-\left(\dfrac{z-z_{SF}+\dfrac{\left|p_{BW,\,i\,j(k),\,SF}\right|}{\rho g}}{\dfrac{\left|p_{BW,\,i\,j(k),\,SF}\right|}{\rho g}\left(-\ln 0.5\right)^{-1/2.5}}\right)^{2.5}\right] & \text{for}\quad z>z_{SF}-\dfrac{\left|p_{BW,\,i\,j(k),\,SF}\right|}{\rho g}\\ 1.0 & \text{for}\quad z\le z_{SF}-\dfrac{\left|p_{BW,\,i\,j(k),\,SF}\right|}{\rho g}\end{cases}$$

z_{SF} : Z co-ordinate, in m, of the liquid surface. In general, it is taken equal to "Z_{TOP}" defined in Ch 4, Sec 6. If the considered location is located in fuel oil, other oil or fresh water tanks, it may be taken as the distance to the half height of the tank. *RCN 1 to July 2008 version (effective from 1 July 2009)*

z : Z co-ordinate, in m, of the point considered

$p_{BW,\,i\,j(k),\,SF}$: Inertial pressure due to liquid, in kN/m^2, taken at the liquid surface in load case "*i*1" and "*i*2" for loading condition "(*k*)". In calculating the inertial pressure according to Ch 4, Sec 6, [2.2.1], x and y coordinates of the reference point are to be taken as liquid surface instead of tank top.

RCN 1 to July 2008 version (effective from 1 July 2009)

$K_{gh}\,K_s$: The stress concentration factor defined in [2.3.3] *RCN 1 to July 2008 version (effective from 1 July 2009)*

2.3.5 Stress due to dry bulk cargo pressure

The hot spot stress, in N/mm^2, due to the dry bulk cargo pressure in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{LCW,\,i\,j\,(k)}=\frac{K_{gl}K_s\,p_{CW,\,i\,j(k)}s\ell^2\left(1-\dfrac{6x_f}{\ell}+\dfrac{6x_f^{\,2}}{\ell^2}\right)}{12w}10^3\qquad(j=1,2)$$

where:

$p_{CW,\,i\,j(k)}$: Inertial pressure, in kN/m^2, due to dry bulk cargo specified in Ch 4, Sec 6, [1.3] for a cargo density ρ_C specified in Ch.4 Annex 3 and with $f_p = 0.5$, in load case "*i*1" and "*i*2" for loading condition "(*k*)"

RCN 1 to July 2010 version (effective from 1July 2012)

2.3.6 Stress due to relative displacement of transverse bulkhead or floor in way of transverse bulkhead or stool

For longitudinal end connection specified in [1.1.2] (2), the additional hot spot stress, in N/mm^2, due to the relative displacement in the direction perpendicular to the attached plate between the transverse bulkhead or floor in way of stools and the adjacent transverse web or floor in load case "*i*1" and "*i*2" for loading condition "(*k*)" is to be obtained from the following formula:

$$\sigma_{d,\,i\,j(k)}=\begin{cases}K_{dF-a}\sigma_{dF-a,\,i\,j(k)}+K_{dA-a}\sigma_{dA-a,\,i\,j(k)} & \text{for point "}a\text{"}\\ K_{dF-f}\sigma_{dF-f,\,i\,j(k)}+K_{dA-f}\sigma_{dA-f,\,i\,j(k)} & \text{for point "}f\text{"}\end{cases}\qquad(j=1,2)$$

RCN1 to July 2008 version (effective from 1July 2009)

where:

a , f : Suffix which denotes the location considered as indicated in Tab 2.

A , F : Suffix which denotes the direction, forward (F) and afterward (A), of the transverse web or floor where the relative displacement is occurred as indicated in Tab 2. (see Fig 3)

$\sigma_{dF\text{-}a\,,\,i\,j(k)}$, $\sigma_{dA\text{-}a\,,\,i\,j(k)}$, $\sigma_{dF\text{-}f\,,\,i\,j(k)}$, $\sigma_{dA\text{-}f\,,\,i\,j(k)}$: Additional stress at point "a" and "f", in N/mm^2, due to the relative displacement between the transverse bulkhead or floors in way of stools and the forward (F) and afterward (A) transverse web or floor respectively in load case "i1" and "i2" for loading condition "(k)" *RCN 1 to July 2008 version (effective from 1 July 2009)*

$$\sigma_{dF-a,i\,j(k)} = \frac{3.9\delta_{F,i\,j(k)} E I_A I_F}{w_A \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15 \frac{|x_{fA}|}{\ell_A}\right) 10^{-5}$$

$$\sigma_{dA-a,i\,j(k)} = \left[\frac{3.9\delta_{A,i\,j(k)} E I_A I_F}{w_A \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15 \frac{|x_{fA}|}{\ell_A}\right) - \frac{0.9\delta_{A,i\,j(k)} E I_A |x_{fA}|}{w_A \ell_A^{\,3}}\right] 10^{-5}$$

$$\sigma_{dF-f,i\,j(k)} = \left[\frac{3.9\delta_{F,i\,j(k)} E I_A I_F}{w_F \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15 \frac{|x_{fF}|}{\ell_F}\right) - \frac{0.9\delta_{F,i\,j(k)} E I_F |x_{fF}|}{w_F \ell_F^{\,3}}\right] 10^{-5}$$

$$\sigma_{dA-f,i\,j(k)} = \frac{3.9\delta_{A,i\,j(k)} E I_A I_F}{w_F \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15 \frac{|x_{fF}|}{\ell_F}\right) 10^{-5}$$

$\delta_{F\,,\,i\,j(k)}$, $\delta_{A\,,\,i\,j(k)}$: Relative displacement, in mm, in the direction perpendicular to the attached plate between the transverse bulkhead or floor in way of stools and the forward (F) and afterward (A) transverse web or floor in load case "i1" and "i2" for loading condition "(k)" (see Fig 3)

(a) For longitudinals penetrating floors in way of stools

Relative displacement is defined as the displacement of the longitudinal in relation to the line passing through the stiffener end connection at the base of the stool measured at the first floor forward (F) or afterward (A) of the stool.

(b) For longitudinals other than (a)

Relative displacement is defined as the displacement of the longitudinal in relation to its original position measured at the first forward (F) or afterward (A) of the transverse bulkhead.

Where the stress of the face of longitudinal at the assessment point due to relative displacement is tension, the sign of the relative displacement is positive. *RCN 1 to July 2008 version (effective from 1 July 2009)*

I_F , I_A : Net moment of inertia, in cm^4, of forward (F) and afterward (A) longitudinal

$K_{dF\text{-}a}$, $K_{dA\text{-}a}$, $K_{dF\text{-}f}$, $K_{dA\text{-}f}$: Stress concentration factor for stiffener end connection at point "a" and "f" subject to relative displacement between the transverse bulkhead and the forward (F) and afterward (A) transverse web or floors in way of stool respectively as defined in Tab 2. The stress concentration can be evaluated directly by the FE analysis when the detail of end connection is not defined in Tab 2.

ℓ_F , ℓ_A : Span, in m, of forward (F) and afterward (A) longitudinal to be measured as shown in Fig 2

x_{fF} , x_{fA} : Distance, in m, to the hot spot from the closest end of ℓ_F and ℓ_A respectively (see Fig 2).

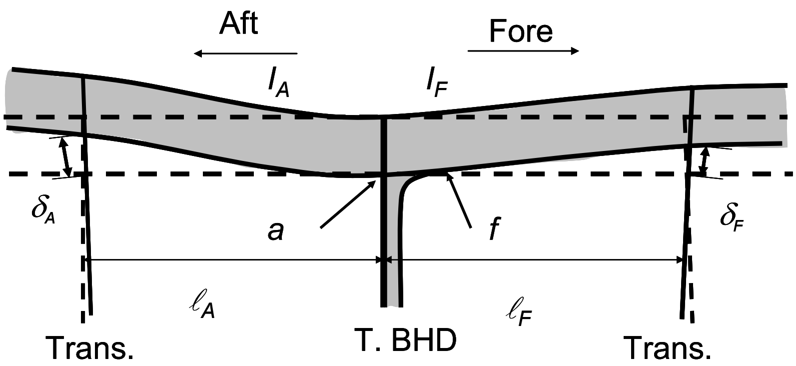

Figure 3: Definition of the relative displacement (Example of the side longitudinal)

RCN 1 to July 2008 version (effective from 1 July 2009)

3. Hot spot mean stress

3.1 Mean stress according to the direct method

3.1.1

The structural hot spot mean stress, in N/mm^2, in each loading condition calculated with the direct method is to be obtained according to Sec 3, [3.1].

3.2 Mean stress according to the superimposition method

3.2.1

The structural hot spot mean stress, in N/mm^2, in each loading condition calculated with the superimposition method is to be obtained according to Sec 3, [3.2].

3.3 Mean stress according to the simplified procedure

3.3.1 Hot spot mean stresses

The structural hot spot mean stress, in N/mm^2, in loading condition "(k)" regardless of load case "i" is to be obtained from the following formula:

$$\sigma_{mean,(k)} = \sigma_{GS,(k)} + \sigma_{S1,(k)} - \sigma_{S2,(k)} + \sigma_{dS,(k)}$$

where

$\sigma_{GS,(k)}$: Stress due to still water hull girder moment, defined in [3.3.2]

$\sigma_{S1,(k)}$: Stress due to static pressure when the pressure is applied on the same side as the ordinary stiffener depending on the considered case, with consideration of the stresses defined in [3.3.3] to [3.3.5]

$\sigma_{S2,(k)}$: Stress due to static pressure when the pressure is applied on the side opposite to the stiffener depending on the considered case

$\sigma_{dS,(k)}$: Stress due to relative displacement of transverse bulkhead in still water, defined in [3.3.6]. *RCN 1 to July 2008 version (effective from 1 July 2009)*

3.3.2 Stress due to still water hull girder moment

The hot spot stress due to still water bending moment, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{GS,(k)} = K_{gh} \frac{M_{S,(k)}(z-N)}{I_Y} 10^{-3}$$

where:

$M_{S,(k)}$: Still water vertical bending moment, in kN.m, defined in Sec 3, [3.2.2].

3.3.3 Stress due to hydrostatic and hydrodynamic pressure

The hot spot stress due to hydrostatic and hydrodynamic pressure, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{LS,(k)} = \frac{K_{gl}K_s\left\{p_{s,(k)} + \frac{p_{CW,i1(k)}+p_{CW,i2(k)}}{2}\right\}s\ell^2\left(1-\frac{6x_f}{\ell}+\frac{6x_f{}^2}{\ell^2}\right)}{12w} 10^3$$

RCN 1 to July 2008 version (effective from 1 July 2009)

where:

$p_{S,(k)}$: Hydrostatic pressure, in kN/m^2, in loading condition "(k)" specified in Ch 4, Sec 5, [1.2].

$p_{CW,ij(k)}$: Corrected hydrodynamic pressure, in kN/m², according to [2.3.3], with $f_p = 0.5$, in load case "i1" and "i2" for loading condition "(k)"

i : Suffix which denotes the load case specified in Sec 2 [2.1.1], when calculating the mean stress, "I" is to be used.

RCN 1 to July 2008 version (effective from 1 July 2009)

3.3.4 Stress due to liquid pressure in still water

The structural hot spot mean stress due to liquid pressure in still water, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{CS,(k)} = \frac{K_{gl}K_s p_{CS,(k)} s\ell^2\left(1-\frac{6x_f}{\ell}+\frac{6x_f{}^2}{\ell^2}\right)}{12w} 10^3$$

where:

$p_{CS,(k)}$: Liquid pressure in still water, in kN/m^2, in loading condition "(k)" specified in Ch 4, Sec 6 [2.1]. Where the considered location is located in fuel oil, other oil or fresh water tanks, d_{AP} and P_{PV} defined in Ch 4, Sec 6 are to be taken equal to 0 and z_{TOP} specified in Ch 4, Sec 6, [2.1] is to be taken equal to z_{SF} specified in [2.3.4] *RCN 1 to July 2008 version (effective from 1 July 2009)*

3.3.5 Stress due to dry bulk cargo pressure in still water

The structural hot spot mean stress due to dry bulk cargo pressure in still water, in N/mm^2, in loading condition "(k)" is to be obtained with the following formula:

$$\sigma_{LCS,(k)} = \frac{K_{gl}K_s p_{CS,(k)} s\ell^2\left(1-\frac{6x_f}{\ell}+\frac{6x_f{}^2}{\ell^2}\right)}{12w} 10^3$$

where:

$p_{CS,(k)}$: Dry bulk cargo pressure in still water, in kN/m^2, in loading condition "(k)" specified in Ch 4, Sec 6, [1.2]

3.3.6 Stress due to relative displacement of transverse bulkhead in still water

The additional hot spot mean stress, in N/mm^2, due to the relative displacement in the transverse direction between the transverse bulkhead and the adjacent transverse web or floor in loading condition "(k)", is to be obtained with the following formula:

$$\sigma_{dS,(k)} = \begin{cases} K_{dF-a}\sigma_{dSF-a,(k)} + K_{dA-a}\sigma_{dSA-a,(k)} & \text{for point "}a\text{"} \\ K_{dF-f}\sigma_{dSF-f,(k)} + K_{dA-f}\sigma_{dSA-f,(k)} & \text{for point "}f\text{"} \end{cases}$$

where:

$\sigma_{dSF-a,(k)}$, $\sigma_{dSA-a,(k)}$, $\sigma_{dSF-f,(k)}$, $\sigma_{dSA-f,(k)}$: Additional stress at point "a" and "f", in N/mm^2, due to the relative displacement between the transverse bulkhead and the forward (F) and afterward (A) transverse web or floor respectively in loading condition (k)

$$\sigma_{dSF-a,(k)} = \frac{3.9\delta_{SF,(k)} E I_A I_F}{w_A \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fA}|}{\ell_A}\right) 10^{-5}$$

$$\sigma_{dSA-a,(k)} = \left[\frac{3.9\delta_{SA,(k)} E I_A I_F}{w_A \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fA}|}{\ell_A}\right) - \frac{0.9\delta_{SA,(k)} E I_A |x_{fA}|}{w_A {\ell_A}^3}\right] 10^{-5}$$

$$\sigma_{dSF-f,(k)} = \left[\frac{3.9\delta_{SF,(k)} E I_A I_F}{w_F \ell_F (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fF}|}{\ell_F}\right) - \frac{0.9\delta_{SF,(k)} E I_F |x_{fF}|}{w_F {\ell_F}^3}\right] 10^{-5}$$

$$\sigma_{dSA-f,(k)} = \frac{3.9\delta_{SA,(k)} E I_A I_F}{w_F \ell_A (\ell_A I_F + \ell_F I_A)} \left(1 - 1.15\frac{|x_{fF}|}{\ell_F}\right) 10^{-5}$$

$\delta_{SF,(k)}$, $\delta_{SA,(k)}$: Relative displacement, in mm, in still water in the transverse direction between the transverse bulkhead and the forward (F) and afterward (A) transverse web or floor respectively in loading condition (k)

RCN 1 to July 2008 version (effective from 1 July 2009)

Section 5 – STRESS ASSESSMENT OF HATCH CORNERS

1. General

1.1 Application

1.1.1

Hot spot stress ranges and structural hot spot mean stresses of hatch corners based on the simplified procedure are to be assessed according to the requirements of this Section.

2. Nominal stress range

2.1 Nominal stress range due to wave torsional moment

2.1.1

The nominal stress range, in N/mm^2, due to cross deck bending induced by wave torsion moments is to be obtained from the following formula:

$$\Delta\sigma_{WT} = \frac{2}{1000} F_S F_L \frac{Q \cdot B_H}{W_Q}$$

where:

$$Q = 1000u \Big/ \left(\frac{(B_H + b_s)^3}{12 E I_Q} + \frac{2.6 B_H}{E A_Q} \right)$$

u : Displacement of hatch corner in longitudinal direction, in m, taken equal to:

$$u = \frac{31.2}{1000} \frac{M_{WT}\ \omega}{I_T E\ DOC}$$

DOC : Deck opening coefficient, taken equal to:

$$DOC = \frac{L_C B}{\sum_{i=1}^{n} L_{H,i} B_{H,i}}$$

M_{WT} : Maximum wave torsional moment, in kN.m, defined in Ch 4, Sec 3, [3.4.1], with $f_p = 0.5$

F_S : Stress correction factor, taken equal to:

$$F_S = 5$$

F_L : Correction factor for longitudinal position of hatch corner, taken equal to:

$$F_L = 1.75 \frac{x}{L} \quad \text{for } 0.57 \le x/L \le 0.85$$

$$F_L = 1.0 \quad \text{for } x/L < 0.57 \text{ and } x/L > 0.85$$

B_H : Breadth of hatch opening, in m

W_Q : Section modulus of the cross deck about z-axis, in m^3, including upper stool, near hatch corner (see Fig 2)

I_Q : Moment of inertia of the cross deck about z-axis, in m^4, including upper stool, near the hatch corner (see Fig 2)

A_Q : Effective shear area of the whole section of the cross deck, in m^2, including upper stool, near the hatch corner (see Fig 2). For the determination of the effective shear area the consideration of only the plate elements is sufficient, and the stiffeners can be neglected.

b_S : Breadth of remaining deck strip on one side, in m, beside the hatch opening

I_T : Torsion moment of inertia of ships cross section, in m^4, calculated within cross deck area by neglecting upper and lower stool of the bulkhead (see Fig 1). It may be calculated according to App 1

ω : Sector coordinate, in m^2, calculated at the same cross section as I_T and at the Y and Z location of the hatch corner (see Fig 1) It may be calculated according to App 1

L_C : Length of cargo area, in m , being the distance between engine room bulkhead and collision bulkhead

$B_{H,i}$: Breadth of hatch opening of hatch i, in m

$L_{H,i}$: Length of hatch opening of hatch i, in m

n : Number of hatches.

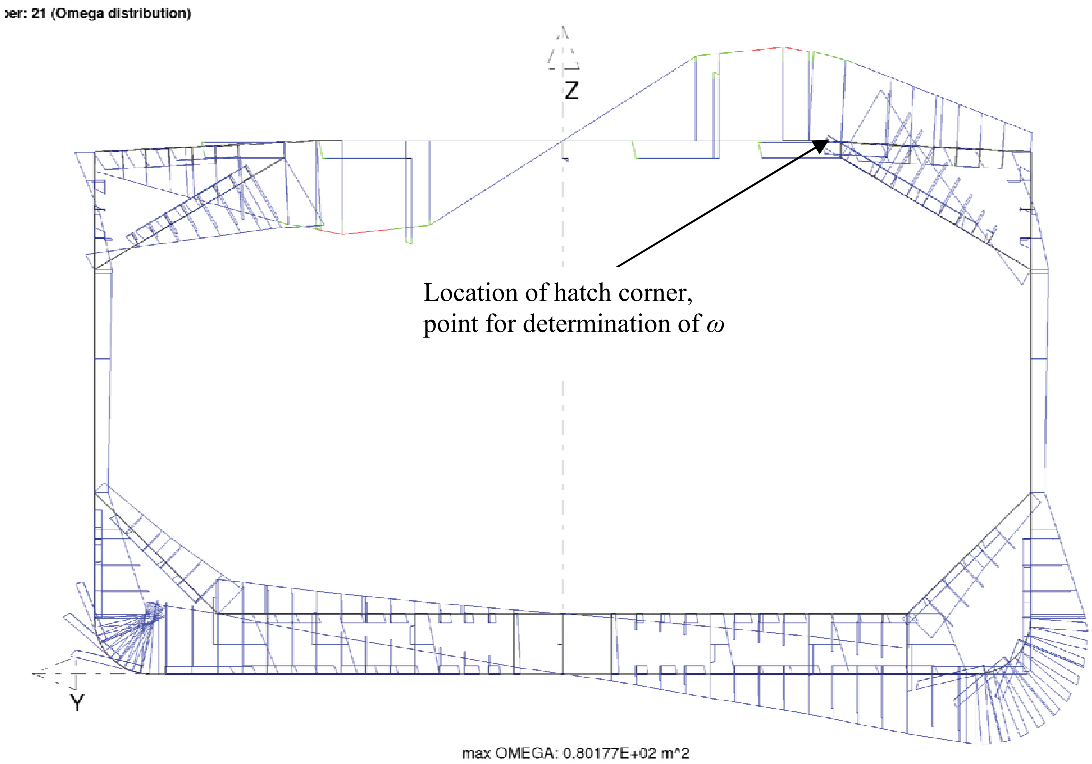

Figure 1: Cross section for determination of I_T and ω

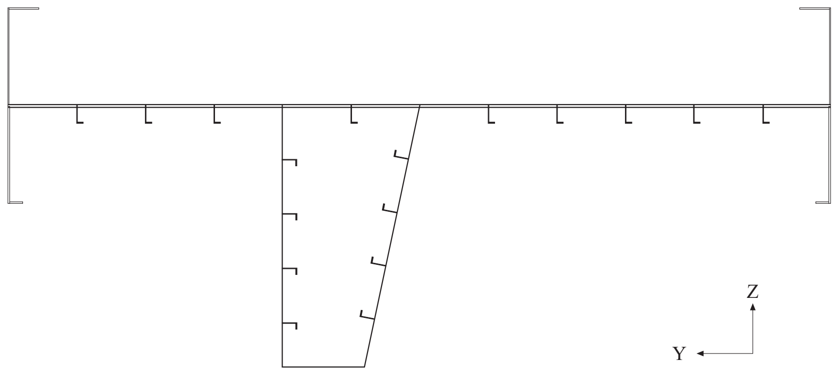

Figure 2: Elements to be considered for the determination of A_Q, W_Q and I_Q

2.2 Nominal mean stress

2.2.1

The mean stress due to still water bending moment within the cross deck is set to 0.

3. Hot spot stress

3.1 Hot spot stress range

3.1.1

The hot spot stress range, in N/mm^2, is to be obtained from the following formula:

$$\Delta\sigma_W = K_{gh} \cdot \Delta\sigma_{WT}$$

where:

K_{gh} : Stress concentration factor for the hatch corner, taken equal to:

$$K_{gh} = \frac{r_a + 2r_b}{3r_a}\left\{1 + \left(\frac{2b}{1.23\ell_{CD} + 1.6b}\frac{0.22\ell_{CD}}{r_a}\right)^{0.65}\right\}$$, to be taken not less than 1.0

r_a : Radius, in m, in major axis

r_b : Radius, in m, in minor axis (if the shape of corner is a circular arc, r_b is to be equal to r_a)

ℓ_{CD} : Length of cross deck, in m, in longitudinal direction

b : Distance, in m, from the edge of hatch opening to the ship's side.

Appendix 1 – CROSS SECTIONAL PROPERTIES FOR TORSION

1. Calculation Formulae

1.1 Torsion Function Φ

1.1.1

For any partial area of closed cells the following geometric figures and ratios have to be computed:

$$A_y = \frac{1}{2}(z_i + z_k)(y_k - y_i)$$

$$l = \sqrt{(y_k - y_i)^2 + (z_k - z_i)^2}$$

$$\frac{s}{t} = \frac{\ell}{t}$$

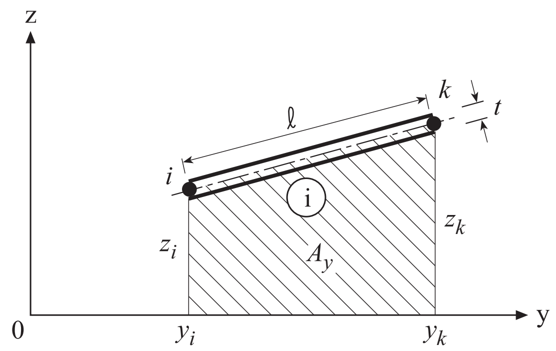

Figure 1:

The following three versions of algorithms may be applied depending on the type of cross section:

Version A: Asymmetric open cross sections as shown in Fig 2

Version B: Symmetric cross sections with particular closed cells (closed cells without shared walls) as shown in Fig 3. In this case the torsion function can be calculated for each cell separately.

$$\Phi_0 = \frac{2\sum_{Cell\,0} A_y}{\sum_{Cell\,0} \frac{s}{t}} \quad ; \quad \Phi_2 = \frac{2\sum_{Cell\,2} A_y}{\sum_{Cell\,2} \frac{s}{t}}$$

Version C: Symmetric cross sections with multiple closed cells (closed cells with shared walls) as shown in Fig 4. In this case the torsion function for each cell i can be calculated by solving a linear system of equations considering the shared walls.

$$\Phi_0 \sum_{Cell\,0} \frac{s}{t} + \Phi_1 \left(\frac{s}{t}\right)_{Common\ Wall} = 2A_{Cell0}$$

$$\Phi_1 \sum_{Cell\,1} \frac{s}{t} + \Phi_0 \left(\frac{s}{t}\right)_{Common\ Wall} = 2A_{Cell1}$$

From this system of equations the torsion functions Φ_0 and Φ_1 can be derived.

1.2 Co-ordinate system, running coordinate *s*

1.2.1

A 2-D cartesian co-ordinate system is to be used. The choice of the reference point O (origin of co-ordinate system) is free, but for symmetric cross sections it is advantageous to define the origin at the line of symmetry of the cross section. The running co-ordinate *s* starts within symmetric cross sections at the intersection of the line of symmetry with the cross section geometry, e.g. in hull cross sections at the intersection of centreline and bottom shell or double-bottom as indicated by '0' in Fig 2 to Fig 4. The orientation of *s* as well as the direction of integration within closed cells is to be considered with respect to the algebraic signs and the assembly of the system of equations for the torsion function.

1.3 Computation of several properties for each part of the cross section

1.3.1

ω_i = ω_k of the preceding partial area or of the preceding point of bifurcation. (to be set equal to zero at the beginning of the computation)

ω_k = $\omega_i + y_i z_k - y_k z_i - \Phi \dfrac{\ell_i}{t_i}$, with $\Phi \dfrac{\ell_i}{t_i}$ within closed cells

l = $\sqrt{(y_k - y_i)^2 + (z_k - z_i)^2}$

		Summation
A	$= \ell t$	$\sum A$
S_y	$= A/2\,(z_i + z_k)$	$\sum S_y$
S_z	$= A/2\,(y_i + y_k)$	$\sum S_z$
S_ω	$= A/2\,(\omega_i + \omega_k)$	$\sum S_\omega$
I_y	$= A/3\,(z_i^2 + z_i z_k + z_k^2)$	$\sum I_y$
I_z	$= A/3\,(y_i^2 + y_i y_k + y_k^2)$	$\sum I_y$
I_{yz}	$= A/6\,[(2y_k + y_i)z_k + (2y_i + y_k)z_i]$	$\sum I_{yz}$
I_ω	$= A/3\,(\omega_i^2 + \omega_i\omega_k + \omega_k^2)$	$\sum I_\omega$
$I_{\omega y}$	$= A/6\,[(2y_k + y_i)\omega_k + (2y_i + y_k)\omega_i]$	$\sum I_{\omega y}$
$I_{\omega z}$	$= A/6\,[(2z_k + z_i)\omega_k + (2z_i + z_k)\omega_i]$	$\sum I_{\omega z}$
$s\,t^3$	$= \ell t^3$	$\sum s \cdot t^3$

1.4 Computation of cross sectional properties for the entire cross section

Asymmetric cross section:			Symmetric cross section (only half of the section is modeled)		
A	=	$\sum A$	A	=	$2\sum A$
y_s	=	$\dfrac{\sum S_z}{\sum A}$	y_s	=	$\dfrac{\sum S_z}{\sum A}$
z_s	=	$\dfrac{\sum S_y}{\sum A}$	z_s	=	$\dfrac{\sum S_y}{\sum A}$
I_y	=	$\sum I_y - \sum A z_s^2$	I_y	=	$2\left(\sum I_y - \sum A z_s^2\right)$
I_z	=	$\sum I_z - \sum A y_s^2$	I_z	=	$2\left(\sum I_z - \sum A y_s^2\right)$
I_{yz}	=	$\sum I_{yz} - \sum A y_s z_s$			
I_T	=	$\sum \dfrac{s t^3}{3} + \sum_{Cell\ i} \left(2 A_{yi} \Phi_i\right)$	I_T	=	$2\left[\sum \dfrac{s t^3}{3} + \sum_{Cell\ i} \left(2 A_{yi} \Phi_i\right)\right]$
ω_0	=	$\dfrac{\sum S_\omega}{\sum A}$			
$I_{\omega y}$	=	$\sum I_{\omega y} - \sum A y_s \omega_0$	$I_{\omega y}$	=	$2\sum I_{\omega y}$
$I_{\omega z}$	=	$\sum I_{\omega z} - \sum A z_s \omega_0$			
y_M	=	$\dfrac{I_{\omega z} I_z - I_{\omega y} I_{yz}}{I_y I_z - I_{yz}^2}$			
z_M	=	$\dfrac{I_{\omega z} I_{yz} - I_{\omega y} I_y}{I_y I_z - I_{yz}^2}$	z_M	=	$-\dfrac{I_{\omega y}}{I_z}$
I_ω	=	$\sum I_\omega - \sum A \omega_0^2 + z_M I_{\omega y} - y_M I_{\omega z}$	I_ω	=	$2\sum I_\omega + z_M I_{\omega y}$

I_y, I_z, I_{yz} are to be computed with relation to the centre of gravity.

S_x, S_y, S_ω, I_ω, $I_{\omega y}$ and $I_{\omega z}$ are to be computed with relation to shear centre M

The sector-coordinate ω has to be transformed with respect to the location of the shear centre M. For cross sections of type **A**, ω_0 is to be added to each ω_i and ω_k as defined in [1.3]

For cross sections of type **B** and **C**, $\Delta\omega$ can be calculated as follows:

$\Delta\omega_i \quad = z_M y_i$

where:

ω_O : Calculated sector co-ordinate with respect to the centre of the coordinate system (O) selected for the calculation according to the formulae for ω_k given in [1.3]

ω : Transformed sector co-ordinate with respect to shear centre M

y_M, z_M : Distance between shear centre M and centre of the coordinate system B.

The transformed values of ω can be obtained by adding $\Delta\omega$ to the values of ω_O obtained according to the formulae in [1.3].

The transformed value for ω is to be equal to zero at intersections of the cross section with the line of symmetry (centreline for ship-sections).

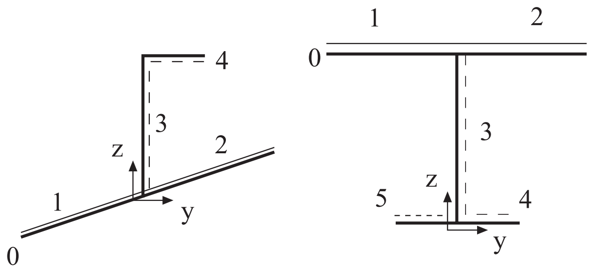

Figure 2: Cross sections of type A

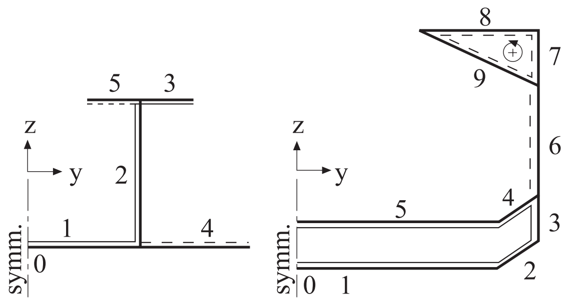

Figure 3: Cross sections of type B

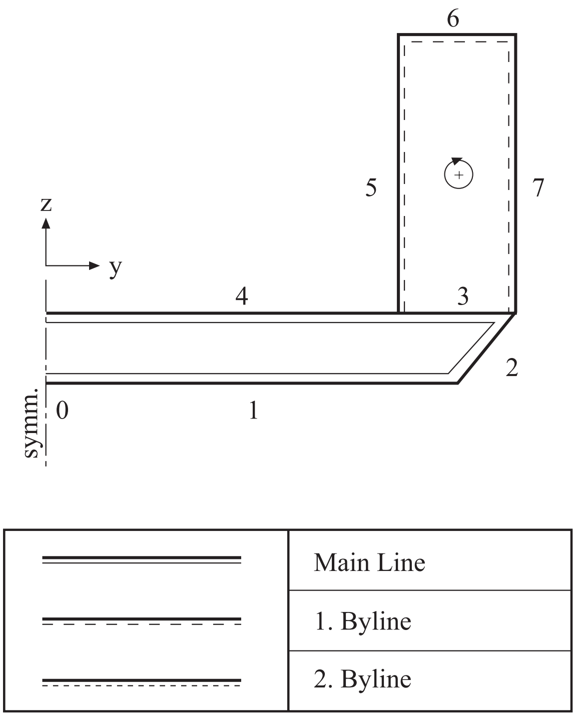

Figure 4: Cross section of type C

Designation of line types (numbers at particular parts of cross sections) gives the order of the particular parts for the calculation and therefore the direction of the running coordinate *s*.

2. Example calculation for a single side hull cross section

2.1 Cross section data

2.1.1

The cross section is shown in Fig 5. The co-ordinates of the node-points marked by filled black circles in Fig 5 are given in the Tab 1, where the plate thicknesses and the line segments (marked by circles in Fig 5) of the cross section are given in Tab 2.

Table 1: Node-coordinates of cross-section

Node number	*Y* Coordinate	*Z* Coordinate
0	0.00	0.00
1	14.42	0.00
2	16.13	1.72
3	16.13	6.11
4	11.70	1.68
5	0.00	1.68
6	16.13	14.15
7	16.13	19.6
8	7.50	20.25
9	7.50	19.63
10	0.00	20.25

2.2 Determination of the torsion function Φ

2.2.1

The first step is to build a linear system of equation for the determination of the torsion function Φ of each closed cell. The cross section and the cells are shown in Fig 5.

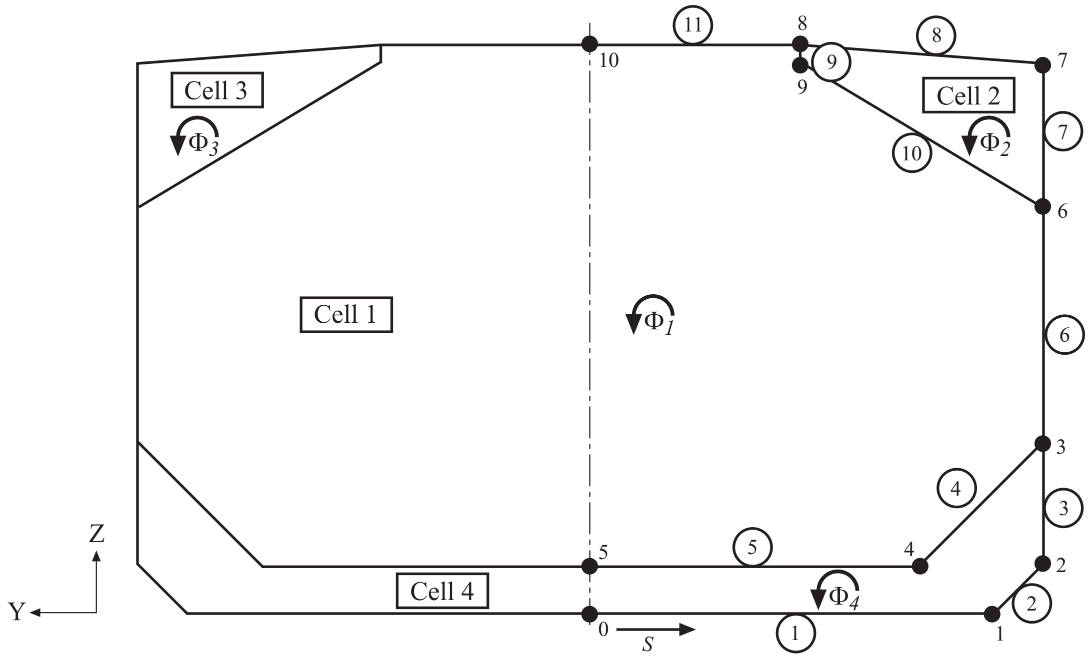

Figure 5: Single side hull cross section

Table 2: Dimensions and nodes of line segments of the cross section

Line-No.	Node i	Node k	y_i	z_i	y_k	z_k	Length	Thickness
1	0	1	0.00	0.00	14.42	0.00	14.42	0.017
2	1	2	14.42	0.00	16.13	1.72	2.43	0.017
3	2	3	16.13	1.72	16.13	6.11	4.39	0.018
4	3	4	16.13	6.11	11.70	1.68	6.26	0.019
5	4	5	11.70	1.68	0.00	1.68	11.70	0.021
6	3	6	16.13	6.11	16.13	14.15	8.04	0.018
7	6	7	16.13	14.15	16.13	19.6	5.45	0.021
8	7	8	16.13	19.60	7.50	20.25	8.65	0.024
9	8	9	7.50	20.25	7.50	19.63	0.62	0.024
10	9	6	7.50	19.63	16.13	14.15	10.22	0.015
11	8	10	7.50	20.25	0.00	20.25	7.50	0.012

Under consideration of the 4 cells (marked by rectangles in Fig 5) of the cross section, the following system of equation for the determination of the torsion function Φ can be developed. It should be noted that the direction of the rotation is to be considered (the rotation directions for the torsion functions Φ_i should point in the same direction for all Φ_i to build up the system of equations).

$$\begin{aligned}
\sum_{1}\frac{s}{t}\Phi_1 \quad -\sum_{1-2}\frac{s}{t}\Phi_2 \quad -\sum_{1-3}\frac{s}{t}\Phi_3 \quad -\sum_{1-4}\frac{s}{t}\Phi_4 &= 2\sum_{1} A \\
-\sum_{1-2}\frac{s}{t}\Phi_1 \quad +\sum_{2}\frac{s}{t}\Phi_2 &= 2\sum_{2} A \\
-\sum_{1-3}\frac{s}{t}\Phi_1 \quad +\sum_{3}\frac{s}{t}\Phi_3 &= 2\sum_{3} A \\
-\sum_{1-4}\frac{s}{t}\Phi_1 \quad +\sum_{4}\frac{s}{t}\Phi_4 &= 2\sum_{4} A
\end{aligned}$$

The coefficients of the matrix can be calculated as follows:

$$\sum_{1}\frac{s}{t}=\frac{2\cdot 11700}{21}+\frac{2\cdot 6265}{19}+\frac{2\cdot 8040}{18}+\frac{2\cdot 10223}{15}+\frac{2\cdot 620}{24}+\frac{2\cdot 7500}{12}=5331.81$$

$$\sum_{2}\frac{s}{t}=\frac{10223}{15}+\frac{5450}{21}+\frac{620}{24}+\frac{8654}{24}=1327.48$$

$$\sum_{3}\frac{s}{t}=1327.48$$

$$\sum_{4}\frac{s}{t}=\frac{2\cdot 14420}{17}+\frac{2\cdot 11700}{21}+\frac{2\cdot 6265}{19}+\frac{2\cdot 2425}{17}+\frac{2\cdot 4390}{18}=4243.34$$

$$\sum_{1-2}\frac{s}{t}=\frac{10223}{15}+\frac{620}{24}=707.36$$

$$\sum_{1-3}\frac{s}{t}=707.36$$

$$\sum_{1-4}\frac{s}{t}=\frac{2\cdot 11700}{21}+\frac{2\cdot 6265}{19}=1773.76$$

The areas of the cells can be calculated as follows:

$$2\sum_{1}A=2\cdot 2\cdot 260.72=1042.90 \quad m^2$$

$$2\sum_{2}A=2\cdot 26.19=52.38 \quad m^2$$

$$2\sum_{3}A=52.38 \quad m^2$$

$$2\sum_{4}A=2\cdot 2\cdot 35.44=141.76 \quad m^2$$

With these results the coefficient matrix will become:

$$\begin{array}{lllllll}
5331.81\Phi_1 & -707.360\Phi_2 & -707.36\Phi_3 & -1773.76\Phi_4 & = & 1042.90 \\
-707.36\Phi_1 & +1327.48\Phi_2 & & & = & 52.38 \\
-707.36\Phi_1 & & +1327.48\Phi_3 & & = & 52.38 \\
-1773.76\Phi_1 & & & +4243.34\Phi_4 & = & 141.76
\end{array}$$

The solution of this system gives:

$$\Phi_1=0.3018$$
$$\Phi_2=0.2003$$
$$\Phi_3=0.2003$$
$$\Phi_4=0.1596$$

2.3 Determination of the line-segment properties

2.3.1

The next step is the determination of ω_k according to the formulae given in [1.3]. '*s*' starts at point 0 (Fig 5) with ω_i=0 and follows the path from point 0 to point 1, 2, 3, 4 up to point 5. It is to be noted, that the term $\Phi\left(\ell_i/t_i\right)$ is for the line segments 1 to 3 (between points 0 and 3) calculated as $\Phi_4\left(\ell_{1\ldots 3}/t_{1\ldots 3}\right)$ where for the line segments 4 and 5 this term becomes $(\Phi_4-\Phi_1)\left(\ell_{4\ldots 5}/t_{4\ldots 5}\right)$ because line segments 4 and 5 are shared walls of cell 4 and

cell 1. The rotation direction for the torsion functions together with the direction of integration (direction of path, which one follows for the calculation) determines the algebraic sign within this term.

For the line segment 6 ω_i has to be set to the value at point 3 and $\Phi\left(\ell_i / t_i\right) = \Phi_1\left(\ell_6 / t_6\right)$. '$s$' follows now the path from point 6 to point 7, 8, 9 back to point 6. The shared wall between cell 2 and cell 1 has to be considered for the terms which include the torsion function Φ. For the line segment 11 between point 8 and 10, ω_i has to be set to the value at point 8.

The other properties of the line segments can be calculated by the formulas given in [1.3].

2.4 Determination of cross-section properties

2.4.1

After the summation of the line-segment properties, the cross section properties can be calculated as described in [1.4].

The sector coordinate has to be transformed with respect to the shear centre as described in [1.4]

The result of the calculations gives the sector co-ordinates, as indicated in Tab 3.

Table 3: Sector co-ordinates for the cross section of Fig 5

Point i	$\omega_{O,i}$	$\Delta\omega_i$	ω_i
0	0.00	0.00	0.00
1	-135.97	84.99	-50.98
2	-134.04	95.07	-38.97
3	-102.32	95.07	-7.25
4	-99.49	68.96	-30.53
5	-0.06	0.00	-0.06
6	-108.20	95.07	-13.13
7	-72.30	95.07	22.77
8	35.07	44.21	79.27
9	33.08	44.21	77.28
10	-2.75	0.00	-2.75

2.5 Notes

2.5.1

For holds of single side skin construction, the hull cross section normally can be simplified in a section with four boxes (cell 1 cargo hold, cell 2 and 3 wing tanks and cell 4 hopper tanks and double bottom as shown in the calculation example) whereas the cross section of holds of double side skin construction can be simplified to a cross section with two closed cells only (cell 1 cargo hold, cell 2 double hull). For the plate thickness of the line elements with variable thicknesses an equivalent plate thickness can be used calculated by the following formulae:

$$t_{eq} = \frac{t_1\ell_1 + t_2\ell_2 + \ldots + t_i\ell_i + \ldots + t_k\ell_k}{\sum_{i=1}^{k}\ell_i}$$

RCN 1 to July 2010 version (effective from 1July 2012)

Due to the simplifications, the value of the sector co-ordinate ω can differ from 0 at the intersections between the cross section and centreline. The difference between the value of the sector co-ordinate ω and the value of the torsional moment of inertia I_T for the simplified cross section is in normal cases less than 3% compared to the values of the original cross section.

Chapter 9

Other Structures

Section 1 – FORE PART

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

L_2 : Rule length L, but to be taken not greater than 300 m

T_B : Minimum ballast draught, in m, for normal ballast conditions

k : Material factor, defined in Ch 3, Sec 1, [2.2]

m : Coefficient taken equal to:

m = 10 for vertical stiffeners, vertical primary supporting members

m = 12 for other stiffeners, other primary supporting members

τ_α : Allowable shear stress, in N/mm^2, taken equal to:

$$\tau_a = \frac{R_Y}{\sqrt{3}}$$

s : Spacing, in m, of ordinary stiffeners or primary supporting members, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners or primary supporting members, measured along the chord between the supporting members, see Ch 3, Sec 6, [4.2] or [5.3] respectively.

c_a : Aspect ratio of the plate panel, equal to:

$$c_a = 1.21\sqrt{1 + 0.33\left(\frac{s}{\ell}\right)^2} - 0.69\frac{s}{\ell}$$, to be taken not greater than 1.0

c_r : Coefficient of curvature of the panel, equal to:

$$c_r = 1 - 0.5\frac{s}{r}$$, to be taken not less than 0.4

r : Radius of curvature, in m.

RCN 1 to July 2010 version (effective from 1July 2012)

1. General

1.1 Application

1.1.1

The requirement of this Section apply to:

- the structures located forward of the collision bulkhead, i.e.:
  - the fore peak structures
  - the stem
- the reinforcements of the bow flare area, according to [4.1]
- the reinforcements of the flat bottom forward area, according to [5.1].

1.1.2
Fore part structures which form the boundary of spaces not intended to carry liquids, and which do not belong to the outer shell, are to be subjected to lateral pressure in flooding conditions. Their scantlings are to be determined according to the relevant criteria in Ch.6.

RCN 1 to July 2010 version (effective from 1July 2012)

1.2 Net thicknesses

1.2.1
As specified in Ch 3, Sec 2, all thicknesses referred to in this Section are net, i.e. they do not include any corrosion addition. The gross thicknesses are to be obtained as specified in Ch 3, Sec 2, [3].

2. Arrangement

2.1 Structural arrangement principles

2.1.1 General
Scantlings of the shell envelope, upper deck and inner bottom, if any, are to be tapered towards the forward end. Special consideration is to be paid to the structural continuity of major longitudinal members in order to avoid abrupt changes in section.

Structures within the fore peak, such as platforms, decks, horizontal ring frames or side stringers are to be scarphed into the structure aft into the cargo hold.

Where inner hull structures terminate at the collision bulkhead, the structural continuity is to be ensured forward of the collision bulkhead by adequate structure with tapering brackets.

Longitudinal stiffeners of deck, bottom and side shell are to be extended as far forward as practicable.

All shell frames and tank boundary stiffeners are to be continuous, or are to be bracketed tat their ends.

Where the brackets are provided to ensure the structural continuity from the forward end to 0.15L behind fore perpendicular, flanged brackets have to be used.

2.1.2 Structures in tanks
Where peaks are used as tanks, stringer plates are to be flanged or face bars are to be fitted at their inner edges. Stringers are to be effectively fitted to the collision bulkhead so that the forces can be properly transmitted.

2.2 Tripping brackets

2.2.1
For peaks or other tanks forward of the collision bulkhead transversely framed, tripping brackets vertically spaced not more than 2.6 m are to be fitted, according to Fig 1, between primary supporting members, decks and/or platforms.

The as-built thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

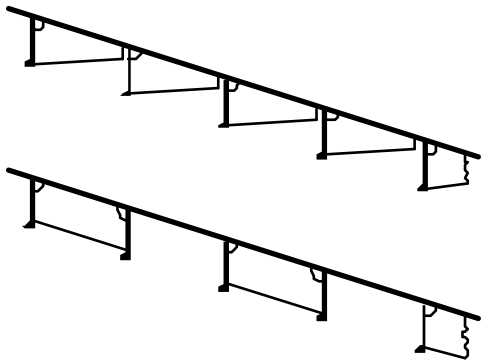

Figure 1: Tripping brackets

2.3 Floors and bottom girders

2.3.1

Where no centreline bulkhead is provided, a centre bottom girder is to be fitted.

In general, the minimum depth of the floor at the centerline and center girders is to be not less than the required depth of the double bottom of the foremost cargo hold.

2.3.2 Solid floors

In case of transverse framing, solid floors are to be fitted at every frame.

In case of the longitudinal framing, the spacing of solid floors is not to be greater than 3.5m or four transverse frame spaces, whichever is the smaller. Larger spacing of solid floors may be accepted, provided that the structure is verified by means of FEA deemed appropriate by the Society.

RCN 1 to July 2010 version (effective from 1July 2012)

2.3.3 Bottom girders

In case of transverse framing, the spacing of bottom girders is not to exceed 2.5m.

In case of longitudinal framing, the spacing of bottom girders is not to exceed 3.5m.

Larger spacing of bottom girders may be accepted, provided that the structure is verified by means of FEA deemed appropriate by the Society.

RCN 1 to July 2010 version (effective from 1July 2012)

3. Load model

3.1 Load point

3.1.1

Unless otherwise specified, lateral pressure is to be calculated at load points according to:

- Ch 6, Sec 1, [1.5], for plating
- Ch 6, Sec 2, [1.4], for stiffeners.

3.2 Pressure in bow area

3.2.1 Lateral pressure in intact conditions

The pressure in bow area, in kN/m^2, is to be taken equal to ($p_S + p_W$).

where:

p_S, p_W : Hydrostatic and hydrodynamic pressures according to Ch 4, Sec 5, or internal still water and inertial pressures according to Ch 4, Sec 6, [2], to be considered among load cases H, F, R and P.

3.2.2 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

$p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating

$p_T = p_{ST}$ otherwise

where:

p_{ST} : Testing pressure defined in Ch 4, Sec 6, [4]

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in Ch 4, Sec 5, [1] for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat.
- if the testing is not carried out afloat: $p_S = 0$

3.2.3 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering separately:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

3.2.4 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

3.3 Bow flare area pressure

3.3.1

The bow pressure p_{FB}, in kN/m^2, is to be obtained according to Ch 4, Sec 5, [4.1].

3.4 Bottom slamming pressure

3.4.1

The bottom slamming pressure p_{SL}, in kN/m^2, in the flat bottom forward is to be obtained according to Ch 4, Sec 5, [4.2].

4. Scantlings

4.1 Bow flare reinforcement

4.1.1

The bow flare area to be reinforced is that extending forward of $0.9L$ from the aft end and above the normal ballast waterline according to the applicable requirements in [4.2] to [4.4].

4.2 Plating

4.2.1

The net thickness of plating are to be not less than those obtained from the formulae in Tab 1 and Tab 2.

Table 1: Net minimum thickness of plating

Minimum net thickness, in mm	
Bottom,	$5.5 + 0.03L$
Side	$0.85L^{1/2}$
Inner bottom	$5.5 + 0.03L$
Strength deck	$4.5 + 0.02L$
Platform and wash bulkhead	6.5
Transverse and longitudinal watertight bulkheads	$0.6L^{1/2}$

RCN 1 to July 2010 version (effective from 1July 2012)

Table 2: Net thickness of plating

Net thickness, in mm	
Intact conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_S + p_W}{0.9 R_Y}}$
Bow flare area	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_{FB}}{0.9 R_Y}}$
Testing conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_T}{1.05 R_Y}}$

4.3 Ordinary stiffeners

4.3.1 General

The requirements of this sub-article apply to ordinary stiffeners considered as clamped at both ends. For other boundary conditions, the yielding check is to be considered on a case by case basis.

4.3.2

The net dimensions of ordinary stiffeners are to comply with the requirements in Ch 6, Sec 2, [2.3]

4.3.3

The net thickness of the web of ordinary stiffeners, in mm, is to be not less than the greater of:

- $t = 3.0 + 0.015L_2$
- 40% of the net required thickness of the attached plating, to be determined according to [4.2] and [5.2].

The net dimensions of ordinary stiffeners are to comply with the requirement in Ch 6 Sec 2, [2.2.2] and [2.3].

RCN 1 to July 2008 version (effective from 1July 2009)

4.3.4

The net scantlings of single-span ordinary stiffeners are to be not less than those obtained from the formulae in Tab 3.

Table 3: Net scantlings of single span ordinary stiffeners

Stiffener type	Net section modulus w, in cm^3	Net sectional shear area A_{sh}, in cm^2
Single span ordinary stiffeners subjected to lateral pressure	$w = \dfrac{(p_S + p_W)s\ell^2}{0.9 m R_Y} 10^3$	$A_{sh} = \dfrac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$
Single span ordinary stiffeners located in bow flare area	$w = \dfrac{p_{FB} s\ell^2}{0.9 m R_Y} 10^3$	$A_{sh} = \dfrac{5 p_{FB} s\ell}{\tau_a \sin\phi}$
Single span ordinary stiffeners subjected to testing pressure	$w = \dfrac{p_T s\ell^2}{1.05 m R_Y} 10^3$	$A_{sh} = \dfrac{5 p_T s\ell}{1.05\tau_a \sin\phi}$

where:

ϕ : Angle, in deg, between the stiffener web and the shell plate, measured at the middle of the stiffener span; the correction is to be applied when ϕ is less than 75.

4.3.5

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to comply with the formulae in Tab 4.

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to be determined by a direct calculation taking into account:

- the distribution of still water and wave pressure and forces, if any
- the number and position of intermediate supports (decks, girders, etc.)
- the condition of fixity at the ends of the stiffener and at intermediate supports
- the geometrical characteristics of the stiffener on the intermediate spans.

Table 4: Checking criteria for multi-span ordinary stiffeners

Condition	Intact	Testing
Normal stress	$\sigma \le 0.9 R_Y$	$\sigma \le 1.05 R_Y$
Shear stress	$\tau \le \tau_a$	$\tau \le 1.05\tau_a$

4.4 Primary supporting members

4.4.1 Minimum thickness

The net thickness of the web of primary supporting members, in mm, is to be not less than that obtained from the following formula:

$$t = 0.7\sqrt{L_2}$$

4.4.2 Side transverses

The net section modulus w, in cm^3 , and the net shear sectional area A_{sh}, in cm^2 , of side transverses are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

In addition, the net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2 , of side transverses located within the bow flare area are to be not less than the values obtained from the following formulae:

$$w = \frac{p_{FB}s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5p_{FB}s\ell}{\tau_a \sin\phi}$$

4.4.3 Side girders

The net section modulus w, in cm^3 , and the net shear sectional area A_{sh}, in cm^2 , of side girders are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

In addition, the net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side girders located within the bow flare area are to be not less than the values obtained from the following formulae:

$$w = \frac{p_{FB}s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5p_{FB}s\ell}{\tau_a \sin\phi}$$

4.4.4 Deck primary supporting members

The net scantlings of deck primary supporting members are to be not less than those obtained from the formulae in Table 5. The design pressures in the formulae are taken from intact conditions and testing conditions respectively as stated in [3.2]. For a complex deck structure, a calculation deemed appropriate by the Society may be carried out in lieu of the formulae.

RCN 1 to July 2010 version (effective from 1July 2012)

Table 5 Net scantlings of deck primary supporting members

Condition	Net section modulus w, in cm^3	Net sectional shear area A_{sh}, in cm^2
Primary supporting members subjected to lateral pressure in intact conditions	$w = \dfrac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$	$A_{sh} = \dfrac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$
Primary supporting members subjected to lateral pressure in testing conditions	$w = \dfrac{p_T s\ell^2}{1.05mR_Y}10^3$	$A_{sh} = \dfrac{5p_T s\ell}{1.05\tau_a \sin\phi}$
where:		
ϕ : Angle, in deg, between the primary supporting member's web and the shell plate, measured at the middle of the primary supporting member's span; the correction is to be applied when ϕ is less than 75.		

RCN 1 to July 2010 version (effective from 1July 2012)

5. Strengthening of bottom forward area

RCN 1 to July 2010 version (effective from 1July 2012)

5.1 Application

5.1.1

The bottom forward area to be reinforced is the part of the ship's bottom extending forward of $0.2V\sqrt{L}$ from the fore perpendicular end, up to a height of $0.05T_B$ or 0.3 m above base line, whichever is the smaller.

RCN 1 to July 2010 version (effective from 1July 2012)

5.2 Bottom plating

5.2.1

The net thickness, in mm, of the bottom forward area, is not to be less than:

$$t = 15.8C_a C_r s\sqrt{\frac{C_s p_{SL}}{R_{eH}}}$$

where:

C_s : Coefficient relating to load patch of impact pressure, taken equal to:

$C_s = 1.0$, where no intermediate longitudinals is provided between ordinary stiffeners

$C_s = 1.3$ where intermediate longitudinals are provided between ordinary stiffeners.

RCN 1 to July 2010 version (effective from 1July 2012)

5.2.2

For ships with a rise of floor the strengthened plating must at least extend to the bilge curvature.

5.3 Ordinary stiffeners

5.3.1

The net section modulus, in cm^3, of transverse or longitudinal ordinary stiffeners of the bottom forward area is not to be less than:

$$w = \frac{C_s p_{SL} s\ell^2}{16R_{eH}}10^3$$

where:

C_s : Coefficient defined in [5.2.1].

RCN 1 to July 2010 version (effective from 1July 2012)

5.3.2

The net shear area, in cm², of transverse or longitudinal ordinary stiffeners of the bottom forward area is not to be less than:

$$A = \frac{5\sqrt{3}p_{SL}s(\ell - 0.5s)}{R_{eH}\sin\phi}$$

The area of the welded connection has to be at least twice this value.

RCN 1 to July 2010 version (effective from 1July 2012)

5.4 Primary supporting members

5.4.1 Girders

The net thickness of girders in double bottom forward area, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = \frac{c_A p_{SL} S\ell}{2(d_0 - d_1)\tau_a}$$

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 \tau_a}{C_1'}t_1}$$

$$t_3 = \frac{C_1'' a}{\sqrt{k}}$$

where:

c_A : Coefficient taken equal to:

$c_A = 3/A$, with $0.3 \le c_A \le 1.0$

A : Loaded area, in m², between the supports of the structure considered, obtained from the following formula:

$A = S\ell$

p_{SL} : As defined in [3.4]

S : Spacing of centre or side girders under consideration, in m

ℓ : Span of centre or side girders between floors under consideration, in m

d_0 : Depth of the centre or side girder under consideration, in m

d_1 : Depth of the opening, if any, at the point under consideration, in m

H : Value obtained from the following formulae:

(a) Where the girder is provided with an unreinforced opening : $H = 1 + 0.5\dfrac{\phi}{\alpha}$

(b) In other cases: $H = 1.0$

ϕ : Major diameter of the openings, in m

α : The greater of a or S_1, in m.

a : Depth of girders at the point under consideration, in m, Where, however, if horizontal stiffeners are fitted on the girder, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration

S_1 : Spacing, in m, of vertical ordinary stiffeners or floors

C_1' : Coefficient obtained from Tab 6 depending on S_1/a. For intermediate values of S_1/a, C_1' is to be determined by linear interpolation.

C_1'' : Coefficient obtained from Tab 7 depending on S_1/a. For intermediate values of S_1/a, C_1'' is to be obtained by linear interpolation.

Table 6 Coefficient C_1'

$\frac{S_1}{a}$	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_1'	64	38	25	19	15	12	10	9	8	7

Table 7 Coefficient C_1''

$\frac{S_1}{a}$		0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4	1.6 and over
C_1''	Centre girder	4.4	5.4	6.3	7.1	7.7	8.2	8.6	8.9	9.3	9.6	9.7
	Side girder	3.6	4.4	5.1	5.8	6.3	6.7	7.0	7.3	7.6	7.9	8.0

5.4.2 Floors

The net thickness of floors in double bottom forward area, in mm, is not to be less than the greatest of either of the value t_1 to t_3 specified in the followings according to each location:

$$t_1 = \frac{c_A p_{SL} S\ell}{2(d_0 - d_1)\tau_a}$$

$$t_2 = 1.75 \cdot \sqrt[3]{\frac{H^2 a^2 \tau_a}{C_2'} t_1}$$

$$t_3 = \frac{8.5 S_2}{\sqrt{k}}$$

where :

c_A : Coefficient taken equal to:

$c_A = 3/A$, with $0.3 \le c_A \le 1.0$

A : Loaded area, in m^2, between the supports of the structure considered, obtained from the following formula:

$A = S\ell$

p_{SL} : As defined in [3.4]

S : Spacing of floors under consideration, in m

ℓ : Span of floors between centre girder and side girder or side girders under consideration, in m

d_0 : Depth of the solid floor at the point under consideration in m

d_1 : Depth of the opening, if any, at the point under consideration in m

H : Value obtained from the following formulae:

a) Where openings with reinforcement or no opening are provided on solid floors:

1) Where slots without reinforcement are provided:

$$H = \sqrt{4.0\frac{d_2}{S_1} - 1.0}$$, without being taken less than 1.0

2) Where slots with reinforcement are provided: $H = 1.0$

b) Where openings without reinforcement are provided on solid floors:

1) Where slots without reinforcement are provided:

$$H = \left(1 + 0.5\frac{\phi}{d_0}\right)\sqrt{4.0\frac{d_2}{S_1} - 1.0}$$, without being taken less than $1 + 0.5\frac{\phi}{d_0}$

2) Where slots with reinforcement are provided:

$$H = 1 + 0.5\frac{\phi}{d_0}$$

d_2 : Depth of slots without reinforcement provided at the upper and lower parts of solid floors, in m, whichever is greater

S_1 : Spacing, in m, of vertical ordinary stiffeners or girders

ϕ : Major diameter of the openings, in m.

a : Depth of the solid floor at the point under consideration, in m, Where, however, if horizontal stiffeners are fitted on the floor, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or the inner bottom plating or the distance between the horizontal stiffeners under consideration

S_2 : The smaller of S_1 or a , in m

C_2' : Coefficient given in Tab 8 depending on S_1 / d_0 . For intermediate values of S_1 / d_0 , C_2' is to be determined by linear interpolation.

Table 8 Coefficient C_2'

S_1 / d_0	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C_2'	64	38	25	19	15	12	10	9	8	7

6. Stem

6.1 Bar stem

6.1.1

The gross cross sectional area, in cm^2, of a bar stem below the load waterline is not to be less than:

$$A_b = 1.25L$$

6.1.2

Starting from the load waterline, the cross sectional area of the bar stem may be reduced towards the upper end to $0.75A_b$.

6.2 Plate stem and bulbous bows

6.2.1

The gross thickness, in mm, is not to be less than the values obtained from the following formula:

$t = (0.6 + 0.4s_B)(0.08L + 6)\sqrt{k}$, without being taken greater than $22\sqrt{k}$

where:

s_B : Spacing, in m, between horizontal stringers (partial or not), breasthooks, or equivalent horizontal stiffening members.

The gross plate thickness is to be not less than the net thickness, obtained according to [4.2], plus the corrosion addition t_C as defined in Ch 3, Sec 3.

Scantlings of the ordinary stiffeners are to be determined according to [4.3].

6.2.2

Starting from 0.6 m above the load waterline up to $T + C$, the gross thickness may gradually be reduced to $0.8t$, where t is the gross thickness defined in [6.2.1].

6.2.3

Plate stems and bulbous bows must be stiffened by breasthooks and/or frames.

7. Forecastle

7.1 General

7.1.1

An enclosed forecastle is to be fitted on the freeboard deck.

The aft bulkhead of the enclosed forecastle is to be fitted in way or aft of the forward bulkhead of the foremost hold, as shown in Fig 2.

However, if this requirement hinders hatch cover operation, the aft bulkhead of forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7% of ship length for freeboard as specified in Ch 1, Sec 4, [3.2] abaft the fore side of stem.

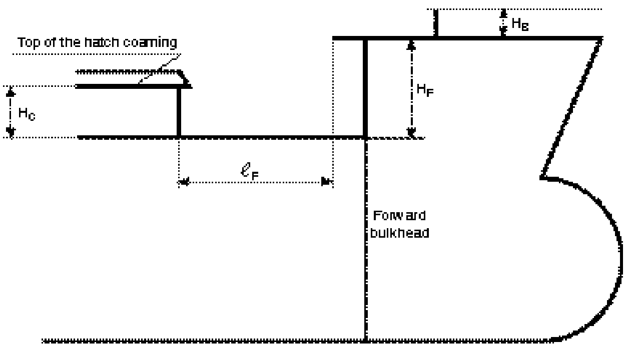

Figure 2: Forecastle

7.1.2

The forecastle height H_F above the main deck is to be not less than the greater of the following values:

the standard height of a superstructure as specified in Ch 1, Sec 4, [3.18]

H_C + 0.5 m, where H_C is the height of the forward transverse hatch coaming of the foremost cargo hold, i.e. cargo hold No.1.

7.1.3

All points of the aft edge of the forecastle deck are to be located at a distance less than or equal to ℓ_F:

$$\ell_F = 5\sqrt{H_F - H_C}$$

from the hatch coaming plate in order to apply the reduced loading to the No.1 forward transverse hatch coaming and No.1 hatch cover in applying Ch 9, Sec 5, [6.2.2] and Ch 9, Sec 5, [7.3.8].

7.1.4

A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centreline is not less than H_B/tan20° forward of the aft edge of the forecastle deck, where H_B is the height of the breakwater above the forecastle (see Fig 2).

Section 2 - AFT PART

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

L_1 : Rule length L, but to be taken not greater than 200 m

L_2 : Rule length L, but to be taken not greater than 300 m

k : Material factor, defined in Ch 3, Sec 1, [2.2]

z_{TOP} : Z co-ordinate, in m, of the top of the tank

m : Coefficient taken equal to:

m = 10 for vertical stiffeners, vertical primary supporting members

m = 12 for other stiffeners, other primary supporting members

τ_α : Allowable shear stress, in N/mm^2, taken equal to:

$$\tau_a = \frac{R_Y}{\sqrt{3}}$$

s : Spacing, in m, of ordinary stiffeners or primary supporting members, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners or primary supporting members, measured along the chord between the supporting members, see Ch 3, Sec 6, [4.2] or [5.3] respectively.

c_a : Aspect ratio of the plate panel, equal to:

$$c_a = 1.21\sqrt{1+0.33\left(\frac{s}{\ell}\right)^2} - 0.69\frac{s}{\ell}$$, to be taken not greater than 1.0

c_r : Coefficient of curvature of the panel, equal to:

$$c_r = 1 - 0.5\frac{s}{r}$$, to be taken not less than 0.4

r : Radius of curvature, in m.

RCN 1 to July 2010 version (effective from 1July 2012)

1. General

1.1 Introduction

1.1.1

The requirements of this Section apply for the scantlings of structures located aft of the aft peak bulkhead and for the reinforcements of the flat bottom aft area.

1.1.2

Aft peak structures which form the boundary of spaces not intended to carry liquids, and which do not belong to the outer shell, are to be subjected to lateral pressure in flooding conditions. Their scantlings are to be determined according to the relevant criteria in Ch 6.

1.2 Connections of the aft part with structures located fore of the aft peak bulkhead

1.2.1 Tapering

Adequate tapering is to be ensured between the scantlings in the aft part and those fore of the aft peak bulkhead. The tapering is to be such that the scantling requirements for both areas are fulfilled.

1.3 Net scantlings

1.3.1

As specified in Ch 3, Sec 2, all thicknesses referred to in this Section are net, i.e. they do not include any corrosion addition. The gross thicknesses are to be obtained as specified in Ch 3, Sec 2, [3].

2. Load model

2.1 Load point

2.1.1

Unless otherwise specified, lateral pressure is to be calculated at load points according to:

- Ch 6, Sec 1, [1.5], for plating
- Ch 6, Sec 2, [1.4], for stiffeners.

2.2 Lateral pressures

2.2.1 Lateral pressure in intact conditions

The aft part lateral pressure in intact conditions, in kN/m^2, is to be taken equal to ($p_S + p_W$).

where:

p_S, p_W : Hydrostatic and hydrodynamic pressures according to Ch 4, Sec 5, or internal still water and inertial pressures according to Ch 4, Sec 6, [2], to be considered among load cases H, F, R and P.

2.2.2 Lateral pressure in testing conditions

The lateral pressure p_T in testing conditions is taken equal to:

- $p_T = p_{ST} - p_S$ for bottom shell plating and side shell plating
- $p_T = p_{ST}$ otherwise

where:

p_{ST} : Testing pressure defined in Ch 4, Sec 6, [4]

p_S : Pressure taken equal to:

- if the testing is carried out afloat: hydrostatic pressure defined in Ch 4, Sec 5, [1] for the draught T_1, defined by the Designer, at which the testing is carried out. If T_1 is not defined, the testing is considered as being not carried out afloat.
- if the testing is not carried out afloat: $p_S = 0$

2.2.3 Elements of the outer shell

The still water and wave lateral pressures are to be calculated considering separately:

- the still water and wave external sea pressures
- the still water and wave internal pressure considering the compartment adjacent to the outer shell as being loaded. If the compartment adjacent to the outer shell is intended to carry liquids, this still water and wave internal pressures are to be reduced from the corresponding still water and wave external sea pressures.

2.2.4 Elements other than those of the outer shell

The still water and wave lateral pressures to be considered as acting on an element which separates two adjacent compartments are those obtained considering the two compartments individually loaded.

3. Aft peak

3.1 Arrangement

3.1.1 General

The aft peak is, in general, to be transversely framed.

3.1.2 Floors

Solid floors are to be fitted at every frame spacing.

The floor height is to be adequate in relation to the shape of the hull. Where a sterntube is fitted, the floor height is to extend at least above the sterntube. Where the hull lines do not allow such extension, plates of suitable height with upper and lower edges stiffened and securely fastened to the frames are to be fitted above the sterntube.

In way of and near the rudder post, propeller post and rudder horn, floors are to be extended up to the peak tank top and are to be increased in thickness; the increase will be considered by the Society on a case by case basis, depending on the arrangement proposed.

Floors are to be provided with stiffeners located at intervals not exceeding 800 mm.

3.1.3 Side frames

Side frames are to be extended up to a deck located above the full load waterline.

Side frames are to be supported by one of the following types of structure:

- non-tight platforms, to be fitted with openings having a total area not less than 10% of the area of the platforms
- side girders supported by side primary supporting members connected to deck transverses.

3.1.4 Platforms and side girders

Platforms and side girders within the peak are to be arranged in line with those located in the area immediately forward.

Where this arrangement is not possible due to the shape of the hull and access needs, structural continuity between the peak and the structures of the area immediately forward is to be ensured by adopting wide tapering brackets.

Where the aft peak is adjacent to a machinery space whose side is longitudinally framed, the side girders in the aft peak are to be fitted with tapering brackets.

3.1.5 Longitudinal bulkheads

A longitudinal non-tight bulkhead is to be fitted on the centreline of the ship, in general in the upper part of the peak, and stiffened at each frame spacing.

Where either the stern overhang is very large or the maximum breadth of the space divided by watertight and wash bulkheads is greater than 20 m, additional longitudinal wash bulkheads may be required.

4. Scantlings

4.1 Plating

4.1.1

The net thickness of plating are to be not less than those obtained from the formulae in Tab 1 and Tab 2.

Table 1: Net minimum thickness of plating

Minimum net thickness, in mm	
Bottom	$5.5 + 0.03L$
Side and transom	$0.85L^{1/2}$
Inner bottom	$5.5 + 0.03L$
Strength deck	$4.5 + 0.02L$
Platform and wash bulkhead	6.5
Transverse and longitudinal watertight bulkheads	$0.6L^{1/2}$

RCN 1 to July 2010 version (effective from 1July 2012)

Table 2: Net thickness of plating

Net thickness, in mm	
Intact conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_S + p_W}{0.9 R_Y}}$
Testing conditions	$t = 15.8 c_a c_r s \sqrt{\dfrac{p_T}{1.05 R_Y}}$

4.2 Ordinary stiffeners

4.2.1 General

The requirements of this sub-article apply to ordinary stiffeners considered as clamped at both ends. For other boundary conditions, the yielding check is to be considered on a case by case basis.

4.2.2

The net dimensions of ordinary stiffeners are to comply with the requirements in Ch 6, Sec 2, [2.3].

4.2.3

The net thickness of the web of ordinary stiffeners, in mm, is to be not less than the greater of:

- $t = 3.0 + 0.015L_2$

- 40% of the net required thickness of the attached plating, to be determined according to [4.1].

The net dimensions of ordinary stiffeners are to comply with the requirement in Ch 6 Sec 2, [2.2.2] and [2.3].

RCN 1 to July 2008 version (effective from 1 July 2009)

4.2.4

The net scantlings of single-span ordinary stiffeners are to be not less than those obtained from the formulae in Tab 3.

Table 3: Net scantlings of single span ordinary stiffeners

Stiffener type	Net section modulus w, in cm^3	Net sectional shear area A_{sh}, in cm^2
Single span ordinary stiffeners subjected to lateral pressure	$w = \frac{(p_S + p_W)s\ell^2}{0.9 m R_Y} 10^3$	$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$
Single span ordinary stiffeners subjected to testing pressure	$w = \frac{p_T s\ell^2}{1.05 m R_Y} 10^3$	$A_{sh} = \frac{5 p_T s\ell}{1.05\tau_a \sin\phi}$
where: ϕ : Angle, in deg, between the stiffener web and the shell plate, measured at the middle of the stiffener span; the correction is to be applied when ϕ is less than 75.		

4.2.5

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to comply with the formulae in Tab 4.

The maximum normal stress σ and shear stress τ in a multi-span ordinary stiffener are to be determined by a direct calculation taking into account:

- the distribution of still water and wave pressure and forces, if any
- the number and position of intermediate supports (decks, girders, etc.)
- the condition of fixity at the ends of the stiffener and at intermediate supports
- the geometrical characteristics of the stiffener on the intermediate spans.

Table 4: Checking criteria for multi-span ordinary stiffeners

Condition	Intact	Testing
Normal stress	$\sigma \le 0.9 R_Y$	$\sigma \le 1.05 R_Y$
Shear stress	$\tau \le \tau_a$	$\tau \le 1.05\tau_a$

4.3 Primary supporting members

4.3.1 Floors

The net thickness of floors is to be not less than that obtained, in mm, from the following formula:

$$t = 0.7\sqrt{L_2}$$

4.3.2 Side transverses

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side transverses are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

4.3.3 Side girders

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of side girders are to be not less than the values obtained from the following formulae:

$$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$$

$$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$$

4.3.4 Deck primary supporting members

The net scantlings of deck primary supporting members are to be not less than those obtained from the formulae in Table 5. The design pressures in the formulae are taken from intact conditions and testing conditions respectively as stated in [2.2]. For a complex deck structure, a direct strength calculation may be carried out in lieu of the formulae.

RCN 1 to July 2010 version (effective from 1July 2012)

Table 5: Net scantlings of deck primary supporting members

Condition	Net section modulus w, in cm^3	Net sectional shear area A_{sh}, in cm^2
Primary supporting members subjected to lateral pressure in intact conditions	$w = \frac{(p_S + p_W)s\ell^2}{0.9mR_Y}10^3$	$A_{sh} = \frac{5(p_S + p_W)s\ell}{\tau_a \sin\phi}$
Primary supporting members subjected to lateral pressure in testing conditions	$w = \frac{p_T s\ell^2}{1.05mR_Y}10^3$	$A_{sh} = \frac{5 p_T s\ell}{1.05\tau_a \sin\phi}$

where:

ϕ : Angle, in deg, between the primary supporting member's web and the shell plate, measured at the middle of the primary supporting member's span; the correction is to be applied when ϕ is less than 75.

RCN 1 to July 2010 version (effective from 1July 2012)

5. Connection of hull structures with the rudder horn

5.1 Connection of aft peak structures with the rudder horn

5.1.1 General

The requirement of this sub-article apply to the connection between peak structure and rudder horn where the stern-frame is of an open type and is fitted with the rudder horn.

5.1.2 Rudder horn

Horn design is to be such as to enable sufficient access for welding and inspection.

The scantlings of the rudder horn, which are to comply with Ch 10, Sec 1, [9.2], may be gradually tapered inside the hull.

Connections by slot welds are not acceptable.

5.1.3 Hull structures

The vertical extension of hull structure to support the rudder horn between the horn intersection with the shell and the peak tank top is in accordance with the requirements of Ch 10, Sec 1, [9.2.6] and [9.2.7].

The thickness of the structures adjacent to the rudder horn, such as shell plating, floors, platforms and side girders, the centreline bulkhead and any other structures, is to be adequately increased in relation to the horn scantlings.

(RCN 2, effective from 1 July 2008)

5.2 Structural arrangement above the aft peak

5.2.1 Side transverses

Where a rudder horn is fitted, side transverses, connected to deck beams, are to be arranged between the platform forming the peak tank top and the weather deck.

The side transverse spacing is to be not greater than:

- 2 frame spacings in way of the horn
- 4 frame spacings for and aft of the rudder horn
- 6 frame spacings in the area close to the aft peak bulkhead.

The side transverses are to be fitted with end brackets and located within the poop. Where there is no poop, the scantlings of side transverses below the weather deck are to be adequately increased with respect to those obtained from the formulae in [4.3.2].

5.2.2 Side girders

Where the depth from the peak tank top to the weather deck is greater than 2.6 m and the side is transversely framed, one or more side girders are to be fitted, preferably in line with similar structures existing forward.

6. Sternframes

6.1 General

6.1.1

Sternframes may be made of cast or forged steel, with a hollow section, or fabricated from plate.

6.1.2

Cast steel and fabricated sternframes are to be strengthened by adequately spaced horizontal plates.

Abrupt changes of section are to be avoided in castings; all sections are to have adequate tapering radius.

6.2 Connections

6.2.1 Connection with hull structure

Sternframes are to be effectively attached to the aft structure and the lower part of the sternframe is to be extended forward of the propeller post to a length not less than $1500 + 6L$ mm, in order to provide an effective connection with the keel. However, the sternframe need not extend beyond the aft peak bulkhead.

The net thickness of shell plating connected with the sternframe is to be not less than that obtained, in mm, from the following formula:

$t = 8.5 + 0.045L$

6.2.2 Connection with the keel

The thickness of the lower part of the sternframes is to be gradually tapered to that of the solid bar keel or keel plate.

Where a keel plate is fitted, the lower part of the sternframe is to be so designed as to ensure an effective connection with the keel.

6.2.3 Connection with transom floors

Rudder posts and propeller posts are to be connected with transom floors having height not less than that of the double bottom and net thickness not less than that obtained, in mm, from the following formula:

$t = 9 + 0.023L_1$

6.2.4 Connection with centre keelson

Where the sternframe is made of cast steel, the lower part of the sternframe is to be fitted, as far as practicable, with a longitudinal web for connection with the centre keelson.

6.3 Propeller posts

6.3.1 Gross scantlings

With reference to Ch 3, Sec 2, all scantlings and dimensions referred to in [6.3.2] to [6.3.4] are gross, i.e. they include the margins for corrosion.

6.3.2 Gross scantlings of propeller posts

The gross scantlings of propeller posts are to be not less than those obtained from the formulae in Tab 6 for single screw ships and Tab 7 for twin screw ships.

Scantlings and proportions of the propeller post which differ from those above may be considered acceptable provided that the section modulus of the propeller post section about its longitudinal axis is not less than that calculated with the propeller post scantlings in Tab 6 or Tab 7, as applicable.

6.3.3 Section modulus below the propeller shaft bossing

In the case of a propeller post without a sole piece, the section modulus of the propeller post may be gradually reduced below the propeller shaft bossing down to 85% of the value calculated with the scantlings in Tab 6 or Tab 7, as applicable.

In any case, the thicknesses of the propeller posts are to be not less than those obtained from the formulae in the tables.

6.3.4 Welding of fabricated propeller post with the propeller shaft bossing

Welding of a fabricated propeller post with the propeller shaft bossing is to be in accordance with Ch 11, Sec 2.

6.4 Propeller shaft bossing

6.4.1

In single screw ships, the thickness of the propeller shaft bossing, included in the propeller post, is to be not less than 60% of the dimension *b* required in [6.3.2] for bar propeller posts with a rectangular section.

Table 6: Single screw ships - Gross scantlings of propeller posts

Gross scantlings of propeller posts, in mm	Fabricated propeller post 	Cast propeller post 	Bar propeller post, cast or forged, having rectangular section a	$50\ L^{1/2}$	$33\ L^{1/2}$	$10\sqrt{7.2L-256}$
b	$35\ L^{1/2}$	$23\ L^{1/2}$	$10\sqrt{4.6L-164}$
t_1 (1)	$2.5\ L^{1/2}$	$3.2\ L^{1/2}$ to be taken not less than 19 mm	-
t_2 (1)	-	$4.4\ L^{1/2}$ to be taken not less than 19 mm	-
t_D	$1.3\ L^{1/2}$	$2.0\ L^{1/2}$	-
R	-	$50\ L^{1/2}$	-

(1) Propeller post thicknesses t_1, and t_2 are, in any case, to be not less than $(0.05\ L + 9.5)$ mm.

Table 7: Twin screw ships - Gross scantlings of propeller posts

Gross scantlings of propeller posts, in mm	Fabricated propeller post 	Cast propeller post 	Bar propeller post, cast or forged, having rectangular section a	$25\ L^{1/2}$	$12.5\ L^{1/2}$	$2.4L + 6$
b	$25\ L^{1/2}$	$25\ L^{1/2}$	$0.8L + 2$
t_1 **(1)**	$2.5\ L^{1/2}$	$2.5\ L^{1/2}$	-
t_2 **(1)**	$3.2\ L^{1/2}$	$3.2\ L^{1/2}$	-
t_3	-	$4.4\ L^{1/2}$	-
t_D	$1.3\ L^{1/2}$	$2.0\ L^{1/2}$	-
(1) Propeller post thicknesses t_1, t_2 and t_3 are, in any case, to be not less than $(0.05L + 9.5)$ mm.			

6.5 Sterntubes

6.5.1 Sterntubes

The sterntube thickness is considered by the Society on a case by case basis. In no case, however, may it be less than the thickness of the side plating adjacent to the stern-frame.

Where the materials adopted for the sterntube and the plating adjacent to the sternframe are different, the sterntube thickness is to be at least equivalent to that of the plating.

Section 3 – MACHINERY SPACE

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

k : Material factor, defined in Ch 3, Sec 1, [2.2]

P : Maximum continuous rating, in kW, of the engine

n_r : Number of revolutions per minute of the engine shaft at power equal to P

L_E : Effective length, in m, of the engine foundation plate required for bolting the engine to the seating, as specified by the engine manufacturer.

1. General

1.1 Application

1.1.1

The requirements of this Section apply for the arrangement and scantling of machinery space structures as regards general strength. It is no substitute to machinery manufacturer's requirements that have to be dealt with at Shipyard diligence.

1.2 Scantlings

1.2.1 Net scantlings

As specified in Ch 3, Sec 2 all scantlings referred to in this Section are net, i.e. they do not include any margin for corrosion.

The gross scantlings are obtained as specified in Ch 3, Sec 2, [3.1].

1.2.2 General

Unless otherwise specified in this Section, the scantlings of plating, ordinary stiffeners and primary supporting members in the machinery space are to be determined according to the relevant criteria in Ch 6.

In addition, the minimum thickness requirements specified in this Section apply.

1.2.3 Primary supporting members

The Designer may propose arrangements and scantlings alternative to the requirements of this Section, on the basis of direct calculations which are to be submitted to the Society for examination on a case by case basis.

The Society may also require such direct calculations to be carried out whenever deemed necessary.

1.3 Connections of the machinery space with structures located aft and forward

1.3.1 Tapering

Adequate tapering is to be ensured between the scantlings in the machinery space and those aft and forward. The tapering is to be such that the scantling requirements for all areas are fulfilled.

1.3.2 Transition zone between engine room and cargo area

In the transition zone between the engine room and the aftermost cargo hold due consideration is to be given to the proper tapering of major longitudinal members within the engine room such as flats, decks, horizontal rings or side stringers into the cargo hold, and for longitudinal bulkheads (inner skin, upper and lower wing tank) into the engine room.

Where such structure is in line with longitudinal members aft or forward of the cargo hold bulkhead, adequate tapering is to be achieved by fitting large tapering brackets inside the wing tanks or engine room.

1.3.3 Deck discontinuities

Decks which are interrupted in the machinery space are to be tapered on the side by means of horizontal brackets.

2. Double bottom

2.1 Arrangement

2.1.1 General

Where the machinery space is immediately forward of the after peak, the double bottom is to be transversely framed. In all other cases it may be transversely or longitudinally framed.

2.1.2 Double bottom height

The double bottom height at the centreline, irrespective of the location of the machinery space, is to be not less than the value defined in Ch 3, Sec 6, [6.1]. This depth may need to be considerably increased in relation to the type and depth of main machinery seatings.

The above height is to be increased by the Shipyard where the machinery space is very large and where there is a considerable variation in draught between light ballast and full load conditions.

Where the double bottom height in the machinery space differs from that in adjacent spaces, structural continuity of longitudinal members is to be ensured by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the sloped inner bottom are to be located in way of floors.

2.1.3 Centre bottom girder

In general, the centre bottom girder may not be provided with holes. In any case, in way of any openings for manholes on the centre girder, permitted only where absolutely necessary for double bottom access and maintenance, local strengthening is to be arranged.

2.1.4 Side bottom girders

In the machinery space the number of side bottom girders is to be adequately increased, with respect to the adjacent areas, to ensure adequate rigidity of the structure. The side bottom girders are to be a continuation of any bottom longitudinals in the areas adjacent to the machinery space and are generally to have a spacing not greater than 3 times that of longitudinals and in no case greater than 3 m.

2.1.5 Side bottom girders in way of machinery seatings

Additional side bottom girders are to be fitted in way of machinery seatings.

Side bottom girders arranged in way of main machinery seatings are to extend for the full length of the machinery space.

Bottom girders are to extend as far aft as practicable in relation to the shape of the bottom and are to be supported by floors and side primary supporting members at the ends.

Forward of the machinery space forward bulkhead, the bottom girders are to be generally tapered for at least three frame spaces and are to be effectively connected to the hull structure.

RCN 1 to July 2010 version (effective from 1July 2012)

2.1.6 Floors in longitudinally framed double bottom

Where the double bottom is longitudinally framed, the floor spacing is to be not greater than:

- 1 frame spacing in way of the main engine and thrust bearing
- 2 frame spacings in other areas of the machinery space.

Additional floors are to be fitted in way of other important machinery.

2.1.7 Floors in transversely framed double bottom

Where the double bottom in the machinery space is transversely framed, floors are to be arranged at every frame. Furthermore, additional floors are to be fitted in way of boiler foundations or other important machinery.

2.1.8 Floors stiffeners

In addition to the requirements in Ch 3, Sec 6, floors are to have web stiffeners sniped at the ends and spaced not more than approximately 1 m apart.

The section modulus of web stiffeners is to be not less than 1.2 times that required in Ch 6, Sec 2, [4.1.2].

2.1.9 Manholes and wells

The number and size of manholes in floors located in way of seatings and adjacent areas are to be kept to the minimum necessary for double bottom access and maintenance.

The depth of manholes is generally to be not greater than 40% of the floor local depth, and in no case greater than 750 mm, and their width is to be equal to approximately 400 mm.

In general, manhole edges are to be stiffened with flanges; failing this, the floor plate is to be adequately stiffened with flat bars at manhole sides.

Manholes with perforated portable plates are to be fitted in the inner bottom in the vicinity of wells arranged close to the aft bulkhead of the engine room.

Drainage of the tunnel is to be arranged through a well located at the aft end of the tunnel.

2.2 Minimum thicknesses

2.2.1

The net thicknesses of inner bottom, floor and girder webs are to be not less than the values given in Tab 1.

Table 1: Double bottom - Minimum net thicknesses of inner bottom, floor and girder webs

Element	Minimum net thickness, in mm
Inner bottom	$6.6 + 0.024L$ The Society may require the thickness of the inner bottom in way of the machinery seatings and on the main thrust blocks to be increased, on a case by case basis.
Margin plate	$0.9L^{1/2} + 1$
Centre girder	$1.55L^{1/3} + 3.5$
Floors and side girders	$1.7L^{1/3} +1$
Girder bounding a duct keel	$0.8L^{1/2} + 2.5$, to be taken not less than that required for the centre girder.

3. Side

3.1 Arrangement

3.1.1 General

The type of side framing in machinery spaces is generally to be the same as that adopted in the adjacent areas.

3.1.2 Extension of the hull longitudinal structure within the machinery space

In ships where the machinery space is located aft and where the side is longitudinally framed, the longitudinal structure is preferably to extend for the full length of the machinery space.

In any event, the longitudinal structure is to be maintained for at least 0.3 times the length of the machinery space, calculated from the forward bulkhead of the latter, and abrupt structural discontinuities between longitudinally and transversely framed structures are to be avoided.

3.1.3 Side transverses

Side transverses are to be aligned with floors. One is preferably to be located in way of the forward end and another in way of the after end of the machinery casing.

For a longitudinally framed side, the side transverse spacing is to be not greater than 4 frame spacings.

For a transversely framed side, the side transverse spacing is to be not greater than 5 frame spaces. The web height is to be not less than twice that of adjacent frames and the section modulus is to be not less than four times that of adjacent frames.

Side transverse spacing greater than that above may be accepted provided that the scantlings of ordinary frames are increased, according to the Society's requirements to be defined on a case by case basis.

4. Platforms

4.1 Arrangement

4.1.1 General

The location and extension of platforms in machinery spaces are to be arranged so as to be a continuation of the structure of side longitudinals, as well as of platforms and side girders located in the adjacent hull areas.

4.1.2 Platform transverses

In general, platform transverses are to be arranged in way of side or longitudinal bulkhead transverses.

For longitudinally framed platforms, the spacing of platform transverses is to be not greater than 4 frame spacings.

4.2 Minimum thicknesses

4.2.1

The net thickness of platforms is to be not less than 6.5 mm.

5. Pillaring

5.1 Arrangement

5.1.1 General

The pillaring arrangement in machinery spaces is to account both for the concentrated loads transmitted by machinery and superstructures and for the position of main machinery and auxiliary engines.

5.1.2 Pillars

Pillars are to be arranged in the following positions:

- in way of machinery casing corners and corners of large openings on platforms; alternatively, two pillars may be fitted on the centreline (one at each end of the opening)
- in way of the intersection of platform transverses and girders
- in way of transverse and longitudinal bulkheads of the superstructure.

In general, pillars are to be fitted with brackets at their ends.

5.1.3 Pillar bulkheads

In general, pillar bulkheads, fitted in ‘tween decks below the upper deck, are to be located in way of load-bearing bulkheads in the superstructures.

Longitudinal pillar bulkheads are to be a continuation of main longitudinal hull structures in the adjacent spaces forward and aft of the machinery space.

Pillar bulkhead scantlings are to be not less than those required in [6.3] for machinery casing bulkheads.

6. Machinery casing

6.1 Arrangement

6.1.1 Ordinary stiffener spacing

Ordinary stiffeners are to be located:

- at each frame, in longitudinal bulkheads
- at a distance of about 750 mm, in transverse bulkheads.

The ordinary stiffener spacing in portions of casings that are particularly exposed to wave action is considered by the Society on a case by case basis.

6.2 Openings

6.2.1 General

All machinery space openings, which are to comply with the requirements in Sec 6, [6], are to be enclosed in a steel casing leading to the highest open deck. Casings are to be reinforced at the ends by deck beams and girders associated to pillars.

In the case of large openings, the arrangement of cross-ties as a continuation of deck beams may be required.

Skylights, where fitted with openings for light and air, are to have coamings of a height not less than:

- 900 mm, if in position 1
- 760 mm, if in position 2.

6.2.2 Access doors

Access doors to casings are to comply with Sec 6, [6.2].

6.3 Scantlings

6.3.1 Plating and ordinary stiffeners

The net scantlings of plating and ordinary stiffeners are to be not less than those obtained according to the applicable requirements in Ch 9, Sec 4.

6.3.2 Minimum thicknesses

The net thickness of bulkheads is to be not less than:

- 5.5 mm for bulkheads in way of cargo holds
- 4 mm for bulkheads in way of accommodation spaces.

7. Main machinery seating

7.1 Arrangement

7.1.1 General

The scantlings of main machinery seatings and thrust bearings are to be adequate in relation to the weight and power of engines and the static and dynamic forces transmitted by the propulsive installation.

7.1.2 Seating supporting structure

Transverse and longitudinal members supporting the seatings are to be located in line with floors and double or single bottom girders, respectively.

They are to be so arranged as to avoid discontinuity and ensure sufficient accessibility for welding of joints and for surveys and maintenance.

7.1.3 Seatings included in the double bottom structure

Where high-power internal combustion engines or turbines are fitted, seatings are to be integral with the double bottom structure. Girders supporting the bedplates in way of seatings are to be aligned with double bottom girders and are to be extended aft in order to form girders for thrust blocks.

The girders in way of seatings are to be continuous from the bedplates to the bottom shell.

7.1.4 Seatings above the double bottom plating

Where the seatings are situated above the double bottom plating, the girders in way of seatings are to be fitted with flanged brackets, generally located at each frame and extending towards both the centre of the ship and the sides.

The extension of the seatings above the double bottom plating is to be limited as far as practicable while ensuring adequate spaces for the fitting of bedplate bolts. Bolt holes are to be located such that they do not interfere with seating structures.

7.1.5 Seatings in a single bottom structure

For ships having a single bottom structure within the machinery space, seatings are to be located above the floors and to be adequately connected to the latter and to the girders located below.

7.1.6 Number of girders in way of machinery seatings

At least two girders are to be fitted in way of main machinery seatings.

One girder may be fitted only where the following three formulae are complied with:

$L < 150$ m

$P < 7100$ kW

$P < 2.3\, n_r\, L_E$

7.2 Minimum scantlings

7.2.1

The net scantlings of the structural elements in way of the internal combustion engine seatings are to be obtained from the formulae in Tab 2. However, the net cross-sectional area of each bedplate of the seatings may be determined by the engine manufacturers, provided the information regarding permissible foundation stiffness considering the engine characteristics and engine room arrangement, etc.

RCN 1 to July 2008 version (effective from 1 July 2009)

Table 2: Minimum scantlings of the structural elements in way of machinery seatings

Scantling minimum value	Scantling minimum value
Net cross-sectional area, in cm^2, of each bedplate of the seatings	$40 + 70\dfrac{P}{n_r L_E}$
Bedplate net thickness, in mm	Bedplates supported by two or more girders: $\sqrt{240 + 175\dfrac{P}{n_r L_E}}$ Bedplates supported by one girder: $5 + \sqrt{240 + 175\dfrac{P}{n_r L_E}}$
Total web net thickness, in mm, of girders fitted in way of machinery seatings	Bedplates supported by two or more girders: $\sqrt{320 + 215\dfrac{P}{n_r L_E}}$ Bedplates supported by one girder:

	$\sqrt{95+65\dfrac{P}{n_r L_E}}$
Web net thickness, in mm, of floors fitted in way of machinery seatings	$\sqrt{55+40\dfrac{P}{n_r L_E}}$

Section 4 – SUPERSTRUCTURES AND DECKHOUSES

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

L_2 : Rule length L, but to be taken not greater than 300 m

p_D : Lateral pressure for decks, in kN/m^2, as defined in [3.2.1]

p_{SI} : Lateral pressure for sides of superstructures, in kN/m^2, as defined in [3.2.3]

k : Material factor, defined in Ch 3, Sec 1, [2.2]

s : Spacing, in m, of ordinary stiffeners, measured at mid-span along the chord

ℓ : Span, in m, of ordinary stiffeners, measured between the supporting members, see Ch 3, Sec 6, [4.2]

RCN 1 to July 2008 version (effective from 1 July 2009)

c : Coefficient taken equal to:

$c = 0.75$ for beams, girders and transverses which are simply supported on one or both ends

$c = 0.55$ in other cases

m_a : Coefficient taken equal to:

$$m_a = 0.204\frac{s}{\ell}\left[4-\left(\frac{s}{\ell}\right)^2\right], \text{ with } \frac{s}{\ell}\le 1$$

1. General

1.1 Definitions

1.1.1 Superstructure

See Ch 1, Sec 4, [3.12.1]

1.1.2 Deckhouse

See Ch 1, Sec 4, [3.15.1]

1.1.3 Long deckhouse

A long deckhouse is a deckhouse the length of which within $0.4L$ amidships exceeds $0.2L$. The strength of a long deckhouse is to be specially considered.

1.1.4 Short deckhouse

A short deckhouse is a deckhouse not covered by the definition given in [1.1.3].

1.1.5 Non-effective superstructure

For the purpose of this section, all superstructures being located beyond $0.4L$ amidships or having a length of less than $0.15L$ are considered as non-effective superstructures.

1.1.6 Insulated funnel

Scantlings of insulated funnels are to be determined as for deckhouses.

1.1.7 Effective superstructure

Effective superstructure is a superstructure not covered by the definition given in [1.1.5]

1.2 Gross scantlings

1.2.1

With reference to Ch 3, Sec 2, all scantlings and dimensions referred to in [4] and [5] are gross, i.e. they include the margins for corrosion.

2. Arrangement

2.1 Strengthening at the ends of superstructures

2.1.1

In way of end bulkheads of superstructures located within 0.4L amidships, the thickness of the strength deck in a breadth of 0.1B from the shell, the thickness of the sheerstrake, and the thickness of the superstructure side plating are to be increased by the percentage of strengthening specified in Tab 1. The strengthening is to be extended over a region from 4 frame spacings abaft the end bulkhead to 4 frame spacings forward of the end bulkhead.

Table 1: Percentage of strengthening

Type of superstructure	Strength deck and sheerstrake	Side plating of superstructure
Effective	30%	20%
Non-effective	20%	10%

2.1.2

Under strength decks in way of 0.6L amidships, girders are to be fitted in alignment with longitudinal walls, which are to extend at least over three frame spacings beyond the end points of the longitudinal walls. The girders are to overlap with the longitudinal walls by at least two frame spacings.

2.2 Attachment of stiffening members

2.2.1 Attachment of deck beams

Transverse deck beams are to be connected to the frames by brackets according to Ch 3, Sec 6.

Deck beams crossing longitudinal walls and girders may be attached to the stiffeners of longitudinal walls and the webs of girders respectively by welding without brackets.

2.2.2 Attachment of deck girders and transverses

End attachments of girders at bulkheads are to be so dimensioned that the bending moments and shear forces can be transferred. Bulkhead stiffeners under girders are to be sufficiently dimensioned to support the girders.
